

Low IBIAS, +1.4V/800nA, Rail-to-Rail Op Amps with +1.2V Buffered Reference

General Description

The single MAX4036/MAX4037 and dual MAX4038/MAX4039 operational amplifiers operate from a single +1.4V to +3.6V (without reference) or +1.8V to +3.6V (with reference) supply and consume only 800nA of supply current per amplifier, and 1.1μA for the optional reference. The MAX4036/MAX4038 feature a common-mode input voltage range from 0V to $V_{DD} - 0.4V$ at $V_{DD} = 1.4V$. The MAX4037/MAX4039 feature a 1.232V voltage reference capable of sourcing 100μA and sinking 20μA.

The MAX4036–MAX4039s' rail-to-rail outputs drive 5kΩ loads to within 25mV of the rails. Ultra-low supply current, low operating voltage, and rail-to-rail outputs make the MAX4036–MAX4039 ideal for use in single-cell lithium-ion (Li+), or two-cell NiCd/NiMH/alkaline battery-powered applications.

The MAX4036 is available in an SC70 package, the MAX4037 in a SOT23 package, and the MAX4038/MAX4039 in UCSP™, μMAX®, and TDFN packages.

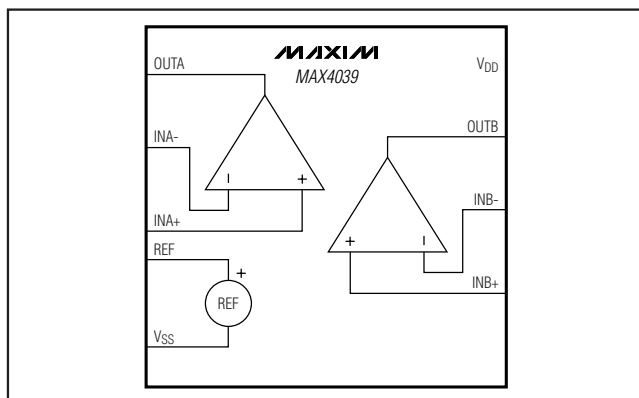

Applications

Battery-Powered/Solar-Powered Systems
 Portable Medical Instrumentation
 Pagers and Cell Phones
 Micropower Thermostats and Potentiostats
 Electrometer Amplifiers
 Remote Sensor Amplifiers
 Active Badges
 pH Meters

Pin Configurations and Selector Guide appear at end of data sheet.

μMAX is a registered trademark and UCSP is a trademark of Maxim Integrated Products, Inc.

Functional Diagram

Features

- ◆ Ultra-Low 800nA per Amplifier Supply Current
- ◆ Ultra-Low 1.4V Supply Voltage Operation (1.8V for MAX4037/MAX4039)
- ◆ Rail-to-Rail Outputs Drive 5kΩ and 5000pF Load
- ◆ 1.232V ±0.5%, 120ppm/°C (max) Reference (MAX4037/MAX4039)
- ◆ No External Reference Bypass Capacitor Required
- ◆ No Phase Reversal for Overdriven Inputs
- ◆ Low 1.0pA (typ) Input Bias Current
- ◆ Low 200μV Input Offset Voltage
- ◆ Unity-Gain Stable
- ◆ Available in Tiny UCSP, SC70, SOT23, TDFN, and μMAX Packages
- ◆ Available in -40°C to +125°C Temperature Range (MAX4036A/MAX4038A)

Detailed Description

The MAX4036–MAX4039 consume an ultra-low supply current and have rail-to-rail output stages specifically designed for low-voltage operation. The input common-mode voltage range extends from V_{DD} - 0.4V to V_{SS}, although full rail-to-rail input range is possible with degraded performance when operating from a supply voltage above 3.0V. The input offset voltage is typically 200 μ V. Low-operating supply voltage, low supply current, and rail-to-rail outputs make the MAX4036–MAX4039 an excellent choice for precision or general-purpose low-voltage, battery-powered systems.

Rail-to-Rail Outputs

The MAX4036–MAX4039 output stages can drive a 5k Ω load and still swing to within 40mV of the rails. Figure 1 shows the output voltage swing of the MAX4036–MAX4039 configured as a unity-gain buffer, powered from a single 2.4V supply. The output for this setup typically swings from 5mV to V_{DD} - 5mV with a 100k Ω load.

Figure 1. Rail-to-Rail Input/Output Voltage Range

Low IBIAS, +1.4V/800nA, Rail-to-Rail Op Amps with +1.2V Buffered Reference

Applications Information

Power-Supply Considerations

The MAX4036-MAX4039 operate from a single 1.4V (MAX4036/MAX4038) or 1.8V (MAX4037/MAX4039) to 3.6V supply. A high amplifier power-supply rejection ratio of 82dB and the excellent reference line regulation allow the devices to be powered directly from a decaying battery voltage, simplifying design and extending battery life. The MAX4036-MAX4039 are ideally suited for low-voltage battery-powered systems. The *Typical Operating Characteristics* show the changes in supply current and reference output as a function of supply voltage.

Power-Up Settling Time

The MAX4036-MAX4039 typically require 0.25ms to power-up. During this startup time, the output is indeterminate. The application circuit should allow for this initial delay. See the *Typical Operating Characteristics* for amplifier and reference settling time curves.

Driving Capacitive Loads: Op Amps

The MAX4036-MAX4039 amplifier(s) require no output capacitor for stability, and are unity-gain stable for loads up to 5000pF. Applications that require greater capacitive-drive capability should use an isolation resistor between the output and the capacitive load (Figure 2). Note that this solution reduces the gain and output voltage swing because R_{ISO} forms a voltage-divider with the load resistor.

Crossover Distortion

The MAX4036-MAX4039 output stages are capable of sourcing and sinking currents with orders of magnitude greater than the stages' quiescent current, which is less than 1 μ A. This ability to drive heavy loads with such a small quiescent current introduces crossover

Figure 2. Using a Resistor to Isolate a Capacitive Load from the Op Amp

Figure 3. Hysteresis

distortion as the output stage passes between sinking and sourcing. In the crossover regions, the output impedance of the MAX4036-MAX4039 increases substantially, thereby changing the load-driving characteristics. The distortion can be greatly reduced by increasing the load resistance. For applications where low load resistance is required, bias the load such that the output current is always in one direction, to avoid crossover distortion.

Reference Bypassing

The MAX4037/MAX4039 reference requires no external capacitors.

Using the MAX4036-MAX4039 as a Comparator

Although optimized for use as an operational amplifier, the MAX4036-MAX4039 can be used as a rail-to-rail I/O comparator (Figures 3, 4). External hysteresis can be used to minimize the risk of output oscillation. The positive feedback circuit, shown in Figure 4, causes the input threshold to change when the output voltage changes state.

Battery Monitoring Using the MAX4037/MAX4039 and Hysteresis

The internal reference and low operating voltage of the MAX4037/MAX4039 make the devices ideal for battery-monitoring applications. Hysteresis can be set using resistors as shown in Figure 4, and the following design procedure:

- 1) Choose R_3 . The input bias current of IN_+ is under 100pA over temperature, so a current through R_3 around 100nA maintains accuracy. The current through R_3 at the trip point is V_{REF} / R_3 , or 100nA for $R_3 = 12M\Omega$. $10M\Omega$ is a good practical value.
- 2) Choose the hysteresis voltage (V_{HB}), the voltage between the upper and lower thresholds. In this example, choose $V_{HB} = 50mV$ (see Figure 3).

Low IBIAS, +1.4V/800nA, Rail-to-Rail Op Amps with +1.2V Buffered Reference

3) Calculate R1:

$$\begin{aligned} R1 &= R3 \times \frac{V_{HB}}{V_{DD}} \\ &= 10M\Omega \times \frac{0.5V}{2.4V} \\ &= 210k\Omega \end{aligned}$$

4) Choose the threshold voltage for V_{IN} rising (V_{THR}). In this example, choose $V_{THR} = 2.0V$.

5) Calculate R2:

$$\begin{aligned} R2 &= \frac{1}{\left[\left(\frac{V_{THR}}{V_{REF} \times R1} \right) - \frac{1}{R1} - \frac{1}{R3} \right]} \\ &= \frac{1}{\left[\left(\frac{2.0V}{1.2V \times 210k\Omega} \right) - \frac{1}{210k\Omega} - \frac{1}{10M\Omega} \right]} \\ &= 325k\Omega \end{aligned}$$

6) Verify the threshold voltages with these formulas:
 V_{IN} rising:

$$V_{THR} = V_{REF} \times R1 \times \left(\frac{1}{R1} + \frac{1}{R2} + \frac{1}{R3} \right)$$

V_{IN} falling:

$$V_{THF} = V_{THR} - \left(\frac{R1 \times V_{DD}}{R3} \right)$$

In this application, the MAX4036-MAX4039 supply current will vary, depending on the output state of the comparator.

Power Supplies and Layout

The MAX4036-MAX4039 operate from a single 1.4V (MAX4036/MAX4038) or 1.8V (MAX4037/MAX4039) to 3.6V power supply. Bypass V_{DD} with a 0.1 μ F capacitor to ground to minimize noise.

Good layout techniques optimize performance by decreasing the amount of stray capacitance to the op amp's inputs and outputs. To decrease stray capacitance, minimize trace lengths by placing external components close to the device.

The exposed paddle (EP) on the TDFN packages of the MAX4038 and MAX4039 is internally connected to the device substrate, V_{SS} . Connect the exposed paddle to V_{SS} or leave EP unconnected. Running traces below the exposed paddle is not recommended.

Low IBIAS, +1.4V/800nA, Rail-to-Rail Op Amps with +1.2V Buffered Reference

Package Information

For the latest package outline information and land patterns, go to www.maxim-ic.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

SC70, 5LEPS

DALLAS SEMICONDUCTOR **MAXIM**

TITLE: PACKAGE OUTLINE, 5L SC70

APPROVAL	DOCUMENT CONTROL NO. 21-0076	REV. E	1/1
----------	---------------------------------	-----------	-----

Low IBIAS, +1.4V/800nA, Rail-to-Rail Op Amps with +1.2V Buffered Reference

Package Information (continued)

For the latest package outline information and land patterns, go to www.maxim-ic.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

MAX4036-MAX4039

6LSOT.EPS

Low IBIAS, +1.4V/800nA, Rail-to-Rail Op Amps with +1.2V Buffered Reference

Package Information (continued)

For the latest package outline information and land patterns, go to www.maxim-ic.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. FOOT LENGTH MEASURED AT INTERCEPT POINT BETWEEN DATUM A & LEAD SURFACE.
3. PACKAGE OUTLINE EXCLUSIVE OF MOLD FLASH & METAL BURR. MOLD FLASH, PROTRUSION OR METAL BURR SHOULD NOT EXCEED 0.25mm.
4. PACKAGE OUTLINE INCLUSIVE OF SOLDER PLATING.
5. PIN 1 IS LOWER LEFT PIN WHEN READING TOP MARK FROM LEFT TO RIGHT. (SEE EXAMPLE TOP MARK)
6. PIN 1 I.D. DOT IS 0.3mm Ø MIN. LOCATED ABOVE PIN 1.
7. MEETS JEDEC MO17B, VARIATION AB.
8. SOLDER THICKNESS MEASURED AT FLAT SECTION OF LEAD BETWEEN 0.08mm AND 0.15mm FROM LEAD TIP.
9. LEAD TO BE COPLANAR WITHIN 0.1mm.
10. NUMBER OF LEADS SHOWN ARE FOR REFERENCE ONLY.
11. MARKING IS FOR PACKAGE ORIENTATION REFERENCE ONLY.
