USB 2.0 Port Protection with Charger Detection

Features

- USB-device charger detector
- Can tolerate USB3.0-PD with VBUS = 20V
- USB Charging-type detection
- Battery Charging 1.2 (BC1.2) – DCP
- Battery Charging 1.2 (BC1.2) – CDP
- Battery Charging 1.2 (BC1.2) – SDP
- Apple 1A, 2A & 2.4A dedicated chargers
- Samsung-Fast chargers
- YD/T-1951 dedicated chargers
- CEA-936 Carkit#1 and #2 chargers
- Integrated Power FET
- VBUS Tolerance up to 28V
- 1.7A Over-Current Protection (OCP)
- VBUS Over-Voltage Protection (OVP)
- Non-charging Accessory Detection
- USB On-The-Go (OTG) detection
- Mobile HDMI Link (MHL) device detection
- Wide Supply Voltage Range 3V to 5.5V
- I^2C Programmability
- Small Package:
  - CSP 1.5x2.0-15L
  - UQFN 3x4x0.5mm 20L

Applications

- Personal Media Players
- Mobile Phones
- Tablet

Description

PI3USB9281A provides external detection for any USB-device. The part can detect various chargers available in the market, MHL accessories, OTG accessories, and car-chargers per the CEA936 spec. It also integrates a power switch with over-voltage and over-current protections. The VBUSIN input pin can tolerate voltages up to 28V, which is important for USB3.0-PowerDelivery enabled ports. The new USB-3.0-PowerDelivery specification supports voltages up to 20V.

The PI3USB9281A can operate over a temperature range of -40 to +85°C.

Typical applications involve portable & consumer applications, such as tablet, smart phones, digital cameras, and notebooks with integrated Li-ion batteries that charge via USB connectors.

Pin Descriptions

Name	Type	Default State	Description
USB Interface			
DPH	Signal Path	Open	D+ signal switch path, dedicated USB port to be connected to the resident USB transceiver on the device
DNH	Signal Path	Open	D- signal switch path, dedicated USB port to be connected to the resident USB transceiver on the device
Connector Interface			
ID	Signal Path	Open	Connected to the USB connector ID pin and used for detecting accessories
D+	Signal Path	Open	Connected to the USB connector D+ pin; depending on the signaling mode
D-	Signal Path	Open	Connected to the USB connector D- pin; depending on the signaling mode
V_{BUSIN}	Power Path	NA	Input voltage supply pin to be connected to the VBUS pin of the USB connector
Power Interface			
V_{BAT}	Power	NA	Input voltage supply pin to be connected to the device battery output or to an internal regulator
V_{DDIO}	Power	NA	Baseband processor interface I/O supply pin
ENB	Input	Hi-Z	System enable for the circuit (Active Low)
GND	Power	NA	Ground
Charger Interface			
V_{BUSOUT}	Power Path	NA	Output voltage supply pin to be connected to the source voltage pin on the charger IC
V_{BUSDET}	Open-Drain Output	Hi-Z	Open-drain active LOW output when VBUSIN is valid
I²C Interface			
SCL	Input	Hi-Z	I²C serial clock signal to be connected to the phone-based I²C master
SDA	Open-Drain I/O	Hi-Z	I²C serial data signal to be connected to the phone-based I²C master
INTB	CMOS Output	LOW	Interrupt active LOW output used to prompt the phone baseband processor to read the I²C register bits, indicates a change in ID pin status or accessory attach status
NC		Hi-Z	No Connection

Maximum Ratings

Storage Temperature	-65°C to +150°C
Supply Voltage from Battery/Baseband	-0.5V to +6.5V
Supply Voltage from Micro-USB Connector	-0.5V to +28.0V
Switch I/O Voltage USB	-1.0V to +5.5V
Input Clamp Diode current	50mA
Charger Detect Pin Sink current (VBUSDET)	30mA
Switch I/O Current (Continuous) USB	50mA
Switch I/O Switch Peak Current (Pulsed at 1ms Duration, <10% Duty Cycle)	
USB, and All Other Channels	150mA
Charger FET	2A
ESD: HBM	3500V
HBM (USB connector pins: VBUSIN, D+, D-, ID to GND)	6500V

Note:
Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes:

1. A fast-mode I²C-bus device can be used in a standard-mode I²C-bus system, but the requirement $t_{SETDAT} \geq 250ns$ must be met.

This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line tr_max + t_{SETDAT} = 1000 + 250 = 1250ns (according to the standard-mode I^2C bus specification) before the SCL line is released.

2. C_b equals the total capacitance of one BUS line in pF. If mixed with high-speed devices, faster fall times are allowed according to the I^2C specification.

Notes:
1. The accessory type is reported in the Device Type 1 (0Ah) and Charger Status (0Eh) registers with each valid accessory detection.
2. Follows the ANSI/CEA-936-A USB Car Kit specification.
3. The PI3USB9281A follows the Battery Charging 1.2 specification, which uses D+ and D- to determine what USB accessory is attached.
4. Samsung 1.2V fast charger will recognize as DCP attachment and enable the fast charging operation.
5. For devices with ID resistance other than those listed in Table 1, PI3USB9281A reports device attachment through I^2C to the embedded controller. The Unknown devices are mapped to OTG such that data switches are turned on to allow embedded controller to communicate and identify the unknown devices through USB protocols.
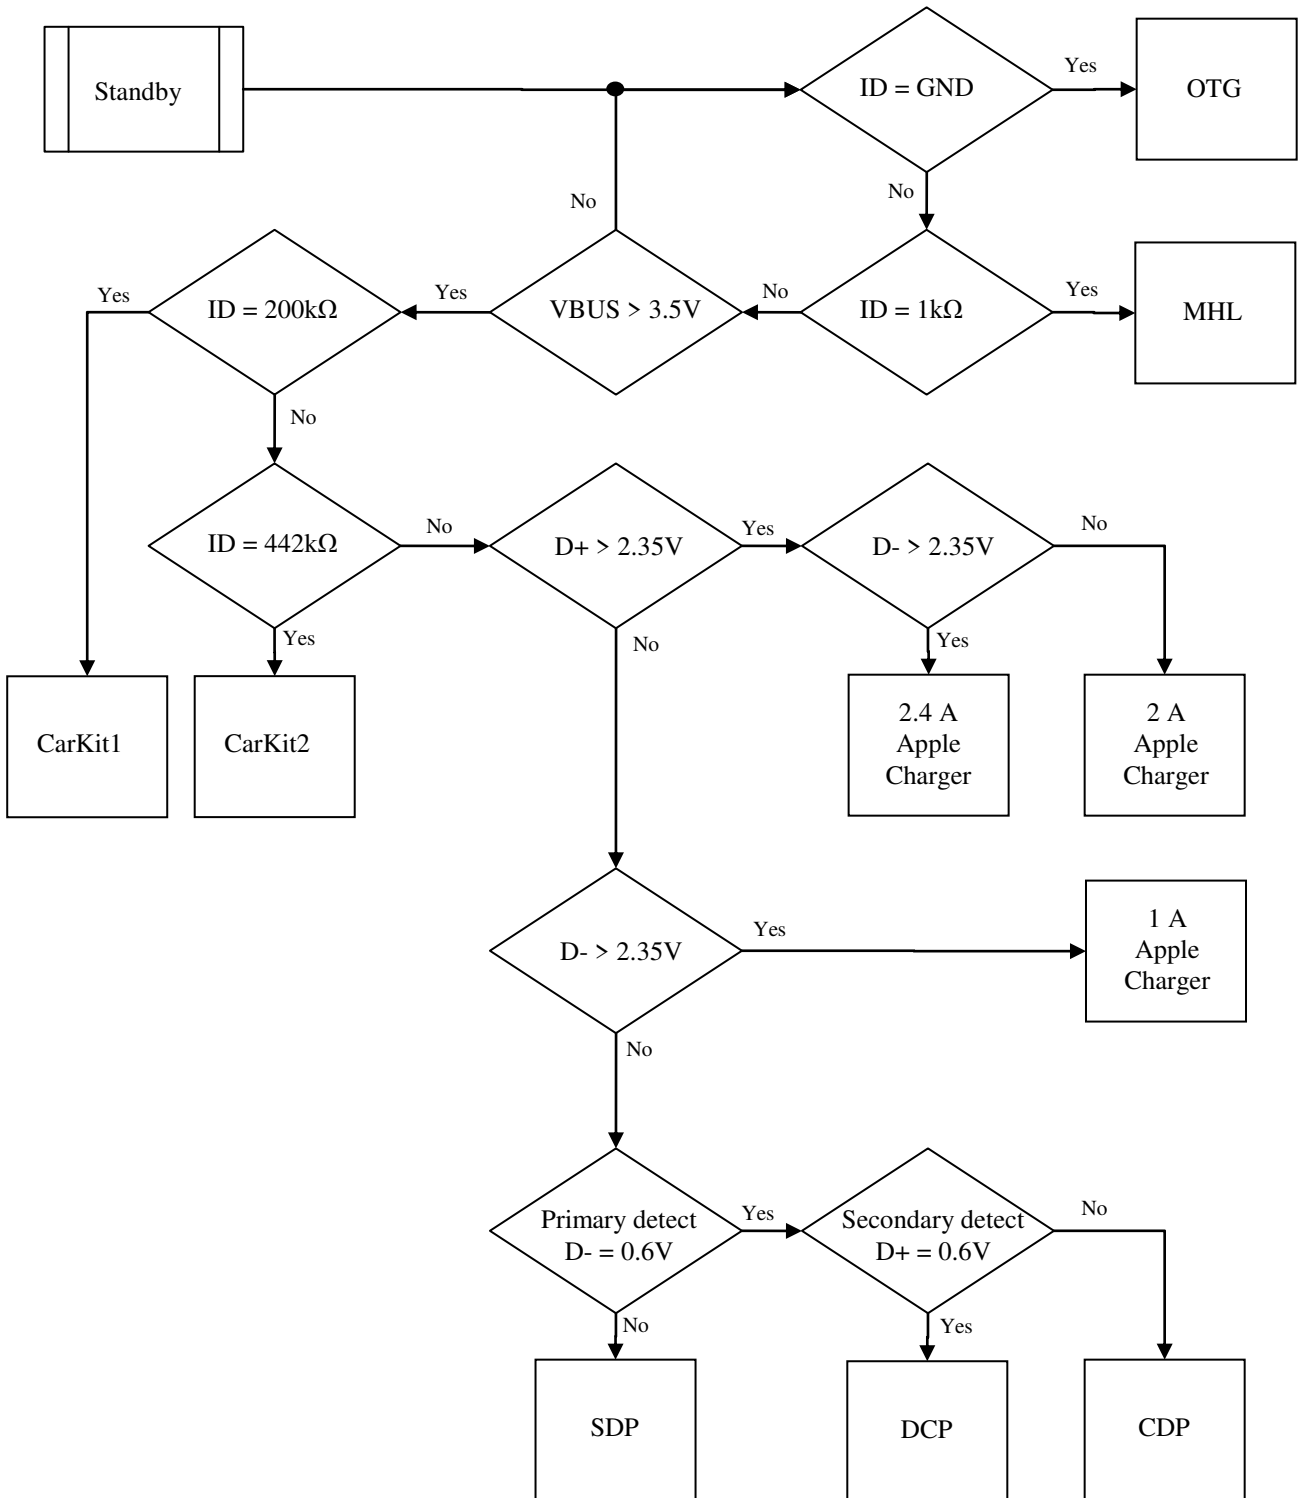

VBUSIN Detection Scheme

VBUSDET pin is used to indicate VBUSIN voltage level. The VBUSIN comparator stays awake in all cases including disable state (ENB=HIGH) and dead battery case (VBAT=0V). Tables below summarize the detection behavior for VBUSIN detection. All charger detections are disabled in disable state (ENB=HIGH). PI3USB9281A will undergo charger detection when the system is recovered from disable state (ENB = Transit from HIGH to LOW).
