

## C-MOS STEP-UP SWITCHING REGULATOR

### ■ GENERAL DESCRIPTION

The **NJU7261 series** is a C-MOS step-up switching regulator which contains accurate voltage reference, error amplifier, CR oscillator, control circuit, switching transistor, diode and resistor.

The stand-by function is effective for low power consumption.

The regulation voltage is fixed by internal circuits and the following line-up of different output voltages version are available.

This series is suitable for portable equipment's or battery operated items because of its small packaged outline, low operating voltage and current.

Note1) When a coil used. This IC of V<sub>CONT</sub> possible over the absolute maximum ratings. Consequently please conduct enough to test.

Note2) The CONT input voltage (V<sub>CONT</sub>) should be inspected at the real application circuit, as some kinds of coils make the CONT input voltage exceed the Absolute Maximum Rating of the V<sub>CONT</sub>.
