ARTESYN DS2000SPE SERIES

2000 Watts Distributed Power System

Advanced Energy's Artesyn DS2000SPE is an ultra-high denstiy power supply providing 50W per cubic inch. The 2000 watt DS2000SPE power supply is housed in 1U high rack-mounting enclosures measuring just 3.4 x 7.7 inches (86.3 x 196.5 mm). This form factor is significantly shorter than that of similarly rated earlier-generation power supplies — freeing up valuable system space — and is achieved by use of the latest power switching technology and high density component packaging techniques.

CONTROL AND STATUS SIGNALS

Input Signals			
PSON_L			
Active LOW signal which enables/disables the main output. Pulling this signal LOW will turn-on the main output.			
		MIN	MAX
V_{IL}	Input logic level LOW		0.8 V
V_{IH}	Input logic level HIGH	2.0 V	3.6 V
I_{SOURCE}	Current that may be sourced by this pin		1.0 mA
I_{SINK}	Current that may be sunk by this pin at low state		4.0 mA
PSKILL_H			
First break/last mate active HIGH signal which enables/disables the main output.			
		MIN	MAX
V_{IL}	Input logic level LOW. This allows for the power supply to be turned on		0.8 V
V_{IH}	Input logic level HIGH. Immediately shuts down the power supply	2.0 V	3.6 V
I_{SOURCE}	Current that may be sourced by this pin		
I_{SINK}	Current that may be sunk by this pin at low state		4.0 mA
VSENSE+, VSENSE-			
VSENSE+ and VSENSE- lines are the remote sense lines for regulation. Each line will compensate for a maximum of 100 mV.			
Output Signals			
ACOK			
Signal used to indicate the presence of AC input to the power supply. A logic level HIGH will indicate that the AC input to the power supply is within the operating range while a logic level LOW will indicate that AC has been lost			
		MIN	MAX
V_{OL}	Output logic level LOW		0.4 V
V_{OH}	Output logic level HIGH	2.4 V	3.6 V
I_{SOURCE}	Current that may be sourced by this pin		2.0 mA
I_{SINK}	Current that may be sunk by this pin at low state		4.0 mA
PWR_GOOD / PWOK			
Signal used to indicate that main output voltage is within regulation range. The PWR_GOOD signal will be driven HIGH when the output voltage is valid and will be driven LOW when the output falls below the under-voltage threshold. This signal also gives an advance warning when there is an impending power loss due to loss of AC input or system shutdown request. More details in the Timing Section.			
		MIN	MAX
V_{OL}	Output logic level LOW		0.4 V
V_{OH}	Output logic level HIGH	2.4 V	3.6 V
I_{SOURCE}	Current that may be sourced by this pin		2.0 mA
I_{SINK}	Current that may be sunk by this pin at low state		4.0 mA

CONTROL AND STATUS SIGNALS (CONTINUED)

Output Signals			
PS_PRESENT			
Signal used to indicate to the system that a power supply is inserted in the power bay. This pin is connected to the standby return in the power supply.			
PS_INTERRUPT			
Active low signal used by the power supply to indicate to the system that a change in power supply status has occurred. This event can be triggered by faults such as OVP, OCP, OTP, and fan fault. This signal can be cleared by a CLEAR_FAULT command.			
		MIN	MAX
V_{OL}	Output logic level LOW		0.8 V
V_{OH}	Output logic level HIGH	2.0 V	3.6 V
