MAX9502 2.5V Video Amplifier with Reconstruction Filter

General Description

The MAX9502 small, low-power video amplifier with integrated reconstruction filter operates from a supply voltage as low as 2.5V. The small size and the low minimum supply voltage make the MAX9502 ideal for portable applications or small, low-power applications.

The MAX9502 DC-couples the input and the output, resulting in a very small solution. The MAX9502 input can be directly connected to the output of a video digital-toanalog converter (DAC). The reconstruction filter is implemented as a 4th-order Chebyshev with a minimum passband of 5.5MHz, 3dB attenuation at 8MHz, and 55dB attenuation at 27MHz.

The output amplifier provides a closed-loop gain of +6dB (MAX9502G) or +12dB (MAX9502M), and can drive a $2V_{P-P}$ video signal into a 150Ω load to ground. The output signal is level-shifted so the sync tip is 110mV (typ) above ground.

The MAX9502 operates from a 2.5V to 3.6V single supply and consumes only 5.3mA quiescent supply current. An active-low shutdown mode reduces the supply current to 0.01µA.

The MAX9502 is available in tiny 6-pin µDFN (1mm x 1.5mm x 0.8mm) and 5-pin SC70 packages. The device is specified over the -40°C to +85°C extended and -40°C to +125°C automotive temperature ranges.

Applications

- Mobile Phones
- Digital Still Cameras
- Portable Video
- Security/CCTV

Pin Configurations appear at end of data sheet.

Features

- Tiny 6-Pin µDFN (1mm x 1.5mm x 0.8mm) and 5-Pin SC70 Packages
- DC-Coupled Input and Output Save Board Space
- 4-Pole Chebyshev Filter
- 5.5MHz Passband
- 55dB Attenuation at 27MHz
- 0.01µA Low-Current Shutdown Mode
- 2.5V to 3.6V Single-Supply Operation
- Video Amplifier with Fixed Gains of +6dB (MAX9502G) or +12dB (MAX9502M)

Typical Operating Circuit

Pin Description

PIN		NAME	FUNCTION
µDFN	SC70		
1	1	IN	Video Input
2	2	GND	Ground
3	3	$\overline{SHDN}$	Active-Low Shutdown Input. Connect to GND to shutdown.
4	4	V_{CC}	Positive Power Supply
5	—	N.C.	No Connection. Not internally connected.
6	5	OUT	Video Output

Detailed Description

The MAX9502 filters and amplifies the video DAC output in applications such as digital still cameras and mobile phones. The MAX9502 consists of a lowpass filter and an output video buffer capable of driving a standard 150Ω video load to ground. The MAX9502G output buffer provides a fixed gain of +6dB, while the MAX9502M output buffer provides a fixed gain of +12dB.

Filter

The MAX9502 contains a 4th-order Chebyshev reconstruction filter. The Chebyshev-type response features a 0.4dB flat passband for NTSC and PAL signals. The stopband offers 55dB (typ) of attenuation at 27MHz and above (see the *Typical Operating Characteristics*).

Output Amplifier

The MAX9502G features a +6dB gain, while the MAX9502M features a +12dB gain. Operating from a 2.5V to 3.0V supply, the output amplifier is able to drive a 2V signal into a 150Ω video load to ground. Operating from a 3.0V to 3.6V supply, the output amplifier is able to drive a $2.4V_{P-P}$ signal into a 150Ω video load to ground. The output is typically offset 110mV above ground to guarantee linear operation of the amplifier. The MAX9502 output only sources current; all loads should be connected to ground.

Short-Circuit Protection

The MAX9502 typical application circuit includes a 75Ω back-termination resistor that limits short-circuit currents for an external short applied at the video output. The MAX9502 features internal output short-circuit protection to prevent device damage in prototyping and applications where the amplifier output can be directly shorted.

Short-circuit protection activates if the output is short-circuited and the output current exceeds 95mA. During short-circuit protection, the output of the MAX9502 is shut off for 12µs and then turns on for 0.8µs. If the short is still present, the MAX9502 output shuts off again. Extended short circuits result in a pulsed output. The device resumes normal operation after the short is removed.

Applications Information

Input Considerations

The MAX9502 input is DC-coupled. When the supply voltage is between a 2.5V and 3V supply, the input voltage range extends from ground to 1.05V for the MAX9502G and from ground to 0.525V for the MAX9502M. When the supply voltage is between 3V and 3.6V, the input voltage range extends from ground to 1.2V for the MAX9502G and from ground to 0.6V for the MAX9502M. The MAX9502G accepts a composite video signal with a sync tip from 0 to 50mV and the MAX9502M accepts a composite video signal with a sync tip from 0 to 25mV. A typical current-output DAC that operates from a single supply usually creates a composite video signal with a sync tip very close to ground. Hence, the DAC output can be directly connected to the MAX9502 input. Keep the board trace as short as possible to minimize parasitic stray capacitance and prevent unintentional high-frequency attenuation.

Output Considerations

The MAX9502 output must be DC-coupled. No AC-coupling capacitors are allowed. The MAX9502 connects directly to the video cable through a 75Ω series backtermination resistor. The other end of the cable should be properly terminated with a 75Ω resistor as well. Because of this configuration, the peak-to-peak amplitude as well as the DC level of the signal is divided by two. The MAX9502 output signal is level-shifted up so the sync tip is around 110mV.

Power-Supply Bypassing and Layout Considerations

The MAX9502 operates from a single-supply voltage down to 2.5V, allowing for low-power consumption. Bypass V_{CC} to GND with a 0.1µF capacitor. Place all external components as close to the device as possible.
