

Clock Buffer/Clock Multiplier With Optional SSC

FEATURES

- Part of a Family of Easy to use Clock Generator Devices With Optional SSC
- Clock Multiplier With Selectable Output Frequency and Selectable SSC
- SSC Controllable via 2 External Pins
 - $\pm 0\%$, $\pm 0.5\%$, $\pm 1\%$, $\pm 2\%$ Center Spread
- Frequency Multiplication Selectable Between x1 or x4 With One External Control Pin
- Output Disable via Control Pin
- Single 3.3V Device Power Supply
- Wide Temperature Range -40°C to 85°C
- Low Space Consumption by 8 Pin TSSOP Package

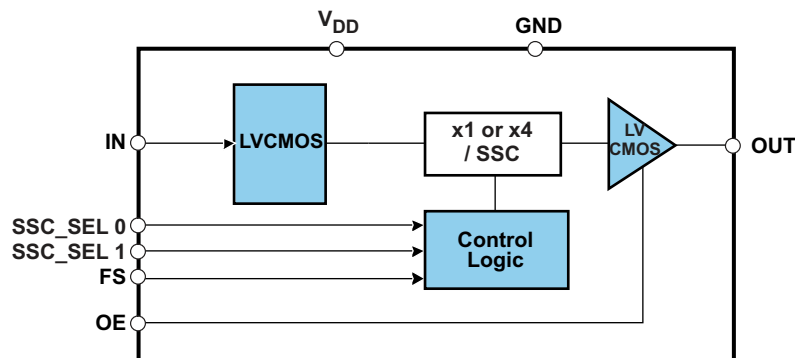

APPLICATIONS

- Consumer and Industrial Applications requiring EMI reduction through Spread Spectrum Clocking and/ or Clock Multiplication

DESCRIPTION

The CDCS503 is a spread spectrum capable, LVC MOS Input Clock Buffer with selectable frequency multiplication.

It shares major functionality with the CDCS502 but utilizes a LVC MOS input stage instead of the crystal input stage of the CDCS502. Also an Output Enable pin has been added to the CDCS503.

The device accepts a 3.3V LVC MOS signal at the input.

The input signal is processed by a PLL, whose output frequency is either equal to the input frequency or multiplied by the factor of 4.

The PLL is also able to spread the clock signal by $\pm 0\%$, $\pm 0.5\%$, $\pm 1\%$ or $\pm 2\%$ centered around the output clock frequency with a triangular modulation.

By this, the device can generate output frequencies between 8MHz and 108MHz with or without SSC.

A separate control pin can be used to enable or disable the output. The CDCS503 operates in 3.3V environment.

It is characterized for operation from -40°C to 85°C , and available in an 8-pin TSSOP package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

APPLICATION INFORMATION

SSC MODULATION

The exact implementation of the SSC modulation plays a vital role for the EMI reduction. The CDCS503 uses a triangular modulation scheme implemented in a way that the modulation frequency depends on the VCO frequency of the internal PLL and the spread amount is independent from the VCO frequency.

The modulation frequency can be calculated by using one of the below formulas chosen by frequency multiplication mode.

$$FS = 0: f_{\text{mod}} = f_{\text{IN}} / 708$$

$$FS = 1: f_{\text{mod}} = f_{\text{IN}} / 620$$
