- 1) To ensure the processor cores are provided with a constant stream of instructions the Instruction Fetch Units will speculatively fetch instructions from the up to 64 bytes ahead of the current PC. If the current PC is within 64 bytes of the top of an instruction memory the Instruction Fetch Unit may attempt to speculatively fetch instruction from beyond the physical range. This may then lead to error conditions and alarms being triggered by the bus and memory systems. It is therefore recommended that the upper 64 bytes of any memory be unused for instruction storage.

2.1.1 Port Functions and Pinning Tables

2.1.1.1 How to Read the Following Port Function Tables

Some hints for interpreting the following tables.

Column “Ctrl.”:

I = Input (for GPIO port Lines with IOCR bit field Selection PCx = 0XXX_B)

AI = Analog input

O = Output

O0 = Output with IOCR bit field selection PCx = 1X000_B

O1 = Output with IOCR bit field selection PCx = 1X001_B (ALT1)

O2 = Output with IOCR bit field selection PCx = 1X010_B (ALT2)

O3 = Output with IOCR bit field selection PCx = 1X011_B (ALT3)

O4 = Output with IOCR bit field selection PCx = 1X100_B (ALT4)

O5 = Output with IOCR bit field selection PCx = 1X101_B (ALT5)

O6 = Output with IOCR bit field selection PCx = 1X110_B (ALT6)

O7 = Output with IOCR bit field selection PCx = 1X111_B (ALT7)

Table 2-1 Example Port Table

Ball	Symbol	Ctrl.	Buffer Type	Function
G10	Pxx.y	I	A1/HighZ/ VDDP3	General-purpose input
	TIMm_n			GTM_TIN
	TOMa_b	O1		GTM_TOUT
	TOMc_d			GTM_TOUT
	IOM_REFv_w			IOM reference input
	ASCLINz_RTS	O2		ASCLIN0 output (aka ARTS_z)

To each input several functions can be connected. The peripherals' configuration defines if this input is used.

The port module (see corresponding chapter) decides which of the 8 output signals O0 to O7 drives the pad.

Some Ox rows list more than one function, e.g. several GTM_TOUT outputs and IOM reference inputs. The GTM module (see corresponding chapter) has its own sub-multiplexer structure that defines which of the GTM sub-units drives this signal. Additionally the IOM modules “listens” on these output signals (see IOM chapter).

Some pin symbol names were changed in this AURIX device compared to other AURIX devices to improve naming systematics. The previously used symbol name is documented in the “Function” column with the text “(aka ...)”¹⁾.

Column “Type”:

IN = Input only

A1 = Pad class A1 (3.3V)

A1+ = Pad class A1+ (3.3V)

S = ADC with digital input. Pad class D for analog input “AI”, pad class S for digital input “I”.

1) “aka” as abbreviation for “also known as”.

PU = with pull-up device connected during reset ($\overline{\text{PORST}} = 0$)

PD = with pull-down device connected during reset ($\overline{\text{PORST}} = 0$)

High-Z = High-Z during reset ($\overline{\text{PORST}} = 0$)

2.1.2 Pull-Up/Pull-Down Reset Behavior of the Pins

Table 2-19 List of Pull-Up/Pull-Down Reset Behavior of the Pins

Pins	$\overline{\text{PORST}} = 0$	$\overline{\text{PORST}} = 1$
all GPIOs	High-Z	
$\overline{\text{TDI}}$, $\overline{\text{TESTMODE}}$	Pull-up	
$\overline{\text{PORST}}^{1)}$	Pull-down with I_{PORST} relevant	Pull-down with I_{PDLI} relevant
$\overline{\text{TRST}}$, TCK, TMS	Pull-down	
$\overline{\text{ESR0}}$	The open-drain driver is used to drive low. ²⁾	Pull-up ³⁾
$\overline{\text{ESR1}}$	Pull-up ³⁾	
P14.2, P14.3, P14.6	Pull-up	
P21.7 / TDO	Pull-up	High-Z/Pull-up ⁴⁾

1) Pull-down with I_{PORST} relevant is always activated when a primary supply monitor detects a violation.

2) Valid additionally after deactivation of $\overline{\text{PORST}}$ until the internal reset phase has finished. See the SCU chapter for details.

3) See the SCU_IOCRR register description.

4) Depends on JTAG/DAP selection with $\overline{\text{TRST}}$.

2.2.1 Port Functions and Pinning Tables

2.2.1.1 How to Read the Following Port Function Tables

Some hints for interpreting the following tables.

Column “Ctrl.”:

I = Input (for GPIO port Lines with IOCR bit field Selection PCx = 0XXX_B)

AI = Analog input

O = Output

O0 = Output with IOCR bit field selection PCx = 1X000_B

O1 = Output with IOCR bit field selection PCx = 1X001_B (ALT1)

O2 = Output with IOCR bit field selection PCx = 1X010_B (ALT2)

O3 = Output with IOCR bit field selection PCx = 1X011_B (ALT3)

O4 = Output with IOCR bit field selection PCx = 1X100_B (ALT4)

O5 = Output with IOCR bit field selection PCx = 1X101_B (ALT5)

O6 = Output with IOCR bit field selection PCx = 1X110_B (ALT6)

O7 = Output with IOCR bit field selection PCx = 1X111_B (ALT7)

Table 2-20 Example Port Table

Pin	Symbol	Ctrl.	Buffer Type	Function
10	Pxx.y	I	A1/HighZ/ VDDP3	General-purpose input
	TIMm_n			GTM_TIN
	TOMa_b	O1		GTM_TOUT
	TOMc_d			GTM_TOUT
	IOM_REFv_w			IOM reference input

To each input several functions can be connected. The peripherals' configuration defines if this input is used.

The port module (see corresponding chapter) decides which of the 8 output signals O0 to O7 drives the pad.

Some Ox rows list more than one function, e.g. several GTM_TOUT and IOM reference inputs. The GTM module (see corresponding chapter) has its own sub-multiplexer structure that defines which of the GTM sub-units drives this signal. Additionally the IOM modules “listens” on these output signals (see IOM chapter).

Column “Type”:

IN = Input only

A1 = Pad class A1 (3.3V)

A1+ = Pad class A1+ (3.3V)

S = ADC with digital input. Pad class D for analog input “AI”, pad class S for digital input “I”.

PU = with pull-up device connected during reset ($\overline{\text{PORST}} = 0$)

PD = with pull-down device connected during reset ($\overline{\text{PORST}} = 0$)

High-Z = High-Z during reset ($\overline{\text{PORST}} = 0$)

V_x = Supply (the Exposed Pad is also considered as VSS and shall be connected to ground)

2.2.2 Pull-Up/Pull-Down Reset Behavior of the Pins

Table 2-38 List of Pull-Up/Pull-Down Reset Behavior of the Pins

Pins	$\overline{\text{PORST}} = 0$	$\overline{\text{PORST}} = 1$
all GPIOs	High-Z	
TDI, $\overline{\text{TESTMODE}}$	Pull-up	
$\overline{\text{PORST}}^{1)}$	Pull-down with I_{PORST} relevant	Pull-down with I_{PDLI} relevant
$\overline{\text{TRST}}$, TCK, TMS	Pull-down	
ESR0	The open-drain driver is used to drive low. ²⁾	Pull-up ³⁾
ESR1	Pull-up ³⁾	
P14.2, P14.3, P14.6	Pull-up	
P21.7 / TDO	Pull-up	High-Z/Pull-up ⁴⁾

1) Pull-down with I_{PORST} relevant is always activated when a primary supply monitor detects a violation.

2) Valid additionally after deactivation of $\overline{\text{PORST}}$ until the internal reset phase has finished. See the SCU chapter for details.

3) See the SCU_IOCR register description.

4) Depends on JTAG/DAP selection with $\overline{\text{TRST}}$.

Table 2-39 Example Port Table

Pin	Symbol	Ctrl.	Buffer Type	Function
10	Pxx.y	I	A1/HighZ/ VDDP3	General-purpose input
	TIMm_n			GTM_TIN
	TOMa_b	O1		GTM_TOUT
	TOMc_d			GTM_TOUT
	IOM_REFv_w			IOM reference input
	ASCLINz_RTS	O2		ASCLIN0 output (aka ARTSz)

To each input several functions can be connected. The peripherals' configuration defines if this input is used.

The port module (see corresponding chapter) decides which of the 8 output signals O0 to O7 drives the pad.

Some Ox rows list more than one function, e.g. several GTM_TOUT outputs and IOM reference inputs. The GTM module (see corresponding chapter) has its own sub-multiplexer structure that defines which of the GTM sub-units drives this signal. Additionally the IOM modules “listens” on these output signals (see IOM chapter).

Some pin symbol names were changed in this AURIX device compared to other AURIX devices to improve naming systematics. The previously used symbol name is documented in the “Function” column with the text “(aka ...)”¹⁾.

Column “Type”:

IN = Input only

A1 = Pad class A1 (3.3V)

A1+ = Pad class A1+ (3.3V)

S = ADC with digital input. Pad class D for analog input “AI”, pad class S for digital input “I”.

PU = with pull-up device connected during reset ($\overline{\text{PORST}} = 0$)

PD = with pull-down device connected during reset ($\overline{\text{PORST}} = 0$)

1) “aka” as abbreviation for “also known as”.

High-Z = High-Z during reset ($\overline{\text{PORST}} = 0$)

V_x = Supply (the Exposed Pad is also considered as VSS and shall be connected to ground)

3 Electrical Specification

3.1 Parameter Interpretation

The parameters listed in this section partly represent the characteristics of the TC233 / TC234 / TC237 and partly its requirements on the system. To aid interpreting the parameters easily when evaluating them for a design, they are marked with an two-letter abbreviation in column "Symbol":

- **CC**
Such parameters indicate **C**ontroller **C**haracteristics which are a distinctive feature of the TC233 / TC234 / TC237 and must be regarded for a system design.
- **SR**
Such parameters indicate **S**ystem **R**equirements which must provided by the microcontroller system in which the TC233 / TC234 / TC237 designed in.

3.2 Absolute Maximum Ratings

Stresses above the values listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the Operational Conditions of this specification is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Table 3-1 Absolute Maximum Ratings

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Storage Temperature	T_{ST} SR	-65	-	170	°C	upto 65h @ $T_J = 150^\circ\text{C}$; upto 15h @ $T_J = 170^\circ\text{C}$
Voltage at V_{DD} power supply pins with respect to V_{SS} ¹⁾	V_{DD} SR	-	-	1.9	V	
Voltage at V_{DDP3} power supply pins with respect to V_{SS}	V_{DDP3} SR	-	-	4.43	V	
Voltage at V_{DDM} power supply pin with respect to V_{SS}	V_{DDM} SR	-	-	7.0	V	
Voltage on all analog and class S input pins with respect to V_{SS} ²⁾	V_{IN} SR	-0.5	-	7.0	V	
Voltage on all other input pins with respect to V_{SS} ¹⁾²⁾	V_{IN} SR	-0.5	-	min($V_{DDP3} + 0.6$, 4.23)	V	Whatever is lower
Input current on any pin during overload condition ³⁾	I_{IN} SR	-10	-	10	mA	
Absolute maximum sum of all input circuit currents during overload condition ³⁾	ΣI_{IN} SR	-100	-	100	mA	

- 1) Valid for cumulated for up to 2.8h and pulse forms following a power supply switch on phase, where the rise and fall times are related to the system capacities and coils.
- 2) Voltages below V_{INmin} have no impact to the device reliability as long as the times and currents defined in section Pin Reliability in Overload for the affected pad(s) are not violated.
- 3) This parameter is an Absolute Maximum Rating. Exposure to Absolute Maximum Ratings for extended periods of time may damage the device.

3.3 Pin Reliability in Overload

When receiving signals from higher voltage devices, low-voltage devices experience overload currents and voltages that go beyond their own IO power supplies specification.

The following table defines overload conditions that will not cause any negative reliability impact if all the following conditions are met:

- full operation life-time is not exceeded
- **Operating Conditions** are met for
 - pad supply levels
 - temperature
- Parameters defined in **Absolute Maximum Ratings** are not violated

If a pin current is out of the **Operating Conditions** but within the overload parameters, then the parameters functionality of this pin as stated in the Operating Conditions can no longer be guaranteed. Operation is still possible in most cases but with relaxed parameters.

Note: An overload condition on one or more pins does not require a reset.

Table 3-2 Overload Parameters

Input current on any digital pin during overload condition	I_{IN}	-5	-	5	mA

- 1) Limitations for time and supply levels specified in this section are not valid for this parameter.
- 2) Overload is measured as increase of pad leakage caused by injection on neighbor pad.

3.4 Operating Conditions

The following operating conditions must not be exceeded in order to ensure correct operation and reliability of the TC233 / TC234 / TC237. All parameters specified in the following tables refer to these operating conditions, unless otherwise noticed.

Digital supply voltages applied to the TC233 / TC234 / TC237 must be static regulated voltages.

All parameters specified in the following tables refer to these operating conditions (see table below), unless otherwise noticed in the Note / Test Condition column.

- 1) It shall be ensured when using the SC DC DC EVR13 that the current is limited to the maximum value documented in the EVR section. EVR SRCSCDC Interrupt shall be kept active to indicate violations of max current and temperature shall be monitored to keep leakage current within limits.
- 2) Realistic Pflash read pattern with 50% Pflash bandwidth utilization and a code mix of 50% 0s and 50% 1s. Dynamic Flash Idle via FCON.IDLE is activated bringing a benefit of 4 mA. A decoupling capacitor of atleast 100nF is used. Dflash read current is also included. In TC23x, separate VDDFL3 pin is not available, so only the total VDDx3RAIL is measured and characterized.
- 3) The total current drawn from external regulator is estimated with 72% EVR13 SMPS regulator Efficiency. I_{DDTOTDCX} is calculated from I_{DDTOT} using the scaled core current $[(I_{\text{DD}} \times V_{\text{DD}})/(\text{Vin} \times \text{Efficiency})]$ and constitutes all other rail currents and I_{DDM} .
- 4) The current during STANDBY mode is drawn at V_{DDP3} supply pin. During RUN-STANDBY mode transition the current drawn at V_{DDP3} supply pin is less than 6mA.
- 5) Incase of EVR13 SCDCDC mode, 50 mW need to be additionally added for the real pattern usecase considering 72% SCDCDC efficiency. Incase of EVR13 LDO mode, 320 mW need to be additionally added to consider the pass device power drop out.

3.10.1 Calculating the 1.3 V Current Consumption

The current consumption of the 1.3 V rail compose out of two parts:

- Static current consumption
- Dynamic current consumption

Electrical Specification Power Supply Current

The static current consumption is related to the device temperature T_J and the dynamic current consumption depends of the configured clocking frequencies and the software application executed. These two parts needs to be added in order to get the rail current consumption.

(3.2)

$$I_0 = 1,541 \left[\frac{\text{mA}}{\text{C}} \right] \times e^{0,0167 \times T_J[\text{C}]}$$

(3.3)

$$I_0 = 3,418 \left[\frac{\text{mA}}{\text{C}} \right] \times e^{0,0183 \times T_J[\text{C}]}$$

Function 2 defines the typical static current consumption and Function 3 defines the maximum static current consumption. Both functions are valid for $V_{DD} = 1.326 \text{ V}$.

3.11 Power-up and Power-down

Figure 3-2 Single Supply mode - 3.3 V single supply

3.11.1 Single Supply mode

3.3 V single supply mode. 1.3 V is generated internally by the EVR13 regulator.

- The rate at which current is drawn from the external regulator (dI_{EXT}/dt) is limited during the basic infrastructure and EVR13 regulator start-up phase (T0 upto T2) to a maximum of 100 mA/100 us. EVR13 is also robust against a voltage ramp-up starting from a residual voltage between 0 - 1 V. Start-up slew rates for supply rails should comply to datasheet values.
- Furthermore it is also ensured that the current drawn from the external regulator (dI_{EXT}/dt) is limited during the Firmware start-up phase (T2 upto T3) to a maximum of 100 mA/100 us.
- PORST is active/ asserted when either PORST (input) or PORST (output) is active/ asserted.
- PORST (input) active means that the reset is held active by external agents by pulling the PORST pin low. It is recommended to keep the PORST (input) asserted until the external supply is above the respective primary reset threshold.
- PORST (output) active means that μC asserts the reset internally and drives the PORST pin low thus propagating the reset to external devices. The PORST (output) is asserted by the μC when atleast one among the two supply domains (1.3 V or 3.3 V) violate their primary under-voltage reset thresholds. The PORST (output) is deasserted by the μC when all supplies are above their primary reset thresholds and the basic supply and clock infrastructure is available.
- The power sequence as shown in [Figure 3-2](#) is enumerated below
 - T1 refers to the point in time when basic supply and clock infrastructure is available as the external supply ramps up. The supply mode is evaluated based on the HWCFG[0,2] pins and consequently a soft start of EVR13 regulator is initiated.
 - T2 refers to the point in time when all supplies are above their primary reset thresholds. EVR13 regulator has ramped up. PORST (output) is deasserted and HWCFG[3:5] pins are latched on PORST rising edge. Firmware execution is initiated.
 - T3 refers to the point in time when Firmware execution is completed. User code execution starts with a default frequency of 100 MHz.
 - T4 refers to the point in time during the Ramp-down phase when atleast one of the externally provided or generated supplies (1.3 V or 3.3 V) drop below their respective primary under-voltage reset thresholds.

Electrical Specification Power-up and Power-down

Figure 3-3 External Supply mode - 3.3 V and 1.3 V external supply

3.11.2 External Supply mode

All supplies, namely 3.3 V & 1.3 V, are externally supplied.

- External supplies VDDP3 & VDD may ramp-up or ramp-down independent of each other with regards to start, rise and fall time(s). The supply system is also robust against a voltage ramp-up starting from a residual voltage between 0 - 1 V. Start-up slew rates for supply rails should comply to datasheet values.
- The rate at which current is drawn from the external regulator (dI_{EXT}/dt , dI_{DD}/dt) is limited in the Start-up phase to a maximum of 50 mA/100 μ s.
- PORST is active/ asserted when either PORST (input) or PORST (output) is active/ asserted.
- PORST (input) active means that the reset is held active by external agents by pulling the PORST pin low. It is recommended to keep the PORST (input) asserted until all the external supplies are above their primary reset thresholds.
- PORST (output) active means that μ C asserts the reset internally and drives the PORST pin low thus propagating the reset to external devices. The PORST (output) is asserted by the μ C when atleast one among the two supply domains (1.3 V or 3.3 V) violate their primary under-voltage reset thresholds. The PORST (output) is deasserted by the μ C when all supplies are above their primary reset thresholds and the basic supply and clock infrastructure is available.
- The power sequence as shown in [Figure 3-3](#) is enumerated below
 - T1 refers to the point in time when all supplies are above their primary reset thresholds and basic clock infrastructure is available. The supply mode is evaluated based on the HWCFG[0,2] pins. PORST (output) is deasserted and HWCFG[3:5] pins are latched on PORST rising edge. Firmware execution is initiated.
 - T2 refers to the point in time when Firmware execution is completed. User code execution starts with a default frequency of 100 MHz.
 - T3 refers to the point in time during the Ramp-down phase when atleast one of the externally provided supplies (1.3 V or 3.3 V) drop below their respective primary under-voltage reset thresholds.

Hold time from PORST rising edge	t_{POH} SR	150	-	-	ns

- 1) The duration of the boot time is defined between the rising edge of the internal application reset and the clock cycle when the first user instruction has entered the CPU pipeline and its processing starts.
- 2) The duration of the boot time is defined by all external supply voltages are inside there operation condicions and the clock cycle when the first user instruction has entered the CPU pipeline and its processing starts.
- 3) The regulator that supplies V_{EXT} should ensure that V_{EXT} is in the operational region before PORST is externally released by the regulator. Incase of 5V nominal supply, it should be ensured that $V_{EXT} > 4V$ before PORST is released. Incase of 3.3V nominal supply, it should be ensured that $V_{EXT} > 3V$ before PORST is released. The additional minimum PORST hold time is required as an additional mechanism to avoid consecutive PORST toggling owing to slow supply slopes or residual supply ramp-ups. It is also required to activate external PORST atleast 100us before power-fail is recognised to avoid consecutive PORST toggling on a power fail event.
- 4) This parameter includes the delay of the analog spike filter in the \overline{PORST} pad.

- 1) A maximum pass device dropout voltage of 700mV is included in the minimum input voltage to ensure optimal pass device operation.
- 2) It is recommended to select a capacitor with ESR less than 50 mOhm (0.5MHz - 10 MHz). It is also recommended that the resistance of the supply trace from the pin to the EVR output capacitor is less than 100 mOhm.
- 3) The reset release on supply ramp-up is delayed by a time duration 30-60 μ s after reaching undervoltage reset threshold. This serves as a time hysteresis to avoid multiple consecutive cold PORST events during slow supply ramp-ups owing to voltage drop/current jumps when reset is released.
- 4) In TQFP-100 pin package, only $V_{DDPRIUV}$ is tested instead of VRST13 as HWCFG2 pin is absent.
- 5) EVR robust against residual voltage ramp-up starting between 0-1 V.

Note: It is recommended to use dimensions E_x and E_y for board layout considerations. Solder wetting between E_x / E_y and A_x / A_y and lead between E_x / E_y and A_x / A_y will not cause any harm.

You can find all of our packages, sorts of packing and others in our Infineon Internet Page "Products": <http://www.infineon.com/products>.

- 1) The top and bottom thermal resistances between the case and the ambient (R_{TCAT} , R_{TCAB}) are to be combined with the thermal resistances between the junction and the case given above (R_{TJCT} , R_{TJCB}), in order to calculate the total thermal resistance between the junction and the ambient (R_{TJA}). The thermal resistances between the case and the ambient (R_{TCAT} , R_{TCAB}) depend on the external system (PCB, case) characteristics, and are under user responsibility.
 The junction temperature can be calculated using the following equation: $T_J = T_A + R_{TJA} * P_D$, where the R_{TJA} is the total thermal resistance between the junction and the ambient. This total junction ambient resistance R_{TJA} can be obtained from the upper four partial thermal resistances.
 Thermal resistances as measured by the 'cold plate method' (MIL SPEC-883 Method 1012.1).
- 2) Value is defined in accordance with JEDEC JESD51-3, JESD51-5, and JESD51-7.
