

NCV4274C

Regulator, 400 mA, Low Dropout Voltage

Description

The NCV4274C is a precision micro-power voltage regulator with an output current capability of 400 mA available in the DPAK, D2PAK and SOT-223 packages.

The output voltage is accurate within $\pm 2.0\%$ with a maximum dropout voltage of 0.5 V with an input up to 40 V. Low quiescent current is a feature drawing only 125 μA with a 1 mA load. This part is ideal for automotive and all battery operated microprocessor equipment.

The regulator is protected against reverse battery, short circuit, and thermal overload conditions. The device can withstand load dump transients making it suitable for use in automotive environments.

Features

- 3.3 V, 5.0 V, $\pm 2.0\%$ Output Options
- Low 125 μA Quiescent Current at 1 mA load current
- 400 mA Output Current Capability
- Fault Protection
- +60 V Peak Transient Voltage with Respect to GND
 - -42 V Reverse Voltage
 - Short Circuit
 - Thermal Overload
- Very Low Dropout Voltage
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These are Pb-Free Devices

ORDERING INFORMATION

See detailed ordering and shipping information on page 12 of this data sheet.

NCV4274C

Figure 1. Block Diagram

Pin Definitions and Functions

Pin No.	Symbol	Function
1	I	Input; Bypass directly at the IC with a ceramic capacitor to GND.
2,4	GND	Ground
3	Q	Output; Bypass with a capacitor to GND.

ABSOLUTE MAXIMUM RATINGS

Pin Symbol, Parameter	Symbol	Condition	Min	Max	Unit
I, Input-to-Regulator	Voltage	V_I	-42	45	V
	Current	I_I	Internally Limited	Internally Limited	
I, Input peak Transient Voltage to Regulator with Respect to GND (Note 1)	V_I			60	V
Q, Regulated Output	Voltage	$V_Q = V_I$	-1.0	40	V
	Current	I_Q	Internally Limited	Internally Limited	
GND, Ground Current	I_{GND}		-	100	mA
Junction Temperature	T_J		-40	150	°C
Storage Temperature	T_{Stg}		-50	150	°C
ESD Capability, Human Body Model (Note 2)	ESD_{HB}		4		kV
ESD Capability, Machine Model (Note 2)	ESD_{MM}		200		V
ESD Capability, Charged Device Model (Note 2)	ESD_{CDM}		1		kV

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Load Dump Test B (with centralized load dump suppression) according to ISO16750-2 standard. Guaranteed by design. Not tested in production. Passed Class C.
- This device series incorporates ESD protection and is tested by the following methods:
 ESD HBM tested per AEC-Q100-002 (EIA/JESD22-A114)
 ESD MM tested per AEC-Q100-003 (EIA/JESD22-A115)
 Field Induced Charge Device Model ESD characterization is not performed on plastic molded packages with body sizes $<50\text{mm}^2$ due to the inability of a small package body to acquire and retain enough charge to meet the minimum CDM discharge current waveform characteristic defined in JEDEC JS-002-2014.

NCV4274C

OPERATING RANGE

Parameter	Symbol	Condition	Min	Max	Unit
Input Voltage (5.0 V Version)	V_I		5.5	40	V
Input Voltage (3.3 V Version)	V_I		4.5	40	V
Junction Temperature	T_J		-40	150	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

THERMAL RESISTANCE

Parameter		Symbol	Condition	Min	Max	Unit
Junction-to-Ambient	DPAK	R_{thja}		-	72.5 (Note 3)	°C/W
Junction-to-Ambient	D2PAK	R_{thja}		-	56.7 (Note 3)	°C/W
Junction-to-Case	DPAK	R_{thjc}		-	5.8	°C/W
Junction-to-Case	D2PAK	R_{thjc}		-	5.8	°C/W
Junction-to-Tab	SOT-223	Ψ_{-JLX} , Ψ_{LX}		-	15.6 (Note 3)	°C/W
Junction-to-Ambient	SOT-223	$R_{\theta JA}$, θ_{JA}		-	87 (Note 3)	°C/W

3. 1 oz copper, 300 mm² copper area, single-sided FR4 PCB.

MOISTURE SENSITIVITY LEVEL (Note 4)

Parameter	Symbol	Condition	Min	Max	Unit
Moisture Sensitivity Level	MSL	DPAK and D2PAK SOT-223	1 3	- -	

4. For more information, please refer to our Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

APPLICATION DESCRIPTION

Output Regulator

The output is controlled by a precision trimmed reference and error amplifier. The PNP output has saturation control for regulation while the input voltage is low, preventing over saturation. Current limit and voltage monitors complement the regulator design to give safe operating signals to the processor and control circuits.

Stability Considerations

The input capacitor C_{I1} in Figure 2 is necessary for compensating input line reactance. Possible oscillations caused by input inductance and input capacitance can be damped by using a resistor of approximately 1 Ω in series with C_{I2}.

The output or compensation capacitor helps determine three main characteristics of a linear regulator: startup delay, load transient response and loop stability.

The capacitor value and type should be based on cost, availability, size and temperature constraints. The aluminum electrolytic capacitor is the least expensive solution, but, if the circuit operates at low temperatures (–25°C to –40°C), both the value and ESR of the capacitor will vary considerably. The capacitor manufacturer’s data sheet usually provides this information.

The value for the output capacitor C_O shown in Figure 2 should work for most applications; however, it is not necessarily the optimized solution. Actual Stability Regions are shown in a graphs in the Typical Performance Characteristics section.

Calculating Power Dissipation in a Single Output Linear Regulator

The maximum power dissipation for a single output regulator (Figure 3) is:

$$P_{D(max)} = [V_{I(max)} - V_{Q(min)}]I_{Q(max)} + V_{I(max)}I_q \quad (\text{eq. 1})$$

Where:

- V_{I(max)} is the maximum input voltage,
- V_{Q(min)} is the minimum output voltage,
- I_{Q(max)} is the maximum output current for the application, and
- I_q is the quiescent current the regulator consumes at I_{Q(max)}.

Once the value of P_{D(max)} is known, the maximum permissible value of R_{θJA} can be calculated:

$$R_{\theta JA} = \frac{(150\text{ C} - T_A)}{P_D} \quad (\text{eq. 2})$$

The value of R_{θJA} can then be compared with those in the package section of the data sheet. Those packages with R_{θJA}’s less than the calculated value in Equation 2 will keep the die temperature below 150°C. In some cases, none of the packages will be sufficient to dissipate the heat generated by the IC, and an external heat sink will be required. The current flow and voltages are shown in the Measurement Circuit Diagram.

Heat Sinks

A heat sink effectively increases the surface area of the package to improve the flow of heat away from the IC and into the surrounding air.

Each material in the heat flow path between the IC and the outside environment will have a thermal resistance. Like series electrical resistances, these resistances are summed to determine the value of R_{θJA}:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CS} + R_{\theta SA} \quad (\text{eq. 3})$$

Where:

- R_{θJC} = the junction–to–case thermal resistance,
- R_{θCS} = the case–to–heat sink thermal resistance, and
- R_{θSA} = the heat sink–to–ambient thermal resistance.

R_{θJC} appears in the package section of the data sheet. Like R_{θJA}, it too is a function of package type. R_{θCS} and R_{θSA} are functions of the package type, heat sink and the interface between them. These values appear in data sheets of heat sink manufacturers.

Thermal, mounting, and heat sinking are discussed in the ON Semiconductor application note AN1040/D, available on the [ON Semiconductor Website](http://www.onsemi.com).
