

DAC7551-Q1 12-Bit, Ultra-Low Glitch, Voltage Output Digital-to-Analog Converter

1 Features

- Qualified for Automotive Applications
- Relative Accuracy (INL): ± 0.35 LSB
- Ultra-Low Glitch Energy: 0.1 nV-s
- Low-Power Operation: 100 μ A at 2.7 V
- Power-On Reset-to-Zero Scale
- Power Supply: 2.7- to 5.5-V Single Supply
- Power-Down: 0.05 μ A at 2.7 V
- 12-Bit Linearity and Monotonicity
- Rail-to-Rail Voltage Output
- Settling Time: 5 μ s (Max)
- SPI-Compatible Serial Interface With Schmitt-Trigger Input: Up to 50 MHz
- Daisy-Chain Capability
- Asynchronous Hardware Clear-to-Zero Scale
- Specified Temperature Range: -40°C to $+105^{\circ}\text{C}$
- Small, 2-mm \times 3-mm, 12-Lead USON Package
- Z-Suffix Offers Improved Delamination

2 Applications

- Portable, Battery-Powered Instruments
- Digital Gain and Offset Adjustment
- Programmable Voltage and Current Sources
- Programmable Attenuators
- Industrial Process Control
- ADAS Radar Applications
- Collision Warning
- Blind-Spot Detection

3 Description

The DAC7551-Q1 device is a single-channel, voltage-output digital-to-analog converter (DAC) with exceptional linearity and monotonicity, and a proprietary architecture that minimizes glitch energy. The low-power DAC7551-Q1 device operates from a single 2.7- to 5.5-V supply. The DAC7551-Q1 output amplifiers can drive a 2-k Ω , 200-pF load rail-to-rail with 5- μ s settling time. The output range is set using an external voltage reference.

The 3-wire serial interface operates at clock rates up to 50 MHz and is compatible with SPI™, QSPI™, microwire, and DSP interface standards. The device incorporates a power-on-reset (POR) circuit to ensure that the DAC output powers up to 0 V and remains at that voltage until a valid write cycle to the device occurs. The device contains a power-down feature that reduces the current consumption of the device to under 2 μ A.

Small size and low-power operation make the DAC7551-Q1 device ideally suited for battery-operated, portable applications. The power consumption is typically 0.5 mW at 5 V, 0.23 mW at 3 V, and reduces to 1 μ W in power-down mode.

The DAC7551-Q1 device is available in a 12-pin USON package and is specified over -40°C to $+105^{\circ}\text{C}$. The Z-suffix offers reduced delamination compared to standard device.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DAC7551-Q1	USON (12)	2.00 mm \times 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

Changes from Revision A (February 2015) to Revision B

Page

- Added ADAS radar, collision warning, and blind-spot detection to *Applications* list **1**
- Changed the thermal information values for the DRN (USON) package in the *Thermal Information* table **4**

Changes from Original (June 2011) to Revision A

Page

- Added the *ESD Ratings* table, *Recommended Operating Conditions* table, *Feature Description* section, *Device Functional Modes* section, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section **1**
- Released the Z-suffix orderable part number, DAC7551ZTDRNRQ1, which offers improved delamination **1**

5 Pin Configuration and Functions

DRN Package
12-Pin USON With Exposed Thermal Pad
Top View

(1) The thermal pad should be connected to GND.

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	V_{DD}	I	Analog voltage supply input
2	V_{REFH}	I	Positive reference voltage input
3	V_{REFL}	I	Negative reference voltage input
4	V_{FB}	I	DAC amplifier sense input.
5	V_{OUT}	O	Analog output voltage from DAC
6	GND	—	Ground.
7	\overline{CLR}	I	Asynchronous input to clear the DAC registers. When the \overline{CLR} pin is low, the DAC register is set to 000h and the output voltage to 0 V.
8	\overline{SYNC}	I	Frame synchronization input. The falling edge of the \overline{SYNC} pulse indicates the start of a serial data frame shifted out to the DAC7551-Q1 device.
9	SCLK	I	Serial clock input
10	SDIN	I	Serial data input
11	SDO	O	Serial data output
12	IOV_{DD}	I	I/O voltage supply input

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted).⁽¹⁾

	MIN	MAX	UNIT
V_{DD} , IOV_{DD} to GND	–0.3	6	V
Digital input voltage to GND	–0.3	$V_{DD} + 0.3$	V
V_{OUT} to GND	–0.3	$V_{DD} + 0.3$	V
Operating temperature range	–40	105	°C
Junction temperature, T_J max		150	°C
Power dissipation (DRN)	$(T_J \text{ max} - T_A) / R_{\theta JA}$		
Storage temperature, T_{stg}	–65	150	°C

(1) Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT	
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000	V	
		Charged-device model (CDM), per AEC Q100-011	All pins		±500
			Corner pins (1, 6, 7, and 12)		±750

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_I	Input voltage	V_{DD}	2.7	5.5	V
		V_{REFH}	0.25	V_{DD}	
		V_{REFL}	0	GND	
		V_{FB}	0	V_{DD}	
		IOV_{DD}	1.8	V_{DD}	
		\overline{CLR}	0	IOV_{DD}	
		\overline{SYNC}	0	IOV_{DD}	
		SCLK	0	IOV_{DD}	
V_O	Output voltage	SDO	0	IOV_{DD}	V
		V_{OUT}	0	V_{DD}	
T_J	Operating junction temperature			150	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DRN (USON) 12 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	49.8	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	45.8	
$R_{\theta JB}$	Junction-to-board thermal resistance	18.2	
Ψ_{JT}	Junction-to-top characterization parameter	0.8	
Ψ_{JB}	Junction-to-board characterization parameter	18.3	
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.9	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

all specifications at –40°C to +105°C, $V_{DD} = 2.7$ to 5.5 V, $V_{REFH} = V_{DD}$, $V_{REFL} = GND$, $R_L = 2$ kΩ to GND, and $C_L = 200$ pF to GND (unless otherwise noted).

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
STATIC PERFORMANCE⁽¹⁾					
Resolution		12			Bits
Relative accuracy			±0.35	±1	LSB
Differential nonlinearity	Specified monotonic by design		±0.08	±0.5	LSB
Offset error				±12	mV
Zero-scale error	All zeroes loaded to DAC register			±12	mV
Gain error				±0.15	%FSR
Full-scale error				±0.5	%FSR
Zero-scale error drift			7		μV/°C
Gain temperature coefficient			3		ppm of FSR/°C

(1) Linearity tested using a reduced code range of 30 to 4065; output unloaded.

Electrical Characteristics (continued)

all specifications at -40°C to $+105^{\circ}\text{C}$, $V_{\text{DD}} = 2.7$ to 5.5 V, $V_{\text{REFH}} = V_{\text{DD}}$, $V_{\text{REFL}} = \text{GND}$, $R_{\text{L}} = 2$ k Ω to GND, and $C_{\text{L}} = 200$ pF to GND (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
PSRR	Power-supply rejection ratio	$V_{\text{DD}} = 5$ V		0.75		mV/V	
OUTPUT CHARACTERISTICS⁽²⁾							
	Output voltage range		$2 \times V_{\text{REFL}}$		V_{REFH}	V	
	Output voltage settling time	$R_{\text{L}} = 2$ k Ω , 0 pF $< C_{\text{L}} < 200$ pF			5	μs	
	Slew rate			1.8		V/ μs	
	Capacitive load stability	$R_{\text{L}} = \infty$		470		pF	
		$R_{\text{L}} = 2$ k Ω		1000			
	Digital-to-analog glitch impulse	1 LSB change around major carry		0.1		nV-s	
	Digital feedthrough			0.1		nV-s	
	Output noise density	10kHz offset frequency		120		nV/ $\sqrt{\text{Hz}}$	
THD	Total harmonic distortion	$f_{\text{OUT}} = 1$ kHz, $f_{\text{S}} = 1$ MSPS, BW = 20 kHz		-85		dB	
	DC output impedance			1		Ω	
	Short-circuit current	$V_{\text{DD}} = 5$ V		50		mA	
		$V_{\text{DD}} = 3$ V		20			
	Power-up time	Coming out of power-down mode, $V_{\text{DD}} = 5$ V		15		μs	
		Coming out of power-down mode, $V_{\text{DD}} = 3$ V		15			
REFERENCE INPUT							
	V_{REFH} input range		0		V_{DD}	V	
	V_{REFL} input range	$V_{\text{REFL}} < V_{\text{REFH}}$	0	GND	V_{DD}	V	
	Reference input impedance			100		k Ω	
	Reference current	$V_{\text{REF}} = V_{\text{DD}} = 5$ V		50	100	μA	
		$V_{\text{REF}} = V_{\text{DD}} = 3$ V		30	60		
LOGIC INPUTS⁽²⁾							
	Input current				± 1	μA	
V_{IN_L}	Input low voltage	$\text{IOV}_{\text{DD}} \geq 2.7$ V			0.3 IOV_{DD}	V	
V_{IN_H}	Input high voltage	$\text{IOV}_{\text{DD}} \geq 2.7$ V	0.7 IOV_{DD}			V	
	Pin capacitance				3	pF	
POWER REQUIREMENTS							
V_{DD}	Supply voltage		2.7		5.5	V	
IOV_{DD}	I/O supply voltage ⁽³⁾		1.8		V_{DD}	V	
I_{DD}	Supply current ⁽⁴⁾	Normal operation (DAC active and excluding load current)	$V_{\text{DD}} = 3.6$ to 5.5 V, $V_{\text{IH}} = \text{IOV}_{\text{DD}}$, $V_{\text{IL}} = \text{GND}$		150	200	μA
			$V_{\text{DD}} = 2.7$ to 3.6 V, $V_{\text{IH}} = \text{IOV}_{\text{DD}}$, $V_{\text{IL}} = \text{GND}$		100	150	
	All power-down modes	$V_{\text{DD}} = 3.6$ to 5.5 V, $V_{\text{IH}} = \text{IOV}_{\text{DD}}$, $V_{\text{IL}} = \text{GND}$		0.2	2	μA	
		$V_{\text{DD}} = 2.7$ to 3.6 V, $V_{\text{IH}} = \text{IOV}_{\text{DD}}$, $V_{\text{IL}} = \text{GND}$		0.05	2		
POWER EFFICIENCY							
	$I_{\text{OUT}}/I_{\text{DD}}$	$I_{\text{LOAD}} = 2$ mA, $V_{\text{DD}} = 5$ V		93%			
TEMPERATURE RANGE							
	Specified performance		-40		105	$^{\circ}\text{C}$	

(2) Specified by design and characterization; not production tested. For 1.8 V $< \text{IOV}_{\text{DD}} < 2.7$ V, TI recommends that $V_{\text{IH}} \geq 0.8 \text{ IOV}_{\text{DD}}$, and $V_{\text{IL}} \leq 0.2 \text{ IOV}_{\text{DD}}$.

(3) IOV_{DD} operates down to 1.8 V with slightly degraded timing, as long as $V_{\text{IH}} \geq 0.8 \text{ IOV}_{\text{DD}}$ and $V_{\text{IL}} \leq 0.2 \text{ IOV}_{\text{DD}}$.

(4) I_{DD} tested with digital input code = 0032.

6.6 Timing Requirements⁽¹⁾

All specifications at –40°C to +105°C, $V_{DD} = 2.7$ to 5.5 V, and $R_L = 2$ kΩ to GND (unless otherwise noted). See [Figure 1](#).

			MIN	MAX	UNIT
$t_1^{(2)}$	SCLK cycle time	$V_{DD} = 2.7$ V to 3.6 V	20		ns
		$V_{DD} = 3.6$ V to 5.5 V	20		
t_2	SCLK HIGH time	$V_{DD} = 2.7$ V to 3.6 V	6.5		ns
		$V_{DD} = 3.6$ V to 5.5 V	6.5		
t_3	SCLK LOW time	$V_{DD} = 2.7$ V to 3.6 V	6.5		ns
		$V_{DD} = 3.6$ V to 5.5 V	6.5		
t_4	$\overline{\text{SYNC}}$ falling edge to SCLK falling edge setup time	$V_{DD} = 2.7$ V to 3.6 V	4		ns
		$V_{DD} = 3.6$ V to 5.5 V	4		
t_5	Data setup time	$V_{DD} = 2.7$ V to 3.6 V	3		ns
		$V_{DD} = 3.6$ V to 5.5 V	3		
t_6	Data hold time	$V_{DD} = 2.7$ V to 3.6 V	3		ns
		$V_{DD} = 3.6$ V to 5.5 V	3		
t_7	SCLK falling edge to $\overline{\text{SYNC}}$ rising edge	$V_{DD} = 2.7$ V to 3.6 V	0	$t_1 - 10$ ns ⁽³⁾	ns
		$V_{DD} = 3.6$ V to 5.5 V	0	$t_1 - 10$ ns ⁽³⁾	
t_8	Minimum $\overline{\text{SYNC}}$ HIGH time	$V_{DD} = 2.7$ V to 3.6 V	20		ns
		$V_{DD} = 3.6$ V to 5.5 V	20		
t_9	SCLK falling edge to SDO valid	$V_{DD} = 2.7$ V to 3.6 V	10		ns
		$V_{DD} = 3.6$ V to 5.5 V	10		
t_{10}	$\overline{\text{CLR}}$ pulse width low	$V_{DD} = 2.7$ V to 3.6 V	10		ns
		$V_{DD} = 3.6$ V to 5.5 V	10		

- (1) All input signals are specified with $t_R = t_F = 1$ ns (10% to 90% of V_{DD}) and timed from a voltage level of $(V_{IL} + V_{IH}) / 2$.
- (2) Maximum SCLK frequency is 50 MHz at $V_{DD} = 2.7$ to 5.5 V.
- (3) SCLK falling edge to $\overline{\text{SYNC}}$ rising edge time should not exceed $(t_1 - 10$ ns) to latch the correct data.

7 Detailed Description

7.1 Overview

The DAC7551-Q1 device is a 12-bit resistor-string digital-to-analog converter (DAC). Unbuffered external reference inputs allow for a positive voltage reference as low as 0.25 V and as high as V_{DD} . An amplifier-feedback input is available for better DC accuracy at the load point. The device is controlled over a 16-bit word three-wire serial peripheral interface (SPI) up to 50 MHz with an option to daisy-chain multiple devices. An asynchronous clear function along with power-down features allows for software controlled resets and low-power consumption. A separate logic-supply input means the device can be used with different logic families across a wide range of supply voltages.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Digital-to-Analog Converter

The architecture of the DAC7551-Q1 device consists of a string DAC followed by an output buffer amplifier. Figure 26 shows a generalized block diagram of the DAC architecture.

Figure 26. Typical DAC Architecture

The input coding to the DAC7551-Q1 device is unsigned binary, which gives the ideal output voltage as show in Equation 1.

$$V_{OUT} = 2 \times V_{REFL} + (V_{REFH} - V_{REFL}) \times D / 4096$$

where

- D is the decimal equivalent of the binary code that is loaded to the DAC register, which ranges from 0 to 4095. (1)

Feature Description (continued)

7.3.2 Resistor String

Figure 27 shows the resistor string section. This section is simply a string of resistors, each of value R. The digital code loaded to the DAC register determines at which node on the string the voltage is tapped off to be fed into the output amplifier. The voltage is tapped off by closing one of the switches connecting the string to the amplifier. The output of the DAC is specified monotonic because it is a string of resistors.

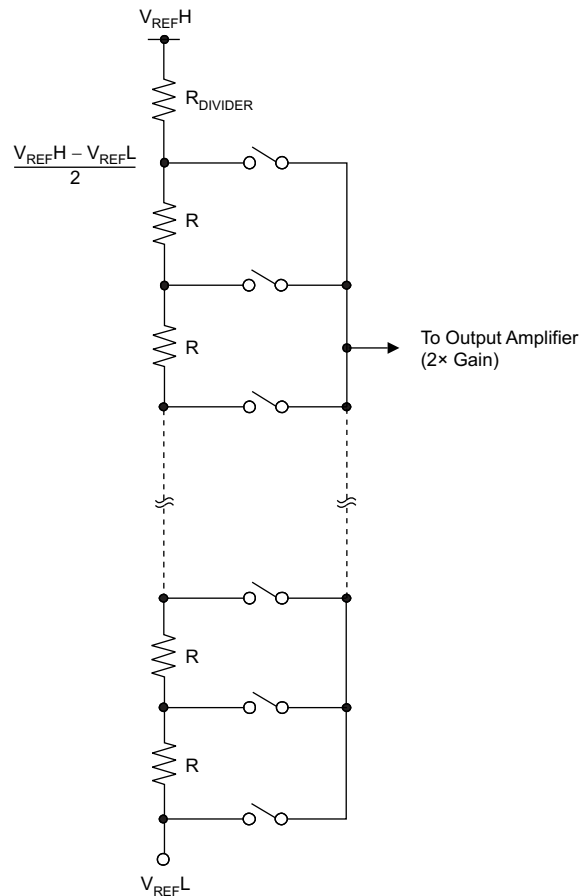

Figure 27. Typical Resistor String

7.3.3 Output Buffer Amplifiers

The output buffer amplifier is capable of generating rail-to-rail voltages on the output, providing an output range of 0 V to V_{DD} . The amplifier is capable of driving a load of 2 k Ω in parallel with up to 1000 pF to ground. Figure 8, Figure 9, and Figure 10 show the sink and source capabilities of the output amplifier. The slew rate is 1.8 V/ μ s with a half-scale settling time of 3 μ s with the output unloaded.

7.3.3.1 DAC External Reference Input

The DAC7551-Q1 device contains V_{REFH} and V_{REFL} reference inputs which are unbuffered. The V_{REFH} reference voltage can be as low as 0.25 V, and as high as V_{DD} because there is no restriction of headroom and footroom from any reference amplifier.

Using a buffered reference in the external circuit is recommended (for example, the REF3140 device). The input impedance is typically 100 k Ω .

Feature Description (continued)

7.3.3.2 Amplifier Sense Input

The DAC7551-Q1 device contains an amplifier-feedback input pin, V_{FB} . For voltage output operation, V_{FB} must be externally connected to V_{OUT} . For better DC accuracy, this connection should be made at load points. The V_{FB} pin is also useful for a variety of applications, including digitally-controlled current sources. The feedback input pin is internally connected to the DAC amplifier negative input terminal through a 100-k Ω resistor. The amplifier negative input terminal internally connects to ground through another 100-k Ω resistor (see [Figure 26](#)). These connections form a gain-of-two, noninverting, amplifier configuration. Overall gain remains 1 because the resistor string has a divide-by-two configuration. The resistance seen at the V_{FB} pin is approximately 200 k Ω to ground.

7.3.3.3 Power-On Reset

On power up, all registers are cleared and the DAC channel is updated with zero-scale voltage. The DAC output remains in this state until valid data are written. This setup is particularly useful in applications where knowing the state of the DAC output while the device is powering up is important. To not turn on ESD protection devices, V_{DD} and IOV_{DD} should be applied before any other pin (such as V_{REFH}) is brought high. The power-up sequence of V_{DD} and IOV_{DD} is irrelevant. Therefore, IOV_{DD} can be brought up before V_{DD} , or the other way around.

7.3.3.4 Power Down

The DAC7551-Q1 device has a flexible power-down capability. During a power-down condition, the user has flexibility to select the output impedance of the DAC. During power-down operation, the DAC can have either 1k Ω , 100k Ω , or Hi-Z output impedance to ground.

7.3.3.5 Asynchronous Clear

The DAC7551-Q1 output is asynchronously set to zero-scale voltage immediately after the \overline{CLR} pin is brought low. The \overline{CLR} signal resets all internal registers and therefore functions similar to the power-on reset. The DAC7551-Q1 device updates at the first rising edge of the \overline{SYNC} signal that occurs after the \overline{CLR} pin is brought back to high.

7.3.3.6 IOVDD and Level Shifters

The DAC7551-Q1 device can be used with different logic families that require a wide range of supply voltages. To enable this useful feature, the IOV_{DD} pin must be connected to the logic supply voltage of the system. All DAC7551-Q1 digital input and output pins are equipped with level-shifter circuits. Level shifters at the input pins ensure that external logic-high voltages are translated to the internal logic-high voltage, with no additional power dissipation. Similarly, the level shifter for the SDO pin translates the internal logic-high voltage (V_{DD}) to the external logic-high level (IOV_{DD}). For single-supply operation, the IOV_{DD} pin can be tied to the V_{DD} pin.

7.3.4 Integral and Differential Linearity

The DAC7551-Q1 device uses precision thin-film resistors providing exceptional linearity and monotonicity. Integral linearity error is typically within ± 0.35 LSBs, and differential linearity error is typically within ± 0.08 LSBs.

7.3.5 Glitch Energy

The DAC7551-Q1 device uses a proprietary architecture that minimizes glitch energy. The code-to-code glitches are so low that they are usually buried within the wide-band noise and cannot be easily detected. The DAC7551-Q1 glitch is typically well under 0.1 nV-s. Such low glitch energy provides more than a ten-time improvement over industry alternatives.

7.4 Device Functional Modes

The DAC7551-Q1 device uses four modes of operation. These modes are accessed by setting bit PD0 (DB13) and PD1 (DB14) in the control register. [Table 1](#) shows how to control the operating mode with data bits PD0 (DB13) and PD1 (DB14). The DAC7551-Q1 device treats the power-down condition as data; all the operation modes are still valid for power down. Broadcasting a power-down condition to all the DAC7551-Q1 devices in a system is possible. Powering down a channel and updating data on other channels is also possible. Furthermore, writing to the DAC register or buffer of the DAC channel that is powered down is also possible. When the DAC is the powered on, the DAC contains this new value.

Device Functional Modes (continued)

When both the PD0 and PD1 bits are set to 0, the device works normally with the typical consumption of 100 μ A at 2.7 V. For the three power-down modes, the supply current falls to 0.05 μ A at 2.7 V. As listed in Table 1, three different power-down options are available. The VOUT pin can be connected internally to GND through a 1-k Ω resistor or a 100-k Ω resistor or can be open circuited (High-Z). In other words, DB14 and DB13 = 11 represent a power-down condition with High-Z output impedance for a selected channel. DB14 and DB13 = 01 and 10 represent a power-down condition with a 1-k Ω and 100-k Ω output impedance respectively.

7.5 Programming

7.5.1 Serial Interface

The DAC7551-Q1 device is controlled over a versatile 3-wire serial interface, which operates at clock rates up to 50 MHz and is compatible with SPI, QSPI, Microwire, and DSP interface standards.

Table 1. Serial Interface Programming

CONTROL				DATA BITS	FUNCTION
DB15	DB14	DB13 (PD1)	DB12 (PD0)	DB11–DB0	
X	X	0	0	data	Normal mode
X	X	0	1	X	Powerdown 1k Ω
X	X	1	0	X	Powerdown 100k Ω
X	X	1	1	X	Powerdown Hi-Z

7.5.1.1 16-Bit Word and Input Shift Register

The input shift register is 16 bits wide. DAC data are loaded into the device as a 16-bit word under the control of a serial clock input, SCLK, as shown in Figure 1. The 16-bit word, listed in Table 1, consists of four control bits followed by 12 bits of DAC data. The data format is straight binary with all 0s corresponding to 0-V output and all 1s corresponding to full-scale output ($V_{REF} - 1$ LSB). Data are loaded MSB first (bit 15) where the first two bits (DB15 and DB14) are *don't care* bits. Bit 13 and bit 12 (DB13 and DB12) determine either normal mode operation or power-down mode (see Table 1).

The $\overline{\text{SYNC}}$ input is a level-triggered input that acts as a frame synchronization signal and chip enable. Data can only be transferred into the device while the $\overline{\text{SYNC}}$ pin is low. To begin the serial data transfer, the $\overline{\text{SYNC}}$ pin should be taken low, observing the minimum $\overline{\text{SYNC}}$ -to-SCLK falling edge setup time, t_4 . After the $\overline{\text{SYNC}}$ pin goes low, serial data is shifted into the device input shift register on the falling edges of SCLK for 16 clock pulses.

The SPI is enabled after the $\overline{\text{SYNC}}$ pin becomes low and the data are continuously shifted into the shift register at each falling edge of the SCLK input. When the $\overline{\text{SYNC}}$ pin is brought high, the last 16 bits stored in the shift register are latched into the DAC register, and the DAC updates.

7.5.1.2 Daisy-Chain Operation

Daisy-chain operation is used for updating serially-connected devices on the rising edge of the $\overline{\text{SYNC}}$ in.

As long as the $\overline{\text{SYNC}}$ pin is high, the SDO pin is in a high-impedance state. When the $\overline{\text{SYNC}}$ pin is brought low the output of the internal shift register is tied to the SDO pin. As long as the $\overline{\text{SYNC}}$ pin is low, the SDO pin duplicates the SDIN signal with a 16-cycle delay. To support multiple devices in a daisy chain, the SCLK and $\overline{\text{SYNC}}$ signals are shared across all devices, and the SDO pin of one DAC7551-Q1 device should be tied to the SDIN pin of the next DAC7551-Q1 device. For n devices in such a daisy chain, $16n$ SCLK cycles are required to shift the entire input data stream. After $16n$ SCLK falling edges are received, following a falling $\overline{\text{SYNC}}$ signal, the data stream becomes complete and the $\overline{\text{SYNC}}$ pin can be brought high to update n devices simultaneously. SDO operation is specified at a maximum SCLK speed of 10 MHz.

In daisy-chain mode, the use of a weak pulldown resistor on the SDO output pin, which provides the SDIN data for the next device in the chain, is recommended. For standalone operation, the maximum clock speed is 50 MHz. For daisy-chain operation, the maximum clock speed is 10 MHz.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Waveform Generation

As a result of the exceptional linearity and low glitch of the DAC7551-Q1 device, the device is well-suited for waveform generation (from DC to 10kHz). The DAC7551-Q1 large-signal settling time is 5 μ s, supporting an update rate of 200 kSPS. However, the update rates can exceed 1 MSPS if the waveform to be generated consists of small voltage steps between consecutive DAC updates. To obtain a high dynamic range, the REF3140 device (4.096 V) or the REF02 device (5 V) is recommended for reference-voltage generation.

8.1.2 Generating ± 5 -V, ± 10 -V, and ± 12 -V Outputs For Precision Industrial Control

Industrial control applications can require multiple feedback loops consisting of sensors, analog-to-digital converters (ADCs), microcontrollers (MCUs), DACs, and actuators. Loop accuracy and loop speed are the two important parameters of such control loops.

8.1.2.1 Loop Accuracy

DAC offset, gain, and the integral linearity errors are not factors in determining the accuracy of the loop. As long as a voltage exists in the transfer curve of a monotonic DAC, the loop can find this voltage and settle to it. On the other hand, DAC resolution and differential linearity do determine the loop accuracy, because each DAC step determines the minimum incremental change the loop can generate. A DNL error less than -1 LSB (non-monotonicity) can create loop instability. A DNL error greater than 1 LSB implies unnecessarily large voltage steps and missed voltage targets. With high DNL errors, the loop loses stability, resolution, and accuracy. Offering 12-bit ensured monotonicity and ± 0.08 -LSB typical DNL error, the DAC755x devices are great choices for precision control loops.

8.1.2.2 Loop Speed

Many factors determine the control-loop speed, such as ADC conversion time, MCU speed, and DAC settling time. Typically, the ADC conversion time, and the MCU computation time are the two major factors that dominate the time constant of the loop. DAC settling time is rarely a dominant factor because ADC conversion times usually exceed DAC conversion times. DAC offset, gain, and linearity errors can slow the loop down only during the startup. When the loop reaches the steady-state operation, these errors do not affect loop speed any further. Depending on the ringing characteristics of the loop-transfer function, DAC glitches can also slow the loop down. With a 1-MSPS (small-signal) maximum data-update rate, the DAC7551-Q1 device can support high-speed control loops. Ultralow glitch energy of the DAC7551-Q1 device significantly improves loop stability and loop settling time.

8.2 Typical Application

8.2.1 Generating Industrial Voltage Ranges

For control-loop applications, DAC gain and offset errors are not important parameters. This consideration could be exploited to lower trim and calibration costs in a high-voltage control-circuit design. Using a quad operational amplifier (OPA4130), and a voltage reference (REF3140), the DAC7551-Q1 can generate the wide voltage swings required by the control loop.

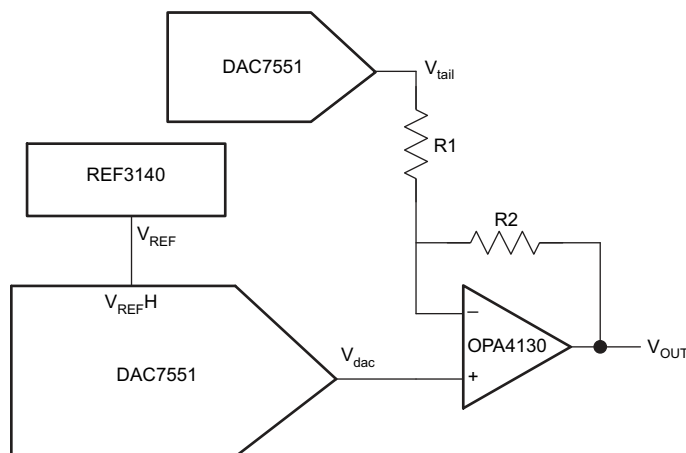

Figure 28. Low-cost, Wide-swing Voltage Generator for Control-Loop Applications

8.2.1.1 Design Requirements

For ± 5 -V operation:

$$R1 = 10 \text{ k}\Omega$$

$$R2 = 15 \text{ k}\Omega$$

$$V_{tail} = 3.33 \text{ V}$$

$$V_{REF} = 4.096 \text{ V}$$

For ± 10 -V operation:

$$R1 = 10 \text{ k}\Omega$$

$$R2 = 39 \text{ k}\Omega$$

$$V_{tail} = 2.56 \text{ V}$$

$$V_{REF} = 4.096 \text{ V}$$

For ± 12 -V operation:

$$R1 = 10 \text{ k}\Omega$$

$$R2 = 49 \text{ k}\Omega$$

$$V_{tail} = 2.45 \text{ V}$$

$$V_{REF} = 4.096 \text{ V}$$

8.2.1.2 Detailed Design Procedure

Use Equation 2 to calculate the output voltage of the configuration.

$$V_{OUT} = V_{REF} \left(\frac{R2}{R1} + 1 \right) \frac{SDIN}{4096} - V_{tail} \left(\frac{R2}{R1} \right) \quad (2)$$

Fixed $R1$ and $R2$ resistors can be used to coarsely set the gain required in the first term of the equation. When $R2$ and $R1$ set the gain to include some minimal over-range gain, a single DAC7551-Q1 device can be used to set the required offset voltages. Residual errors are not an issue for loop accuracy because offset and gain errors can be tolerated. One DAC7551-Q1 device can provide the V_{tail} voltages, while four additional DAC7551-Q1 devices can provide the V_{dac} voltages to generate four high-voltage outputs. A single SPI is sufficient to control all five DAC7551-Q1 devices in a daisy-chain configuration.

Typical Application (continued)

9 Power Supply Recommendations

The power applied to the V_{DD} pin should be well regulated and low noise. Switching power supplies and DC-DC converters often have high frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high-frequency spikes as the internal logic switches states. This noise can easily couple into the DAC output voltage through various paths between power connections and analog output. As with the GND connection, the V_{DD} pin should be connected to a power-supply plane of trace that is separate from the connection for digital logic until they are connected at the power-entry point. In addition, the use of a 1- μ F and 10- μ F capacitor and a 0.1- μ F bypass capacitor is strongly recommended. In some situations, additional bypassing may be required, such as a 100- μ F electrolytic capacitor or even a Pi filter made up of inductors and capacitors. These bypassing methods are all designed to low-pass filter the supply and remove the high-frequency noise.

10 Layout

10.1 Layout Guidelines

A precision analog component requires careful layout, adequate bypassing, and clean, well-regulated power supplies. The DAC7551-Q1 device offers single-supply operation, and is often used in close proximity with digital logic, microcontrollers, microprocessors, digital signal processors, or a combination. The more digital logic present in the design and the higher the switching speed, the more difficult it is to prevent digital noise from appearing at the output. As a result of the single ground pin of the DAC7551-Q1 device, all return currents (including digital and analog return currents for the DAC) must flow through a single point. Ideally, the GND should be connected directly to an analog ground plane. This plane should be separate from the ground connection for the digital components until these components were connected at the power-entry point of the system.

10.2 Layout Example

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DAC7551TDRNRQ1	ACTIVE	USON	DRN	12	3000	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 105	RAN	Samples
DAC7551ZTDRNRQ1	ACTIVE	USON	DRN	12	3000	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 105	SJT	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. SON (Small Outline No-Lead) package configuration.
 -  The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
 - E. Package complies to JEDEC MO-229.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, Quad Flatpack No-Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

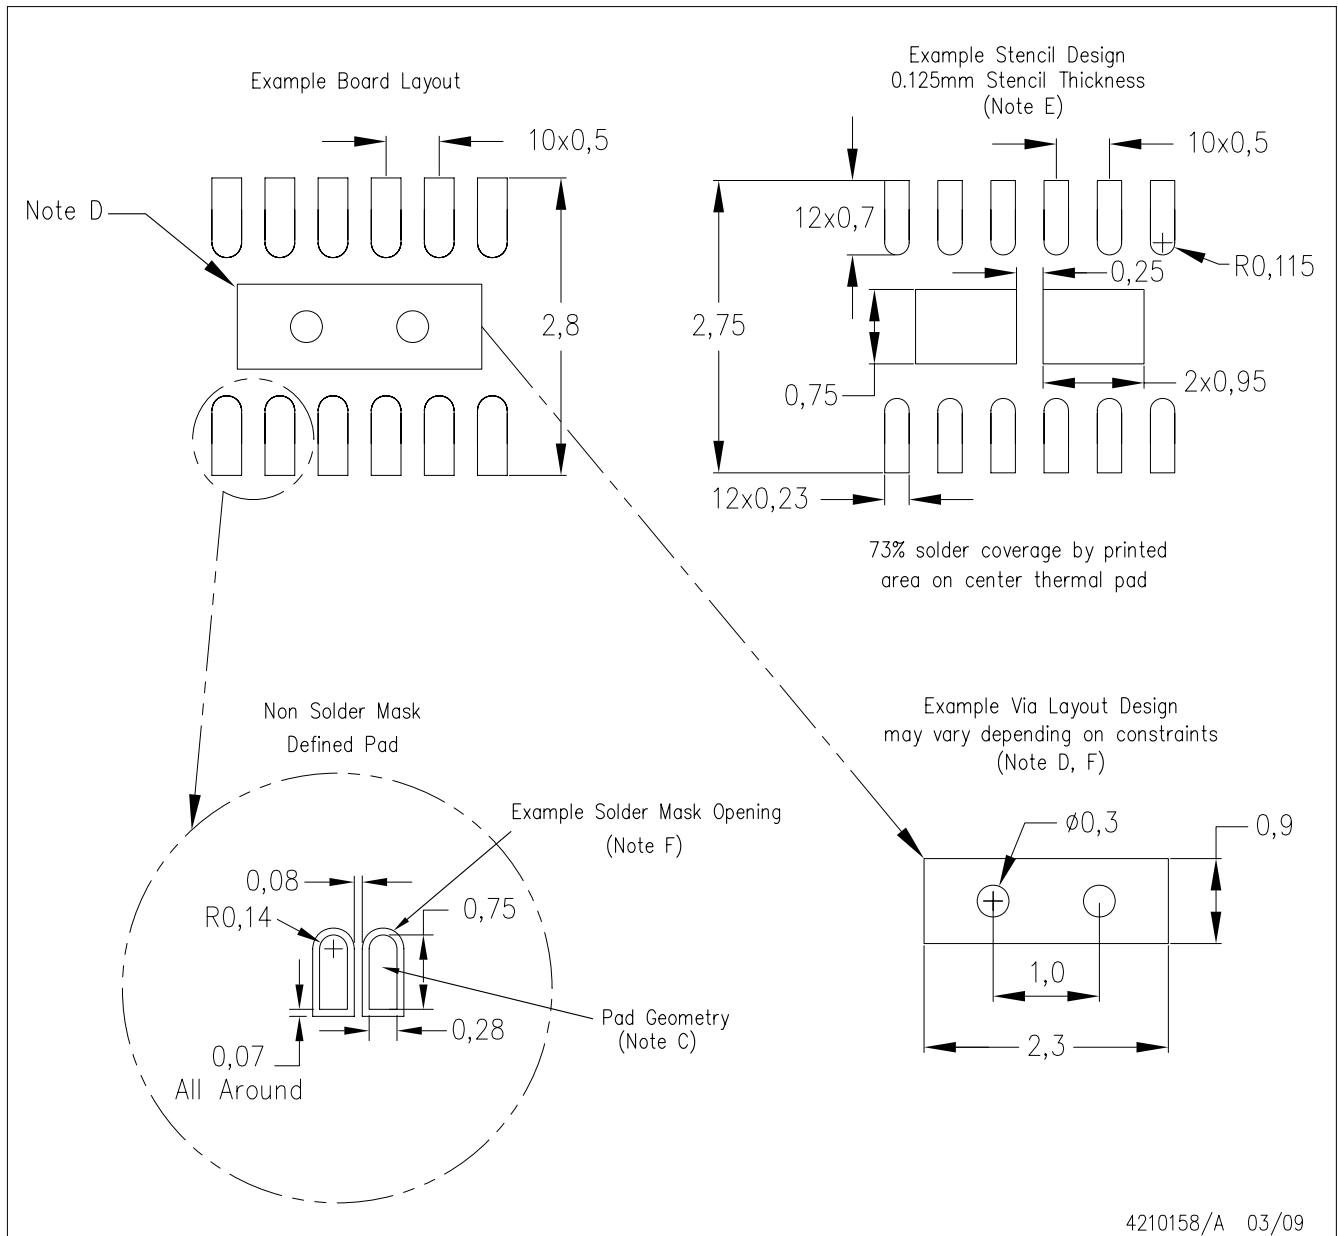

Bottom View

NOTE: All linear dimensions are in millimeters

Exposed Thermal Pad Dimensions

DRN (R-PUSON-N12)

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - F. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
