

500mA, Micropower, VLDO Linear Regulator**UM1770Y-xx SOT89-5****UM1770DA-xx DFN6 2.0×2.0****General Description**

The UM1770 series are VLDO (very low dropout) linear regulators designed for low power portable applications. Typical output noise is only $90\mu\text{V}_{\text{RMS}}$ (Fixed Output, $V_{\text{OUT}}=1.0\text{V}$) and maximum dropout is just 320mV at the load current of 500mA. The internal P-channel MOSFET pass transistor requires no base current, allowing the device to draw only 250 μA during normal operation at the maximum load current of 500mA.

Other features include high output voltage accuracy, excellent transient response, under voltage lockout, stability with ultra low ESR ceramic capacitors as small as 1 μF , short-circuit and thermal overload protection and output current limiting.

The UM1770Y-xx series are available in SOT89-5 package and the UM1770DA-xx series are available in a low profile DFN6 2.0×2.0 package.

Applications

- Bluetooth/802.11 Cards
- PDAs and Notebook Computers
- Portable Instruments and Battery-Powered Systems
- Cellular Phones

Features

- Very Low Dropout: 320mV (Max) at 500mA
- Maximum Input Voltage: 6.0V
- Low Noise (10Hz to 100kHz):
 $90\mu\text{V}_{\text{RMS}}$ (Fixed Output, $V_{\text{OUT}}=1.0\text{V}$);
 $60\mu\text{V}_{\text{RMS}}$ (Adjustable Output, $V_{\text{OUT}}=1.0\text{V}$);
 $194\mu\text{V}_{\text{RMS}}$ (Adjustable Output, $V_{\text{OUT}}=3.3\text{V}$);
 $305\mu\text{V}_{\text{RMS}}$ (Adjustable Output, $V_{\text{OUT}}=5.0\text{V}$)
- $\pm 2\%$ Voltage Accuracy at 500mA
- Fast Transient Response
- Under Voltage Lockout
- Fixed Output Voltage of UM1770Y/DA-xx:
1.0V to 4.0V with 0.1V Interval
- Adjustable Output Voltage of
UM1770Y/DA-00:
1.0V to 5.0V
- Output Current Limit
- Stable with 1 μF Output Capacitor
- Short-Circuit and Thermal Overload Protection
- Low Profile SOT89-5 and DFN6 2.0×2.0 Packages

Absolute Maximum Ratings (Note 1)

Symbol	Parameter	Value	Unit	
V_{IN}	Supply Voltage on VIN Pin	-0.3 to +7.5	V	
$V_{\overline{SHDN}}$	Voltage on \overline{SHDN} Pin	-0.3 to +7.5	V	
V_{OUT}	Voltage on VOUT Pin	-0.3 to +7.5	V	
V_{FB}	Voltage on FB Pin	-0.3 to +7.5	V	
T_J	Operating Junction Temperature (Note 2, 3)	-40 to +125	°C	
T_{STG}	Storage Temperature Range	-65 to +150	°C	
T_L	Lead Temperature for Soldering 10 Seconds	+300	°C	
P_D (Note 4)	Power Dissipation @ 25°C	DFN6 2.0×2.0	0.9	W
		SOT89-5	1.5	
θ_{JA}	Package Thermal Resistance	DFN6 2.0×2.0	110	°C/W
		SOT89-5	66	

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: The UM1770 is tested and specified under pulse load conditions such that $T_J \approx T_A$. Specifications over the -40°C to 125°C operating junction temperature range are assured by design, characterization and correlation with statistical process controls.

Note 3: This IC includes over-temperature protection that is intended to protect the device during momentary overload conditions. Junction temperature will exceed 125°C when over-temperature protection is active. Continuous operation above the specified maximum operating junction temperature may impair device reliability.

Note 4: The maximum allowable power dissipation of any T_A (ambient temperature) is $P_{D\text{MAX}} = (T_{J\text{MAX}} - T_A) / \theta_{JA}$. Exceeding the maximum allowable power dissipation will result in excessive die temperature and the regulator will go into thermal shutdown.

Electrical Characteristics

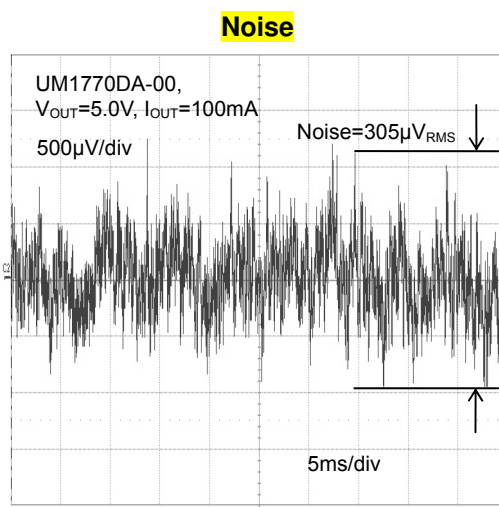

Over recommended operating free-air temperature range (unless otherwise noted)

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
V_{IN}	Input Voltage Range		2.5		6.0	V
V_{UVLO}	Input Under Voltage Lockout	V_{IN} Falling	1.8		2.4	V

Load Transient Response

Line Transient Response

Startup Waveform

Shutdown Waveform

Pin Function

SHDN: Shutdown, Active Low. This pin is used to put the UM1770 into shutdown. The SHDN pin cannot be left floating and must be tied to the input pin if not used.

GND: Ground and Heat Sink. Solder to a ground plane or large pad to maximize heat dissipation.

VIN: Power for UM1770 and Load. Power is supplied to the devices through the VIN pin. The VIN pin should be locally bypassed to ground if the UM1770 series are more than a few inches away from another source of bulk capacitance.

VOUT: Voltage Regulated Output. The VOUT pin supplies power to the load. A minimum output capacitor of 1μF is required to ensure stability. Larger output capacitors may be required for applications with large transient loads to limit peak voltage transients.

NC: Not Connected.

FB: Output voltage feedback. This terminal is used to set the output voltage.

Output Voltage Setting

The output voltage of the UM1770 adjustable regulator is programmed using an external resistor divider as shown in Figure 2. The output voltage is calculated using:

$$V_{OUT} = V_{FB} \left(1 + \frac{R1}{R2} \right)$$

Where: $V_{FB}=1.00V$ (Typ) (the internal reference voltage)

Resistors R1 and R2 should be chosen for approximately 3-5μA divider current. Lower value resistors can be used but offer no inherent advantage and waste more power. Higher values should be avoided, as leakage currents at FB increase the output voltage error. The recommended design procedure is to choose $R2=200k\Omega$ to set the divider current at 5μA and then calculate R1 using:

$$R1 = \left(\frac{V_{OUT}}{V_{FB}} - 1 \right) \times R2$$

Where: $V_{FB}=1.00V$ (Typ).
