Built for plug&play simplicity with extensive remote management, deployment and customization options, the Spectre 4G cellular industrial router wirelessly connects Ethernet equipment and other devices to the Internet or intranet. It creates secure connections in locations where cable connections are impractical. Standard configuration includes a 10/100 Ethernet port, USB host port, binary input/output port and SIM card holder. It also has 2 auxiliary ports for connecting to other types of networks such as additional Ethernet switch ports, RS-232, RS-485/422 interfaces and additional digital/analog I/O. The function of each port is dependent on the specific router model. An additional option is integrated 802.11b/g/n Wi-Fi technology, allowing the router to serve as a Wi-Fi access Point (AP) or “Hotspot”. Non-WiFi models support GPS.

The router supports VPN tunnel creation using IPsec, OpenVPN and L2TP to ensure safe communication. The web interface provides detailed statistics about router activities, signal strength, etc. The router supports DHCP, NAT, NAT-T, DynDNS, NTP, VRRP, control by SMS, and many other functions. The router provides diagnostic functions which include automatically monitoring the PPP connection, automatic restart in case of connection losses, and a hardware watchdog that monitors the router status. The router can automatically upgrade its configuration and firmware from your central server. This allows for mass reconfiguration of numerous routers at the same time. Additional management software, like R-SeeNet, for router monitoring are also supported.

Uniquely designed on an open source LINUX architecture, Spectre products are customizable through installation of software plug-in modules. Users can create their own with common LINUX commands and scripts, or add from B+B’s existing library, including Modbus gateway, dynamic routing protocols and secure VPNs.
