

Ultra-Low Noise Microphone with Bottom Port and PDM Digital Output

GENERAL DESCRIPTION

The INMP521* is a high performance, ultra-low noise, low power, digital output, bottom-ported omnidirectional MEMS microphone. The INMP521 consists of a MEMS microphone element and an impedance converter amplifier followed by a fourth-order sigma-delta (Σ - Δ) modulator. The digital interface allows for the pulse density modulated (PDM) output of two microphones to be time-multiplexed on a single data line using a single clock. The INMP521 is function and pin compatible with the INMP421 microphone, providing an easy upgrade path.

The INMP521 has a very high signal-to-noise ratio (SNR) and common sensitivity of -26 dBFS, making it an excellent choice for far field applications. The INMP521 has an extended wide-band frequency response resulting in natural sound with high intelligibility. Low current consumption and a sleep mode with less than 1 μ A current consumption enables long battery life for portable applications. The INMP521 complies with the TIA-920 Tele-communications Telephone Terminal Equipment Transmission Requirements for Wideband Digital Wireline Telephones standard.

The INMP521 is available in a thin 4 mm \times 3 mm \times 1 mm surface-mount package. It is reflow solder compatible with no sensitivity degradation. The INMP521 is halide free.

**Protected by U.S. Patents 7,449,356; 7,825,484; 7,885,423; and 7,961,897. Other patents are pending.*

FUNCTIONAL BLOCK DIAGRAM

APPLICATIONS

- Smartphones and Feature Phones
- Microphone Arrays
- Tablet Computers
- Teleconferencing Systems
- Digital Still and Video Cameras
- Bluetooth Headsets
- Notebook PCs
- Security and Surveillance

FEATURES

- Small, Thin 4 \times 3 \times 1 mm Surface-Mount Package
- Omnidirectional Response
- Very High SNR of 65 dB
- Sensitivity of -26 dBFS
- Wide Frequency Response from 100 Hz to 16 kHz
- Low Current Consumption of 900 μ A
- Sleep Mode for Extended Battery Life, <1 μ A
- 120 dB Maximum SPL
- High PSR of -80 dBFS
- Fourth-Order Σ - Δ Modulator
- Digital PDM Output
- Sn/Pb and Pb-Free Solder Processes
- RoHS/WEEE Compliant

ABSOLUTE MAXIMUM RATINGS

Stress above those listed as Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to the absolute maximum ratings conditions for extended periods may affect device reliability.

TABLE 3. ABSOLUTE MAXIMUM RATINGS

PARAMETER	RATING
Supply Voltage (V_{DD})	-0.3 V to +3.63 V
Digital Pin Input Voltage	-0.3 V to $V_{DD} + 0.3$ V or 3.63 V, whichever is less
Sound Pressure Level	160 dB
Mechanical Shock	10,000 <i>g</i>
Vibration	Per MIL-STD-883 Method 2007, Test Condition B
Temperature Range	
Biased	-40°C to +85°C
Storage	-55°C to +150°C

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

SOLDERING PROFILE

Figure 2. Recommended Soldering Profile Limits

TABLE 4. RECOMMENDED SOLDERING PROFILE*

PROFILE FEATURE		Sn63/Pb37	Pb-Free
Average Ramp Rate (T_L to T_P)		1.25°C/sec max	1.25°C/sec max
Preheat	Minimum Temperature (T_{SMIN})	100°C	100°C
	Minimum Temperature (T_{SMIN})	150°C	200°C
	Time (T_{SMIN} to T_{SMAX}), t_s	60 sec to 75 sec	60 sec to 75 sec

THEORY OF OPERATION

PDM DATA FORMAT

The output from the DATA pin of the INMP521 is in PDM format. This data is the 1-bit output of a fourth-order Σ - Δ modulator. The data is encoded so that the left channel is clocked on the falling edge of CLK and the right channel is clocked on the rising edge of CLK.

After driving the DATA signal high or low in the appropriate half frame of the CLK signal, the DATA driver of the microphone is tristated. In this way, two microphones—one set to the left channel and the other to the right channel—can drive a single DATA line.

Figure 1 shows a timing diagram of the PDM data format; the DATA1 and DATA2 lines shown in Figure 1 are two halves of the single physical DATA signal. Figure 8 shows a diagram of the two stereo channels sharing a common DATA line.

Figure 8. Stereo PDM Format

If only one microphone is connected to the DATA signal, the output is clocked on a single edge only (See Figure 9.)

Figure 9. Mono PDM Format

For example, a left channel microphone is never clocked on the rising edge of CLK. In a single microphone application, each bit of the DATA signal is typically held for the full CLK period until the next transition of the CLK signal because the leakage of the DATA line is not sufficient to discharge the line while the driver is tristated.

The channel assignments are determined by the logic level on the L/R SELECT pin (see Table 6.)

TABLE 6. INMP521 CHANNEL SETTING

L/R SELECT Pin Setting	Channel
Low (tie to GND)	Right (DATA1)
High (tie to VDD)	Left (DATA2)

For PDM data, the density of the pulses indicates the signal amplitude. A high density of high pulses indicates a signal near positive full scale, and a high density of low pulses indicates a signal near negative full scale. A perfect zero (DC) audio signal is indicated by an alternating pattern of high and low pulses.

The output PDM data signal has a small DC offset of approximately 5% of full scale. A high-pass filter in the codec that is connected to the digital microphone typically removes this DC signal and does not affect the performance of the microphone.

PDM MICROPHONE SENSITIVITY

The sensitivity of a PDM output microphone is specified in units of dBFS (decibels relative to a full-scale digital output). A 0 dBFS sine wave is defined as a signal whose peak just touches the full-scale code of the digital word (see Figure 10). This measurement convention means that signals with a different crest factor may have an RMS level higher than 0dBFS. For example, a full-scale square wave has an RMS level of 3dBFS.

Figure 10. 1 kHz, 0 dBFS Sine Wave

The definition of a 0 dBFS signal must be understood when measuring the sensitivity of the INMP521. An acoustic input signal of a 1 kHz sine wave at 94 dB SPL applied to the INMP521 results in an output signal with a -26 dBFS level. This means that the output digital word peaks at -26 dB below the digital full-scale level. A common misunderstanding is that the output has an RMS level of -29 dBFS; however, this is not the case because of the definition of a 0 dBFS sine wave.

There is no commonly accepted unit of measurement to express the instantaneous level of a digital signal output from the microphone, as opposed to the RMS level of the signal. Some measurement systems express the instantaneous level of an individual sample in units of D, where 1.0 D is digital full scale (see Figure 10). In this case, a -26 dBFS sine wave has peaks at 0.05 D.

For more information about digital microphone sensitivity, see the AN-1112 Application Note, *Microphone Specifications Explained*.

CONNECTING PDM MICROPHONES

A PDM output microphone is typically connected to a codec with a dedicated PDM input. This codec separately decodes the left and right channels and filters the high sample rate modulated data back to the audio frequency band. The codec also generates the clock for the PDM microphones or is synchronous with the source that generates the clock.

Figure 11 and Figure 12 show mono and stereo connections between the INMP521 and a codec. The mono connection shows an INMP521 set to output data on the right channel. To output data on the left channel, tie the L/R SELECT pin to VDD instead of GND.

Figure 11. Mono PDM Microphone (Right Channel) Connection to Codec

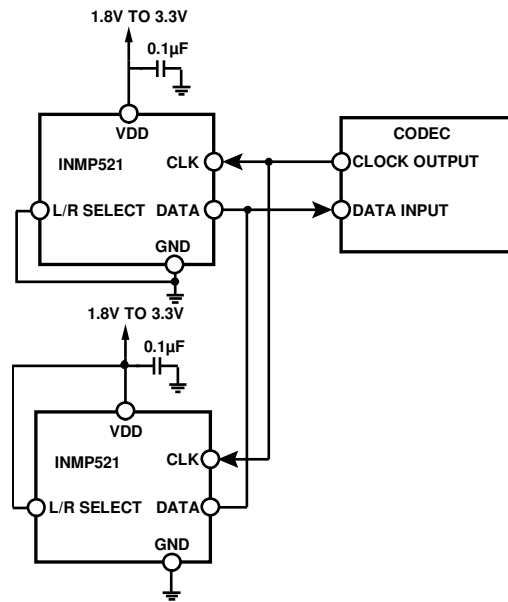

Figure 12. Stereo PDM Microphone Connection to Codec

Decouple the VDD pin of the INMP521 to GND with a 0.1 µF capacitor. Place this capacitor as close to VDD as the printed circuit board (PCB) layout allows.

Do not use a pull-up or pull-down resistor on the PDM data signal line because the resistor can pull the signal to an incorrect state during the period that the signal line is tristated.

The DATA signal does not need to be buffered in normal use when the INMP521 microphones are placed close to the codec on the PCB. If the INMP521 must drive the DATA signal over a long cable (>15 cm) or other large capacitive load, a digital buffer may be needed. Use a signal buffer on the DATA line only when one microphone is in use or after the point where two microphones are connected (see Figure 13.)

Figure 13. Buffered Connection Between Stereo INMP521 Devices and a Codec

The DATA output of each microphone in a stereo configuration cannot be individually buffered because the two buffer outputs cannot drive a single signal line. If a buffer is used, take care to select a buffer with low propagation delay so that the timing of the data connected to the codec is not corrupted.

When long wires are used to connect the codec to the INMP521, a 100 Ω source termination resistor can be used on the clock output of the codec instead of a buffer to minimize signal over-shoot or ringing. Depending on the drive capability of the codec clock output, a buffer may still be needed, as shown in Figure 13.

SLEEP MODE

The microphone enters sleep mode when the clock frequency falls below 1 kHz. In sleep mode, the microphone data output is in a high impedance state. The current consumption of the INMP521 in sleep mode is less than 1 μA at $V_{DD} = 1.8$ V.

The INMP521 enters sleep mode within 1 ms of the clock frequency falling below 1 kHz. The microphone wakes up from sleep mode 32,768 cycles after the clock becomes active. For a 2.4 MHz clock, the microphone begins to output data in 13.7 ms. The wake-up time, as specified in Table 2, indicates the time from when the clock is enabled to when the INMP521 is consuming its specified current.

START-UP TIME

The start-up time of the INMP521 from when the clock is active is the same as the wake-up time from sleep mode. The microphone starts up 32,768 cycles after the clock is active.

PCB DESIGN AND LAND PATTERN LAYOUT

Lay out the PCB land pattern for the INMP521 at a 1:1 ratio to the solder pads on the microphone package (see Dimensions shown in millimeters

Figure 14.) Take care to avoid applying solder paste to the sound hole in the PCB. Dimensions shown in millimeters Figure 15 shows a suggested solder paste stencil pattern layout.

The response of the INMP521 is not affected by the PCB hole size, as long as the hole is not smaller than the sound port of the microphone (0.25 mm, or 0.010 inch, in diameter). A 0.5 mm to 1 mm (0.020 inch to 0.040 inch) diameter for the hole is recommended.

Align the hole in the microphone package with the hole in the PCB. The exact degree of the alignment does not affect the performance of the microphone as long as the holes are not partially or completely blocked.

Dimensions shown in millimeters
Figure 14. Suggested PCB Land Pattern Layout

Dimensions shown in millimeters
Figure 15. Suggested Solder Paste Stencil Pattern Layout

ALTERNATIVE PCB LAND PATTERNS

The standard PCB land pattern of the INMP521 has a solid rectangle around the edge of the footprint (see Figure 14). In some board designs, this rectangle can make routing the microphone signals more difficult. The rectangle is used to improve the RF immunity performance of the INMP521; however, it is not necessary to have the full rectangle connected for electrical functionality. If a design can tolerate reduced RF immunity, this rectangle can either be broken or removed completely from the PCB footprint.

Figure 16 shows an example PCB land pattern with no enclosing rectangle around the edge of the part.

Figure 16. Example PCB Land Pattern with No Enclosing Rectangle

Figure 17 shows an example PCB land pattern with the rectangle broken on two sides so that the inner pads can be more easily routed on the PCB.

Figure 17. Example PCB Land Pattern with Broken Enclosing Rectangle

Note that in both of these patterns, the solid ring around the sound port is still present; this ring is needed to ground the microphone and for acoustic performance. The pad on the package connected to this ring is ground and still needs a solid electrical connection to the PCB ground.

If a land pattern similar to Figure 16 or Figure 17 is used on a PCB, make sure that the unconnected rectangle on the bottom of the INMP521 is not placed directly over any exposed copper. The ring on the microphone is still at ground, and any PCB traces routed beneath it must be properly masked to avoid short circuits.

PCB MATERIAL AND THICKNESS

The performance of the INMP521 is not affected by PCB thickness. The INMP521 can be mounted on either a rigid or flexible PCB. A flexible PCB with the microphone can be attached directly to the device housing with an adhesive layer. This mounting method offers a reliable seal around the sound port while providing the shortest acoustic path for good sound quality.

HANDLING INSTRUCTIONS

PICK AND PLACE EQUIPMENT

The MEMS microphone can be handled using standard pick-and-place and chip shooting equipment. Take care to avoid damage to the MEMS microphone structure as follows:

- Use a standard pickup tool to handle the microphone. Because the microphone hole is on the bottom of the package, the pickup tool can make contact with any part of the lid surface.
- Do not pick up the microphone with a vacuum tool that makes contact with the bottom side of the microphone. Do not pull air out of or blow air into the microphone port.
- Do not use excessive force to place the microphone on the PCB.

REFLOW SOLDER

For best results, the soldering profile must be in accordance with the recommendations of the manufacturer of the solder paste used to attach the MEMS microphone to the PCB. It is recommended that the solder reflow profile not exceed the limit conditions specified in Figure 2 and Table 4.

BOARD WASH

When washing the PCB, ensure that water does not make contact with the microphone port. Do not use blow-off procedures or ultrasonic cleaning.
