

User's Guide

BQ25170EVM Evaluation Module

Bill Johns

ABSTRACT

This user's guide describes the characteristics, operation, and use of the BQ25170EVM evaluation module (EVM). This EVM is designed to help the user evaluate and test the various operating modes of the BQ25170. This user's guide includes setup instructions for the hardware and software, a schematic diagram, a bill of materials (BOM), and PCB layout drawings for the evaluation module.

Throughout this user's guide, the abbreviations *EVM*, *BQ25170EVM*, *BMS033*, and the term *evaluation module* are synonymous with the BMS033 evaluation module, unless otherwise noted.

WARNING

Hot surface! Contact may cause burns. Do not touch!

Some components may reach high temperatures >55°C when the board is powered on. The user must not touch the board at any point during operation or immediately after operating, as high temperatures may be present.

1 Introduction

The Texas Instruments BQ25170EVM is a Li-Ion, Li-Poly and LiFePO₄ chemistry battery charger IC for single cell. Charging voltage can be adjusted using external resistors on VSET. Charging current can be set from 60mA to 600mA with external resistor on ISET.

1.1 Printed Circuit Board Assembly

The BQ25170EVM PCB contains the BQ25170 IC, LDO TPS7B8133 and support circuits. This board contains several jumpers and connectors. S1 (VSET) allows selected output voltages to be programmed. R9 resistor allows a wide range of adjustment of VSET. R22 can be used to change ISET value, fast charge current. R19 can be used to adjust TS, battery temp sensor to simulate hot and cold fault.

1.2 I/O Descriptions

Table 1-1 lists the input and output connections available on this EVM and their respective descriptions.

Table 1-1. EVM I/O Connections

I/O Connector	Description
J1 – VIN / GND	Input voltage from external power supply, recommended 5V. Max operating input voltage is 6.6V, OVP trip point. Max input voltage is 30V while in OVP.
J2 – OUT (BAT+) / GND (BAT-) / GND / TS	Battery connection, TS should be 10k NTC but not needed.
JP1 – VSET ADJ.	Disable R9, default is installed.
JP2 – REG / IN / OUT	Source voltage for housekeeping regulator, U2. Default Input voltage IN.
JP3 – PG (Power Good) LED	Default setting is ON.
JP4 – ISET	Sets Fast Charge Current. Fixed=400mA ADJ= R22 range 60mA to 600mA
JP5 - STAT LED	Default setting is ON.
JP6 – TS	NTC temp sensor. Fixed=10k (safe) ADJ=R19 range from 0 to 50k ohms. Default Fixed.
JP7	Not used, do not install
JP8	Not used, do not install
JP9	Not used, do not install

Table 1-2 lists the S1 switch positions for VSET and their respective descriptions. Use only one position ON, do not combine.

Table 1-2. VSET S1 Switch Positions

Position / RX / Value	Li+Voltage / Configuration
#1 / R1 / 100k ohm	3.5V / 1-Cell LiFePO ₄
#2 / R2 / 82k ohm	3.6V / 1-Cell LiFePO ₄
#3 / R3 / 62k ohm	3.7V / 1-Cell LiFePO ₄
#4 / R4 / 36k ohm	4.1V / 1-Cell Li-Ion
#5 / R5 / 27k ohm	4.2V / 1-Cell Li-Ion
#6 / R6 / 24k ohm	4.35V / 1-Cell Li-Ion
#7 / R7 / 18k ohm	4.4V / 1-Cell Li-Ion
#8 / R8 / 0 ohm	Short Circuit – No Charge

2 Test Summary

This section describes the jumpers and connectors on the EVM as well as how to properly connect, setup, and use the BQ25170EVM. Note that the default jumper setting of headers and switches are marked with two dots to indicate the shorting jumper position. This will put the unit into a single cell Li-Ion configuration, 4.2V at 400mA.

2.1 Equipment

This section includes a list of supplies required to perform tests on this EVM.

1. Battery simulator such as Keithley 2400 or equivalent. Or a single-cell battery.
2. Power supply, 5V 1A input. Note that unit can operate up to 6.6V input.
3. Voltage meter and current meter.

2.2 Cautions

To prevent possible damage to battery under test verify that charging conditions of the cell are not exceeded. Check max charge voltage and current.

Power dissipation of the device can be exceeded with too high an input to output voltage drop and current. Thermal regulation begins reducing current at 125 °C, at 150 °C device will shut off.

Device can get hot during high input-to-output voltage drop and high current conditions. Use caution when handling the board.

2.3 Test Instructions

In order for this EVM to operate properly, the following components must be connected and properly configured.

1. Set input power supply to 5V and Battery Simulator to 3.6V with compliance to support 800mA. Turn off Supply and Battery Simulator.
2. Connect input voltages to J1 and Battery Simulator to J2 on the EVM.
3. Configure all EVM jumpers to factory setting, refer to table below.
4. Turn on all supplies and loads
 - a. 5V Input supply current limit should be greater than 500mA
 - b. Out voltage should be 3.6V and charge current 400mA
 - c. LED D1 and D2 will be ON
5. Simulate battery completing charge by increasing Battery Simulator voltage to 4.2V
 - a. Current will decrease to 0mA
 - b. LED D2 will switch to OFF.

Table 2-1. Jumper Factory Setting

I/O Connector	Factory Setting
JP1	Installed
JP2	IN
JP3	Installed
JP4	Fixed
JP5	Installed
JP6	Fixed
JP7	N/A
JP8	N/A
JP9	N/A
S1	Position 3 (4.2 V Li-Ion)
S2	N/A

Note: IN, ON, Fixed are positions of a 3 pin header. If it is a 2 pin header then it is installed or not installed.

3 Board Layout, Schematic, and Bill of Materials

3.1 Board Layout

The board layout is shown in [Figure 3-1](#) to [Figure 3-6](#).
