## 3.3V / 5V ECL Differential Receiver/Driver with Variable Output Swing and Internal Input Termination

The MC100EP16VT is a differential receiver functionally equivalent to the 100EP16 with input pins controlling the amplitude of the outputs (pin 1) and providing an internal termination network (pin 4).

The  $V_{CTRL}$  input pin controls the output amplitude of the EP16VT and is referenced to  $V_{CC}$ . (See Figure 4.) The operational range of the  $V_{CTRL}$  input is from  $\leq V_{BB}$  (a supply at  $V_{CC}-1.42$  V, maximum output amplitude) to  $V_{CC}$  (minimum output amplitude).  $V_{BB}$  is an externally supplied voltage equal to  $V_{CC}-1.42$  V (See Figures 2 and 3). A variable resistor between  $V_{CC}$  and  $V_{BB}$ , with the wiper driving  $V_{CTRL}$ , can control the output amplitude. Typical application circuits and a  $V_{CTRL}$  Voltage vs. Output Amplitude graph are described in this data sheet. When left open, the  $V_{CTRL}$  pin will be internally pulled down to  $V_{EE}$  and operate as a standard EP16, with 100% output amplitude.

The  $V_{TT}$  input pin offers an internal termination network for a 50 ohm line impedance environment, shown in Figure 1. For further reference, see Application Note AND8020, Termination of ECL Logic Devices. Input considerations are required for D and  $\bar{D}$  under no signal conditions to prevent instability.

Special considerations are required for differential inputs under No Signal conditions to prevent instability.

- 220 ps Propagation Delay
- Maximum Frequency > 4 GHz Typical (See Graph)
- The 100 Series Contains Temperature Compensation
- PECL Mode Operating Range:  $V_{CC} = 3.0$  V to 5.5 V with  $V_{EE} = 0$  V
- NECL Mode Operating Range:  $V_{CC} = 0$  V with  $V_{EE} = -3.0$  V to  $-5.5$  V
- Open Input Default State
- 50  $\Omega$  Internal Termination Resistor
