

# QUAD, 1-TO-1, DIFFERENTIAL-TO-2.5V, 3.3V, 5V LVPECL RECEIVER

ICS853017

## GENERAL DESCRIPTION

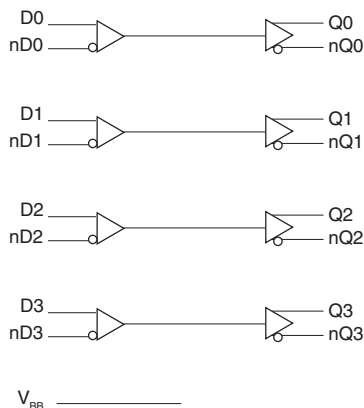

The ICS853017 is a quad 1-to-1, 2.5V/3.3V/5V differential LVPECL/ECL receiver and a member of the HiperClocks™ family of High Performance Clock Solutions from IDT. The ICS853017 operates with a positive or negative power supply at 2.5V, 3.3V or 5V, and can accept both single-ended and differential inputs. For single-ended operation, an internally generated voltage, which is available on output pin  $V_{BB}$ , can be used as a switching bias voltage on the unused input of the differential pair.  $V_{BB}$  can also be used to rebias AC coupled inputs.

## FEATURES

- Four differential LVPECL / ECL 1:1 receivers
- Four differential LVPECL clock input pairs
- Dx, nDx pairs can accept the following differential input levels: LVPECL, LVDS, CML, SSTL
- Output frequency: >2GHz (typical)
- Translates any single ended input signal to LVPECL levels with resistor bias on nDx input
- Output skew: TBD
- Part-to-part skew: TBD
- Propagation delay: 320ps (typical)
- LVPECL mode operating voltage supply range:  $V_{CC} = 2.375V$  to  $5.25V$
- ECL mode operating voltage supply range:  $V_{CC} = 0V$ ,  $V_{EE} = -5.25V$  to  $-2.375V$
- $-40^{\circ}C$  to  $85^{\circ}C$  ambient operating temperature
- Available in both standard (RoHS 5) and lead-free (RoHS 6) packages

The Preliminary Information presented herein represents a product in pre-production. The noted characteristics are based on initial product characterization and/or qualification. Integrated Device Technology, Incorporated (IDT) reserves the right to change any circuitry or specifications without notice.

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1, 20	V <sub>CC</sub>	Power		Positive supply pins.
2	D0	Input	Pulldown	Non-inverting differential clock input.
3	nD0	Input	Pullup/ Pulldown	Inverting differential clock input. V <sub>CC</sub> /2 default when left floating.
4	D1	Input	Pulldown	Non-inverting differential clock input.
5	nD1	Input	Pullup/ Pulldown	Inverting differential clock input. V <sub>CC</sub> /2 default when left floating.
6	D2	Input	Pulldown	Non-inverting differential clock input.
7	nD2	Input	Pullup/ Pulldown	Inverting differential clock input. V <sub>CC</sub> /2 default when left floating.
8	D3	Input	Pulldown	Non-inverting differential clock input.
9	nD3	Input	Pullup/ Pulldown	Inverting differential clock input. V <sub>CC</sub> /2 default when left floating.
10	V <sub>BB</sub>	Power		Bias Voltage.
11	V <sub>EE</sub>	Power		Negative supply pin.
12, 13	nQ3, Q3	Output		Differential output pair. LVPECL interface levels.
14, 15	nQ2, Q2	Output		Differential output pair. LVPECL interface levels.
17, 18	nQ1, Q1	Output		Differential output pair. LVPECL interface levels.
19, 20	nQ0, Q0	Output		Differential output pair. LVPECL interface levels.

NOTE: *Pullup* and *Pulldown* refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

**ABSOLUTE MAXIMUM RATINGS**

Supply Voltage, $V_{CC}$	5.5V (LVPECL mode, $V_{EE} = 0$ )
Negative Supply Voltage, $V_{EE}$	-5.5V (ECL mode, $V_{CC} = 0$ )
Inputs, $V_I$ (LVPECL mode)	-0.5V to $V_{CC} + 0.5V$
Inputs, $V_I$ (ECL mode)	0.5V to $V_{EE} - 0.5V$
Outputs, $I_O$	
Continuous Current	50mA
Surge Current	100mA
$V_{BB}$ Sing/Source, $I_{BB}$	$\pm 0.5mA$
Operating Temperature Range, $T_A$	-40°C to +85°C
Storage Temperature, $T_{STG}$	-65°C to 150°C
Package Thermal Impedance, $\theta_{JA}$ (Junction-to-Ambient)	46.2°C/W (0 lfpm)

**NOTE:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

## APPLICATION INFORMATION

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 1A shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} \approx V_{CC}/2$  is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio

of R1 and R2 might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and  $V_{CC} = 3.3V$ ,  $V_{REF}$  should be 1.25V and  $R2/R1 = 0.609$ .

FIGURE 1A. SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LVPECL LEVELS

Figure 1B shows an example of the differential input that can be wired to accept single ended LVPECL levels. The reference voltage level  $V_{BB}$  generated from the device is connected to the

negative input. The C1 capacitor should be located as close as possible to the input pin.

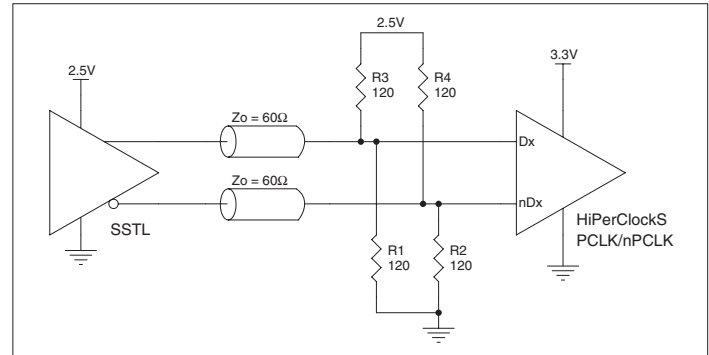

FIGURE 1B. SINGLE ENDED LVPECL SIGNAL DRIVING DIFFERENTIAL INPUT

## LVPECL CLOCK INPUT INTERFACE

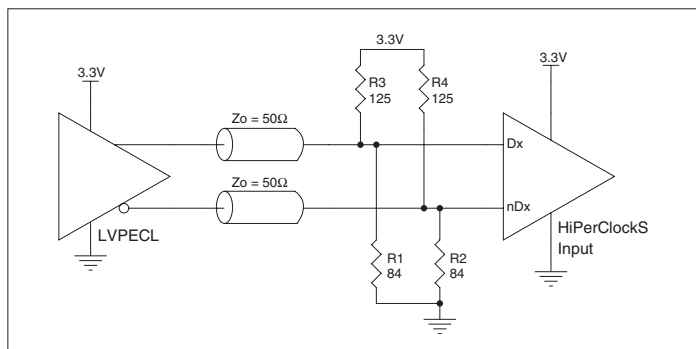

The Dx/nDx accepts LVPECL, CML, SSTL and other differential signals. Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 2A to 2E show interface examples for the HiPerClockS Dx/nDx input driven by the most common driver

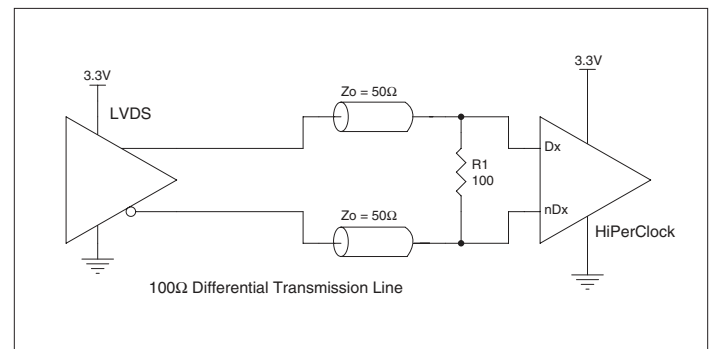

**FIGURE 2A. HiPerClockS D/nD INPUT DRIVEN BY A CML DRIVER**

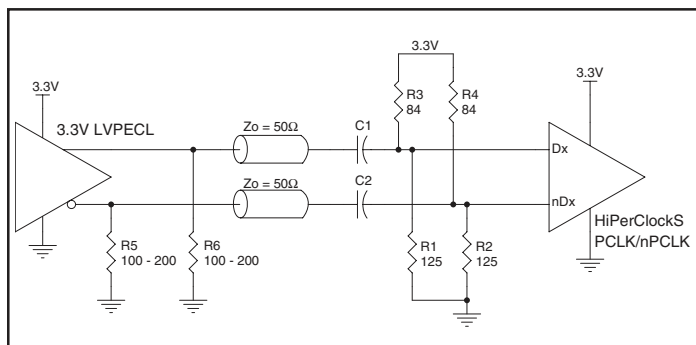

**FIGURE 2B. HiPerClockS D/nD INPUT DRIVEN BY AN SSTL DRIVER**

**FIGURE 2C. HiPerClockS D/nD INPUT DRIVEN BY A 3.3V LVPECL DRIVER**

**FIGURE 2E. HiPerClockS D/nD INPUT DRIVEN BY A 3.3V LVPECL DRIVER WITH AC COUPLE**

### TERMINATION FOR 3.3V LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω

transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 3A and 3B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 3A. LVPECL OUTPUT TERMINATION

FIGURE 3B. LVPECL OUTPUT TERMINATION

### TERMINATION FOR 5V LVPECL OUTPUT

This section shows examples of 5V LVPECL output termination. *Figure 4A* shows standard termination for 5V LVPECL. The termination requires matched load of 50Ω resistors pull down to

$V_{cc} - 2V = 3V$  at the receiver. *Figure 4B* shows Thevenin equivalence of *Figure 4A*. In actual application where the 3V DC power supply is not available, this approach is normally used.

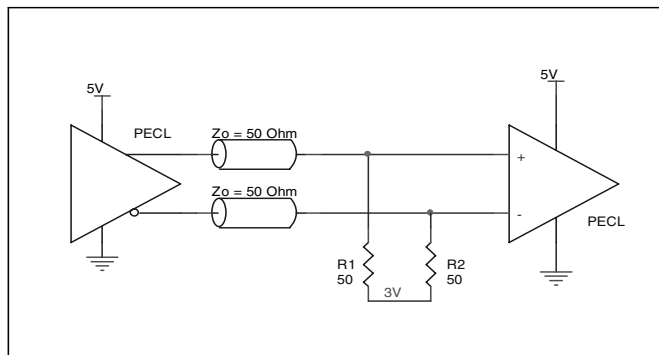

FIGURE 4A. STANDARD 5V LVPECL OUTPUT TERMINATION

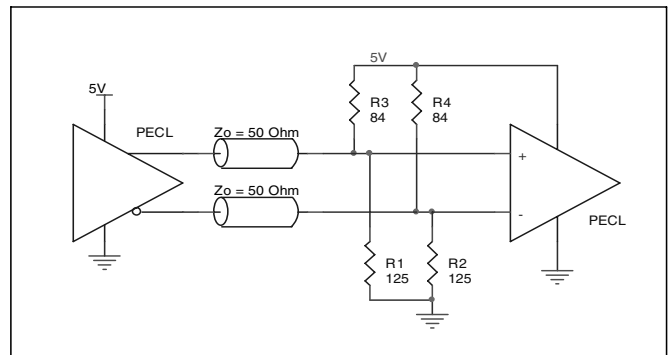

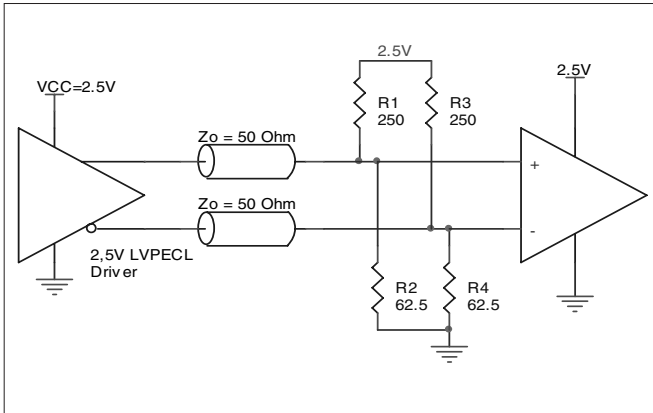

FIGURE 4B. 5V LVPECL OUTPUT TERMINATION EXAMPLE

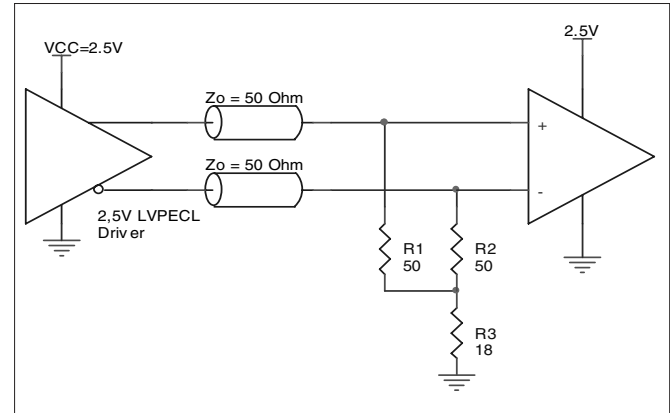

**TERMINATION FOR 2.5V LVPECL OUTPUT**

Figure 5A and Figure 5B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to  $V_{cc} - 2V$ . For  $V_{cc} = 2.5V$ , the  $V_{cc} - 2V$  is very close to ground

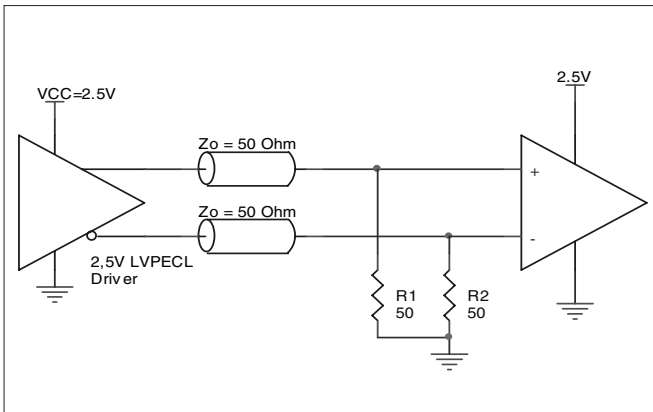

level. The R3 in Figure 5B can be eliminated and the termination is shown in Figure 5C.

**FIGURE 5A. 2.5V LVPECL DRIVER TERMINATION EXAMPLE**

**FIGURE 5B. 2.5V LVPECL DRIVER TERMINATION EXAMPLE**

**FIGURE 5C. 2.5V LVPECL TERMINATION EXAMPLE**

**RECOMMENDATIONS FOR UNUSED INPUT PINS**

**INPUTS:**

**Dx INPUTS**

For applications not requiring the use of a clock input, it can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from the Dx input to ground.

**OUTPUTS:**

**LVPECL OUTPUTS**

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS853017. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS853017 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 5.5V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{CC,MAX} * I_{EE,MAX} = 5.5V * 46mA = 253mW$
- Power (outputs)<sub>MAX</sub> = **30.94mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $4 * 30.94mW = 123.76mW$

$$\text{Total Power}_{MAX} (5.5V, \text{ with all outputs switching}) = 123.76mW + 253mW = 376.76mW$$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd_{total} + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd_{total}$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming no air flow and a multi-layer board, the appropriate value is 46.2°C/W per Table 6 below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ C + 0.377W * 46.2^\circ C/W = 102.4^\circ C. \text{ This is well below the limit of } 125^\circ C.$$

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 6. THERMAL RESISTANCE  $\theta_{JA}$  FOR 20-PIN SOIC, FORCED CONVECTION**

	$\theta_{JA}$ by Velocity (Linear Feet per Minute)		
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	83.2°C/W	65.7°C/W	57.5°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	46.2°C/W	39.7°C/W	36.8°C/W

**NOTE:** Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

### 3. Calculations and Equations.

LVPECL output driver circuit and termination are shown in Figure 6.

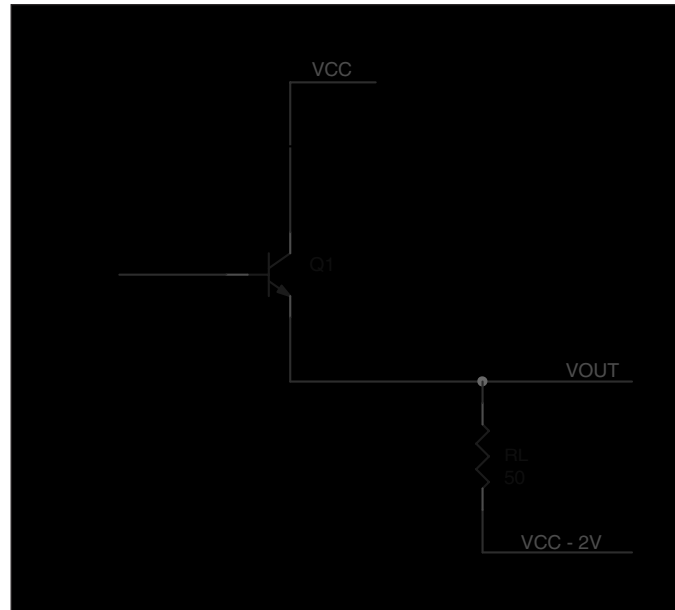

FIGURE 6. LVPECL Driver Circuit and Termination

To calculate worst case power dissipation into the load, use the following equations which assume a  $50\Omega$  load, and a termination voltage of  $V_{CC} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CC\_MAX} - 0.935V$

$$(V_{CC\_MAX} - V_{OH\_MAX}) = 0.935V$$

- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CC\_MAX} - 1.67V$

$$(V_{CC\_MAX} - V_{OL\_MAX}) = 1.67V$$

$$Pd\_H = [(V_{OH\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - 0.935V)/50\Omega] * 0.935V = 19.92mW$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - 1.67V)/50\Omega] * 1.67V = 11.02mW$$

Total Power Dissipation per output pair =  $Pd\_H + Pd\_L = 30.94mW$

## RELIABILITY INFORMATION
