LTM4601EV

DESCRIPTION

Demonstration circuit 1118A-C features the LTM[®]4601EV, the high efficiency, high density switch mode step-down power modules. The input voltage range is from 5V to 20V. There are three output rails: 3.3V, 2.5V and 1.8V, refer to step down ratio curve in the LTM4601 datasheet. The rated load currents are 3.3V @ 10A, 2.5V @ 12A, 1.8V @ 12A and 1.5V @ 12A, while derating is necessary for certain V_{IN} and thermal conditions. The outputs of U2, 2.5V_{out}, U3, 1.8V_{out} and U4, 1.5V_{out} are set to coincidentally track with 3.3V output. The DC1118A-C has onboard 90 degree interleaving clock generator LTC6902 at 750 KHz. Margining function

is provided for the user who wants to stress their system by varying supply voltages during testing; refer to datasheet for functional diagram.

Integrated input and output filters enable a simple PCB layout. Only bulk input and output capacitors are needed.

Design files for this circuit board are available. Call the LTC Factory.

TEST PROCEDURE

Demonstration circuit 1118A-C is easy to set up to evaluate the performance of the LTM4601EV. Please refer to Figure 1 for proper measurement equipment setup and follow the procedure below:

- Place jumpers in the following positions for a typical application:

RUN	U1 & U2 MAR0	U1 & U2 MAR1	U3 ~ U4	U3 ~ U4
-----	-----------------	-----------------	------------	------------

			MAR0	MAR1
ON	LO	LO	LO	LO

- With power off, connect the input power supply, load, and meters as shown in Figure 1. Preset the load to 0A and V_{IN} supply to be less than 20V.
- Turn on the power at the input. The output voltage of U1 should be $3.3V \pm 2\%$, the output voltage of U2 should be $2.5V \pm 2\%$, the output voltage of U3 should be $1.8V \pm 2\%$ and the output voltage of U4 should be $1.5V \pm 2\%$.

QUICK START GUIDE FOR DEMONSTRATION CIRCUIT 1118A-C POLYPHASE HIGH DENSITY POWER MODULE

- Once the proper output voltage is established, adjust the load within the operating range and observe the output voltage regulation, ripple voltage, efficiency and other parameters. When measuring the input or output voltage ripple, care must be taken to avoid a long ground lead on the oscilloscope probe. Measure the input or output voltage ripple by touching the probe tip directly across the Vin or Vout capacitors. See Figure 2 for proper scope probe technique
- For tracking function test, shut down the power supply, discharge the output capacitors until outputs read 0V. Use single trigger of the oscil-

loscope to capture the input waveform and output voltage waveforms of U1, U2 and U3.

- For Margining function test, place jumper MAR0 and MAR1 in the configurations shown in the following table, measure the output voltage at Vo+ and Vo-.

MAR1	MAR0	Vout
LO	LO	0
LO	HI	+5%
HI	LO	-5%
HI	HI	0
