Note 2: Definition of optical measurement system

The optical characteristics should be measured in a dark room with ambient temperature T_{a} =+25°C. The optical properties are measured at the center point of the LCD screen after 5 minutes operation. (Equipment: Photo detector TOPCON BM-7 Field of view: 1°/Height: 500mm.)

Note 3: Definition of response time

The response time is defined as the LCD optical switching time interval between "White" state and "Black" state. Rise time (T_{on}) is the time between photo detector output intensity changed from 90% to 10%, and fall time (T_{off}) is the time between photo detector output intensity changed from 10% to 90%.

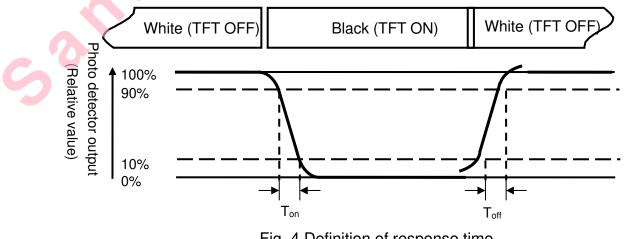

Fig. 4 Definition of response time

Note 4: Definition of contrast ratio

 $Contrast ratio (CR) = \frac{Luminance measured when LCD on the "White" state}{Luminance measured when LCD on the "Black" state}$

Note 5: Definition of luminance

Measured at the center area of the panel when LCD panel is driven at "white" state.

Note 6: Definition of color chromaticity (CIE1931)

Color coordinates measured at the center point of LCD when panel is driven at "White", "Red", "Green" and "Blue" state respectively.

Note 7: Definition of luminance uniformity

To test for uniformity, the tested area is divided into 3 rows and 3 columns. The measurement spot is placed at the center of each circle as below.

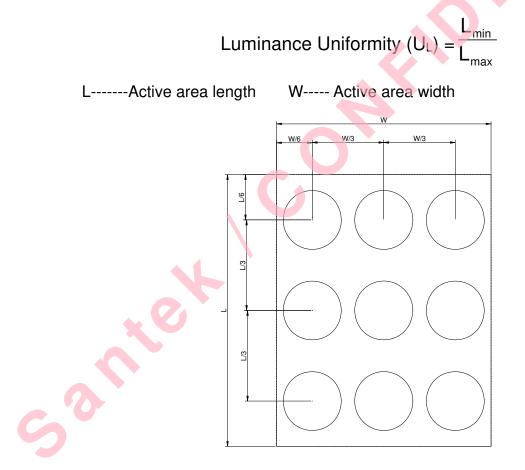

Fig. 5 Definition of luminance uniformity

 L_{min} : The measured minimum luminance of all measurement position.

 L_{max} : The measured maximum luminance of all measurement position.
