

ADC3421-Q1 Automotive, Quad-Channel, 12-Bit, 25-MSPS Analog-to-Digital Converter

1 Features

- AEC-Q100 Qualified for automotive applications
 - Temperature grade 1: -40°C to 125°C T_A
- Quad channel
- 12-Bit resolution
- Single supply: 1.8 V
- Serial LVDS interface
- Flexible input clock buffer with divide-by-1, -2, -4
- $\text{SNR} = 71.1$ dBFS, $\text{SFDR} = 90$ dBc at $f_{\text{IN}} = 10$ MHz
- Ultra-low power consumption:
 - 44 mW/Ch at 25 MSPS
- Channel isolation: 105 dB
- Internal dither and chopper
- Support for multichip synchronization

2 Applications

- Solid state LiDAR
- [Motor control feedback](#)
- Nondestructive testing
- [Radar and smart antenna arrays](#)
- Munitions guidance

3 Description

The ADC3421-Q1 is an automotive-grade, high-linearity, ultra-low power, quad-channel, 12-bit, 25-MSPS analog-to-digital converter (ADC). The device is designed specifically to support demanding, high input frequency signals with large dynamic range requirements. An input clock divider gives more flexibility for system clock architecture design, and the SYSREF input enables complete system synchronization. The ADC3421-Q1 supports serial low-voltage differential signaling (LVDS) in order to reduce the number of interface lines, thus allowing for high system integration density. The serial LVDS interface is two-wire, where each ADC data are serialized and output over two LVDS pairs. An internal phase-locked loop (PLL) multiplies the incoming ADC sampling clock to derive the bit clock that is used to serialize the 12-bit output data from each channel. In addition to the serial data streams, the frame and bit clocks are also transmitted as LVDS outputs.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ADC3421-Q1	VQFN (56)	8.00 mm × 8.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

Spectrum at 10-MHz IF
SFDR = 90 dBc, SNR = 71.2 dBFS,
SINAD = 71.1 dBFS, THD = 89 dBc

• Changed the <i>Register Initialization</i> section	27
• Changed Figure 50	29

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
AVDD	6, 7, 10, 11, 14, 15, 20, 23, 28, 29, 32, 33, 36	I	Analog 1.8-V power supply
CLKM	21	I	Negative differential clock input for the ADC
CLKP	22	I	Positive differential clock input for the ADC
DA0M	4	O	Negative serial LVDS output for wire-0 of channel A
DA0P	3	O	Positive serial LVDS output for wire-0 of channel A
DA1M	2	O	Negative serial LVDS output for wire-1 of channel A
DA1P	1	O	Positive serial LVDS output for wire-1 of channel A
DB0M	56	O	Negative serial LVDS output for wire-0 of channel B
DB0P	55	O	Positive serial LVDS output for wire-0 of channel B
DB1M	54	O	Negative serial LVDS output for wire-1 of channel B
DB1P	53	O	Positive serial LVDS output for wire-1 of channel B
DC0M	46	O	Negative serial LVDS output for wire-0 of channel C
DC0P	45	O	Positive serial LVDS output for wire-0 of channel C
DC1M	44	O	Negative serial LVDS output for wire-1 of channel C
DC1P	43	O	Positive serial LVDS output for wire-1 of channel C
DD0M	42	O	Negative serial LVDS output for wire-0 of channel D
DD0P	41	O	Positive serial LVDS output for wire-0 of channel D
DD1M	40	O	Negative serial LVDS output for wire-1 of channel D
DD1P	39	O	Positive serial LVDS output for wire-1 of channel D
DCLKM	51	O	Negative bit clock output
DCLKP	50	O	Positive bit clock output
DVDD	5, 38, 47, 52	I	Digital 1.8-V power supply
FCLKM	49	O	Negative frame clock output
FCLKP	48	O	Positive frame clock output
INAM	8	I	Negative differential analog input for channel A
INAP	9	I	Positive differential analog input for channel A
INBM	13	I	Negative differential analog input for channel B
INBP	12	I	Positive differential analog input for channel B
INCM	30	I	Negative differential analog input for channel C
INCP	31	I	Positive differential analog input for channel C
INDM	35	I	Negative differential analog input for channel D
INDP	34	I	Positive differential analog input for channel D
PDN	37	I	Power-down control. This pin can be configured using the SPI. This pin has an internal 150-k Ω pulldown resistor.
RESET	24	I	Hardware reset; active high. This pin has an internal 150-k Ω pulldown resistor.
SCLK	16	I	Serial interface clock input. This pin has an internal 150-k Ω pulldown resistor.
SDATA	17	I	Serial interface data input. This pin has an internal 150-k Ω pulldown resistor.
SDOUT	19	O	Serial interface data output
SEN	18	I	Serial interface enable; active low. This pin has an internal 150-k Ω pullup resistor to AVDD.
SYSREFM	26	I	Negative external SYSREF input
SYSREFP	25	I	Positive external SYSREF input
VCM	27	O	Common-mode voltage for analog inputs
Thermal Pad	—	—	Connect thermal pad to ground.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Analog supply voltage range, AVDD		-0.3	2.1	V
Digital supply voltage range, DVDD		-0.3	2.1	V
Voltage applied to input pins	INAP, INBP, INCP, INDP, INAM, INBM, INCM, INDM	-0.3	min (1.9, AVDD + 0.3)	V
	CLKP, CLKM	-0.3	AVDD + 0.3	
	SYSREFP, SYSREFM	-0.3	AVDD + 0.3	
	SCLK, SEN, SDATA, RESET, PDN	-0.3	3.9	
Temperature	Operating junction, T _J		150	°C
	Storage, T _{stg}	-65	150	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾ HBM ESD Classification Level 2	±2000
		Charged-device model (CDM), per AEC Q100-011 CDM ESD Classification Level C5	±750

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supplies					
AVDD	Analog supply voltage range	1.7	1.8	1.9	V
DVDD	Digital supply voltage range	1.7	1.8	1.9	V
Analog Input					
V _{ID}	Differential input voltage	For input frequencies < 450 MHz	2		V _{PP}
		For input frequencies < 600 MHz	1		
V _{IC}	Input common-mode voltage	VCM ± 0.025			V
Clock Input					
	Input clock frequency	Sampling clock frequency	15 ⁽²⁾	25	MSPS
	Input clock amplitude (differential)	Sine wave, ac-coupled	0.2	1.5	V _{PP}
		LPECL, ac-coupled	1.6		
		LVDS, ac-coupled	0.7		
	Input clock duty cycle		35%	50%	65%
	Input clock common-mode voltage		0.95		V
Digital Outputs					
C _{LOAD}	Maximum external load capacitance from each output pin to GND		3.3		pF
R _{LOAD}	Single-ended load resistance		100		Ω
Temperature					
T _J	Operating Junction Temperature	-40	125		°C

(1) After power-up, use only the RESET pin to reset the device for the first time; see the [Register Initialization](#) section for details.

(2) See [Table 1](#) for details.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ADC3421-Q1	UNIT
		RWE (VQFN ^P)	
		56 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	20.3	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	8.8	°C/W
R _{θJB}	Junction-to-board thermal resistance	5.6	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.1	°C/W
ψ _{JB}	Junction-to-board characterization parameter	5.6	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	0.7	°C/W

(1) For more information about traditional and new thermal metrics, see the [IC Package Thermal Metrics application report](#).

6.5 Electrical Characteristics: General

Typical values are over the operating free-air temperature range, at T_A = 25°C, full temperature range is T_{MIN} = –40°C to T_{MAX} = 125°C, maximum sampling rate, 50% clock duty cycle, AVDD = DVDD = 1.8 V, and –1-dBFS differential input, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
	ADC clock frequency				25	MSPS
	Resolution		12			Bits
	1.8-V analog supply current			54	71	mA
	1.8-V digital supply current			45	71	mA
	Total power dissipation			177	240	mW
	Global power-down dissipation			5	17	mW
	Standby power-down dissipation			34	75	mW
Analog Input						
	Differential input full-scale			2.0		V _{PP}
r _i	Input resistance	Differential at dc		6.6		kΩ
c _i	Input capacitance	Differential at dc		3.7		pF
V _{OC(VCM)}	VCM common-mode voltage output			0.95		V
	VCM output current capability			10		mA
	Input common-mode current	Per analog input pin		1.5		μA/MSPS
	Analog input bandwidth (3 dB)	50-Ω differential source driving 50-Ω termination across INP and INM		540		MHz
DC accuracy						
E _O	Offset error		–25		25	mV
α _{EO}	Temperature coefficient of offset error			± 0.024		mV/°C
E _{G(REF)}	Gain error as a result of internal reference inaccuracy alone		–2		2	%FS
E _{G(CHAN)}	Gain error of channel alone			–2		%FS
α _(EGCHAN)	Temperature coefficient of E _{G(CHAN)}			±0.008		Δ%FS/Ch
Channel-to-channel Isolation						
Crosstalk ⁽¹⁾		f _{IN} = 10 MHz	Near channel		105	dB
			Far channel		105	
		f _{IN} = 100 MHz	Near channel		95	
			Far channel		105	
		f _{IN} = 200 MHz	Near channel		94	
			Far channel		105	
		f _{IN} = 230 MHz	Near channel		92	
			Far channel		105	
		f _{IN} = 300 MHz	Near channel		85	
			Far channel		105	

(1) Crosstalk is measured with a –1-dBFS input signal on the aggressor channel and no input on the victim channel.

6.6 Electrical Characteristics: AC Performance

Typical values are over the operating free-air temperature range, at $T_A = 25^\circ\text{C}$, full temperature range is $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = 125^\circ\text{C}$, ADC sampling rate = 25 MSPS, 50% clock duty cycle, AVDD = DVDD = 1.8 V, and -1-dBFS differential input, unless otherwise noted.

PARAMETER		TEST CONDITIONS	DITHER ON			DITHER OFF			UNIT
			MIN	TYP	MAX	MIN	TYP	MAX	
SNR	Signal-to-noise ratio (from 1-MHz offset)	$f_{\text{IN}} = 10\text{ MHz}$		70.9			71.1		dBFS
		$f_{\text{IN}} = 20\text{ MHz}$	68.9	70.7			70.9		
		$f_{\text{IN}} = 70\text{ MHz}$		70.4			70.6		
		$f_{\text{IN}} = 100\text{ MHz}$		70.3			70.5		
		$f_{\text{IN}} = 170\text{ MHz}$		69.7			69.9		
		$f_{\text{IN}} = 230\text{ MHz}$		68.9			69.1		
	Signal-to-noise ratio (full Nyquist band)	$f_{\text{IN}} = 10\text{ MHz}$		70.2			70.5		dBFS
		$f_{\text{IN}} = 20\text{ MHz}$		70.1			70.3		
		$f_{\text{IN}} = 70\text{ MHz}$		69.8			70.0		
		$f_{\text{IN}} = 100\text{ MHz}$		69.6			69.8		
		$f_{\text{IN}} = 170\text{ MHz}$		69.2			69.3		
		$f_{\text{IN}} = 230\text{ MHz}$		68.3			68.5		
NSD ⁽¹⁾	Noise spectral density (averaged across Nyquist zone)	$f_{\text{IN}} = 10\text{ MHz}$		-141.5			-141.7		dBFS/Hz
		$f_{\text{IN}} = 20\text{ MHz}$		-141.3	-139.5		-141.5		
		$f_{\text{IN}} = 70\text{ MHz}$		-141.0			-141.2		
		$f_{\text{IN}} = 100\text{ MHz}$		-140.9			-141.1		
		$f_{\text{IN}} = 170\text{ MHz}$		-140.3			-140.5		
		$f_{\text{IN}} = 230\text{ MHz}$		-139.5			-139.7		
SINAD ⁽¹⁾	Signal-to-noise and distortion ratio	$f_{\text{IN}} = 10\text{ MHz}$		71			71.1		dBFS
		$f_{\text{IN}} = 20\text{ MHz}$	67.9	70.8			70.9		
		$f_{\text{IN}} = 70\text{ MHz}$		69.5			70		
		$f_{\text{IN}} = 100\text{ MHz}$		70.5			70.7		
		$f_{\text{IN}} = 170\text{ MHz}$		69.6			69.8

		$f_{\text{IN}} = 100\text{ MHz}$		11.4			11.4		
		$f_{\text{IN}} = 170\text{ MHz}$		11.3			11.3		
		$f_{\text{IN}} = 230\text{ MHz}$		11.1			11.1		
SFDR	Spurious-free dynamic range	$f_{\text{IN}} = 10\text{ MHz}$		93			90		dBc
		$f_{\text{IN}} = 20\text{ MHz}$	84	91			85		
		$f_{\text{IN}} = 70\text{ MHz}$		93			88		
		$f_{\text{IN}} = 100\text{ MHz}$		85			82		
		$f_{\text{IN}} = 170\text{ MHz}$		86			85		
		$f_{\text{IN}} = 230\text{ MHz}$		82			82		

(1) Reported from a 1-MHz offset.

Electrical Characteristics: AC Performance (continued)

Typical values are over the operating free-air temperature range, at $T_A = 25^\circ\text{C}$, full temperature range is $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = 125^\circ\text{C}$, ADC sampling rate = 25 MSPS, 50% clock duty cycle, $\text{AVDD} = \text{DVDD} = 1.8\text{ V}$, and -1-dBFS differential input, unless otherwise noted.

PARAMETER		TEST CONDITIONS	DITHER ON			DITHER OFF			UNIT
			MIN	TYP	MAX	MIN	TYP	MAX	
HD2	Second-order harmonic distortion	$f_{\text{IN}} = 10\text{ MHz}$		93			92	dBc	
		$f_{\text{IN}} = 20\text{ MHz}$	83	100		94			
		$f_{\text{IN}} = 70\text{ MHz}$		93		92			
		$f_{\text{IN}} = 100\text{ MHz}$		94		93			
		$f_{\text{IN}} = 170\text{ MHz}$		86		85			
		$f_{\text{IN}} = 230\text{ MHz}$		86		82			
HD3	Third-order harmonic distortion	$f_{\text{IN}} = 10\text{ MHz}$		96		90	dBc		
		$f_{\text{IN}} = 20\text{ MHz}$	82	91		85			
		$f_{\text{IN}} = 70\text{ MHz}$		93		88			
		$f_{\text{IN}} = 100\text{ MHz}$		85		82			
		$f_{\text{IN}} = 170\text{ MHz}$		89		89			
		$f_{\text{IN}} = 230\text{ MHz}$		82		82			
Non HD2, HD3	Spurious-free dynamic range (excluding HD2, HD3)	$f_{\text{IN}} = 10\text{ MHz}$		99		92	dBc		
		$f_{\text{IN}} = 20\text{ MHz}$	86	98		91			
		$f_{\text{IN}} = 70\text{ MHz}$		96		92			
		$f_{\text{IN}} = 100\text{ MHz}$		95		93			
		$f_{\text{IN}} = 170\text{ MHz}$		92		90			
		$f_{\text{IN}} = 230\text{ MHz}$		97		91			
THD	Total harmonic distortion	$f_{\text{IN}} = 10\text{ MHz}$		90		86	dBc		
		$f_{\text{IN}} = 20\text{ MHz}$	78	90		83			
		$f_{\text{IN}} = 70\text{ MHz}$		89		85			
		$f_{\text{IN}} = 100\text{ MHz}$		84		80			
		$f_{\text{IN}} = 170\text{ MHz}$		84		83			
		$f_{\text{IN}} = 230\text{ MHz}$		80		79			
IMD3	Two-tone, third-order intermodulation distortion	$f_{\text{IN1}} = 45\text{ MHz}$, $f_{\text{IN2}} = 50\text{ MHz}$		-98		-98	dBFS		
		$f_{\text{IN1}} = 185\text{ MHz}$, $f_{\text{IN2}} = 190\text{ MHz}$		-91		-91			

6.7 Digital Characteristics

The dc specifications refer to the condition where the digital outputs are not switching, but are permanently at a valid logic level 0 or 1. AVDD = DVDD = 1.8 V, and –1-dBFS differential input, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Digital Inputs (RESET, SCLK, SDATA, SEN, PDN)						
V _{IH}	High-level input voltage	All digital inputs support 1.8-V and 3.3-V CMOS logic levels	1.3			V
V _{IL}	Low-level input voltage	All digital inputs support 1.8-V and 3.3-V CMOS logic levels			0.4	V
I _{IH}	High-level input current	RESET, SDATA, SCLK, PDN	V _{HIGH} = 1.8 V	10		μA
		SEN ⁽¹⁾	V _{HIGH} = 1.8 V	0		μA
I _{IL}	Low-level input current	RESET, SDATA, SCLK, PDN	V _{LOW} = 0 V	0		μA
		SEN	V _{LOW} = 0 V	10		μA
Digital Inputs (SYSREFP, SYSREFM)						
V _{IH}	High-level input voltage			1.3		V
V _{IL}	Low-level input voltage			0.5		V
	Common-mode voltage for SYSREF			0.9		V
Digital Outputs (CMOS Interface, SDOUT)						
V _{OH}	High-level output voltage		DVDD – 0.1	DVDD		V
V _{OL}	Low-level output voltage			0	0.1	V
Digital Outputs (LVDS Interface)						
V _{ODH}	High-level output differential voltage	With an external 100-Ω termination	280	350	460	mV
V _{ODL}	Low-level output differential voltage	With an external 100-Ω termination	–460	–350	–280	mV
V _{OCM}	Output common-mode voltage			1.05		V

(1) SEN has an internal 150-kΩ pullup resistor to AVDD. SPI pins (SEN, SCLK, SDATA) can be driven by 1.8 V or 3.3 V CMOS buffers.

6.8 Timing Requirements: General

Typical values are at T_A = 25°C, AVDD = DVDD = 1.8 V, and –1-dBFS differential input, unless otherwise noted. Minimum and maximum values are across the full temperature range: T_{MIN} = –40°C to T_{MAX} = 125°C.

		MIN	TYP	MAX	UNIT
t _A	Aperture delay	1.24	1.44	1.64	ns
	Aperture delay matching between two channels of the same device		±70		ps
	Aperture delay variation between two devices at same temperature and supply voltage		±150		ps
t _J	Aperture jitter		130		f _S rms
	Wake-up time:	Time to valid data after exiting standby power-down mode		35	200
Time to valid data after exiting global power-down mode (in this mode, both channels power down)			85	450	μs
ADC latency ⁽¹⁾ :	2-wire mode (default)		9		Clock cycles
	1-wire mode		8		Clock cycles
t _{SU_SYSREF}	SYSREF reference time:	Setup time for SYSREF referenced to input clock rising edge	1000		ps
t _{H_SYSREF}		Hold time for SYSREF referenced to input clock rising edge	100		ps

(1) Overall latency = ADC latency + t_{PDI}.

6.9 Timing Requirements: LVDS Output⁽¹⁾⁽²⁾

Typical values are at $T_A = 25^\circ\text{C}$, $AVDD = DVDD = 1.8\text{ V}$, and -1-dBFS differential input, 6x Serialization (2-Wire Mode), $C_{LOAD} = 3.3\text{ pF}^{(3)}$, and $R_{LOAD} = 100\ \Omega^{(4)}$, unless otherwise noted.. Minimum and maximum values are across the full temperature range: $T_{MIN} = -40^\circ\text{C}$ to $T_{MAX} = 125^\circ\text{C}$.

			MIN	TYP	MAX	UNIT
t_{SU}	Data setup time: data valid to zero-crossing of differential output clock (CLKOUTP – CLKOUTM) ⁽⁵⁾⁽⁶⁾	1-wire mode	1.3	1.48		ns
		2-wire mode	2.61	3.06		
t_{HO}	Data hold time: zero-crossing of differential output clock (CLKOUTP – CLKOUTM) to data becoming invalid ⁽⁵⁾⁽⁶⁾	1-wire mode	1.32	1.57		ns
		2-wire mode	2.75	3.12		
t_{PDI}	Clock propagation delay: input clock falling edge cross-over to frame clock rising edge cross-over (15 MSPS < sampling frequency < 25 MSPS)	1-wire mode	$0.1 \times t_S + t_{DELAY}$			ns
		2-wire mode	$0.61 \times t_S + t_{DELAY}$			ns
t_{DELAY}	Delay time		3	4.5	5.9	ns
	LVDS bit clock duty cycle: duty cycle of differential clock (CLKOUTP – CLKOUTM)			49%		
t_{FALL} , t_{RISE}	Data fall time, data rise time: rise time measured from -100 mV to 100 mV , $15\text{ MSPS} \leq \text{Sampling frequency} \leq 25\text{ MSPS}$			0.11		ns
$t_{CLKRISE}$, $t_{CLKFALL}$	Output clock rise time, output clock fall time: rise time measured from -100 mV to 100 mV , $15\text{ MSPS} \leq \text{Sampling frequency} \leq 25\text{ MSPS}$			0.11		ns

- (1) Measurements are done with a transmission line of a $100\text{-}\Omega$ characteristic impedance between the device and load. Setup and hold time specifications take into account the effect of jitter on the output data and clock.
- (2) Timing parameters are ensured by design and characterization and are not tested in production.
- (3) C_{LOAD} is the effective external single-ended load capacitance between each output pin and ground.
- (4) R_{LOAD} is the differential load resistance between the LVDS output pair.
- (5) Data valid refers to a logic high of 100 mV and a logic low of -100 mV .
- (6) Write relevant register settings as mentioned in [Table 22](#).

6.10 Typical Characteristics

typical values are at $T_A = 25^\circ\text{C}$, ADC sampling rate = 25 MSPS, 50% clock duty cycle, AVDD = 1.8 V, DVDD = 1.8 V, -1-dBFS differential input, $2 \cdot V_{PP}$ full-scale, 32k-point FFT, chopper disabled, and SNR reported with a 1-MHz offset from dc when chopper is disabled and from $f_S / 2$ when chopper is enabled (unless otherwise noted).

8 Detailed Description

8.1 Overview

The ADC3421-Q1 is an automotive-grade, high-linearity, ultra-low power, quad-channel, 12-bit, 25-MSPS analog-to-digital converter (ADC). The device is designed specifically to support demanding, high input frequency signals with large dynamic range requirements. An input clock divider gives more flexibility for system clock architecture design, and the SYSREF input enables complete system synchronization. The ADC3421-Q1 supports a serial low-voltage differential signaling (LVDS) interface in order to reduce the number of interface lines, thus allowing for high system integration density. The serial LVDS interface is two-wire, where each ADC data are serialized and output over two LVDS pairs. An internal phase-locked loop (PLL) multiplies the incoming ADC sampling clock to derive the bit clock that is used to serialize the 12-bit output data from each channel. In addition to the serial data streams, the frame and bit clocks are also transmitted as LVDS outputs.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Analog Inputs

The ADC3421-Q1 analog signal inputs are designed to be driven differentially. Each input pin (INP, INM) must swing symmetrically between $(V_{CM} + 0.5\text{ V})$ and $(V_{CM} - 0.5\text{ V})$, resulting in a $2\text{-}V_{PP}$ (default) differential input swing. The input sampling circuit has a 3-dB bandwidth that extends up to 540 MHz (50- Ω source driving 50- Ω termination between INP and INM).

8.3.2 Clock Input

The device clock inputs can be driven differentially (sine, LVPECL, or LVDS) or single-ended (LVCMOS), with little or no difference in performance between them. The common-mode voltage of the clock inputs is set to 0.95 V using internal 5-k Ω resistors. The self-bias clock inputs of the ADC3421-Q1 can be driven by the transformer-coupled, sine-wave clock source or by the ac-coupled, LVPECL and LVDS clock sources, as shown in Figure 36, Figure 37, and Figure 38. See Figure 39 for details regarding the internal clock buffer.

NOTE: R_T = termination resistor, if necessary.

Figure 36. Differential Sine-Wave Clock Driving Circuit

Figure 37. LVDS Clock Driving Circuit

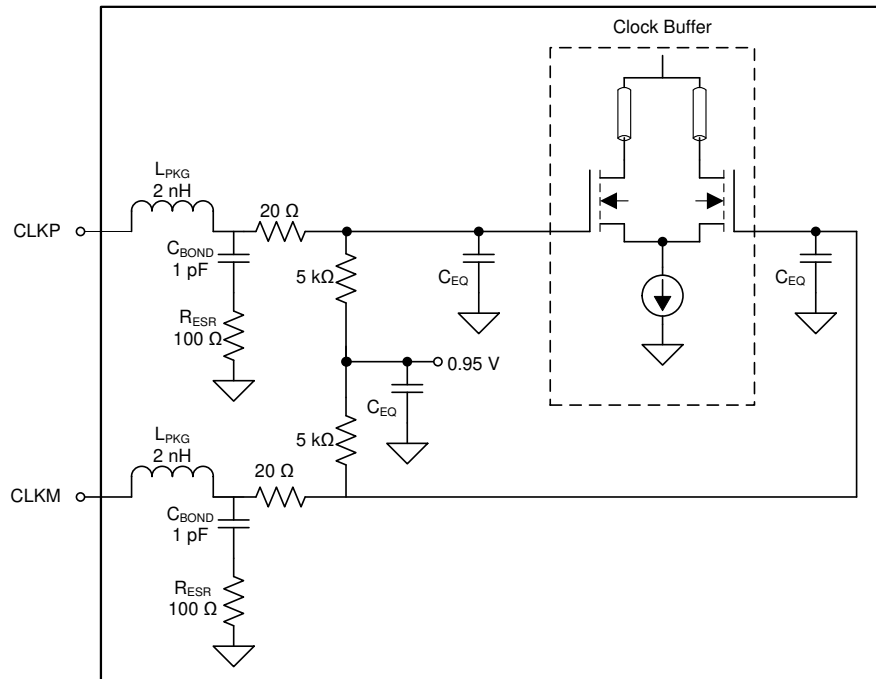

Figure 38. LVPECL Clock Driving Circuit

NOTE: C_{EQ} is 1 pF to 3 pF and is the equivalent input capacitance of the clock buffer.

Figure 39. Internal Clock Buffer

A single-ended CMOS clock can be ac-coupled to the CLKP input, with CLKM connected to ground with a 0.1-μF capacitor, as shown in Figure 40. However, for best performance the clock inputs must be driven differentially, thereby reducing susceptibility to common-mode noise. For high input frequency sampling, TI recommends using a clock source with very low jitter. Band-pass filtering of the clock source can help reduce the effects of jitter. There is no change in performance with a non-50% duty cycle clock input.

Figure 40. Single-Ended Clock Driving Circuit

8.3.2.1 SNR and Clock Jitter

The signal-to-noise ratio of the ADC is limited by three different factors, as shown in Equation 1. Quantization noise (typically 74 dB for a 12-bit ADC) and thermal noise limit SNR at low input frequencies, and the clock jitter sets SNR for higher input frequencies.

$$SNR_{ADC}[dBc] = -20 \cdot \log \sqrt{\left(10^{\frac{SNR_{Quantization_Noise}}{20}} \right)^2 + \left(10^{\frac{SNR_{Thermal_Noise}}{20}} \right)^2 + \left(10^{\frac{SNR_{Jitter}}{20}} \right)^2} \tag{1}$$

The SNR limitation resulting from sample clock jitter can be calculated with Equation 2.

$$SNR_{jitter}[dBc] = -20 \cdot \log(2\pi \cdot f_{in} \cdot t_{jitter}) \tag{2}$$

The total clock jitter (T_{Jitter}) has two components: the internal aperture jitter (130 fs for the device) which is set by the noise of the clock input buffer and the external clock. T_{Jitter} can be calculated with Equation 3.

$$t_{\text{Jitter}} = \sqrt{(t_{\text{Jitter,Ext.Clock_Input}})^2 + (t_{\text{Aperture_ADC}})^2} \tag{3}$$

External clock jitter can be minimized by using high-quality clock sources and jitter cleaners as well as band-pass filters at the clock input; a faster clock slew rate improves the ADC aperture jitter. The devices have a typical thermal noise of 70.6 dBFS and internal aperture jitter of 130 fs. The SNR, depending on the amount of external jitter for different input frequencies, is shown in Figure 41.

Figure 41. SNR vs Frequency for Different Clock Jitter

8.3.3 Digital Output Interface

The devices offer two different output format options, thus making interfacing to a field-programmable gate array (FPGA) or an application-specific integrated circuit (ASIC) easy. Each option can be easily programmed using the serial interface, as shown in Table 1. The output interface options are:

- One-wire, 1x frame clock, 12x serialization with the DDR bit clock and
- Two-wire, 1x frame clock, 6x serialization with the DDR bit clock.

Table 1. Interface Rates

INTERFACE OPTIONS	SERIALIZATION	RECOMMENDED SAMPLING FREQUENCY (MSPS)		BIT CLOCK FREQUENCY (MHz)	FRAME CLOCK FREQUENCY (MHz)	SERIAL DATA RATE PER WIRE (Mbps)
		MINIMUM	MAXIMUM			
One-wire	12x	15	25	90	15	180
				150	25	300
Two-wire (Default after Reset)	6x	20 ⁽¹⁾	25	60	20	120
				75	25	150

(1) Use the LOW SPEED ENABLE register bits for low speed operation; see .

8.3.3.1 One-Wire Interface: 12x Serialization

In this interface option, the device outputs the data of each ADC serially on a single LVDS pair (one-wire). The data are available at the rising and falling edges of the bit clock (DDR bit clock). The ADC outputs a new word at the rising edge of every frame clock, starting with the LSB. The data rate is 12x sample frequency (12x serialization).

8.3.3.2 Two-Wire Interface: 6x Serialization

In two-wire interface, the output data rate is 6x sample frequency because six data bits are output every clock cycle on each differential pair. Each ADC sample is sent over the two wires with the six MSBs on Dx1P, Dx1M and the six LSBs on Dx0P, Dx0M, as shown in Figure 42.

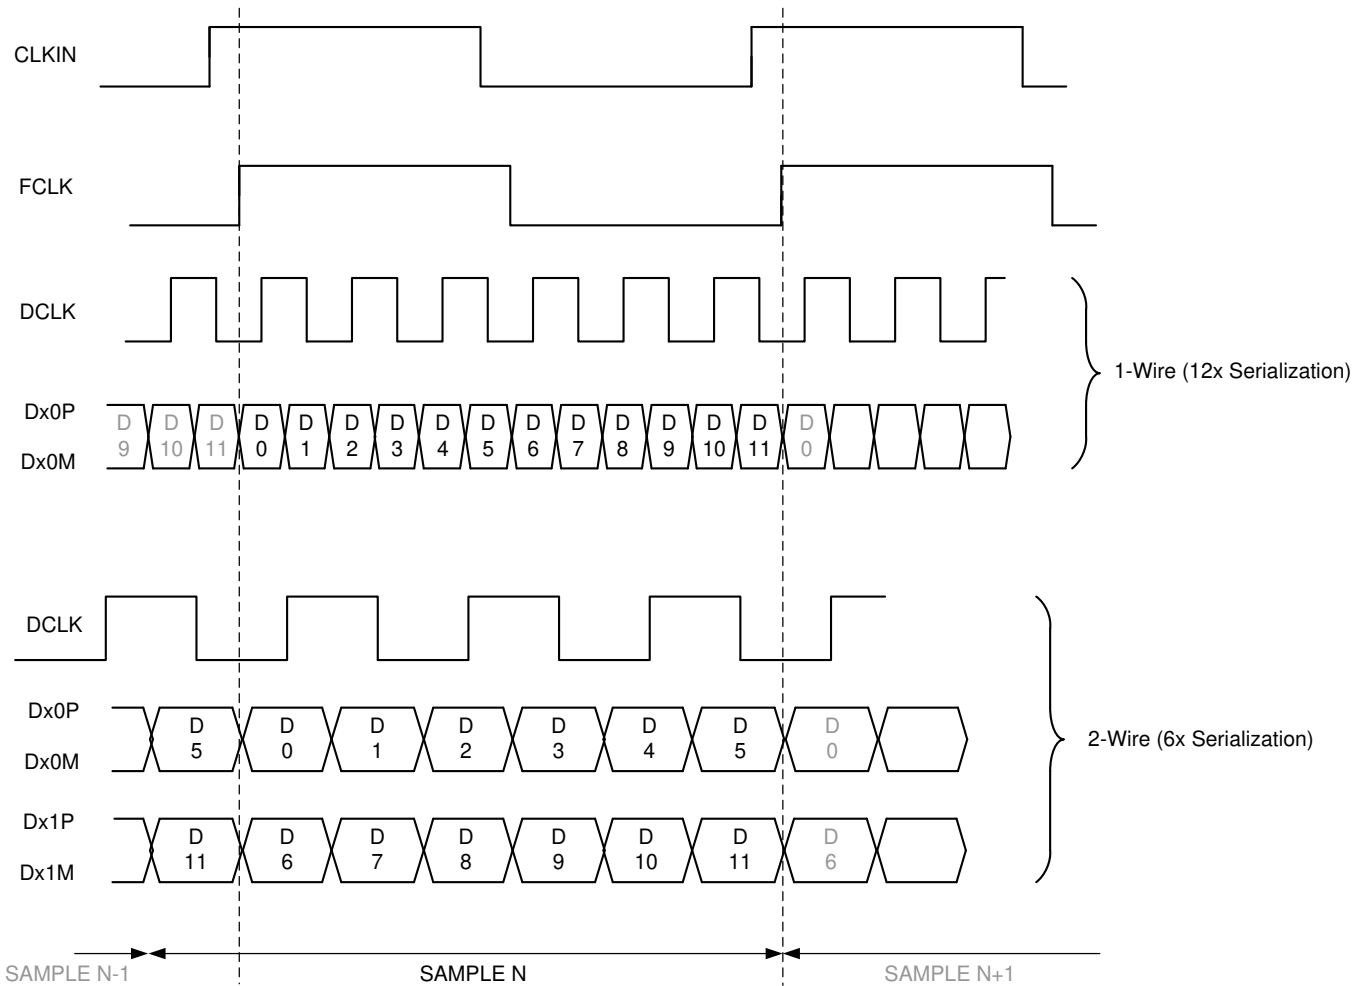

Figure 42. Output Timing Diagram

8.4 Device Functional Modes

8.4.1 Input Clock Divider

The devices are equipped with an optional internal divider on the clock input. The clock divider allows operation with a faster input clock (divide by 2 and divide by 4 options programmable using SPI), thus simplifying the system clock distribution design.

8.4.2 Chopper Functionality

The devices are equipped with an internal chopper front-end. Enabling the chopper function swaps the ADC noise spectrum by shifting the $1/f$ noise from dc to $f_S / 2$. Figure 43 shows the noise spectrum with the chopper off and Figure 44 shows the noise spectrum with the chopper on. This function is especially useful in applications requiring good ac performance at low input frequencies or in dc-coupled applications. The chopper can be enabled via SPI register writes and is recommended for input frequencies below 30 MHz. The chopper function creates a spur at $f_S / 2$ that must be filtered out digitally.

8.4.3 Power-Down Control

The power-down functions of the ADC3421-Q1 can be controlled either through the parallel control pin (PDN) or through an SPI register setting (see register 15h). The PDN pin can also be configured via SPI to a global power-down or standby functionality, as shown in Table 2.

Table 2. Power-Down Modes

FUNCTION	POWER CONSUMPTION (mW)	WAKE-UP TIME (μ s)
Global power-down	5	85
Standby	34	35

8.4.4 Internal Dither Algorithm

The ADC3421-Q1 uses an internal dither algorithm to achieve high SFDR and a clean spectrum. However, the dither algorithm marginally degrades SNR, creating a trade-off between SNR and SFDR. If desired, the dither algorithm can be turned off by using the DIS DITH CHx registers bits. [Figure 45](#) and [Figure 46](#) show the effect of using dither algorithms.

8.4.5 Summary of Performance Mode Registers

[Table 3](#) lists the location, value, and functions of performance mode registers in the device.

Table 3. Performance Modes

MODE	REGISTER SETTINGS	DESCRIPTION
Special modes	Registers 139 (bit 3), 239 (bit 3), 439 (bit 3), and 539 (bit 3)	Always write 1 for best performance
Disable dither	Registers 1 (bits 7:0), 134 (bits 5 and 3), 234 (bits 5 and 3), 434 (bits 5 and 3), and 534 (bits 5 and 3)	Disable dither to improve SNR
Disable chopper	Registers 122 (bit 1), 222 (bit 1), 422 (bit 1), and 522 (bit 1)	Disable chopper (shifts 1/f noise floor at dc)
High IF modes	Registers 11Dh (bit 1), 21Dh (bit 1), 31Dh (bit 7 and bit 1), 41Dh (bit 1), 51Dh (bit 1), 308h (bits 7-6), 608h (bits 7-6) and 61Dh (bit 7 and bit 1)	Improves HD3 by a couple of dB for IF > 100 MHz

8.4.6 Device Diagnostic Modes

The device offers various diagnostic modes to check proper device operation at system level. These modes can be enabled using the SPI. Outputs of these modes are stored in diagnostic read-only registers.

8.4.6.1 Internal Reference and Clock Status Check

Device is equipped with a mode to verify presence of a valid input clock, as well as status of on-chip ADC reference. When a valid clock input clock is absent at input clock pins (CLKP,CLKM) of ADC, device sets register bit CLK STATUS to '1'. Similarly, if internal reference block is malfunctioning for a channel, device sets register bits REF STATUS CHx to '1'. To read the status of internal reference from these pins:

1. First enable reference status check by setting register bit EN REF STATUS CHECK to '1'.
2. Read back register bits REF STATUS CHx on SDATA pin for desired channel (x = A, B, C or D).

8.4.6.2 DC Input check

In this mode, an internally generated DC voltage can be forced by device to its analog inputs. Before forcing internal DC voltage, analog inputs must float. To enable forcing internal DC voltage, register bit EN DC FORCE must be set HIGH. Forced voltage is programmable by register bits DC FORCE[2:0], applied to all four channels together. In terms of output code, typical value of programmed DC voltage is given by equation mentioned below:

$$\text{Output code} = 368 \times \text{DC FORCE}[2:0] + 745.$$

Output code is available on LVDS data outputs.

8.4.6.3 Mean and Variance Measurement

Mean and variance values of the ADC output can be analyzed using the on-chip statistical module available for individual channel for a programmable length of samples. These values are stored in register bits MEAN[11:0] and VAR[11:0] in 2s complement format. Equation for computing mean and variance values respectively are given below:

$$\begin{aligned} \bullet \quad \text{Mean} = \bar{x} &= \sum_{n=1}^N \frac{S(n)}{N} \\ \bullet \quad \text{Variance} &= \sum_{n=1}^N \frac{|S(n) - \bar{x}|}{N} \end{aligned}$$

Where S(n) is nth sample, N is total number of samples used for computation, programmed by register bits SAMPLES FOR STATS[1:0].

Follow steps mentioned below to read the mean and variance:

1. Enable Statistical Module by setting bit EN STATS to '1'.
2. Select desired channel through bits STATS CH SEL[1:0].
3. Program number of samples, N, using register bits SAMPLES FOR STATS[1:0].
4. Wait for at least 4N samples for module to compute and update the results.
5. Disable Statistical Module by resetting EN STATS bit to '0'.
6. Read back mean and variance values from register bits MEAN[11:0] and VAR[11:0]. These values are in 2s complement format.

8.4.6.4 Temperature Sensor

The device is equipped with a temperature sensor to measure internal junction temperature.

The temperature sensor output is a 9-bit digital data available in 2s complement format directly representing temperature in degree Celsius units. Temperature data is internally updated every $1024 \times T_{\text{CLK}} \times 16$ seconds where T_{CLK} period of sampling clock in seconds. Follow the steps mentioned below to read temperature sensor's output:

1. Enable temperature sensor by setting bits EN TEMP SENSE and EN TEMP SENSE CONV to '1'.
2. Wait for at least $1024 \times T_{\text{CLK}} \times 16$ seconds for temperature sensor to update the data.
3. Disable temperature sensor by resetting the bit EN TEMP SENSE to '0'.
4. Load temperature sensor's data to register bits TEMPDATA[8:0] by setting register bit EN TEMP DATA READOUT to '1'.
5. Readout 9-bit temperature data from register bits TEMPDATA[8:0] located in register addresses 10h and 11h.

8.5 Programming

The ADC3421-Q1 can be configured using a serial programming interface, as described in this section.

8.5.1 Serial Interface

The device has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock), SDATA (serial interface data), and SDOUT (serial interface data output) pins. Serially shifting bits into the device is enabled when SEN is low. Serial data SDATA are latched at every SCLK rising edge when SEN is active (low). The serial data are loaded into the register at every 24th SCLK rising edge when SEN is low. When the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active SEN pulse. The interface can function with SCLK frequencies from 20 MHz down to very low speeds (of a few hertz) and also with a non-50% SCLK duty cycle.

Programming (continued)

8.5.1.1 Register Initialization

After power-up, the internal registers **must** be initialized to their default values through a hardware reset by applying a high pulse on the RESET pin (of durations greater than 10 ns), as shown in Figure 47. If required, the serial interface registers can be cleared during operation either:

1. Through a hardware reset, or
2. By applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 06h) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

8.5.1.1.1 Serial Register Write

The device internal register can be programmed with these steps:

1. Drive the SEN pin low,
2. Set the R/W bit to 0 (bit A15 of the 16-bit address),
3. Set bit A14 in the address field to 1,
4. Initiate a serial interface cycle by specifying the address of the register (A13 to A0) whose content must be written, and
5. Write the 8-bit data that are latched in on the SCLK rising edge.

Figure 47 and Table 4 show the timing requirements for the serial register write operation.

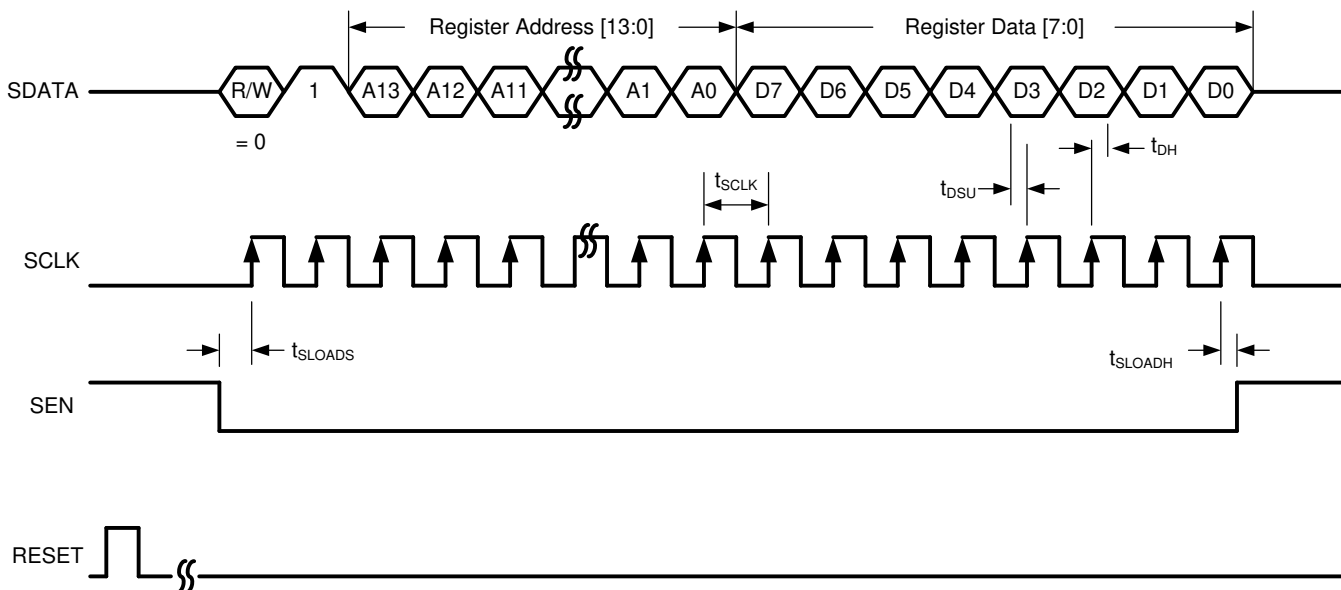

Figure 47. Serial Register Write Timing Diagram

Table 4. Serial Interface Timing⁽¹⁾

		MIN	TYP	MAX	UNIT
f_{SCLK}	SCLK frequency (equal to $1 / t_{SCLK}$)	> dc		20	MHz
t_{SLOADS}	SEN to SCLK setup time	25			ns
t_{SLOADH}	SCLK to SEN hold time	25			ns
t_{DSU}	SDIO setup time	25			ns
t_{DH}	SDIO hold time	25			ns

(1) Typical values are at 25°C, full temperature range is from $T_{MIN} = -40^{\circ}\text{C}$ to $T_{MAX} = 85^{\circ}\text{C}$, and $AVDD = DVDD = 1.8\text{ V}$, unless otherwise noted.

8.5.1.1.2 Serial Register Readout

The device includes a mode where the contents of the internal registers can be read back using the SDOUT pin. This readback mode may be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC. The procedure to read the contents of the serial registers is as follows:

1. Drive the SEN pin low.
2. Set the R/W bit (A15) to 1. This setting disables any further writes to the registers.
3. Set bit A14 in the address field to 1.
4. Initiate a serial interface cycle specifying the address of the register (A13 to A0) whose content must be read.
5. The device outputs the contents (D7 to D0) of the selected register on the SDOUT pin.
6. The external controller can latch the contents at the SCLK rising edge.
7. To enable register writes, reset the R/W register bit to 0.

When READOUT is disabled, the SDOUT pin is in a high-impedance mode. If serial readout is not used, the SDOUT pin must float. Figure 48 shows a timing diagram of the serial register read operation. Data appear on the SDOUT pin at the SCLK falling edge with an approximate delay (t_{SD_DELAY}) of 20 ns, as shown in Figure 49.

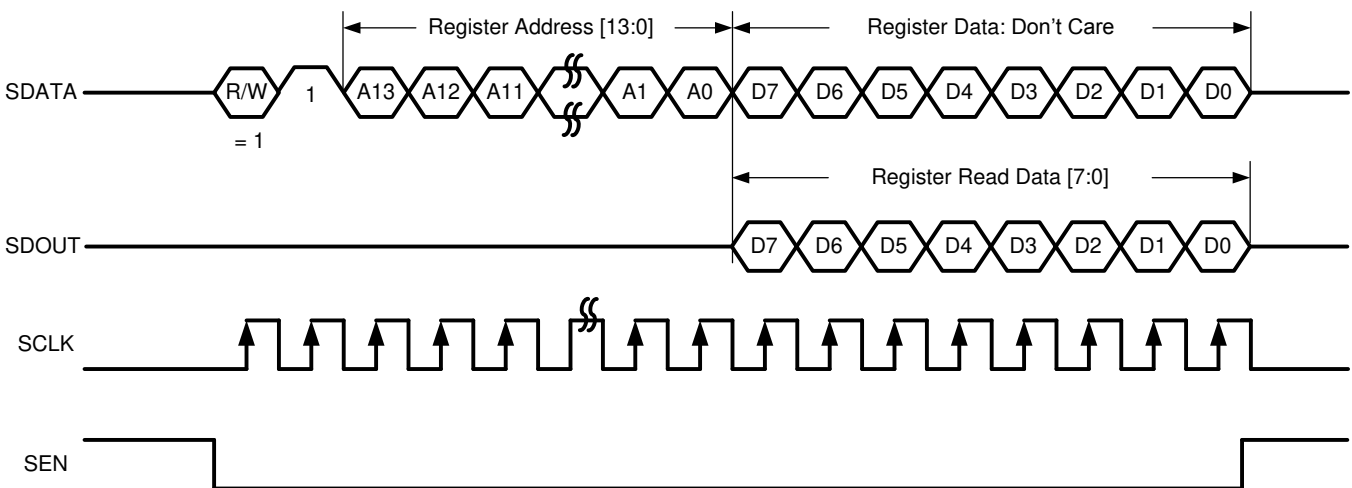

Figure 48. Serial Register Read Timing Diagram

Figure 49. SDOUT Timing Diagram

8.5.2 Register Initialization

After power-up, the internal registers must be initialized to their default values through a hardware reset by applying a high pulse on the RESET pin, as shown in [Figure 50](#) and [Table 5](#).

Figure 50. Initialization of Serial Registers after Power-Up

Table 5. Power-Up Timing

		MIN	TYP	MAX	UNIT
t_1	Power-on delay from power-up to active high RESET pulse	1			ms
t_2	Reset pulse duration: active high RESET pulse duration	10			ns
t_3	Register write delay from RESET disable to SEN active	100			ns

If required, the serial interface registers can be cleared during operation either:

1. Through hardware reset, or
2. By applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 06h) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

Table 19. Register 10h Field Descriptions

Bit	Field	Type	Reset	Description
7-5, 0	REF STATUS CHB, REF STATUS CHD, REF STATUS CHA, REF STATUS CHC	Read Only	0h	When internal reference diagnostic is enabled by setting EN REF STATUS CHECK bit to '1', these bits carry status of internal reference for corresponding channel. See Internal Reference and Clock Status Check for details. Note that these bits are multiplexed with temperature sensor's data and carry TEMPDATA[3:0] if temperature sensor's is enabled.
4	CLK STATUS	Read Only	0h	This bit indicates presence of input clock. By default, device sets this bit 0. If input clock is absent, this bit becomes '1'
7-5, 3-1, 0	TEMPDATA [6:0]	Read Only	0h	When temperature sensor's data is being read, these bits carry seven MSBs of temperature sensor's 9-bit data. Remaining two LSBs are available on address 11h bit 5:4. See Temperature Sensor for details of operation.

3-1	DC FORCE[2:0]	R/W	0h	These Bits force internal DC voltage to ADC's analog inputs together for all channels. Minimum DC voltage corresponds to output code 745 and max DC voltage to output code 3332 typically following the equation: Output Code = 368 × DC FORCE[2:0] + 745
0	0	W	0h	Must write 0.

9 Applications and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

Typical applications involving transformer-coupled circuits are discussed in this section. Transformers (such as ADT1-1WT or WBC1-1) can be used up to 250 MHz to achieve good phase and amplitude balances at ADC inputs. When designing the dc driving circuits, the ADC input impedance must be considered. Figure 97 and Figure 98 show the impedance ($Z_{in} = R_{in} || C_{in}$) across the ADC input pins.

9.2 Typical Applications

9.2.1 Driving Circuit Design: Low Input Frequencies

Figure 99. Driving Circuit for Low Input Frequencies

9.2.1.1 Design Requirements

For optimum performance, the analog inputs must be driven differentially. An optional 5-Ω to 15-Ω resistor in series with each input pin can be kept to damp out ringing caused by package parasitic. The drive circuit may have to be designed to minimize the impact of kick-back noise generated by sampling switches opening and closing inside the ADC, as well as ensuring low insertion loss over the desired frequency range and matched impedance to the source.

9.2.1.2 Detailed Design Procedure

A typical application involving using two back-to-back coupled transformers is illustrated in Figure 99. The circuit is optimized for low input frequencies. An external R-C-R filter using 50-Ω resistors and a 22-pF capacitor is used with the series inductor (39 nH), this combination helps absorb the sampling glitches.

9.2.1.3 Application Curve

Figure 100 shows the performance obtained by using the circuit shown in Figure 99.

SFDR = 95 dBc, SNR = 71 dBFS, SINAD = 71 dBFS,
THD = 94 dBc, HD2 = 106 dBc, HD3 = 95 dBc

Figure 100. Performance FFT at 10 MHz (Low Input Frequency)

Typical Applications (continued)

9.2.2 Driving Circuit Design: Input Frequencies Between 100 MHz to 230 MHz

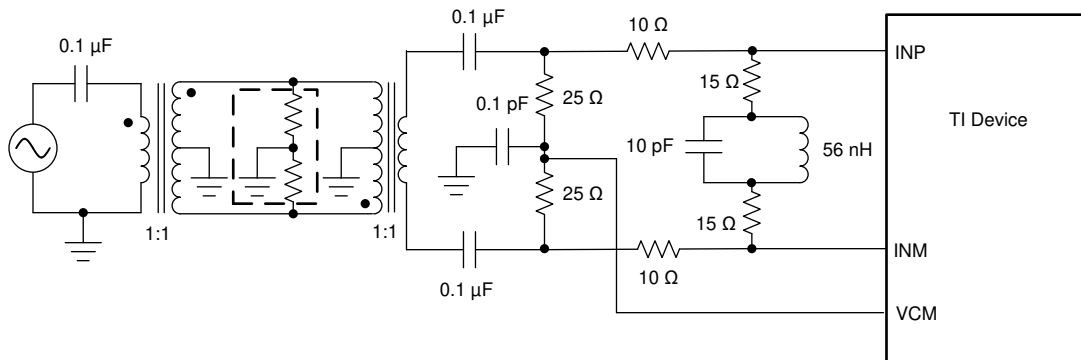

Figure 101. Driving Circuit for Mid-Range Input Frequencies ($100 \text{ MHz} < f_{IN} < 230 \text{ MHz}$)

9.2.2.1 Design Requirements

See the [Design Requirements](#) section for further details.

9.2.2.2 Detailed Design Procedure

When input frequencies are between 100 MHz to 230 MHz, an R-LC-R circuit can be used to optimize performance, as shown in [Figure 101](#).

9.2.2.3 Application Curve

[Figure 102](#) shows the performance obtained by using the circuit shown in [Figure 101](#).

SFDR = 87 dBc, SNR = 69.8 dBFS, SINAD = 69.7 dBFS,
 THD = 85 dBc, HD2 = 90 dBc, HD3 = 87 dBc

Figure 102. Performance FFT at 170 MHz (Mid Input Frequency)

Typical Applications (continued)

9.2.3 Driving Circuit Design: Input Frequencies Greater than 230 MHz

Figure 103. Driving Circuit for High Input Frequencies ($f_{IN} > 230$ MHz)

9.2.3.1 Design Requirements

See the [Design Requirements](#) section for further details.

9.2.3.2 Detailed Design Procedure

For high input frequencies (> 230 MHz), using the R-C-R or R-LC-R circuit does not show significant improvement in performance. However, a series resistance of $10\ \Omega$ can be used as shown in [Figure 103](#).

9.2.3.3 Application Curve

[Figure 104](#) shows the performance obtained by using the circuit shown in [Figure 103](#).

SFDR = 67 dBc, SNR = 66.4 dBFS, SINAD = 66.4 dBFS,
THD = 93 dBc, HD2 = 67 dBc, HD3 = 88 dBc

Figure 104. Performance FFT at 450 MHz (High Input Frequency)

10 Power Supply Recommendations

The device requires a 1.8-V nominal supply for AVDD and DVDD. There are no specific sequence power-supply requirements during device power-up. AVDD and DVDD can power up in any order.

11 Layout

11.1 Layout Guidelines

The ADC3421-Q1 EVM layout can be used as a reference layout to obtain the best performance. A layout diagram of the EVM top layer is provided in [Figure 105](#). Some important points to remember during laying out the board are:

1. Analog inputs are located on opposite sides of the device pin out to ensure minimum crosstalk on the package level. To minimize crosstalk onboard, the analog inputs must exit the pin out in opposite directions, as shown in the reference layout of [Figure 105](#) as much as possible.
2. In the device pin out, the sampling clock is located on a side perpendicular to the analog inputs in order to minimize coupling between them. This configuration is also maintained on the reference layout of [Figure 105](#) as much as possible.
3. Keep digital outputs away from the analog inputs. When these digital outputs exit the pin out, the digital output traces must not be kept parallel to the analog input traces because this configuration can result in coupling from digital outputs to analog inputs and degrade performance. All digital output traces to the receiver [such as a field-programmable gate array (FPGA) or an application-specific integrated circuit (ASIC)] must be matched in length to avoid skew among outputs.
4. At each power-supply pin (AVDD and DVDD), keep a 0.1- μF decoupling capacitor close to the device. A separate decoupling capacitor group consisting of a parallel combination of 10- μF , 1- μF , and 0.1- μF capacitors can be kept close to the supply source.

11.2 Layout Example

Figure 105. Typical Layout of the ADC3421-Q1 Board

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

12.3 Trademarks

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
AD3421QRWERQ1	ACTIVE	VQFNP	RWE	56	2000	RoHS & Green	NIPDAUAG	Level-3-260C-168 HR	-40 to 125	AZ3421Q	Samples
AD3421QRWETQ1	ACTIVE	VQFNP	RWE	56	250	RoHS & Green	NIPDAUAG	Level-3-260C-168 HR	-40 to 125	AZ3421Q	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals.
