**2CH PWM DC/DC CONTROLLER**

---

NO.EA-086-160125

**OUTLINE**

The R1280D002x Series are CMOS-based 2-channel PWM Step-up (as Channel 1)/Inverting (as Channel 2) DC/DC converter controllers.

Each of the R1280D002x Series consists of an oscillator, a PWM control circuit, a reference voltage unit, an error amplifier, a reference current unit, a protection circuit, and an under voltage lockout (UVLO) circuit. A high efficiency Step-up/Inverting DC/DC converter can be composed of this IC with inductors, diodes, power MOSFETs, resistors, and capacitors. Each Output Voltage can be adjustable with external resistors, while soft-start time can be adjustable with external capacitors.

Maximum Duty Cycle of R1280D002A and C series can be also adjustable with external resistors.

Maximum Duty Cycle of R1280D002B is built-in as 90%(Typ.).

When CE pin of R1280D002B is set at GND level, this IC turns off external power MOSFETs of Step-up/Inverting as Standby-mode.

Standby current is typically 0 $\mu$ A.

As for a protection circuit, if Maximum duty cycle of either Step-up DC/DC converter side or Inverting DC/DC converter side is continued for a certain time, the R1280D Series latch both external drivers with their off state by its Latch-type protection circuit. Delay time for protection is internally fixed typically at 100ms. To release the protection circuit, restart with power-on (Voltage supplier is equal or less than UVLO detector threshold level), or as for R1280D002B, once after making the circuit be stand-by with chip enable pin and enable the circuit again.

**FEATURES**

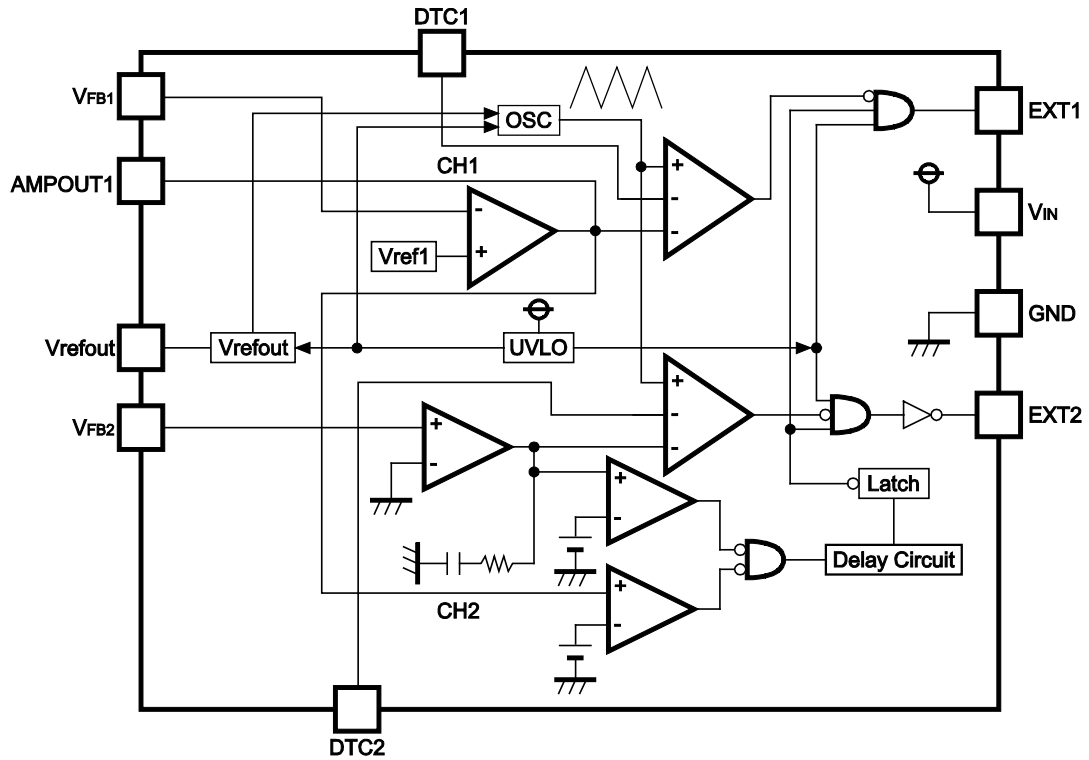

- Input Voltage Range .....2.5V to 5.5V
- Built-in Latch-type Protection Function by monitoring duty cycle (Fixed Delay Time Typ. 100ms)
- Oscillator Frequency .....700kHz (R1280D002A,B)/200kHz (R1280D002C)
- Maximum Duty Cycle .....Typ. 90% (Only applied to R1280D002B Series)
- High Reference Voltage Accuracy ..... $\pm 1.5\%$
- U.V.L.O. Threshold.....Typ. 2.2V (Hysteresis: Typ. 0.1V)
- Small Package .....thin SON-10 (package thickness Max. 0.9mm)

**APPLICATIONS**

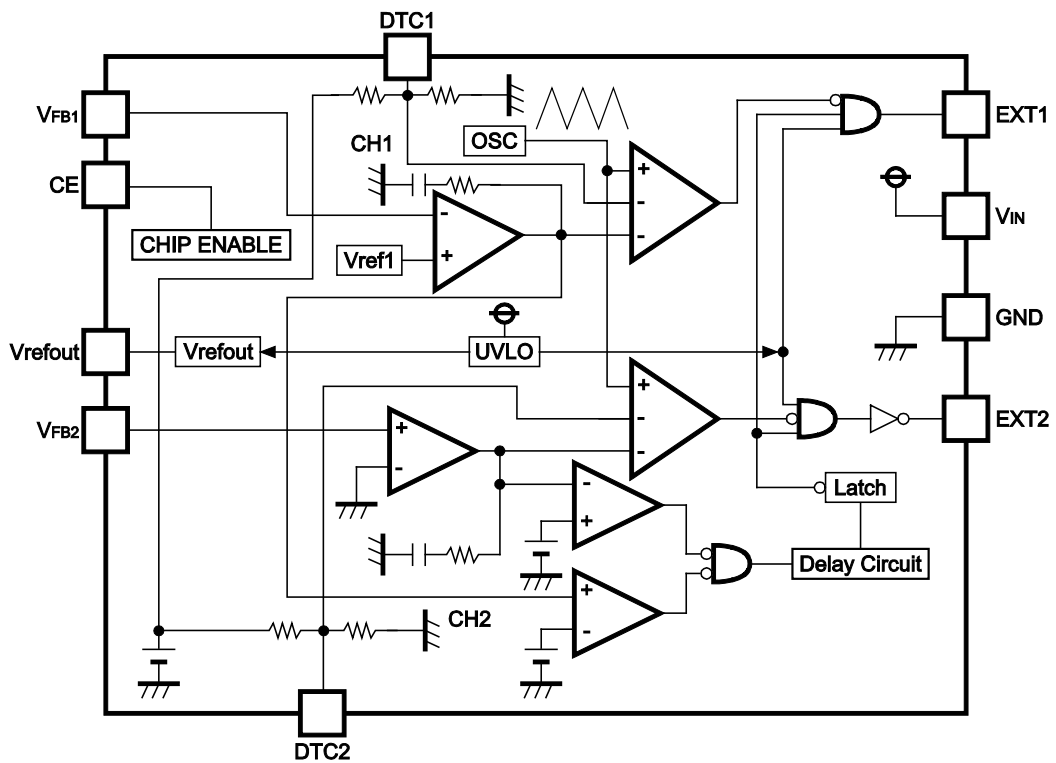

- Constant Voltage Power Source for Portable Equipment.
- Constant Voltage Power Source for LCD and CCD.

### BLOCK DIAGRAM

- R1280D002A/C

- R1280D002B

## SELECTION GUIDE

The mask option for the ICs can be selected at the user's request. The selection can be made with designating the part number as shown below;

### Selection Guide

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
R1280D002x-TR-FE	SON-10	3,000 pcs	Yes	Yes

x: Designation of Mask Option

A version: fosc=700kHz, with External Phase Compensation for Channel 1

B version: fosc=700kHz, with Internal Phase Compensation and standby mode

C version: fosc=200kHz, with External Phase Compensation for Channel 1

## PIN CONFIGURATION

## **PIN DESCRIPTION**

### **• R1280D002A/C**

<b>Pin No</b>	<b>Symbol</b>	<b>Description</b>
1	EXT1	External Transistor of Channel 1 Drive Pin (CMOS Output)
2	GND	Ground Pin
3	AMPOUT1	Amplifier Output Pin of Channel 1
4	DTC1	Maximum Duty Cycle of Channel 1 Setting Pin
5	V <sub>FB1</sub>	Feedback pin of Channel 1
6	V <sub>FB2</sub>	Feedback pin of Channel 2
7	DTC2	Maximum Duty Cycle of Channel 2 Setting Pin
8	Vrefout	Reference Output Pin
9	V <sub>IN</sub>	Voltage Supply Pin of the IC
10	EXT2	External Transistor of Channel 2 Drive Pin (CMOS Output)

### **• R1280D002B**

<b>Pin No</b>	<b>Symbol</b>	<b>Description</b>
1	EXT1	External Transistor of Channel 1 Drive Pin (CMOS Output)
2	GND	Ground Pin
3	CE	Chip Enable Pin
4	DTC1	Soft-start Time of Channel 1 Setting Pin
5	V <sub>FB1</sub>	Feedback pin of Channel 1
6	V <sub>FB2</sub>	Feedback pin of Channel 2
7	DTC2	Soft-start Time of Channel 2 Setting Pin
8	Vrefout	Reference Output Pin
9	V <sub>IN</sub>	Voltage Supply Pin of the IC
10	EXT2	External Transistor of Channel 2 Drive Pin (CMOS Output)

## ABSOLUTE MAXIMUM RATINGS

## Operation of Step-up DC/DC Converter and Output Current

Step-up DC/DC Converter makes higher output voltage than input voltage by releasing the energy accumulated during on time of Lx Transistor on input voltage.

Step 1. Lx Tr. is on, then the current  $I_L=i_1$  flows, and the energy is charged in L. In proportion to the on time of Lx Tr. ( $T_{on}$ ),  $I_L=i_1$  increases from  $I_L=I_{Lxmin}=0$  and reaches  $I_{Lxmax}$ .

Step 2. When the Lx Tr. is off, L turns on Schottky Diode (SD), and  $I_L=i_2$  flows to maintain  $I_L=I_{Lxmax}$ .

Step 3.  $I_L=i_2$  gradually decreases, and after  $T_f$  passes,  $I_L=I_{Lxmin}=0$  is true, then SD turns off. Note that in the case of the continuous mode, before  $I_L=I_{Lxmin}=0$  is true,  $T_{off}$  passes, and the next cycle starts, then Lx Tr. turns on again.

In this case,  $I_{Lxmin}>0$ , therefore  $I_L=I_{Lxmin}>0$  is another starting point and  $I_{Lx max}$  increases.

With the PWM controller, switching times during the time unit are fixed. By controlling  $T_{on}$ , output voltage is maintained.

## Output Current and Selection of External Components

### Output Current of Step-up Circuit and External Components

There are two modes, or discontinuous mode and continuous mode for the PWM step-up switching regulator depending on the continuous characteristic of inductor current.

During on time of the transistor, when the voltage added on to the inductor is described as  $V_{IN}$ , the current is  $V_{IN} \times t/L$ .

Therefore, the electric power,  $P_{ON}$ , which is supplied with input side, can be described as in next formula.

$$P_{ON} = \int_0^{T_{on}} V_{IN}^2 \times t/L dt \quad \dots\dots\dots \text{Formula 1}$$

With the step-up circuit, electric power is supplied from power source also during off time. In this case, input current is described as  $(V_{OUT}-V_{IN}) \times t/L$ , therefore electric power,  $P_{OFF}$  is described as in next formula.

$$P_{OFF} = \int_0^{T_f} V_{IN} \times (V_{OUT} - V_{IN})t/L dt \quad \dots\dots\dots \text{Formula 2}$$

In this formula,  $T_f$  means the time of which the energy saved in the inductance is being emitted. Thus average electric power,  $P_{AV}$  is described as in the next formula.

$$P_{AV} = 1/(T_{on} + T_{off}) \times \left\{ \int_0^{T_{on}} V_{IN}^2 \times t/L dt + \int_0^{T_f} V_{IN} \times (V_{OUT} - V_{IN})t/L dt \right\} \quad \dots\dots\dots \text{Formula 3}$$

In PWM control, when  $T_f=T_{off}$  is true, the inductor current becomes continuous, then the operation of switching regulator becomes continuous mode.

In the continuous mode, the deviation of the current is equal between on time and off time.

$$V_{IN} \times T_{on}/L = (V_{OUT} - V_{IN}) \times T_{off}/L \quad \dots\dots\dots \text{Formula 4}$$

Further, the electric power,  $P_{AV}$  is equal to output electric power,  $V_{OUT} \times I_{OUT}$ , thus,

$$I_{OUT} = f_{osc} \times V_{IN}^2 \times T_{on}^2 / \{2 \times L \times (V_{OUT} - V_{IN})\} = V_{IN}^2 \times T_{on} / (2 \times L \times V_{OUT}) \quad \dots\dots\dots \text{Formula 5}$$

When  $I_{OUT}$  becomes more than  $V_{IN} \times T_{on} \times T_{off} / (2 \times L \times (T_{on} + T_{off}))$ , the current flows through the inductor, then the mode becomes continuous. The continuous current through the inductor is described as

$I_{const}$ , then,

$$I_{OUT} = f_{osc} \times V_{IN}^2 \times T_{on}^2 / (2 \times L \times (V_{OUT} - V_{IN})) + V_{IN} \times I_{const} / V_{OUT} \quad \dots\dots\dots \text{Formula 6}$$

In this moment, the peak current,  $I_{Lxmax}$  flowing through the inductor and the driver  $T_r$  is described as follows:

$$I_{Lxmax} = I_{const} + V_{IN} \times T_{on} / L \dots\dots\dots \text{Formula 7}$$

With the formula 4,6, and  $I_{Lxmax}$  is,

$$I_{Lxmax} = V_{OUT} / V_{IN} \times I_{OUT} + V_{IN} \times T_{on} / (2 \times L) \dots\dots\dots \text{Formula 8}$$

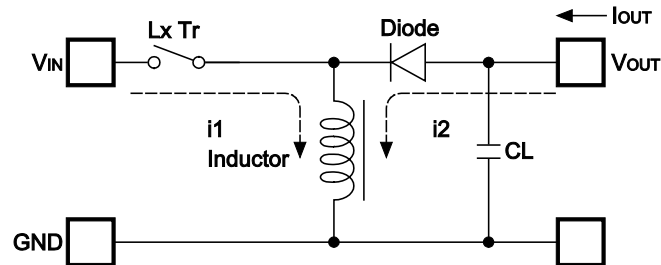

Therefore, peak current is more than  $I_{OUT}$ . Considering the value of  $I_{Lxmax}$ , the condition of input and output, and external components should be selected.

In the formula 7, peak current  $I_{Lxmax}$  at discontinuous mode can be calculated. Put  $I_{const}=0$  in the formula.

The explanation above is based on the ideal calculation, and the loss caused by  $L_x$  switch and external components is not included. The actual maximum output current is between 50% and 80% of the calculation. Especially, when the  $I_{Lx}$  is large, or  $V_{IN}$  is low, the loss of  $V_{IN}$  is generated with the on resistance of the switch. As for  $V_{OUT}$ ,  $V_f$  (as much as 0.3V) of the diode should be considered.

## Operation of Inverting DC/DC converter and Output Current

Inverting DC/DC converter saves energy during on time of Lx transistor, and supplies the energy to output during off time, output voltage opposed to input voltage is obtained.

<Current through L>

Step 1. Lx Tr. turns on, current,  $IL=i1$  flows, energy is charged in L. In proportion to the on time,  $T_{on}$ , of Lx Tr.  $IL=i1$  increases from  $IL=IL_{xmin}=0$  and reaches  $IL_{xmax}$ .

Step 2. When the Lx Tr. turns off, L turns on Shottky diode (SD) and flow  $IL=i2$  to maintain  $IL = IL_{xmax}$ .

Step 3.  $IL=i2$  decreases gradually, after  $T_f$  passes,  $IL=IL_{xmin}=0$  is true, then SD turns off. Note that in the case of continuous mode, before  $IL=IL_{xmin}=0$  is true,  $T_{off}$  passes and next cycle starts, then Lx Tr. turns on. In this case,  $IL_{xmin}>0$ , therefore  $IL$  increases from  $IL=IL_{xmin}>0$ .

With the PWM controller, switching time ( $f_{osc}$ ) in the time unit is fixed, and by controlling  $T_{on}$ , output voltage is maintained.

## Output Current and Selection of External Components

There are also two modes, or discontinuous mode and continuous mode for the PWM inverting switching regulator depending on the continuous characteristic of inductor current.

During on time of the transistor, when the voltage added on to the inductor is described as  $V_{IN}$ , the current is  $V_{IN} \times t/L$ .

Therefore, the electric power,  $P$ , which is supplied with input side, can be described as in next formula.

$$P = \int_0^{T_{on}} V_{IN}^2 \times t/L dt \quad \dots\dots\dots \text{Formula 9}$$

Thus average electric power in one cycle,  $P_{AV}$  is described as in the next formula.

$$P_{AV} = 1/(T_{on} + T_{off}) \times \int_0^{T_{on}} V_{IN}^2 \times t/L dt = V_{IN}^2 \times T_{on}^2 / (2 \times L \times (T_{on} + T_{off})) \quad \dots\dots\dots \text{Formula 10}$$

This electric power  $P_{AV}$  equals to output electric power  $V_{OUT} \times I_{OUT}$ , thus,

$$I_{OUT} = f_{OSC} \times V_{IN}^2 \times T_{on}^2 / (2 \times L \times V_{OUT}) \quad \dots\dots\dots \text{Formula 11}$$

When  $I_{OUT}$  becomes more than  $V_{IN} \times T_{on} \times T_{off} / (2 \times L \times (T_{on} + T_{off}))$ , the current flows through the inductor continuously, then the mode becomes continuous. In the continuous mode, the deviation of the current equals between  $T_{on}$  and  $T_{off}$ , therefore,

$$V_{IN} \times T_{on} / L = V_{OUT} \times T_{off} / L \quad \dots\dots\dots \text{Formula 12}$$

In this moment, the current flowing continuously through  $L$ , is assumed as  $I_{const}$ ,  $I_{OUT}$  is described as in the next formula:

$$I_{OUT} = f_{OSC} \times V_{IN}^2 \times T_{on}^2 / (2 \times L \times V_{OUT}) + T_{on} / (T_{on} + T_{off}) \times V_{IN} \times I_{const} / V_{OUT} \quad \dots\dots\dots \text{Formula 13}$$

In this moment, the peak current,  $I_{Lxmax}$  flowing through the inductor and the driver  $Tr$ . is described as follows:

$$I_{Lxmax} = I_{const} + V_{IN} \times T_{on} / L \quad \dots\dots\dots \text{Formula 14}$$

With the formula 12,13,  $I_{Lxmax}$  is,

$$I_{Lxmax} = (T_{on} + T_{off}) / T_{off} \times I_{OUT} + V_{IN} \times T_{on} / (2 \times L) \quad \dots\dots\dots \text{Formula 15}$$

Therefore, peak current is more than  $I_{OUT}$ . Considering the value of  $I_{Lxmax}$ , the condition of input and output, and external components should be selected.

In the formula 14, peak current  $I_{Lxmax}$  at discontinuous mode can be calculated. Put  $I_{const}=0$  in the formula.

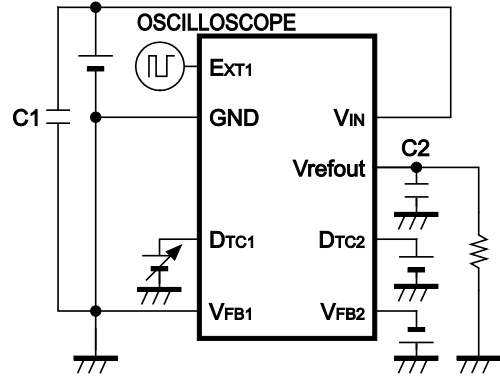

The explanation above is based on the ideal calculation, and the loss caused by  $L_x$  switch and external components is not included. The actual maximum output current is between 50% and 80% of the calculation. Especially, when the  $I_{Lx}$  is large, or  $V_{IN}$  is low, the loss of  $V_{IN}$  is generated with the on resistance of the switch. As for  $V_{OUT}$ ,  $V_f$  (as much as 0.3V) of the diode should be considered.

## TEST CIRCUITS

Test Circuit 7

Test Circuit 8

Test Circuit 9

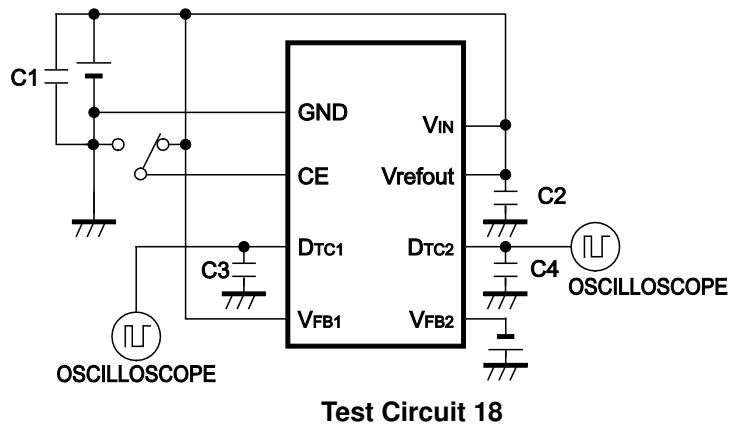

Test Circuit 10

Test Circuit 11

Test Circuit 12

Typical Characteristics shown in the following pages are obtained with test circuits shown above.

## TYPICAL APPLICATION AND TECHNICAL NOTES

### • R1280D002A/C

#### External Components

Inductor L1,2: 6.8 $\mu$ H, VLF504012MT (TDK) for A type, 22 $\mu$ H for C type

Diode: CRS10I30A (Toshiba)

NMOS: IRF7601 (International Rectifier)

PMOS: Si3443DV (Siliconix)

Resistors: R1, R2, R3, and R4 are for Setting Output Voltage. Recommendation values are  $R1+R2 \leq 100k\Omega$  or  $R3+R4 \leq 100k\Omega$

$R5=43k\Omega$ ,  $R6=10k\Omega$ ,  $R7=R9=22k\Omega$ ,  $R8=R10=43k\Omega$ ,  $R11=220k\Omega$

Capacitors: Ceramic Capacitor

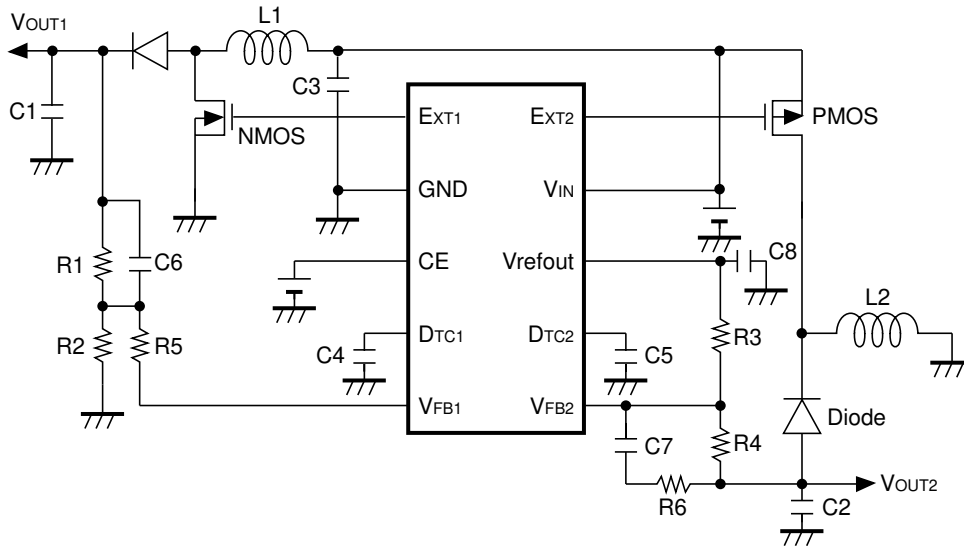

(Example)

R1280D002A:  $C1=C2=10\mu F$ ,  $C3=4.7\mu F$ ,  $C4=0.22\mu F$ ,  $C5=0.47\mu F$ ,  $C6=120pF$ ,  $C7=50pF$ ,  $C8=1\mu F$ ,  $C9=1000pF$

R1280D002C:  $C1=C2=10\mu F$ ,  $C3=4.7\mu F$ ,  $C4=0.22\mu F$ ,  $C5=0.47\mu F$ ,  $C6=220pF$ ,  $C7=330pF$ ,  $C8=1\mu F$ ,  $C9=1000pF$

Note: Maximum voltage tolerance of each component should be considered. With the transistor shown above is appropriate to set up to  $\pm 15V$  as output voltage.

• R1280D002B

External Components

Inductor L1,2: 6.8 $\mu$ H, VLF504012MT (TDK)

Diode: CRS10I30A (Toshiba)

NMOS: IRF7601 (International Rectifier)

PMOS: Si3443DV (Siliconix)

Resistors: R1, R2, R3, and R4 are for Setting Output Voltage. Recommendation values are  
 $R1+R2 \leq 100k\Omega$  or  $R3+R4 \leq 100k\Omega$   
 $R5=43k\Omega$ ,  $R6=10k\Omega$

Capacitors: Ceramic Capacitor

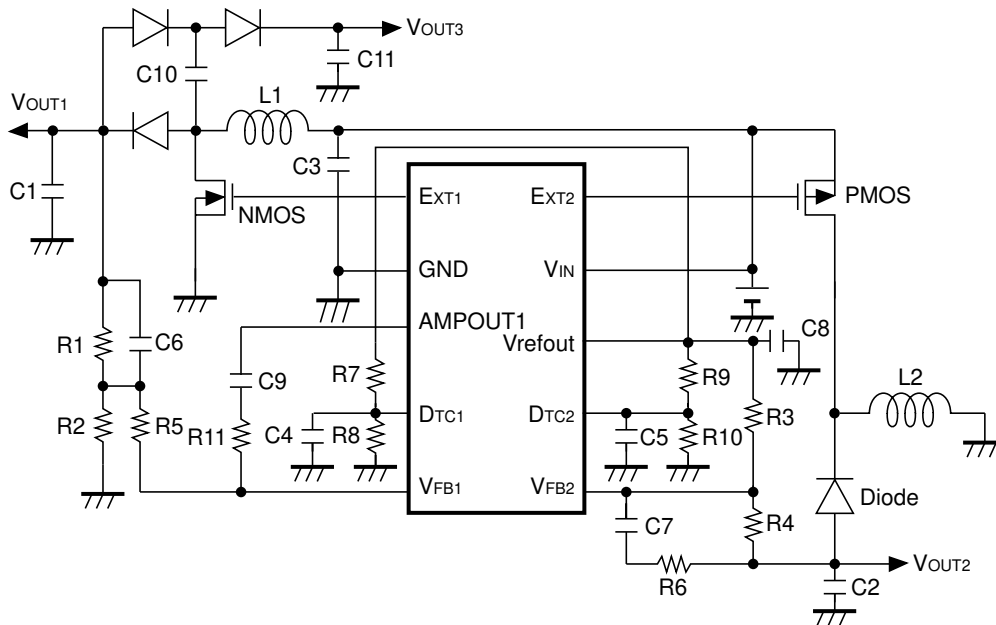

(Example)

$C1=C2=10\mu F$ ,  $C3=4.7\mu F$ ,  $C4=0.33\mu F$ ,  $C5=0.33\mu F$ ,  $C6=120pF$ ,  $C7=50pF$ ,  $C8=1\mu F$

Note: Maximum voltage tolerance of each component should be considered. With the transistor shown above is appropriate to set up to  $\pm 15V$  as output voltage.

## APPLICATION EXAMPLE

### • R1280D002A/C

#### External Components

Inductor L1,2: 6.8 $\mu$ H, VLF504012MT (TDK) for A version, 22 $\mu$ H for R1280D002C

Diode: CRS10I30A (Toshiba)

NMOS: IRF7601 (International Rectifier)

PMOS: Si3443DV (Siliconix)

Resistors: R1, R2, R3, and R4 are for Setting Output Voltage. Recommendation values are  
 $R1+R2 \leq 100\text{k}\Omega$  or  $R3+R4 \leq 100\text{k}\Omega$   
 $R5=43\text{k}\Omega$ ,  $R6=10\text{k}\Omega$ ,  $R7=R9=22\text{k}\Omega$ ,  $R8=R10=43\text{k}\Omega$ ,  $R11=220\text{k}\Omega$

Capacitors: Ceramic Capacitor

(Example)

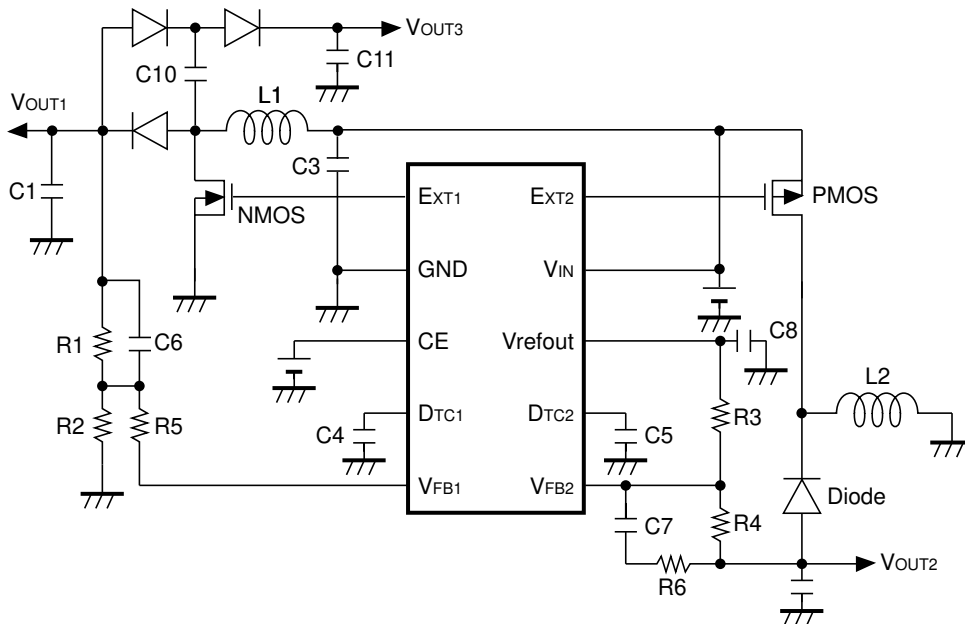

R1280D002A: C1=C2=10 $\mu$ F, C3=4.7 $\mu$ F, C4=0.22 F, C5=0.47 $\mu$ F, C6=120pF, C7=50pF,  
 C8=C10=C11=1 $\mu$ F, C9=1000pF

R1280D002C: C1=C2=10 $\mu$ F, C3=4.7 $\mu$ F, C4=0.22 $\mu$ F, C5=0.47 $\mu$ F, C6=220pF, C7=330pF,  
 C8=C10=C11=1 $\mu$ F, C9=1000pF

This IC can be used 3 Output TFT Bias Circuit as shown above.  $V_{OUT3}=2 \times V_{OUT1}-V_f$

Note: Maximum voltage tolerance of each component should be considered. With the transistor shown above is appropriate to set up to +15V as  $V_{OUT1}$ , -15V as  $V_{OUT2}$ , 30V as  $V_{OUT3}$ .

• R1280D002B

External Components

Inductor L1,2: 6.8 $\mu$ H, VLF504012MT (TDK)

Diode: CRS10I30A (Toshiba)

NMOS: IRF7601 (International Rectifier)

PMOS: Si3443DV (Siliconix)

Resistors: R1, R2, R3, and R4 are for Setting Output Voltage. Recommendation values are R1+R2 100k $\Omega$  or R3+R4 100k $\Omega$ , R5=43k $\Omega$ , R6=10k $\Omega$ ,

Capacitors: Ceramic Capacitor

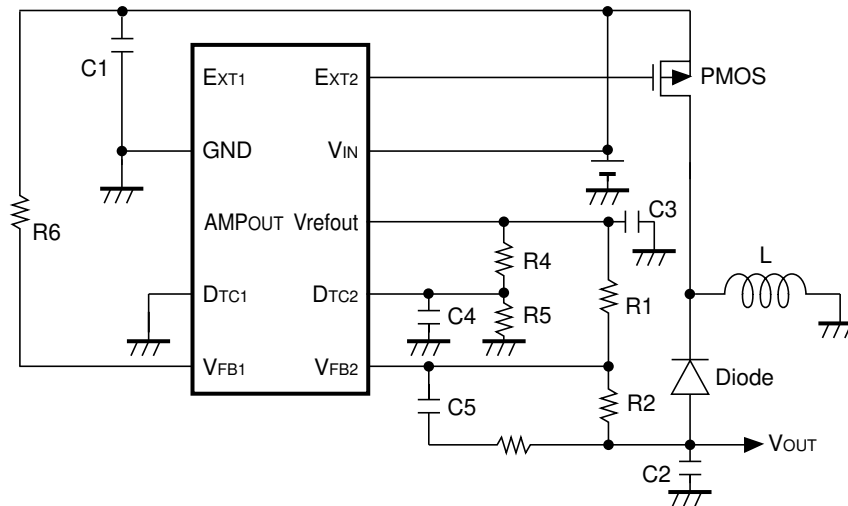

(Example)

R1280D002B: C1=C2=10 $\mu$ F, C3=4.7 $\mu$ F, C4=0.22 $\mu$ F, C5=0.33 $\mu$ F, C6=120pF, C7=50pF, C8=C10=C11=1 $\mu$ F

This IC can be used 3 Output TFT Bias Circuit as shown above.  $V_{OUT3}=2 \times V_{OUT1} - V_f$

Note: Maximum voltage tolerance of each component should be considered. The transistor shown above is appropriate to set up to +15V as  $V_{OUT1}$ , -15V as  $V_{OUT2}$ , 30V as  $V_{OUT3}$

- R1280D002A/C

#### Components examples

Inductor L: 6.8 $\mu$ H VLF504012MT (TDK) (R1280D002C: 22 $\mu$ H)

Diode: CRS10I30A (Toshiba)

PMOS: Si3443DV (Siliconix)

Resistance: As setting resistors total value for the output voltage, R1+R2 should be 100k $\Omega$  or less.

R1=10k $\Omega$  R2=68k $\Omega$  R3=10k $\Omega$  R4=22k $\Omega$

R5=43k $\Omega$  R6=1k $\Omega$

\*In the circuit above, output, V<sub>OUT</sub>=-10V

#### Capacitors Ceramic Type

R1280D002A Ex.)

C1=4.7 $\mu$ F C2=10 $\mu$ F C3=1 $\mu$ F C4=0.47 $\mu$ F C5= 50pF

R1280D002C Ex.)

C1=4.7 $\mu$ F C2=10 $\mu$ F C3=1 $\mu$ F C4=0.47 $\mu$ F C5=330pF

As for R1280D002B, when DTC1 is OPEN and V<sub>FB1</sub>=V<sub>DD</sub>, then the R1280D002B can be used as an inverting controller without step-up channel.

Note: Consider the ratings of external components including voltage tolerance. With the transistor in the circuit above, V<sub>OUT</sub>=-15V is the voltage setting limit.

**If this IC is used as an inverting controller without step-up channel, V<sub>refout</sub> pin and V<sub>FB1</sub>, DTC1 pin should not connect one another. Both the direct connection and via resistor are not permitted.**

## EXTERNAL COMPONENTS

### 1. How to set the output voltages

As for step-up side, feedback ( $V_{FB1}$ ) pin voltage is controlled to maintain 1V, therefore,

$$V_{OUT1}: R1+R2=V_{FB1}: R2$$

Thus,  $V_{OUT1}=V_{FB1}\times(R1+R2)/R2$

Output Voltage is adjustable with R1 and R2.

As for inverting side, Feedback ( $V_{FB2}$ ) pin voltage is controlled to maintain 0V, therefore,

$$V_{refout} : R3=|-V_{OUT2}|:R4$$

Thus,  $|-V_{OUT2}|=V_{refout}\times R4/R3$

Output Voltage is adjustable with R3 and R4.

### 2. How to set Soft-Start Time

As for R1280D002B, soft-start time is adjustable with connecting a capacitor to DTC pin.

Soft starting time,  $T_{SS1}$  and  $T_{SS2}$  are adjustable. Soft-start time can be set with the time constant of RC.

Soft-start time can be described as in next formula. ( $T_{opt}=25^{\circ}C$ )

$$T_{SS1}\cong RS1\times C4, T_{SS2}\cong RS2\times C5$$

In the above formulas, RS1 value is Typ.  $32k\Omega$ , while RS2 value is Typ.  $45k\Omega$ . Tolerance of these values is  $\pm 25\%$  caused by dispersion of wafer process parameters.

On the other hand, as for R1280D002A/C, each soft-start time is set with the time constant of each external resistors and capacitor shown as in the next formula.

$$T_{SS1}\cong R_{O1}\times C4, T_{SS2}\cong R_{O2}\times C5$$

In the above formula,  $R_{O1}=(R7\times R8)/(R7+R8)$ ,  $R_{O2}=(R9\times R10)/(R9+R10)$

## **TECHNICAL NOTES on EXTERNAL COMPONENTS**

- External components should be set as close to this IC as possible. Especially, wiring of the capacitor connected to  $V_{IN}$  pin should be as short as possible.
- Enforce the ground wire. Large current caused by switching operation flows through GND pin. If the impedance of ground wire is high, internal voltage level of this IC might fluctuate and operation could be unstable.
- Recommended capacitance value of C3 is equal or more than  $4.7\mu\text{F}$ . Recommended maximum voltage tolerance of C3 is three times as large as set output voltage or more, because the external transistor might generate a high voltage with a shape of spike because of an effect from inductor.
- If the spike noise of  $V_{OUT}$  is too large, the noise is feedback from  $V_{FB1}$  pin and operation might be unstable. In that case, use the resistor ranging from  $10\text{k}\Omega$  to  $50\text{k}\Omega$  as R5 and try to reduce the noise level. In the case of  $V_{OUT2}$ , use the resistor as much as  $10\text{k}\Omega$  as R6.
- Select an inductor with low D.C. current, large permissible current, and uneasy to cause magnetic saturation. If the inductance value is too small,  $IL_x$  might be beyond the absolute maximum rating at the maximum load.
- Select a Schottky diode with fast switching speed and large enough permissible current.
- Recommended capacitance value of C1 and C2 is as much as Ceramic  $10\mu\text{F}$ . In case that the operation with the system of DC/DC converter would be unstable, add a series resistor less than  $0.5\Omega$  to each output capacitor or use tantalum capacitors with appropriate ESR. If you choose too large ESR, ripple noise may be forced to  $V_{FB1}$  and  $V_{FB2}$ , and unstable operation may result. Use a capacitor with three times as large as voltage tolerance of the capacitor.
- In this IC, for the test efficiency, Latch release function is included. By forcing  $(V_{IN}-0.3)\text{V}$  or more voltage to DTC1 pin or DTC2 pin, Latch release function works.
- Consider the threshold voltage of Power MOSFET transistor. Select an appropriate MOSFET transistor, depending on the input voltage in order to make the MOSFET turn on completely.
- Performance of the power controller with using this IC depends on external components. Each component, layout should not be beyond each absolute maximum rating such as voltage, current, and power dissipation.

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to our sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of our company.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under our company's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. The X-ray exposure can influence functions and characteristics of the products. Confirm the product functions and characteristics in the evaluation stage.
9. WLCSP products should be used in light shielded environments. The light exposure can influence functions and characteristics of the products under operation or storage.
10. There can be variation in the marking when different AOI (Automated Optical Inspection) equipment is used. In the case of recognizing the marking characteristic with AOI, please contact our sales or our distributor before attempting to use AOI.
11. Please contact our sales representatives should you have any questions or comments concerning the products or the technical information.
