## Low Noise Amplifier with Bypass Switch

### 1 Introduction

The MC13821 is a high gain LNA with extremely low noise figure, designed for cellular, GPS and ISM band applications. An integrated bypass switch is included to preserve input intercept performance. The input and output match are external to allow maximum design flexibility. The MC13821 is fabricated using Freescale's advanced RF BiCMOS process using the SiGe:C option and is packaged in the QFN-12 leadless package.

#### 1.1 Features

- RF Input Frequency: 1000 MHz to 2.4 GHz
- Gain: 16.4 dB (typ) at 1960 MHz and 15.7 dB (typ) at 2140 MHz
- Output 3rd Order Intercept Point (OIP3): 17.4 dBm (typ) at 1960 MHz and 19.7 dBm (typ) at 2140 MHz
- Noise Figure (NF): 1.25 dB (typ) at 1960 MHz and 1.3 dB (typ) at 2140 MHz
- 1dB Compression Point (P1dB): -6 dBm (typ) at 1960 MHz and -5 dBm (typ) at 2140 MHz

Introduction

- Freescale’s IP3 Boost Circuitry
- Bypass Mode Included for Improved Intercept Point Performance
- Total Supply Current:  
2.8 mA @ 2.7 Vdc  
10  $\mu$ A (typ) in Bypass Mode
- Bias Stabilized for Device and Temperature Variations
- QFN-12 Leadless Package with Low Parasitics
- SiGe Technology Ensures Lowest Possible Noise Figure

## 2 Electrical Specifications

**Table 1. Maximum Ratings**

Ratings	Symbol	Minimum	Typical	Maximum	Unit
Supply Voltage	$V_{CC}$	2.7	2.75	3.3	V
Storage Temperature Range	$T_{stg}$	-65	25	150	°C
Operating Ambient Temperature Range	$T_A$	-30	25	85	°C
RF Input Power	$P_{rf}$	—	-30	10	dBm
Power Dissipation	$P_{dis}$	—	—	100	mW
Thermal Resistance, Junction to Case	$R_{\theta JC}$	24	24	24	C/W
Thermal Resistance, Junction to Ambient, 4 Layer Board	$R_{\theta JA}$	90	90	90	C/W

- NOTES:**
- Maximum Ratings are those values beyond which damage to the device may occur. Functional operation should be restricted to the limits in the Recommended Operating Conditions and Electrical Characteristics tables.
  - ESD (electrostatic discharge) immunity meets Human Body Model (HBM)  $\leq 200$  V, Charge Device Model (CDM)  $\leq 450$  V, and Machine Model (MM)  $\leq 50$  V. Additional ESD data available upon request.

**Table 2. Recommended Operating Conditions**

Characteristic	Symbol	Minimum	Typical	Maximum	Unit
RF Frequency range	$f_{RF}$	1000	—	2400	MHz
Supply Voltage	$V_{CC}$	2.7	2.75	3	V
Logic Voltage					V
Input High Voltage	—	1.25	1.8	$V_{CC}$	
Input Low Voltage	—	0	0	0.8	

**Table 3. Electrical Characteristics**

### 3 Application Information

The MC13821 SiGe:C LNA is designed for applications in the 1000 MHz to 2.4 GHz range. It has three different modes: High Gain, Low Gain (Bypass) and Disabled. The IC is programmable through the Gain and Enable pins. The logic truth table is given in [Table 5](#).

In these application examples a balance is made between the competing RF performance characteristics of  $I_{CC}$ , NF, gain, IP3 and return losses with unconditional stability. Conjugate matching is not used for the input or output. Instead, matching which achieves a trade-off in RF performance qualities is utilized. For a particular application or spec requirement, the matching can be changed to achieve enhanced performance of one parameter at the expense of other parameters.

Application information for 1575, 1960, 2140 and 2400 MHz are shown. For each application, two current drain examples are provided. Typical RF performance is shown for two values of bias resistor R1: 1.2 kΩ and 2 kΩ, see [Table 6](#), [Table 7](#), [Table 8](#), and [Table 9](#). These two current drain states offer variation in intercept point, gain, and noise figure. For 1960 and 2140 MHz, additional application circuits are shown. These demonstrate specific performance characteristics and utilize varying input and output matches and different biasing resistors.

Measurements are made at a bias of  $V_{CC} = 2.75$  V. Freq. spacing for IP3 measurements is 200 kHz. Non-linear measurements are made at  $P_{in} = -30$  dB. The board loss corrections for these boards are: Input 0.16 dB, Output 0.2 dB. Gain and NF results incorporate these corrections in order to better reflect the actual performance of the device.

### 3.1 1575 MHz Application

This application circuit was designed to provide  $NF < 1.2$  dB,  $S_{21}$  gain  $> 18$  dB, OIP3 of 18 dBm with  $S_{11}$  better than -10 dB and  $S_{22}$  better than -10 dB at 1575 MHz with unconditional stability from 100 MHz to 10 GHz. Typical performance that can be expected from this circuit at 2.75 V  $V_{CC}$  is listed in [Table 6](#). The component values can be changed to enhance the performance of a particular parameter, but usually at the expense of another. Two variations of the circuit are realized for different requirements for IP3 and  $I_{CC}$ . Values of external resistors R1 and R2 are varied to adjust  $I_{CC}$  and IP3.

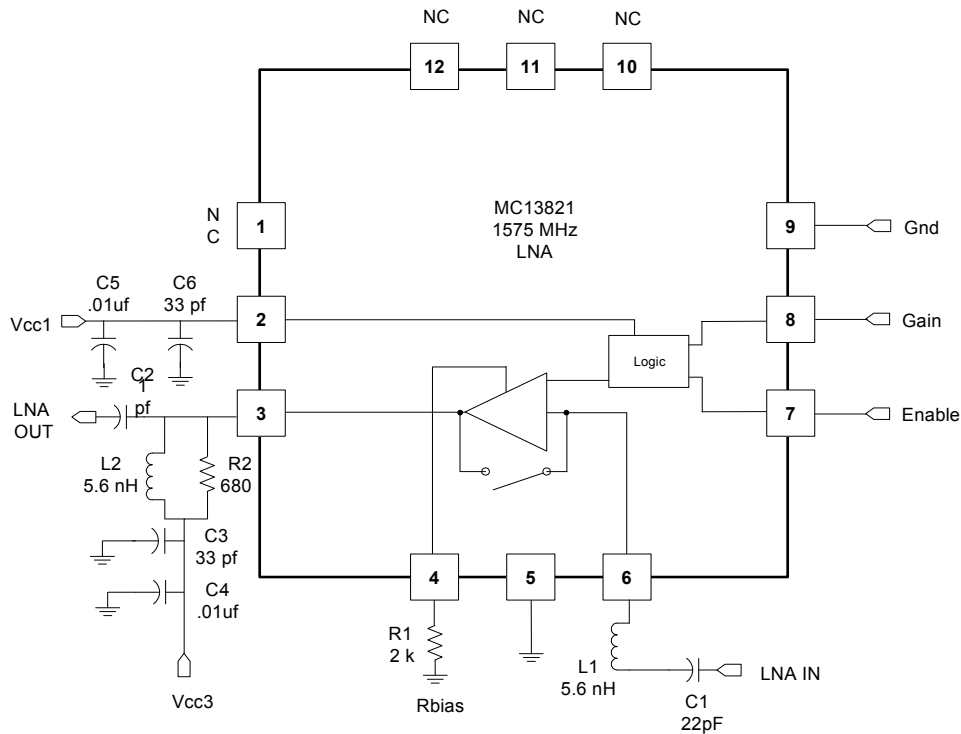

Figure 9. 1575 MHz LNA Application Schematic

### 3.2 1960 MHz Application

These application circuits are designed to demonstrate performance at 1960 MHz. By varying the value of resistor R1, the current draw and the IP3 performance of the device can be tailored for a particular application. Shown here are four variations of the circuit for different IP3 and I<sub>CC</sub> requirements. The input and output matches are also changed on some circuits to demonstrate different NF and gain performance. Typical performance that can be expected from this circuit at 2.75 V V<sub>CC</sub> is listed in Table 7. Two variations of the circuit utilize different matches. For all circuits the match consists of a highpass match on the output and a simple inductor-capacitor network on the LNA input.

### 3.3 2140 MHz Application

These application circuits demonstrate performance at 2140 MHz. Resistor values for R1 and R2 are varied to adjust  $I_{CC}$ , which also adjusts IP3 performance. Matching component values can be changed to enhance a particular parameter, but usually at the expense of another. Typical performance that can be expected from this circuit at 2.75 V  $V_{CC}$  is listed in Table 8. Three variations of the circuit are realized for different requirements for IP3 and  $I_{CC}$ . The same matching networks are used on the 2140 MHz circuit as on the 1960 MHz application circuit, with a highpass match on the output and a simple inductor-capacitor network on the LNA input.

### 3.4 2400 MHz Application

This application circuit was designed to provide  $NF < 1.3$  dB,  $S_{21}$  gain  $> 16$  dB,  $OIP3$  of 18 dBm with  $S_{11}$  better than -10 dB and  $S_{22}$  better than -10 dB at 2140 MHz with unconditional stability from 100 MHz to 10 GHz. Typical performance that can be expected from this circuit at 2.75 V  $V_{CC}$  is listed in Table 9. The component values can be changed to enhance the performance of a particular parameter, but usually at the expense of another. Two variations of the circuit are realized for different requirements for  $IP3$  and  $I_{CC}$ . Values of external resistors  $R1$  and  $R2$  are varied to adjust  $I_{CC}$  and  $IP3$ .

Information in this document is provided solely to enable system and software implementers to use Freescale Semiconductor products. There are no express or implied copyright licenses granted hereunder to design or fabricate any integrated circuits or integrated circuits based on the information in this document.

Freescale Semiconductor reserves the right to make changes without further notice to any products herein. Freescale Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Freescale Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters that may be provided in Freescale Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals", must be validated for each customer application by customer's technical experts. Freescale Semiconductor does not convey any license under its patent rights nor the rights of others. Freescale Semiconductor products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Freescale Semiconductor product could create a situation where personal injury or death may occur. Should Buyer purchase or use Freescale Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold Freescale Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Freescale Semiconductor was negligent regarding the design or manufacture of the part.
