TYPICAL APPLICATION CIRCUIT

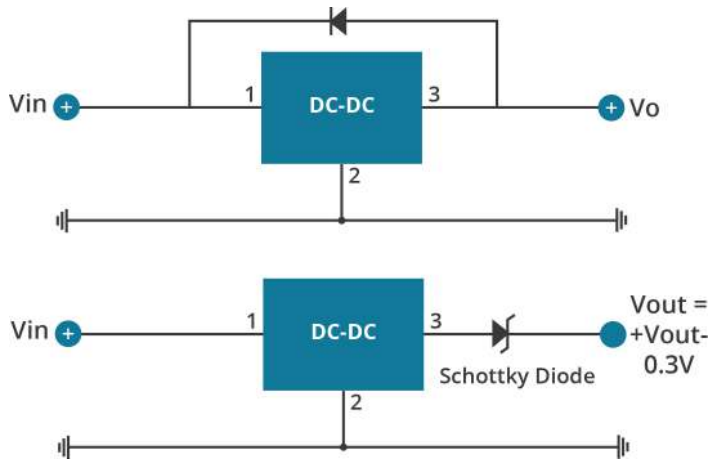

1. The regulator proposed to establish the input voltage by soft-start, no plug and play, if the input voltage changes from low voltage to high voltage abruptly, the regulator might be damaged.
2. If the applications is high-voltage input, the regulator must add an external capacitor $C1 (\leq 47\mu F/100V)$ to prevent voltage spikes caused by damage to the module.
3. No parallel connection.

APPLICATION EXAMPLE

1. The input current amount of the back-grade regulator and the pre-class load should be less than or equal the max load current of the pre-class regulator.
2. If further filtering is required, please add components as per the above circuit (We recommend not to add components), if request, please make sure the capacitors $C1 \leq 47\mu F, C2 \leq 10\mu F$ more close to the back-grade regulator.
