Pin Out-LCD

The 10.1" LCD has a Hirose 45 position, 0.5mm pitch, MPN: FH34SRJ-45S-0.5SH(50)

Note: First pin name is the LTS pin name but for clarity, we are providing the second pin name based on the OpenLDI spec.

Backlight Specifications

This design has 2 LED rails to achieve maximum brightness. JST ZH series connectors were chosen for ease of integration. The backlight wiring has been pinned out to a 2 position, 1.5 mm pitch connector with part number ZHR-2, an example mating connector part number is S2B-ZR-SM2-TF. The supply current mentioned below is the sum, i.e., 143mA per backlight connector is required for a total of 286mA (typical) at 1000NITS.

Note 1: Measurement setup

The LCD module should be stabilized at a given temperature for 25 minutes to avoid abrupt temperature change during measurement. After temperature saturation measurement should be executed.

**Note 2: Brightness Uniformity**

Brightness uniformity = (Minimum Luminance of 9 points / Max Luminance of 9 points) * 100

Note 3: Viewing Angle

Definition of viewing angle for Y+/- and X+/- is as follows.

**Note 4: Response Time**

Definition of response time as follows below.

Note 5: Contrast Ratio

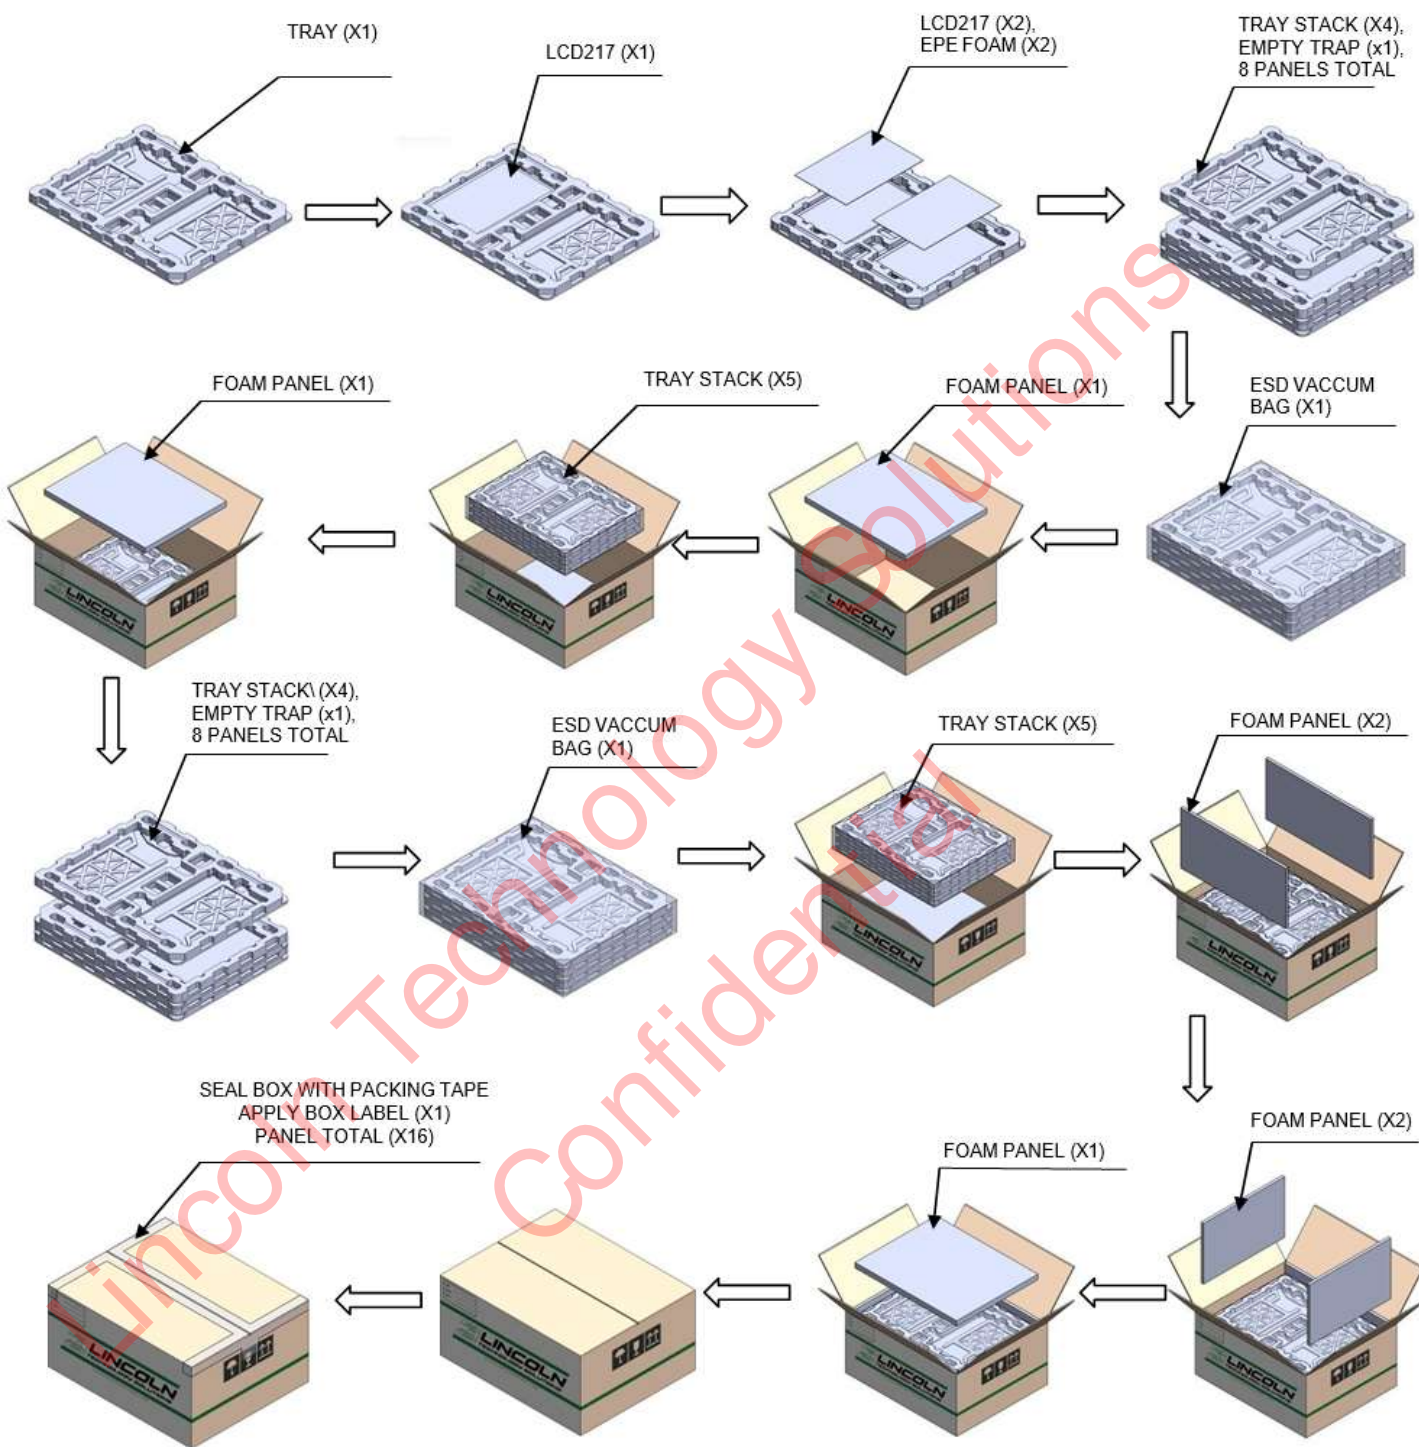

Definition of Contrast Ratio is as follows.

Contrast measurements shall be made at a viewing angle of 0° at the center of the surface.

$$\text{CR} = \frac{\text{Luminance when displaying White}}{\text{Luminance when displaying Black}}$$

Quality & Inspection Criteria

Terminologies:

LCD: Liquid Crystal Display; Each pixel contains three dots of R, G, and B (sub-pixel).

Bright Dot: 1 sub-pixel is a dot. Defects should be larger than 1/2 of a sub-pixel. Dots that are not visible through a 5% ND Filter or smaller than 1/2 of sub-pixel size will not be counted as a dot defect.

Dark Dot: Any single sub-pixel that does not light up in a white screen or another non-black screen is called a dark dot.

Two adjacent dots (horizontal direction): Use the bright dot illustration as an example to demonstrate two horizontal consecutive dots.

Two adjacent dots (vertical direction): Use the bright spot illustration as an example to demonstrate two vertical consecutive dots.

Two adjacent dots (bevel direction): Use the bright spot illustration as an example to demonstrate two consecutive dots in the bevel direction.

Three or more adjacent dots (horizontal): Use the bright spot illustration as an example to demonstrate three or more consecutive horizontal and vertical dots.

Illustration of spacing between two dots: (Distance is the relative distance between the X-axes of the two dots or the relative distance between the Y-axes of the two dots, whichever is larger)

Functional Test

The LCD display testing program should display the following screens in order: all red, all green, all blue, all white, all gray, all black.

Inspection Requirements

After booting the system (single illumination), there are no non-display, unlit backlight, dark backlight, blinking, or other abnormal signs, and there are no bright lines, dark lines, or bright rims/leakage of light close to the LCD bezel.

Newton's Ring

Under high temperature and high humidity conditions, uneven deformations caused by heat in different layers of the LCD module will result in the display of an all-white screen. However, this condition can be recovered when temperature is resumed under normal circumstances. A specific determination can be conducted according to the operating conditions and storage conditions defined in the product's technical specifications. Any exception will be negotiated and mutually agreed by both parties. (Ripples are not permitted at fixed locations. For ripples at non-fixed locations, they are OK if they disappear within two seconds.)

LCD blaze

Uneven internal LCD installation, surface deformation of the LCD polarizer, internal structural interference of the LCD module, damaged LCD backlight plates, and other factors may cause partial fading of color on the LCD display. When observed from a certain incident angle (upper 10°, lower 3°, 40° on both sides), they will appear as white cicatrices, typically about the size of a grain of rice. In serious cases, they accumulate in large patches or stripes, appear in different degrees under various colors (red, blue, green, black, gray, white), and are especially obvious under an all- gray screen. Blazes with diameters $\geq 0.5\text{mm}$ are not allowed: for those with diameters under 0.5 mm, 2 are acceptable if the space between them is $\geq 15\text{mm}$. Card chromatic aberration ratio versus ND Filter: $1.0 + 0.3 \text{ standard} = 5\% \text{ ND}$ Filer (see definition of Mura).

Mura

Mura refers to the unevenness and irregularity that is visible in the image. It is difficult for visual inspection to recognize the non-uniform brightness or mura. Mura detection is subjective and therefore doesn't have pass/fail criteria. There are several precautions to take which can avoid mura. Avoid high ambient temperatures around the module, frame warpage and high temperature operation over long periods of time. Utilize screen savers to avoid mura.

Inspection Conditions

Inspection distance should be $35\text{cm} \pm 5\text{cm}$ with a FujiFilm ND-LCD 5% filter approximately 5cm from the backlight surface.

Viewing angle: $90^\circ \pm 5^\circ$.

Room temperature: $23 \pm 2^\circ\text{C}$

Humidity: $60 \pm 10\%$

Inspection Ambient Illumination: 300-700 LUX

Acceptance Criteria Table

There should be no corrosion or cracking, or an uneven coating layer on LCD display surface, and there should be no sign of coagulation, flaking, cracking, or wear. The definition of minor defects and acceptance criteria are shown in the following table:

Item	Size	Unit	Acceptance qty.
Unfelt scratch visible with backlight off.	$W < 0.05$	m	Ignore
	$W > .05$ and $< .10$ $L > .3$ and < 3.0	m	4
	$W > .10$ or $L > 3.0$	m	none
