

MIC5323

High PSRR Low Noise 300mA μ Cap
Ultra-Low Dropout LDO Regulator

General Description

The MIC5323 is a high-performance, 300mA LDO regulator, offering extremely high PSRR and very low noise while consuming low ground current.

Ideal for battery operated applications, the MIC5323 features 2% accuracy, extremely low dropout voltage (120mV @ 300mA), and low ground current at light load (typically 90 μ A). When disabled, the MIC5323 typically consumes less than 1 μ A.

The MIC5323 is a μ Cap design operating with small ceramic output capacitors for stability, thereby reducing required board space and component cost.

The MIC5323 is available in fixed output voltages and adjustable output voltages in the super compact 6-pin 2mm \times 2mm Thin MLF[®] and thin SOT-23-5 package. Additional voltage options are available. Contact Micrel marketing.

Data sheets and support documentation can be found on Micrel's web site at www.micrel.com.

Features

- Ultra low dropout voltage of 120mV @ 300mA
- Input voltage range: 2.65 to 5.5V
- Stable with ceramic output capacitor
- 300mA guaranteed output current
- Low output noise — 20 μ Vrms
- High PSRR, up to 80dB @1kHz
- Less than 30 μ s turn-on time with $C_{BYP} = 0.1\mu$ F
- High output accuracy: $\pm 2.0\%$ over temperature
- Thermal shutdown protection
- Current limit protection
- 6-pin 2mm \times 2mm Thin MLF[®] package
- Thin SOT-23-5 package

Applications

- Cellular phones
- Notebook and Tablet Computers
- Fiber optic modules
- Portable electronics
- Instrumentation Systems
- Audio Codec power supplies

Typical Application

Power Supply Rejection Ratio
($C_{BYP} = 0.1\mu$ F)

Enable Input Voltage	Logic Low			0.2	V
	Logic High	1.2			V
Enable Input Current	$V_{IL} \leq 0.2V$		0.01	1	μA
	$V_{IH} \geq 1.2V$		0.01	1	μA

Notes:

- Exceeding the absolute maximum rating may damage the device.
- The device is not guaranteed to function outside its operating rating.
- The maximum allowable power dissipation of any T_A (ambient temperature) is $P_{D(max)} = (T_{J(max)} - T_A) / \theta_{JA}$. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown.
- Devices are ESD sensitive. Handling precautions recommended. Human body model, 1.5k Ω in series with 100pF.
- Specification for packaged product only.
- Regulation is measured at constant junction temperature using low duty cycle pulse testing, changes in output voltage due to heating effects are covered by the thermal regulation specification.
- Ground pin current is the regulator quiescent current. The total current drawn from the supply is the sum of the load current plus the ground pin current.

Application Information

Enable/Shutdown

The MIC5323 comes with an active high enable pin that allows the regulator to be disabled. Forcing the enable pin low disables the regulator and sends it into a “zero” off mode current state. In this state, current consumed by the regulator goes nearly to zero. Forcing the enable pin high enables the output voltage. The active high enable pin uses CMOS technology, and the enable pin cannot be left floating; a floating enable pin may cause an indeterminate state on the output.

Input Capacitor

The MIC5323 is a high performance, high bandwidth device. Therefore, it requires a well-bypassed input supply for optimal performance. A 2.2μF capacitor is required from the input-to-ground to provide stability. Low ESR ceramic capacitors provide optimal performance using a minimum amount of space. Additional high frequency capacitors, such as small valued NPO dielectric type capacitors, help filter out high-frequency noise, and are a good practice in any RF based circuit.

Output Capacitor

The MIC5323 requires an output capacitor of 2.2μF or greater to maintain stability. The design is optimized for use with low ESR ceramic chip capacitors. High ESR capacitors may cause high frequency oscillation. The output capacitor can be increased, but performance has been optimized for a 2.2μF ceramic output capacitor, and it does not improve significantly with larger capacitance.

X7R/X5R dielectric type ceramic capacitors are recommended because of their temperature performance. X7R type capacitors change capacitance by 15% over their operating temperature range, making them the most stable type of ceramic capacitors. Z5U and Y5V dielectric capacitors change value by as much as 50% and 60%, respectively, over their operating temperature ranges. To use a ceramic chip capacitor with Y5V dielectric, the value must be much higher than an X7R ceramic capacitor to ensure the same minimum capacitance over the equivalent operating temperature range.

Bypass Capacitor

A capacitor can be placed from the noise bypass pin to ground to reduce output voltage noise. The capacitor bypasses the internal reference. A 0.1μF capacitor is recommended for applications that require low noise outputs. The bypass capacitor can be increased, further reducing noise and improving PSRR. Turn-on time increases slightly with respect to bypass capacitance. A unique, quick-start circuit allows the MIC5323 to drive a large capacitor on the bypass pin without significantly

slowing turn on time. Refer to the Typical Characteristics section for performance with different bypass capacitors.

No Load Stability

Unlike many other voltage regulators, the MIC5323 will remain stable and in regulation with no load. This is especially important in CMOS RAM keep alive applications.

Adjustable Regulator Application

Adjustable regulators use the ratio of two resistors to multiply the reference voltage to produce the desired output voltage. The MIC5323 can be adjusted from 1.25V to 5.5V by using two external resistors (Figure 1). The resistors set the output voltage based on the following equation:

$$V_{OUT} = V_{REF} \cdot \left(1 + \frac{R1}{R2} \right)$$

$$V_{REF} = 1.25V$$

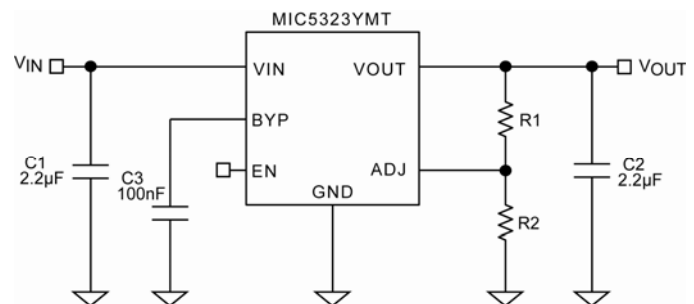

Figure 1. Adjustable Voltage Application

Thermal Considerations

The MIC5323 is designed to provide 300mA of continuous current in a very small package. Maximum ambient operating temperature can be calculated based on the output current and the voltage drop across the part. Given that the input voltage is 3.3V, the output voltage is 2.8V and the output current = 300mA.

The actual power dissipation of the regulator circuit can be determined using the equation:

$$P_D = (V_{IN} - V_{OUT}) I_{OUT} + V_{IN} I_{GND}$$

Because this device is CMOS and the ground current is typically <100μA over the load range, the power dissipation contributed by the ground current is < 1% and can be ignored for this calculation.

$$P_D = (3.3V - 2.8V) \times 300mA$$

$$P_D = 0.15W$$

To determine the maximum ambient operating temperature of the package, use the junction-to-ambient thermal resistance of the device and the following basic equation:

$$P_{D(max)} = \left(\frac{T_{J(max)} - T_A}{\theta_{JA}} \right)$$

Where $T_{J(max)}$ is the maximum junction temperature, 125°C, and θ_{JA} represents the junction-to-ambient

thermal resistance, 93°C/W.

Substituting P_D for $P_{D(max)}$ and solving for the ambient operating temperature will give the maximum operating conditions for the regulator circuit consuming P_D watts. The maximum power dissipation must not be exceeded for proper operation.

For example, when operating the MIC5323-2.8YMT at an input voltage of 3.3V and 300mA load with a minimum footprint layout, the maximum ambient can be solved for as follows:

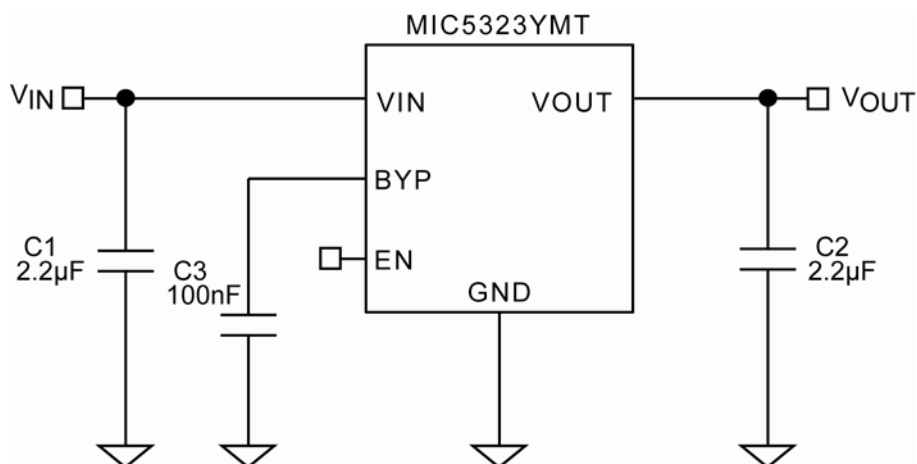

$$0.15W = \left(\frac{125^\circ C - T_A}{93^\circ C/W} \right)$$

$$T_A = 111^\circ C$$

Therefore, a 2.8V application at 300mA of output current can accept an ambient operating temperature of 111°C in a 6 pin 2mm x 2mm Thin MLF[®] package. For a full discussion of heat sinking and thermal effects on voltage regulators, refer to the "Regulator Thermals" section of *Micrel's Designing with Low-Dropout Voltage Regulators* handbook.
