

**TWO-CHANNEL, 20-BIT, AC'97 2.3 CODECS WITH STEREO MICROPHONE AND MIC/JACK SENSING**
**STAC9766/9767**
**FEATURES**

- This datasheet is for Rev. CC1 Parts and Beyond
- High Performance  $\Sigma\Delta$  Technology
- AC'97 Rev 2.3 Compliant
- 20-bit Full Duplex Stereo ADC & DACs
- Independent Sample Rates for ADC & DACs
- 5-Wire AC-Link Protocol Compliance
- 20-bit SPDIF Output
- Full Stereo Microphone Pre-Amp
- Internal Jack Sensing on Headphone & Line\_Out
- Internal Microphone Input Sensing
- Digital PC Beep Option
- Extended AC'97 2.3 Paging Registers
- Digital-ready Status
- General Purpose I/O
- Crystal Elimination Circuit
- Headphone Drive Capability (50 mW)
- 0dB, 10dB, 20dB and 30dB Microphone Boost Capability
- +3.3 V (STAC9767) and +5 V (STAC9766) Analog Power Supply Options
- Pin Compatible with STAC9700/21/56
- 100% Compatible with STAC9750/52
- IDT Surround (SS3D) Stereo Enhancement
- Energy Saving Dynamic Power Modes
- Multi-CODEC Option (Intel AC'97 rev 2.3)
- Six Analog Line-level Inputs
- 103dB SNR LINE-LINE

**KEY SPECIFICATIONS**

- Analog LINE\_OUT SNR: 103 dB
- Digital DAC SNR: 95 dB
- Digital ADC SNR: 85 dB
- Full-scale Total Harmonic Distortion: 0.002%
- Crosstalk Between Input Channels: -70 dB
- Spurious Tone Rejection: 100 dB

**DESCRIPTION**

IDT's STAC9766/9767 (Revision CC1 and beyond) are general purpose 20-bit, full duplex, audio CODECs conforming to the analog component specification of AC'97 (Audio CODEC 97 Component Specification Rev. 2.3).

The STAC9766/9767 incorporates IDT's proprietary  $\Sigma\Delta$  technology. The AC'97 CODEC is designed to achieve a DAC SNR in excess of 103dB.

The DACs, ADCs and mixer are integrated with analog I/Os, which include four analog line-level stereo inputs, two analog line-level mono inputs, two stereo outputs, and one mono output channel. The STAC9766/9767 includes digital input/output capability for support of modern PC systems with an output that supports the SPDIF format.

The STAC9766/9767 is a standard 2-channel stereo CODEC. With IDT's headphone drive capability, headphones can be driven with or without an external amplifier.

The STAC9766/9767 may be used as a secondary CODEC, with the STAC9700/21/56/08/84/50/52 as the primary, in a multiple CODEC configuration conforming to the AC'97 Rev. 2.3 specification. This configuration can provide the true six-channel, AC-3 playback required for DVD applications.

The STAC9766/9767 communicates via the five-wire AC-Link to any digital component of AC'97, providing flexibility in the audio system design.

Packaged in an AC'97 compliant 48-pin TQFP, the STAC9766/9767 can be placed on a motherboard, daughter boards, PCI, AMR, CNR, MDC or ACR cards.

The STAC9766/9767 provides variable sample rate Digital-to-Analog (DA) and Analog-to-Digital (AD) conversion, mixing and analog processing.

Supported audio sample rates include 48KHz, 44.1KHz, 32KHz, 22.05KHz, 16KHz, 11.025KHz, and 8 KHz; additional rates are supported in the STAC9766/9767 soft audio drivers. All ADCs and DACs operate at 20-bit resolution.

The STAC9766/9767 includes *full Stereo Microphone*

## 1. PRODUCT BRIEF

### 1.1. Features (Revision CC1 and beyond)

- High Performance  $\Sigma\Delta$  Technology
- AC'97 Rev 2.3 Compliant
- 20-bit Full Duplex Stereo ADCs, DACs
- Independent Sample Rates for ADCs & DACs
- 5-Wire AC-Link Protocol Compliance
- 20-bit SPDIF Output
- Full Stereo Microphone Pre-Amp
- Internal Jack Sensing on Headphone and Line\_Out
- Internal Microphone Input Sensing
- Digital PC Beep Option
- Extended AC'97 2.3 Paging Registers
- Adjustable VREF Amplifier
- Digital-ready Status
- General Purpose I/Os
- Crystal Elimination Circuit
- Headphone Drive Capability (50 mW)
- 0dB, 10dB, 20dB, and 30dB Stereo or Mono Microphone Boost Capability
- +3.3V (STAC9767) and +5V (STAC9766) Analog Power Supply Options
- Pin Compatible with the STAC9700, STAC9721, STAC9756
- 100% Pin Compatible with STAC9750 and STAC9752
- IDT Surround (SS3D) Stereo Enhancement
- Energy Saving Dynamic Power Modes
- Multi-CODEC option (Intel AC'97 rev 2.3)
- Six Analog Line-level Inputs
- 103dB SNR LINE-LINE

### 1.2. Description

IDT's STAC9766/9767 (Revision CC1 and beyond) are general purpose 20-bit, full duplex, audio CODECs conforming to the analog component specification of AC'97 (Audio CODEC 97 Component Specification Rev. 2.3). The STAC9766/9767 incorporates IDT's proprietary  $\Sigma\Delta$  technology to achieve a DAC SNR in excess of 103dB. The DACs, ADCs and mixer are integrated with analog I/Os, which include four analog line-level stereo inputs, two analog line-level mono inputs, two stereo outputs, and one mono output channel. The STAC9766/9767 includes digital output capability for support of modern PC systems with an output that supports the SPDIF format. The STAC9766/9767 is a standard 2-channel stereo CODEC. With IDT's headphone drive capability, headphones can be driven without an external amplifier. The STAC9766/9767 may be used as a secondary CODEC, with the STAC9700/21/44/56/08/84/50/66 as the primary, in a multiple CODEC configuration conforming to the AC'97 Rev. 2.3 specification. This configuration can provide the true six-channel, AC-3 playback required for DVD applications. The STAC9766/9767 communicates via the five-wire

AC-Link to any digital component of AC'97 providing flexibility in the audio system design. Packaged in an AC'97 compliant 48-pin TQFP, the STAC9766/9767 can be placed on a motherboard, daughter boards, PCI, AMR, CNR, MDC or ACR cards.

The STAC9766/9767 block diagram is illustrated in Figure 1. It provides variable sample rate Digital-to-Analog (DA) and Analog-to-Digital (AD) conversion, mixing, and analog processing. Supported audio sample rates include 48KHz, 44.1KHz, 32 KHz, 22.05KHz, 16KHz, 11.025KHz, and 8KHz; additional rates are supported in the STAC9766/9767 soft audio drivers. All ADCs and DACs operate at 20-bit resolution.

Two 20-bit DACs convert the digital stereo PCM-out content to audio. The MIXER block combines the PCM\_OUT with any analog sources to drive the LINE\_OUT and HP\_OUT outputs. The MONO\_OUT delivers either microphone only, or a mono mix of sources from the MIXER. The stereo variable sample rate 20-bit ADCs provide record capability for any mix of mono or stereo sources, and deliver a digital stereo PCM-in signal back to the AC-Link. The microphone input and mono mix input can be recorded simultaneously, thus allowing for an all digital output in support of the digital ready initiative. For a digital ready record path, the microphone is connected to the left channel ADC while the mono output of the stereo mixer is connected to right channel ADC.

The STAC9766/9767 includes full Stereo Microphone Pre-Amp support and can be used with the 10dB, 20dB and 30dB Microphone Boost options. This integration allows for additional cost savings and options.

The STAC9766/9767 includes jack sensing on the Headphone and Line\_Out. The STAC9766/9767 jack sense can detect the presence of devices on the Headphone and Line Outputs and on both Mic inputs. With proprietary IDT current- and impedance-sensing techniques, the impedance load on the Headphone and Line Outputs can also be detected. The GPIOs on the STAC9766/9767 remain available for advanced configurations.

The STAC9766/9767 implementation of jack sense uses the Extended Paging Registers defined by the AC'97 2.3 Specification. This allows for additional registry space to hold the identification information about the CODEC, the jack sensing details and results, and the external surroundings of the CODEC. The information within the Extended Paging Registers will allow for the automatic configuration of the audio subsystem without end-user intervention. For example, the BIOS can populate the Extended Paging Registers with valuable information for both the audio driver and the operating system such as gain and attenuation stages, input population and input phase. With this input information, the IDT driver will automatically provide to the Volume Control Panel only the volume sliders that are implemented in the system, thus improving the end-user's experience with the PC.

The information in the Extended Paging Registers will also allow for automatic configuration of microphone inputs, the ability to switch between SPDIF and analog outputs, the routing of the master volume slider to the proper physical output, and SoftEQ configurations. The fully parametric IDT SoftEQ can be initiated upon jack insertion and sensed impedance levels.

The STAC9766/9767 also offers two styles of PC BEEP, Analog and Digital. The digital PC BEEP is a new feature added to the AC'97 Specification Rev 2.3.

The STAC9766/9767 is designed primarily to support stereo (2-speaker) audio. True AC-3 playback can be achieved for 6-speaker applications by taking advantage of the multi-CODEC option available in the STAC9766/9767 to support multiple CODECs in an AC'97 architecture. Additionally, the

STAC9766/9767 provides for a stereo enhancement feature, IDT Surround 3D (SS3D). SS3D provides the listener with several options for improved speaker separation beyond the normal 2- or 4-speaker arrangements.

The STAC9766/9767 can be SoundBlaster® and Windows Sound System® compatible when used with IDT's WDM driver for Windows 98/2K/ME/XP or with Intel/Microsoft driver included with Windows 2K/ME/XP.

SoundBlaster is a registered trademark of Creative Labs.

Windows is a registered trademark of Microsoft Corporation.

Additional product and company information can be obtained by going to the IDT web site at: [www.IDT.com](http://www.IDT.com)

## 2. CHARACTERISTICS AND SPECIFICATIONS

### 2.1. Electrical Specifications

#### 2.1.1. Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the STAC9766/9767. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Item	Pin	Maximum Rating
Analog maximum supply voltage	AVdd	6 Volts
Digital maximum supply voltage	DVdd	5.5 Volts
VREFOUT output current		5 mA
Voltage on any pin relative to ground		Vss - 0.3 V to Vdd + 0.3 V
Operating temperature		0°C to +70°C
Storage temperature		-55 °C to +125 °C
Soldering temperature		260 °C for 10 seconds * Soldering temperature information for all available packages begins on page 92.

#### 2.1.2. Recommended Operation Conditions

Parameter		Min.	Typ.	Max.	Units
Power Supply Voltage	Digital - 3.3 V	3.135	3.3	3.465	V
	Analog - 3.3 V	3.135	3.3	3.465	V
	Analog - 5 V	4.75	5	5.25	V
Ambient Operating Temperature		0		+70	°C
Case Temperature	T <sub>case</sub> (48-LQFP)			+90	°C

**ESD:** The STAC9766/9767 is an ESD (electrostatic discharge) sensitive device. The human body and test equipment can accumulate and discharge electrostatic charges up to 4000 Volts without detection. Even though the STAC9766/9767 implements internal ESD protection circuitry, proper ESD precautions should be followed to avoid damaging the functionality or performance.

### 2.1.3. Power Consumption

Parameter	Min	Typ	Max	Unit
<b>Digital Supply Current</b>				
+ 3.3V Digital	-	35	-	mA
<b>Analog Supply Current</b>				
+ 5V Analog	-	80	-	mA
+ 3.3V Analog	-	70	-	mA
<b>Power Down Status</b>				
PR0 Supply Current	-	TBD	-	mA
PR1 Supply Current	-	TBD	-	mA
PR2 Supply Current	-	TBD	-	mA
PR3 Supply Current	-	TBD	-	mA
PR4 Supply Current	-	TBD	-	mA
PR5 Supply Current	-	TBD	-	mA
PR6 Supply Current	-	TBD	-	mA

### 2.1.4. AC-Link Static Digital Specifications

( $T_{\text{ambient}} = 25\text{ }^{\circ}\text{C}$ ,  $DV_{\text{dd}} = 3.3\text{ V} \pm 5\%$ ,  $AV_{\text{ss}} = DV_{\text{ss}} = 0\text{ V}$ ; 50 pF external load)

Parameter	Symbol	Min	Typ	Max	Unit
Input Voltage Range	$V_{\text{in}}$	-0.30	-	$DV_{\text{dd}} + 0.30$	V
Low level input range	$V_{\text{il}}$	-	-	$0.35 \times DV_{\text{dd}}$	V
High level input voltage	$V_{\text{ih}}$	$0.65 \times DV_{\text{dd}}$	-	-	V
High level output voltage	$V_{\text{oh}}$	$0.90 \times DV_{\text{dd}}$	-	-	V
Low level output voltage	$V_{\text{ol}}$	-	-	$0.1 \times DV_{\text{dd}}$	V
Input Leakage Current (AC-Link inputs)	-	-10	-	10	$\mu\text{A}$
Output Leakage Current (AC-Link outputs - Hi-Z)	-	-10	-	10	$\mu\text{A}$
Output buffer drive current	-	-	4	-	mA

### 2.1.5. STAC9766 Analog Performance Characteristics

( $T_{\text{ambient}} = 25\text{ }^{\circ}\text{C}$ ,  $AV_{\text{dd}} = 5.0\text{ V} \pm 5\%$ ,  $DV_{\text{dd}} = 3.3\text{ V} \pm 5\%$ ,  $AV_{\text{ss}} = DV_{\text{ss}} = 0\text{ V}$ ; 1 KHz input sine wave; Sample Frequency = 48 KHz; 0dB = 1 Vrms, 10 K $\Omega$  / 50 pF load, Testbench Characterization BW: 20 Hz – 20 KHz, 0dB settings on all gain stages)

Parameter	Min	Typ	Max	Unit
<b>Full Scale Input Voltage:</b>				
All Analog Inputs except Mic	-	1.0	-	Vrms
Mic Inputs (Note 1)	-	0.03	-	Vrms
<b>Full Scale Output:</b>				
Line Output	-	1.0	-	Vrms
PCM (DAC) to LINE_OUT	-	1.0	-	Vrms
MONO_OUT	-	1.0	-	Vrms
HEADPHONE_OUT (32 $\Omega$ load) (peak)	-	50	-	mW
<b>Analog S/N: (Note 2)</b>				
CD to LINE_OUT	-	103	-	dB
Other to LINE_OUT	-	103	-	dB

Parameter	Min	Typ	Max	Unit
D/A to LINE_OUT	-	95	-	dB
LINE_IN to A/D with High pass filter enabled	-	85	-	dB
Analog Frequency Response (Note 3)	20	-	20,000	Hz
<b>Total Harmonic Distortion: (Note 4)</b>				
CD to LINE_OUT	-	95	-	dB
Other to LINE_OUT	-	95	-	dB
D/A to LINE_OUT (full scale)	-	84	-	dB
LINE_IN to A/D with High pass filter enabled	84	-	-	dB
HEADPHONE_OUT	74	80	-	dB
A/D & D/A Digital Filter Pass Band (Note 5)	20	-	19,200	Hz
A/D & D/A Digital Filter Transition Band	19,200	-	28,800	Hz
A/D & D/A Digital Filter Stop Band	28,800	-	-	Hz
A/D & D/A Digital Filter Stop Band Rejection (Note 6)	100	-	-	dB
DAC Out-of-Band Rejection (Note 7)	55	-	-	dB
Group Delay (48 KHz sample rate)	-	-	1	ms
Any Analog Input to LINE_OUT Crosstalk (10 KHz Signal Frequency)	70	-	-	dB
Any Analog Input to LINE_OUT Crosstalk (1 KHz Signal Frequency)	-	100	-	dB
Spurious Tone Rejection	-	100	-	dB
Attenuation, Gain Step Size	-	1.5	-	dB
Input Impedance (Note 8)	-	50	-	K $\Omega$
Input Capacitance	-	15	-	pF
VREFout	-	0.5 x AVdd	-	V
Interchannel Gain Mismatch ADC	-	-	0.5	dB
Interchannel Gain Mismatch DAC	-	-	0.5	dB

- Note:**
1. With +30 dB Boost on, 1.0 Vrms with Boost off
  2. Ratio of Full Scale signal to idle channel noise output is measured "A weighted" over a 20 Hz to a 20 KHz bandwidth. (AES17-1991 Idle Channel Noise or EIAJ CP-307 Signal-to-noise Ratio).
  3.  $\pm 1$  dB limits for Line Output & 0dB gain
  4. 20 KHz BW, 48 KHz Sample Frequency
  5.  $\pm 0.25$  dB limits
  6. Stop Band rejection determines filter requirements. Out-of-Band rejection determines audible noise.
  7. The integrated Out-of-Band noise generated by the DAC process, during normal PCM audio playback, over a bandwidth 28.8 to 100 KHz, with respect to a 1 Vrms DAC output.
  8. For all inputs except PC BEEP.

### 2.1.6. STAC9767 Analog Performance Characteristics

( $T_{\text{ambient}} = 25^{\circ}\text{C}$ ,  $AV_{\text{dd}} = 3.3\text{V} \pm 5\%$ ,  $DV_{\text{dd}} = 3.3\text{V} \pm 5\%$ ,  $AV_{\text{ss}} = DV_{\text{ss}} = 0\text{V}$ ; 1KHz inputsine wave; Sample Frequency=48KHz; 0dB=1Vrms, 10K $\Omega$  / 50 pFload, TestbenchCharacterization BW: 20Hz–20KHz, 0dB settings on all gain stages)

## 2.2. AC Timing Characteristics

( $T_{\text{ambient}} = 25\text{ }^{\circ}\text{C}$ ,  $AV_{\text{dd}} = 3.3\text{ V}$  or  $5\text{ V} \pm 5\%$ ,  $DV_{\text{dd}} = 3.3\text{ V} \pm 5\%$ ,  $AV_{\text{ss}} = DV_{\text{ss}} = 0\text{ V}$ ; 75 pF external load for BIT\_CLK and 60pF external load for SDATA\_IN)

### 2.2.1. Cold Reset

Figure 2. Cold Reset Timing

Parameter	Symbol	Min	Typ	Max	Units
RESET# active low pulse width	$T_{\text{res\_low}}$	1.0	-	-	$\mu\text{s}$
RESET# inactive to SDATA_IN or BIT_CLK active delay	$T_{\text{tri2actv}}$	-	-	25	ns
RESET# inactive to BIT_CLK startup delay	$T_{\text{rst2clk}}$	0.01628	-	400	$\mu\text{s}$
BIT_CLK active to RESET# asserted (Not shown in diagram)	$T_{\text{clk2rst}}$	0.416	-	-	$\mu\text{s}$

Note: BIT\_CLK and SDATA\_IN are in a high impedance state during reset.

### 2.2.2. Warm Reset

Figure 3. Warm Reset Timing

Parameter	Symbol	Min	Typ	Max	Units
SYNC active high pulse width	$T_{\text{sync\_high}}$	1.0	1.3	-	$\mu\text{s}$
SYNC inactive to BIT_CLK startup delay	$T_{\text{sync2clk}}$	162.8	-	-	ns

### 2.2.3. Clocks

Figure 4. Clocks Timing

Parameter	Symbol	Min	Typ	Max	Units
BIT_CLK frequency		-	12.288	-	MHz
BIT_CLK period	Tclk_period	-	81.4	-	ns
BIT_CLK output jitter		-	750	-	ps
BLT_CLK high pulse width (Note 1)	Tclk_high	36	40.7	45	ns
BIT_CLK low pulse width (Note 1)	Tclk_low	36	40.7	45	ns
SYNC frequency		-	48.0	-	KHz
SYNC period	Tsync_period	-	20.8	-	μs
SYNC high pulse width	Tsync_high	-	1.3	-	μs
SYNC low pulse width	Tsync_low	-	19.5	-	μs

**Note:** 1. Worst case duty cycle restricted to 45/55.

### 2.2.4. STAC9766/9767 Crystal Elimination Circuit and Clock Frequencies

The STAC9766/9767 supports several clock frequency inputs as described in the following table. In general, when a 24.576 MHz xtal is not used, the XTALOUT pin should be tied to ground. This short to ground configures the part into an alternate clock mode and enables an on board PLL.

CODEC Modes:

P = The STAC9766/9767 as a Primary CODEC

S = The STAC9766/9767 as a Secondary CODEC.

Table 1. Clock Mode Configuration

XTL_OUT Pin Config	CID1 Pin Config	CID0 Pin Config	Clock Source Input	CODEC Mode	CODEC D
XTAL	float	float	24.576MHz crystal	P	0
XTAL or open	float	pulldown	12.288 MHz BIT_CLK	S	1
XTAL or open	pulldown	float	12.288 MHz BIT_CLK	S	2
XTAL or open	pulldown	pulldown	12.288 MHz BIT_CLK	S	3
short to ground	float	float	14.31818 MHz source	P	0
short to ground	float	pulldown	27 MHz source	P	0
short to ground	pulldown	float	48 MHz source	P	0
short to ground	pulldown	pulldown	24.576 MHz source	P	0

Table 2. Common Clocks and Sources

Clock Source	Clock Frequency
XTAL	24.576MHz
BIT_CLK	12.288MHz
VGA	14.31818MHz
Digital Video	27MHz
USB	48MHz

### 2.2.5. Data Setup and Hold

(50pF external load)

Figure 5. Data Setup and Hold Timing

Parameter	Symbol	Min	Typ	Max	Units
Setup to falling edge of BIT_CLK	Tsetup	10	-	-	ns
Hold from falling edge of BIT_CLK	Thold	10	-	-	ns
Output Valid Data from rising edge of BIT_CLK	tco	-	-	15	ns

**Note:** Setup and hold time parameters for SDATA\_IN are with respect to the AC'97 controller.

### 2.2.6. Signal Rise and Fall Times

(BIT\_CLK: 75pF external load; from 10% to 90% of Vdd)

(SDATA\_IN: 60pF external load; from 10% to 90% of Vdd)

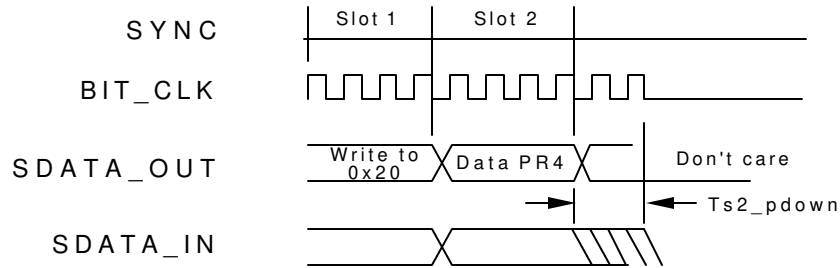

Figure 6. Signal Rise and Fall Times Timing

Parameter	Symbol	Min	Typ	Max	Units
BIT_CLK rise time	Triseclk	-	-	6	ns
BIT_CLK fall time	Tfallclk	-	-	6	ns
SDATA_IN rise time	Trisedin	-	-	6	ns
SDATA_IN fall time	Tfalldin	-	-	6	ns

### 2.2.7. AC-Link Low Power Mode Timing

Figure 7. AC-Link Low Power Mode Timing

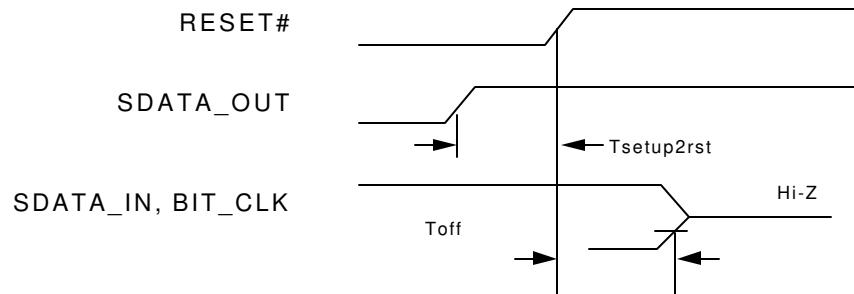

Note: BIT\_CLK not to scale

Parameter	Symbol	Min	Typ	Max	Units
End of Slot 2 to BIT_CLK, SDATA_IN low	Ts2_pdown	-	-	1.0	$\mu$ s

### 2.2.8. ATE Test Mode

Figure 8. ATE Test Mode Timing

Parameter	Symbol	Min	Typ	Max	Units
Setup to trailing edge of RESET# (also applies to SYNC)	Tsetup2rst	15.0	-	-	ns
Rising edge of RESET# to Hi-Z delay	Toff	-	-	25.0	ns

Note: 1) All AC-Link signals are normally low through the trailing edge of RESET#. Bringing SDATA\_OUT high for the trailing edge of RESET# causes the STAC9766/9767 AC-Link outputs to go high-impedance, which is suitable for ATE in-circuit testing.

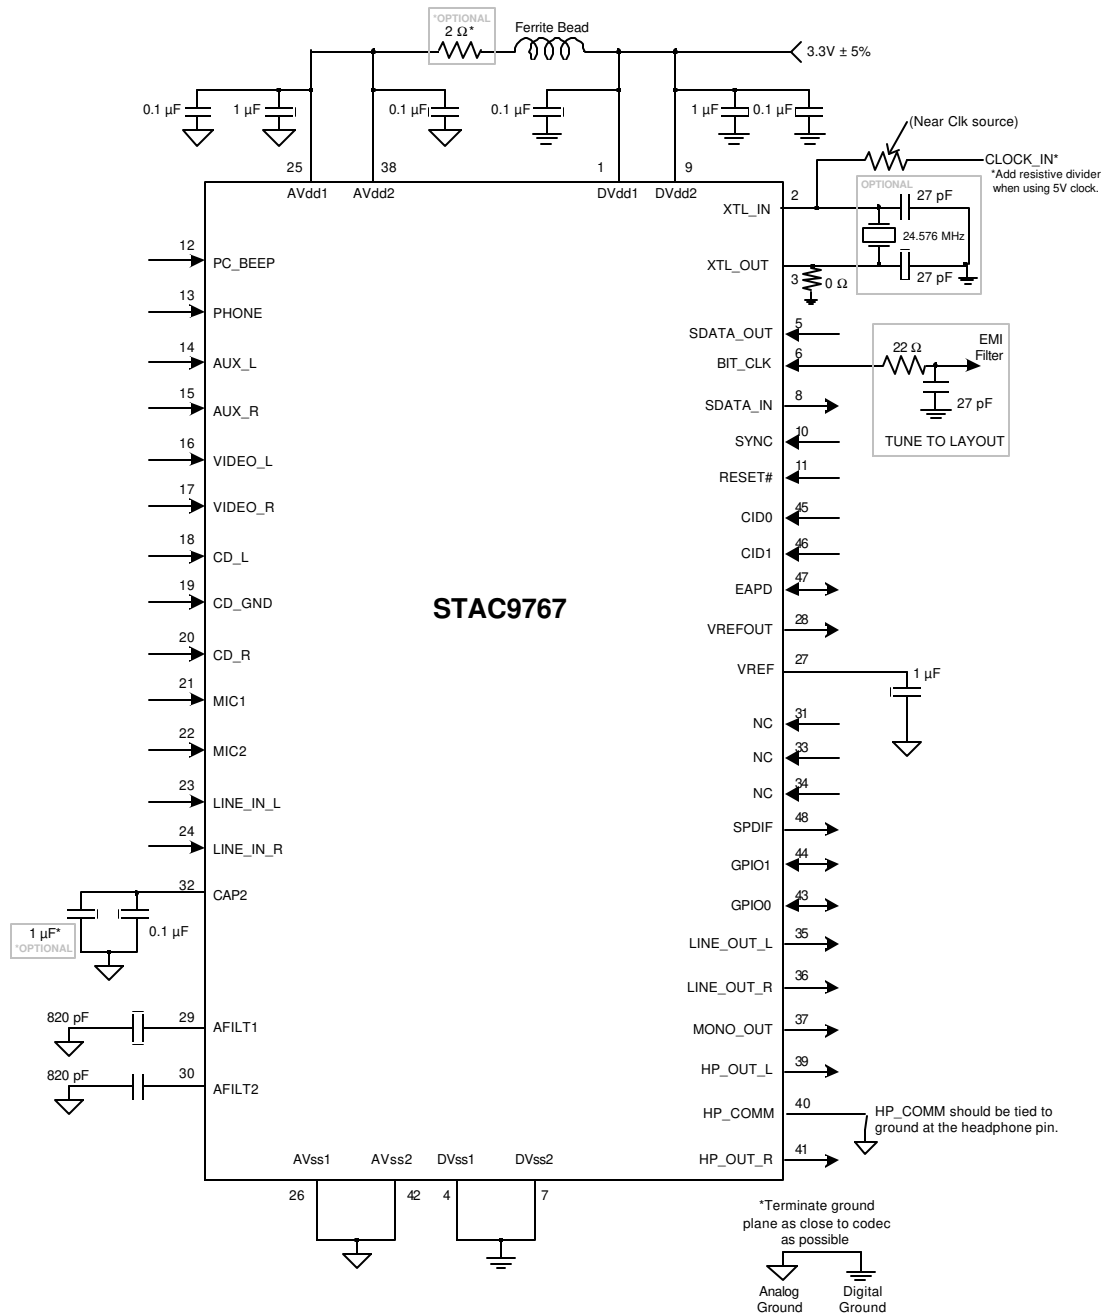

Note: 2) Once the test mode has been entered, the STAC9766/9767 must be issued another RESET# with all AC-Link signals low to return to the normal operating mode.

Note: 3) # denotes active low.

### 3. TYPICAL CONNECTION DIAGRAM

Figure 9. Typical Connection Diagram

**Pin 48:** To Enable SPDIF, use a 1KΩ - 10 KΩ external pulldown. To Disable SPDIF, use a 1KΩ - 10 KΩ external pullup. Do NOT leave Pin 48 floating.

The CD\_GND signal is an AC signal return for the two CD input channels. It is normally biased at about 2.5V. The name of the pin in the AC'97 specification is CD\_GND, and this has confused many designers. It should not have any DC path to GND. Connecting the CD\_GND signal directly to ground will change the internal bias of the entire CODEC, and cause significant distortion. If there is no analog CD input, then this pin can be No-Connect.

### 3.1. Split Independent Power Supply Operation

In PC applications, one power supply input to the STAC9766/9767 may be derived from a supply regulator and the other directly from the PCI power supply bus. When power is applied to the PC, the regulated supply input to the IC will be applied some time delay after the PCI power supply. Without proper on-chip partitioning of the analog and digital circuitry, some manufacturer's CODECs would be subject to on-chip SCR type latch-up.

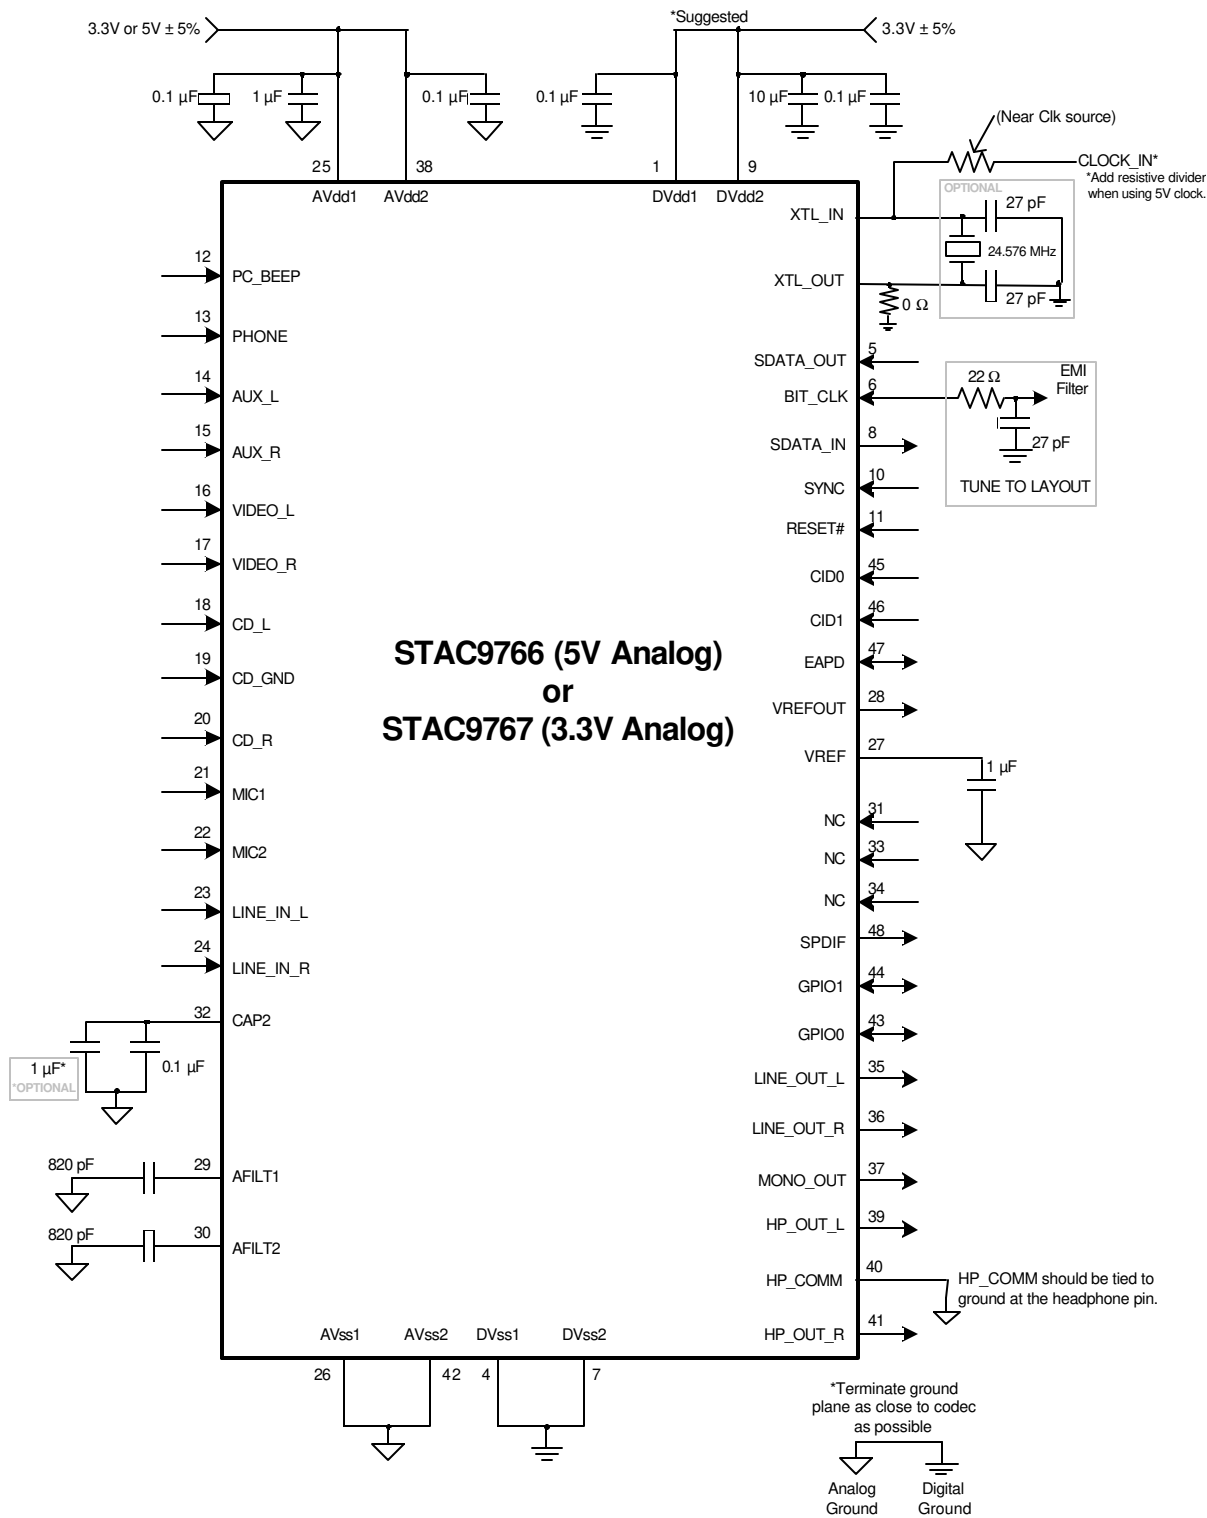

IDT's STAC9766/9767 specifically allows power-up sequencing delays between the analog (AVddx) and digital (VDddx) supply pins. These two power supplies can power-up independently and at different rates with no adverse effects to the CODEC. The IC is designed with independent analog and digital circuitry that prevents on-chip SCR type latch-up.

However, the STAC9766/9767 is not designed to operate for extended periods with only the analog supply active.

*Note: Pin 48: To Enable SPDIF, use a 1 K $\Omega$  - 10 K $\Omega$  external pulldown. To Disable SPDIF, use a 1 K $\Omega$  - 10 K $\Omega$  external pullup. Do NOT leave Pin 48 floating.*

*Note: The CD\_GND signal is an AC signal return for the two CD input channels. It is normally biased at about 2.5V. The name of the pin in the AC97 specification is CD\_GND, and this has confused many designers. It should not have any DC path to GND. Connecting the CD\_GND signal directly to ground will change the internal bias of the entire CODEC, and cause significant distortion. If there is no analog CD input, then this pin can be No-Connect.*

Figure 10. Split Independent Power Supply Operation

## 4. CONTROLLER, CODEC AND AC-LINK

This section describes the physical and high-level functional aspects of the AC'97-Controller to CODEC interface, referred to as AC-link.

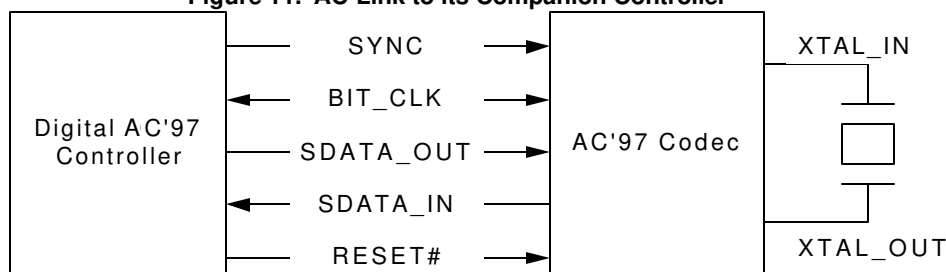

### 4.1. AC-link Physical interface

The STAC9766/9767 communicates with its companion Digital Controller via the AC-link digital serial interface. AC-link has been defined to support connections between a single Controller and up to four CODECs. All digital audio, modem, and handset data streams, as well as all control (command/status) information are communicated over this serial interconnect, which consists of a clock (BIT\_CLK), frame synchronization (SYNC), serial data in (SDATA\_IN), serial data out (SDATA\_OUT), and a reset (RESET#).

### 4.2. Controller to Single CODEC

The simplest and most common AC'97 system configuration is a point-to-point AC-link connection between Controller and the STAC9766/9767, as illustrated in Figure 11.

**Figure 11. AC-Link to its Companion Controller**

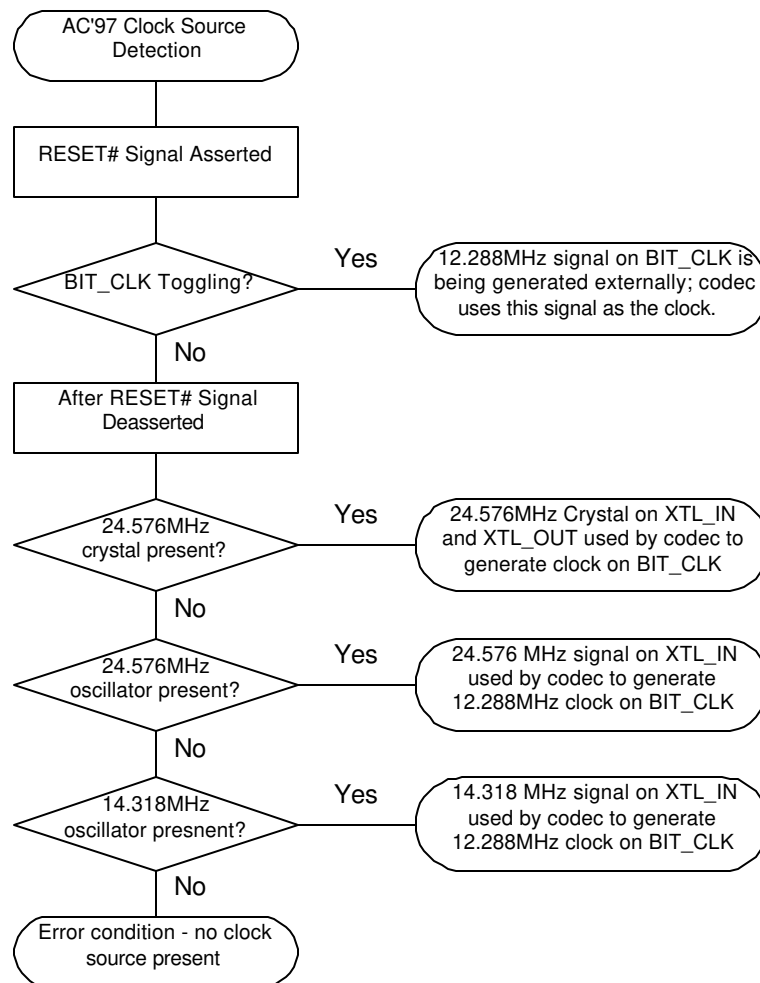

A primary CODEC may act as either a source or a consumer of BIT\_CLK, depending on the configuration.

While RESET# is asserted, if a clock is present at the BIT\_CLK pin for at least five cycles before RESET# is de-asserted, then the CODEC is a consumer of BIT\_CLK, and must not drive BIT\_CLK when RESET# is de-asserted. The clock is being provided by other than the primary CODEC, for instance by the controller or an independent clock chip. In this case the primary CODEC must act as a consumer of the BIT\_CLK signal as if it were a secondary CODEC.

This clock source detection must be done each time the RESET# line is asserted. In the case of a warm reset, where the clock is halted but RESET# is not asserted, the CODEC must remember the clock source, and not begin generating the clock on the assertion of SYNC if the CODEC had previously determined that it was a consumer of BIT\_CLK.

Figure 12. CODEC Clock Source Detection

The STAC9766/9767 uses the XTAL\_OUT pin (pin 3) and the CID0 and CID1 pins (pins 45 & 46) to determine its alternate clock frequencies. See section 2.2.4: page14 for additional information on Crystal Elimination and for supported clock frequencies.

If, when the RESET# signal has been de-asserted, the CODEC has not detected a signal on BIT\_CLK, as defined in the previous paragraph, then the AC'97 CODEC derives its clock internally from an externally attached 24.576 MHz crystal or oscillator (or optionally from an external 14.318 MHz oscillator), and drives a buffered 12.288 MHz clock to its digital companion Controller over AC-link under the signal name "BIT\_CLK". Clock jitter at the DACs and ADCs is a fundamental impediment to high quality output, and the internally generated clock will provide AC'97 with a clean clock that is independent of the physical proximity of AC'97's companion Digital Controller (henceforth referred to as "the Controller").

If BIT\_CLK begins toggling while the RESET# signal is still asserted, the clock is being provided by other than the primary CODEC, for instance by the controller or by a discrete clock source. In this case, the primary CODEC must act as a consumer of the BIT\_CLK signal as if it were a secondary CODEC.

The beginning of all audio sample packets, or Audio Frames, transferred over AC-link is synchronized to the rising edge of the SYNC signal. SYNC is driven by the Controller. The Controller generates SYNC by dividing BIT\_CLK by 256 and applying some conditioning to tailor its duty cycle. This yields a 48 KHz SYNC signal whose period defines an audio frame. Data is transitioned on AC-link on every rising edge of BIT\_CLK, and subsequently sampled by the receiving device on the receiving side of AC-link on each immediately following falling edge of BIT\_CLK.

### 4.3. Controller to Multiple CODECs

Several vendor specific methods of supporting multiple CODEC configurations on AC-link have been implemented or proposed, including CODECs with selective AC-link pass-through and controllers with duplicate AC-links.

Potential implementations include:

- 6-channel audio using 3 x 2-channel CODECs.
- Separate CODECs for independent audio and modem AFE.
- Docking stations, where one CODEC is in the laptop and another is in the dock.

This specification defines support for up to four CODECs on the AC-link. By definition there can be one Primary CODEC (ID 00) and up to three Secondary CODECs (IDs 01, 10, and 11). The CODEC ID functions as a chip select. Secondary devices therefore have completely orthogonal register sets; each is individually accessible and they do not share registers.

Multiple CODEC AC-link implementations must run off a common BIT\_CLK. They can potentially save Controller pins by sharing SYNC, SDATA\_OUT, and RESET# from the AC'97 Digital Controller. Each device requires its own SDATA\_IN pin back to the Controller. This prevents contention of multiple devices on one serial input line.

Support for multiple CODEC operation necessitates a specially designed Controller. An AC'97 Digital Controller that supports multiple CODEC configurations implements multiple SDATA\_IN inputs, supporting one Primary CODEC and up to three Secondary CODECs.

#### 4.3.1. Primary CODEC Addressing

Primary AC'97 CODECs respond to register read and write commands directed to CODEC ID 00. Primary devices must be configurable (by hardwiring, strap pin(s), or other methods) as CODEC ID 00, and reflect this in the two-bit CODEC ID field(s) of the Extended Audio and/or Extended Modem ID Register(s).

The Primary CODEC may either drive the BIT\_CLK signal or consume a BIT\_CLK signal provided by the digital controller or other clock generator.

#### 4.3.2. Secondary CODEC Addressing

Secondary AC'97 CODECs respond to register read and write commands directed to CODEC IDs 01, 10, or 11. Secondary devices must be configurable (via hardwiring, strap pin(s), or other methods) as CODEC IDs 01, 10, or 11 in the two-bit field(s) of the Extended Audio and/or Extended Modem ID Register(s).

CODECs configured as Secondary must power up with the BIT\_CLK pin configured as an input. Using the provided BIT\_CLK signal is necessary to ensure that everything on the AC-link is synchronous. BIT\_CLK is the clock source (multiplied by 2 so that the internal rate is 24.576 MHz).

### 4.3.3. CODEC ID Strapping

Audio CODECs in the 48-pin package use pins 45 and 46 (defined as ID0# and ID1#) as strapping (i.e. configuration) pins to configure the CODEC ID. The ID0# and ID1# strapping bits adopt inverted polarity and default to 00 = Primary (via a weak internal pullup) when left floating. This eliminates the need for external resistors for CODECs configured as Primary, and maintains backward compatibility with existing layouts that treat pins 45 and 46 as “no connect” or cap to ground. Pulldowns are typically 1 K $\Omega$  - 10 K $\Omega$  and connected to Digital (not Analog) Ground.

**Table 3. Recommended CODEC ID Strapping**

CID1 (pin 46)	CID0 (pin 45)	Configuration
NC (weak internal pullup)	NC (weak internal pullup)	Primary ID 00
NC (weak internal pullup)	pulldown	Secondary ID 01
pulldown	NC (weak internal pullup)	Secondary ID 10
pulldown	pulldown	Secondary ID 11

## 4.4. Clocking for Multiple CODEC Implementations

To keep the system synchronous, all Primary and Secondary CODEC clocking must be derived from the same clock source, so they are operating on the same time base. In addition, all AC-link protocol timing must be based on the BIT\_CLK signal, to ensure that everything on the AC-link will be synchronous.

The following are potential 24.576 MHz clock options available to a Secondary CODEC:

- Using an external 24.576 MHz signal source (external oscillator or AC'97 Digital Controller)
- Using the Primary's XTAL\_OUT
- Using the Primary's BIT\_CLK output to derive 24.576 MHz

*See section 2.2.3: page14 for clock frequencies supported and configurations.*

### 4.4.1. STAC9766/9767 as a Primary CODEC

Primary devices are required to support correctly either of the following clocking options:

- 24.576 MHz crystal attached to XTAL\_IN and XTAL\_OUT
- 24.576 MHz external oscillator provided to XTAL\_IN
- 12.288 MHz oscillator provided to the BIT\_CLK input

The Primary device may also optionally support the following clocking option:

- 14.318 MHz external oscillator provided to XTAL\_IN

*See section 2.2.3: page14 for clock frequencies supported and configurations.*

#### 4.4.2. STAC9766/9767 as a Secondary CODEC

Secondary devices are required to function correctly using one or more of the following clocking options:

- 24.576 MHz external oscillator provided to XTAL\_IN (synchronous and in phase with Primary 24.576 MHz clock)
- BIT\_CLK input provided by the Primary. In this mode, a clock at XTAL\_IN (Pin 2) is ignored.

See section 2.2.3: page 14 for clock frequencies supported and configurations.

### 4.5. AC-link Power Management

#### 4.5.1. Powering down the AC-link

The AC-link signals can be placed in a low power mode. When AC'97's Powerdown Register (26h) is programmed to the appropriate value, both BIT\_CLK and SDATA\_IN are brought to and held at a logic low voltage level. After signaling a reset to AC'97, the AC'97 Controller should not attempt to play or capture audio data until it has sampled a CODEC Ready indication from AC'97.

**Figure 13. STAC9766/9767 Powerdown Timing**

Note: BIT\_CLK not to scale

BIT\_CLK and SDATA\_IN are transitioned low immediately following decode of the write to the Powerdown Register (26h) with PR4. When the AC'97 Controller driver is at the point where it is ready to program the AC-link into its low power mode, slots 1 and 2 are assumed to be the only valid stream in the audio output frame.

After programming the AC'97 device to this low power, halted mode, the AC'97 Controller is required to drive and keep SYNC and SDATA\_OUT low.

Once the AC'97 CODEC has been instructed to halt BIT\_CLK, a special "wake-up" protocol must be used to bring the AC-link to the active mode, since normal audio output and input frames can not be communicated in the absence of BIT\_CLK.

#### 4.5.2. Waking up the AC-link

There are two methods for bringing the AC-link out of a low power, halted mode. Regardless of the method, it is the AC'97 Controller that performs the wake-up task.

AC-link protocol provides for a “Cold AC'97 Reset”, and a “Warm AC'97 Reset”. The current power down state would ultimately dictate which form of AC'97 reset is appropriate. Unless a “cold” or “register” reset (a write to the Reset Register) is performed, wherein the AC'97 registers are initialized to their default values, registers are required to keep state during all power down modes.

Once powered down, re-activation of the AC-link via re-assertion of the SYNC signal must not occur for a minimum of four audio frame times following the frame in which the power down was triggered. When AC-link powers up the CODEC indicates readiness via the CODEC Ready bit (input slot 0, bit 15).

### 4.5.3. CODEC Triggers Wake-up

The STAC9766/9767 (running off Vaux) can trigger a wake event (PME#) by transitioning SDATA\_IN from low to high and holding it high until either a warm or cold reset is observed on the AC-link. This functionality is typically implemented in modem CODECs that detect ring, Caller ID, etc.

Note that when the AC-link is either programmed to the low power mode or shut off completely, BIT\_CLK may stop if the primary CODEC is supplying the clock, which shuts down the AC-link clock to the Secondary CODEC<sup>1</sup>. In order for a Secondary CODEC to react to an external event (phone ringing), it must support an independent clocking scheme for any PME# associated logic that must be kept alive when the AC-link is down. This includes logic to asynchronously drive SDATA\_IN to a logic high-level which signals a wake request to the AC'97 Digital Controller.

### 4.5.4. CODEC Reset

There are three types of AC'97 reset:

- A *cold* reset where all AC'97 logic (most registers included) is initialized to its default state.
- A *warm* reset where the contents of the AC'97 register set are left unaltered.
- A *register* reset which only initializes the AC'97 registers to their default states.

#### 4.5.4.1. Cold AC'97 Reset

A cold reset is achieved by asserting RESET# low for the minimum specified time, then subsequently de-asserting RESET# high. BIT\_CLK and SDATA\_IN will be activated, or re-activated as the case may be, and all AC'97 control registers will be initialized to their default power-on reset values.

RESET# is an asynchronous AC'97 input.

#### 4.5.4.2. Warm AC'97 Reset

A warm AC'97 reset will re-activate the AC-link without altering the current AC'97 register values. A warm reset is signaled by driving SYNC high for a minimum of 1  $\mu$ s in the absence of BIT\_CLK.

---

1. Secondary CODEC always configures its BIT\_CLK pin as an input.

Within normal audio frames SYNC is a synchronous AC'97 input. However, in the absence of BIT\_CLK, SYNC is treated as an asynchronous input used in the generation of a warm reset to AC'97.

AC'97 MUST NOT respond with the activation of BIT\_CLK until SYNC has been sampled low again by AC'97. This will preclude the false detection of a new audio frame.

#### 4.5.4.3. *Register AC'97 Reset*

Most registers in an AC device can be restored to their default values by performing a write (any value) to the Reset Register, 00h.

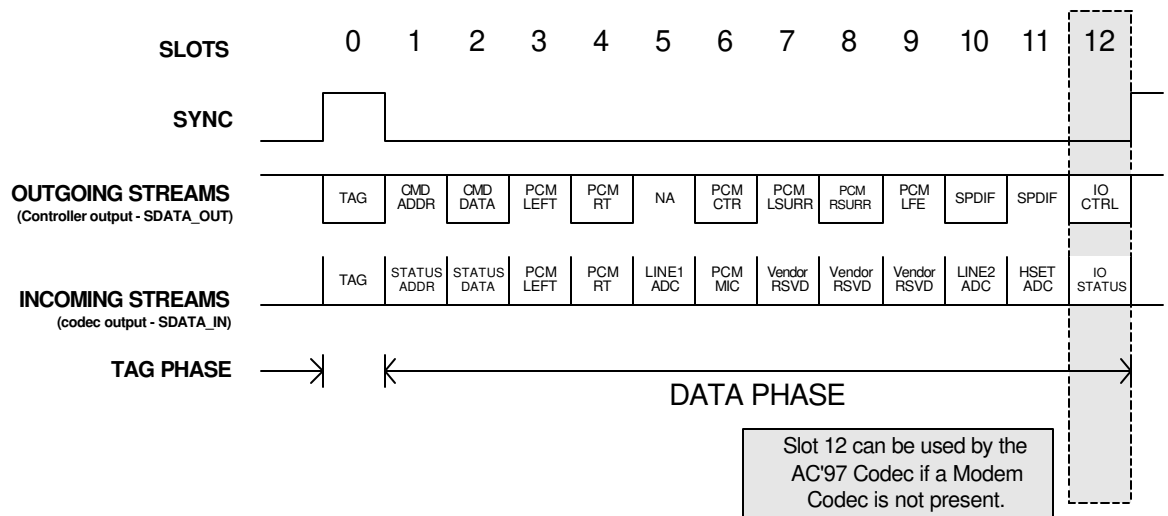

## 5. AC-LINK DIGITAL INTERFACE

### 5.1. Overview

AC-link is the 5 pin digital serial interface that links AC'97 CODEC to Controller. The AC-link protocol is a bi-directional, fixed clock rate, serial digital stream. AC-link handles multiple input and output PCM audio streams, as well as control register accesses, employing a time division multiplexed (TDM) scheme that divides each audio frame into 12 outgoing and 12 incoming data streams, each with 20-bit sample resolution.

The STAC9766/9767 DACs, ADCs and SPDIF can be assigned to slots 3&4, 6&9, 7&8 or 10&11.

**Figure 14. Bi-directional AC-link Frame with Slot Assignments**

**Table 4. AC-link Output Slots (Transmitted from the Controller)**

Slot	Name	Description
0	SDATA_OUT TAG	MSBs indicate which slots contain valid data; LSBs convey CODEC ID
1	Control CMD ADDR write port	Read/write command bit plus 7-bit CODEC register address
2	Control DATA write port	16-bit command register write data
3, 4	PCM L&R DAC playback	20-bit PCM data for Left and Right channels
5	Modem Line 1 DAC	16-bit modem data for modem Line 1 output
6, 7, 8, 9	PCM Center, Surround L&R, LFE	20-bit PCM data for Center, Surround L&R, LFE channels
10	Modem Line 2 DAC	16-bit modem data for modem Line 2 output
11	Modem handset DAC	16-bit modem data for modem Handset output
12	Modem IO control	GPIO write port for modem Control
12	CODEC IRQ	Can be used by CODEC if a modem CODEC is not present.
10-11	SPDIF Out	Optional AC-link bandwidth for SPDIF output
10-12	Double rate audio	Optional AC-link bandwidth for 88.26KHz or 96KHz on L, C, R channels

**Table 5. The AC-link input slots (transmitted from the CODEC)**

Slot	Name	Description
0	SDATA_IN TAG	MSBs indicate which slots contain valid data
1	STATUS ADDR read port	MSBs echo register address; LSBs indicate which slots request data
2	STATUS DATA read port	16-bit command register read data
3, 4	PCM L&R ADC record	20-bit PCM data from Left and Right inputs
5	Modem Line 1 ADC	16-bit modem data from modem Line1 input
6-11	PCM ADC Record	20-bit PCM data - Alternative Slots for Input
12	GPIO Status	GPIO read port and interrupt status

## 5.2. AC-link Serial Interface Protocol

The AC'97 Controller signals synchronization of all AC-link data transactions. The AC'97 CODEC, Controller, or external clock source drives the serial bit clock (BIT\_CLK) onto the AC-link, which the AC'97 Controller then qualifies with a synchronization signal to construct audio frames. SYNC, fixed at 48 KHz, is derived by dividing down the serial bit clock (BIT\_CLK). BIT\_CLK, fixed at 12.288 MHz, provides the necessary clocking granularity to support twelve 20-bit outgoing and incoming time slots. AC-link serial data is transitioned on each rising edge of BIT\_CLK. The receiver of AC-link data (CODEC for outgoing data and Controller for incoming data) samples each serial bit on the falling edges of BIT\_CLK.

The AC-link protocol provides for a special 16-bit time slot (Slot 0) wherein each bit conveys a valid tag for its corresponding time slot within the current audio frame. A 1 in a given bit position of slot 0 indicates that the corresponding time slot within the current audio frame has been assigned to a data stream, and contains valid data. If a slot is tagged invalid, it is the responsibility of the source of the data, (AC'97 CODEC for the input stream, AC'97 Controller for the output stream), to stuff all bit positions with 0 during that slot's active time.

SYNC remains high for a total duration of 16 BIT\_CLKs at the beginning of each audio frame. The portion of the audio frame where SYNC is high is defined as the "Tag Phase". The remainder of the audio frame where SYNC is low is defined as the "Data Phase".

Additionally, for power savings, BIT\_CLK, SYNC, and all data signals can be halted. This requires that an AC'97 CODEC be implemented as a static design to allow its register contents to remain intact when entering a power savings mode.

### 5.2.1. AC-link Variable Sample Rate Operation

The AC-link serial interconnect defines a digital data and control pipe between the Controller and the CODEC. The AC-link supports twelve 20-bit slots at 48 KHz on SDATA\_IN and SDATA\_OUT. The time division multiplexed (TDM) "slot-based" architecture supports a per-slot valid tag infrastructure that the source of each slot's data sets or clears to indicate the validity of the slot data within the current audio frame. This tag infrastructure can be used to support transfers between Controller and CODEC at any sample rate.

### 5.2.2. Variable Sample Rate Signaling Protocol

AC-link's tag infrastructure imposes FIFO requirements on both sides of the AC-link. For example, in passing a 44.1 KHz stream across the AC-link, for every 480 audio output frames that are sent across, 441 of them must contain valid sample data. Does the AC'97 Digital Controller pass all 441 PCM samples followed by 39 invalid slots? Or does the AC'97 Digital Controller evenly interleave valid and non-valid slots? Each possible method brings with it different FIFO requirements. To achieve interoperability between AC'97 Digital Controllers and CODECs designed by different manufacturers, it is necessary to standardize the scheme for at least one side of the AC-link so that the FIFO requirements will be common to all designs. The CODEC side of the AC-link is the focus of this standardization.

The new standard approach calls for the addition of "on demand" slot request flags. These flags are passed from the CODEC to the AC'97 Digital Controller during every audio input frame. Each time the AC'97 Digital Controller sees one or more of the newly-defined slot request flags set active (low) in a given audio input frame, it knows that it must pass along the next PCM sample for the corresponding slot(s) in the AC-link output frame that immediately follows.

The VRA (Variable Rate Audio) bit in the Extended Audio Status and Control Register must be set to 1 to enable variable sample rate audio operation. Setting the VRA = 1 has two functions:

1. Enables PCM DAC/ADC conversions at variable sample rates by write enabling Sample Rate Registers 2C-34h.
2. Enables the on-demand CODEC-to-Controller signaling protocol using SLOTREQ bits that becomes necessary when a DACs sample rate varies from the 48 KHz AC-link serial frame rate

The table below summarizes the behavior:

**Table 6. VRA Behavior**

AC'97 Functionality	VRA = 0	VRA = 1
SLOTREQ bits	always 0 (data each frame)	0 or 1 (data on demand)
sample rate registers	forced to 48 KHz	writable

*Note: If more than one CODEC is being used with the SAME controller DMA engine, VRA should NOT be used.*

For variable sample rate output, the CODEC examines its sample rate control registers, the state of its FIFOs, and the incoming SDATA\_OUT tag bits at the beginning of each AC-link output frame to determine which SLOTREQ bits to set active (low). SLOTREQ bits asserted during the current AC-link input frame signal which *active output slots* require data from the AC'97 Digital Controller in the next audio output frame. An *active output slot* is defined as any slot supported by the CODEC that is not in a power-down state. For fixed 48 KHz operation the SLOTREQ bits are always set active (low) and a sample is transferred in each frame.

For variable sample rate input, the tag bit for each input slot indicates whether valid data is present or not. Thus, even in variable sample rate mode, the CODEC is always the master: for SDATA\_IN (CODEC to Controller), the CODEC sets the TAG bit; for SDATA\_OUT (Controller to CODEC), the CODEC sets the SLOTREQ bit and then checks for the TAG bit in the next frame.

The VRM (Variable Rate Mic Audio) bit in the Extended Audio Status and Control Register controls the optional MIC ADC input behavior in the same way that VRA = 1 controls the PCM ADC.

### 5.2.3. SLOTRREQ Behavior and Power Management

SLOTRREQ bits for fixed rate, powered down, and all unsupported slots should be driven with 0 for maximum compatibility with the original AC '97 Component Specification. When a DAC channel is powered down, it disappears completely from the serial frame: output tag and slot are ignored, and the SLOTRREQ bit is absent (forced to zero).

When the Controller wants to power-down a channel, all it needs to do is:

1. Disable source of DAC samples in Controller.
2. Set PR bit for DAC channel in Registers 26h, 2Ah, or 3Eh.

When it wants to power up the channel, all it needs to do is:

1. Clear PR bit for DAC channel in Registers 26h, 2Ah, or 3Eh.
2. Enable source of DAC samples in Controller.

### 5.2.4. Primary and Secondary CODEC Register Addressing

The 2-bit CODEC ID field in the LSBs of Output Slot 0 is an addition to the original AC-link protocol that enables an AC'97 Digital Controller to independently access Primary and Secondary CODEC registers.

For Primary CODEC access, the AC'97 Digital Controller:

1. Sets the AC-link Frame valid bit (Slot 0, bit 15).
2. *Validates* the tag bits for Slot 1 and 2 Command Address and Data (Slot 0, bits 14 and 13).
3. Sets a *zero* value (00) into the CODEC ID field (Slot 0, bits 1 and 0).
4. Transmits the desired Primary CODEC Command Address and Command Data in Slots 1 and 2.

For Secondary CODEC access, the AC'97 Digital Controller:

1. Sets the AC-link Frame valid bit (Slot 0, bit 15).
2. Places a *non-zero* value (01, 10, or 11) into the CODEC ID field (Slot 0, bits 1 and 0).
3. Transmits the desired Secondary CODEC Command Address and Command Data in Slots 1 and 2.

Secondary CODECs disregard the Command Address and Command Data (Slot 0, bits 14 and 13) tag bits. In a sense the Secondary CODEC ID field functions as an alternative Valid Command Address (for Secondary reads and writes) and Command Data (for Secondary writes) tag indicator.

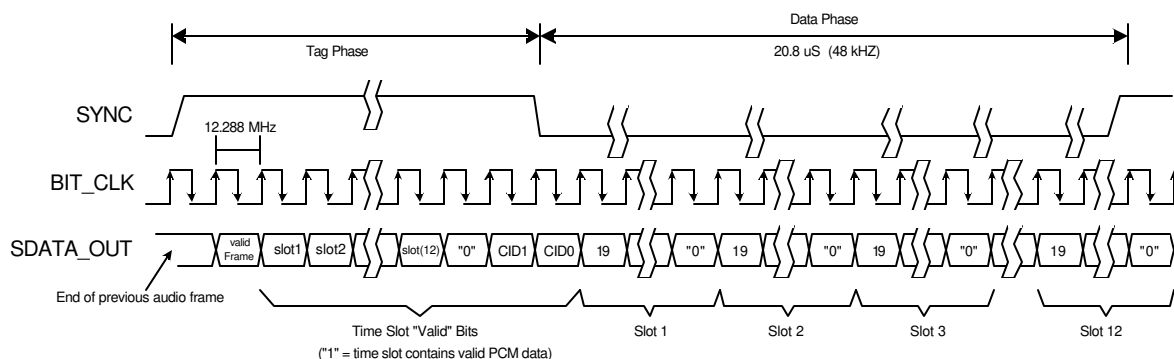

Secondary CODECs must monitor the Frame Valid bit, and ignore the frame (regardless of the state of the Secondary CODEC ID bits) if it is not valid. AC'97 Digital Controllers should set the frame valid bit for a frame with a Secondary register access, even if no other bits in the output tag slot except the Secondary CODEC ID bits are set.

### 5.3. AC-link Output Frame (SDATA\_OUT)

The AC-link output frame data streams correspond to the multiplexed bundles of all digital output data targeting AC'97's DAC inputs, and control registers. As mentioned earlier, each AC-link output frame supports up to twelve 20-bit outgoing data time slots. Slot 0 is a special reserved time slot containing 16-bits which are used for AC-link protocol infrastructure.

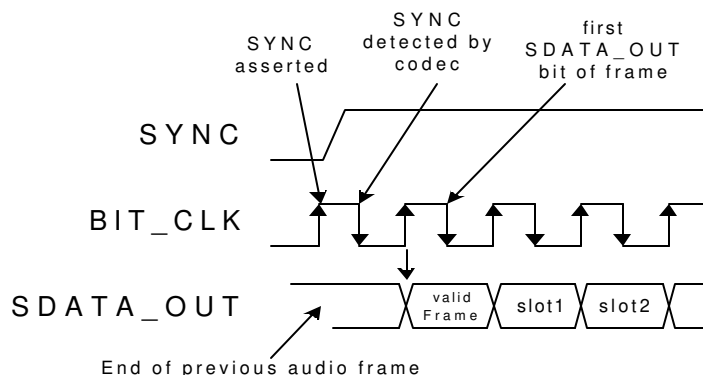

Figure 15 illustrates the time slot based AC-link protocol.

**Figure 15. AC-Link Audio Output Frame**

A new AC-link output frame begins with a low to high transition of SYNC. SYNC is synchronous to the rising edge of BIT\_CLK. On the immediately following falling edge of BIT\_CLK, the AC'97 CODEC samples the assertion of SYNC. This falling edge marks the time when both sides of AC-link are aware of the start of a new audio frame. On the next rising of BIT\_CLK, the AC'97 Controller transitions SDATA\_OUT into the first bit position of slot 0 (Valid Frame bit). Each new bit position is presented to AC-link on a rising edge of BIT\_CLK, and subsequently sampled by the AC'97 CODEC on the following falling edge of BIT\_CLK. This sequence ensures that data transitions and subsequent sample points for both incoming and outgoing data streams are time aligned.

**Figure 16. Start of an Audio Output Frame**

SDATA\_OUT's composite stream is MSB justified (MSB first) with all non-valid slots' bit positions stuffed with 0 by the AC'97 Controller. If there are less than 20 valid bits within an assigned and valid time slot, the AC'97 Controller always stuffs all trailing non-valid bit positions of the 20-bit slot with 0.

As an example, consider an 8-bit sample stream that is being played out to one of the STAC9766/9767 DACs. The first 8-bit positions are presented to the DAC (MSB justified) followed by the next

12 bit positions, which are stuffed with 0 by the AC'97 Controller. This ensures that regardless of the resolution of the implemented DAC (16, 18 or 20-bit), no DC biasing will be introduced by the least significant bits.

When mono audio sample streams are output from the AC'97 Controller it is necessary that BOTH left and right sample stream time slots be filled with the same data.

### 5.3.1. Slot 0: TAG / CODEC ID

**Table 7. Output Slot 0 Bit Definitions**

Bit	Description
15	Frame Valid
14	Slot 1 Primary CODEC Valid Command Address bit (Primary CODEC only)
13	Slot 2 Primary CODEC Valid Command Data bit (Primary CODEC only)
	<i>Slot 3-12 Valid Data bits</i>
12	Slot 3: PCM Left channel
11	Slot 4: PCM Right channel
10	Slot 5: Modem Line 1 (not used on STAC9766/9767)
9	Slot 6: Alternative PCM1 Left
8	Slot 7: Alternative PCM2 Left
7	Slot 8: Alternative PCM2 Right
6	Slot 9: Alternative PCM1 Right
5	Slot 10: SPDIF Left
4	Slot 11: SPDIF Right
3	Slot 12: Audio GPIO
2	Reserved (Set to 0)
1-0	2-bit CODEC ID field (00 reserved for Primary; 01, 10, 11 indicate Secondary)

*Note: The DAC can be assigned to slots 3&4, 6&9, 7&8, or 10&11.*

Within slot 0, the first bit is a global bit (SDATA\_OUT slot 0, bit 15) which flags the validity for the entire audio frame. If the "Valid Frame" bit is a 1, this indicates that the current audio frame contains at least one time slot of valid data. The next 12 bit positions sampled by AC'97 indicate which of the corresponding 12 time slots contain valid data. In this way data streams of differing sample rates can be transmitted across AC-link at its fixed 48 KHz audio frame rate.

The two LSBs of Slot 0 transmit the CODEC ID used to distinguish Primary and Secondary CODEC register access.

### 5.3.2. Slot 1: Command Address Port

The command port is used to control features, and monitor status (see AC-link input frame Slots 1 and 2) for AC'97 CODEC functions including, but not limited to, mixer settings and power management (refer to the control register section of this specification).

The control interface architecture supports up to 64 16-bit read/write registers, addressable on even byte boundaries. Only the even registers (00h, 02h, etc.) are currently defined, odd registers (01h, 03h, etc.) are reserved for future expansion.

Note that shadowing of the control register file on the AC'97 Controller is an option left open to the implementation of the AC'97 Controller. The AC'97 CODEC's control register file is nonetheless required to be readable as well as writeable to provide more robust testability.

AC-link output frame slot 1 communicates control register address, and write/read command information to the STAC9766/9767.

**Table 8. Command Address Port Bit Assignments**

Bit	Description	Comments
19	Read/Write command	1 = read, 0 = write
18:12	Control Register Index	Sixty-four 16-bit locations, addressed on even byte boundaries
11:0	Reserved	Stuffed with 0s

The first bit (MSB) sampled by AC'97 indicates whether the current control transaction is a read or a write operation. The following 7 bit positions communicate the targeted control register address. The trailing 12 bit positions within the slot are reserved and must be stuffed with 0s by the AC'97 Controller.

### 5.3.3. Slot 2: Command Data Port

The command data port is used to deliver 16-bit control register write data in the event that the current command port operation is a write cycle. (as indicated by Slot 1, bit 19)

- Bit(19:4) Control Register Write Data (Stuffed with 0 if current operation is a read)
- Bit(3:0) Reserved (Stuffed with 0)

If the current command port operation is a read, then the entire slot time must be stuffed with 0 by the AC'97 Controller.

### 5.3.4. Slot 3: PCM Playback Left Channel

AC-link output frame slot 3 is the composite digital audio left playback stream. In a typical "Games Compatible" PC this slot is composed of standard PCM (.wav) output samples digitally mixed (on the AC'97 Controller or host processor) with music synthesis output samples. If a sample stream of resolution less than 20-bits is transferred, the AC'97 Controller must stuff all trailing non-valid bit positions within this time slot with 0.

*The DAC can be assigned to slots 3&4, 6&9, 7&8, or 10&11.*

### 5.3.5. Slot 4: PCM Playback Right Channel

AC-link output frame slot 4 is the composite digital audio right playback stream. In a typical "Games Compatible" PC this slot is composed of standard PCM (.wav) output samples digitally mixed (on the AC'97 Controller or host processor) with music synthesis output samples. If a sample stream of res-

olution less than 20-bits is transferred, the AC'97 Controller must stuff all trailing non-valid bit positions within this time slot with 0.

*The DAC can be assigned to slots 3&4, 6&9, 7&8, or 10&11.*

### 5.3.6. Slot 5: Not Used by STAC9766/9767 (Modem Line 1 Output Channel)

Audio output frame slot 5 is reserved for modem operation and is not used by the STAC9766/9767.

### 5.3.7. Slot 6 -11: DAC

*The DAC can be assigned to slots 3&4, 6&9, 7&8, or 10&11.*

### 5.3.8. Slot 12: Audio GPIO Control Channel

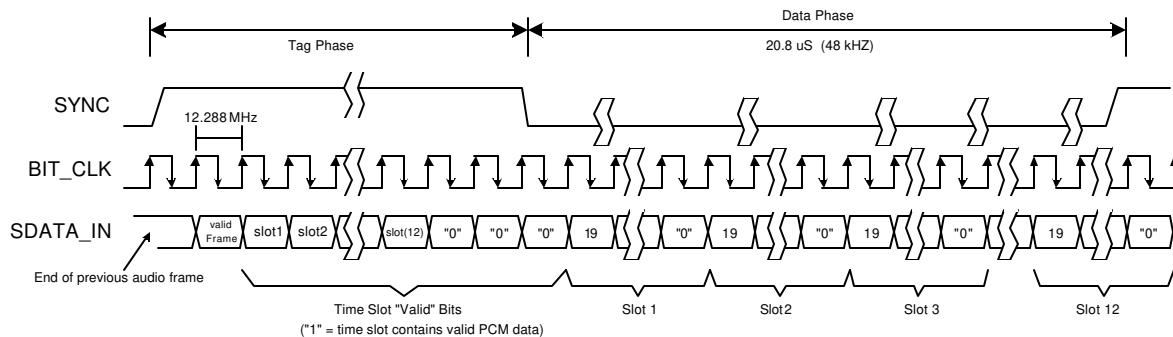

AC-link output frame slot 12 contains the audio GPIO control outputs.

## 5.4. AC-link Input Frame (SDATA\_IN)

The AC-link input frame data streams correspond to the multiplexed bundles of all digital input data targeting the AC'97 Controller. As is the case for audio output frame, each AC-link input frame consists of twelve 20-bit time slots. Slot 0 is a special reserved time slot containing 16-bits which are used for AC-link protocol infrastructure.

The following diagram illustrates the time slot-based AC-link protocol.

**Figure 17. STAC9766/9767 Audio Input Frame**

A new AC-link input frame begins with a low to high transition of SYNC. SYNC is synchronous to the rising edge of BIT\_CLK. On the immediately following falling edge of BIT\_CLK, the AC'97 CODEC samples the assertion of SYNC. This falling edge marks the time when both sides of AC-link are aware of the start of a new audio frame. On the next rising of BIT\_CLK, the AC'97 CODEC transitions SDATA\_IN into the first bit position of slot 0 ("CODEC Ready" bit). Each new bit position is presented to AC-link on a rising edge of BIT\_CLK, and subsequently sampled by the AC'97 Controller on the following falling edge of BIT\_CLK. This sequence ensures that data transitions and subsequent sample points for both incoming and outgoing data streams are time aligned.

Figure 18. Start of an Audio Input Frame

SDATA\_IN's composite stream is MSB justified (MSB first) with all non-valid bit positions (for assigned and/or unassigned time slots) stuffed with 0 by the AC'97 CODEC. SDATA\_IN data is sampled on the falling edges of BIT\_CLK.

#### 5.4.1. Slot 0: TAG

Within slot 0 the first bit is a global bit (SDATA\_IN slot 0, bit 15), which flags whether the AC'97 CODEC is in the "CODEC Ready" state or not. If the "CODEC Ready" bit is a 0, this indicates that the AC'97 CODEC is not ready for normal operation. This condition is normal following the deassertion of power on reset for example, while the AC'97 CODEC's voltage references settle. When the AC-link "CODEC Ready" indicator bit is a 1 it indicates that the AC-link and AC'97 CODEC control and status registers are in a fully operational state. CODEC must assert "CODEC Ready" within 400  $\mu$ s after it starts receiving valid SYNC pulses from the controller, to provide indication of connection to the link and Control/Status registers are available for access. The AC'97 Controller and related software **must wait** until all of the lower four bits of the Control/Status Register, 26h, are set before attempting any register writes, or attempting to enable any audio stream, to avoid undesirable audio artifacts.

Prior to any attempts at putting an AC'97 CODEC into operation, the AC'97 Controller should poll the first bit in the AC-link input frame (SDATA\_IN slot 0, bit 15) for an indication that CODEC has gone "CODEC Ready". Once an AC'97 CODEC is sampled "CODEC Ready"<sup>1</sup>, then the next 12 bit positions sampled by the AC'97 Controller indicate which of the corresponding 12 time slots are assigned to input data streams and contain valid data.

#### 5.4.2. Slot 1: Status Address Port / SLOTREQ signaling bits

##### 5.4.2.1. Status Address Port

The status port is used to monitor status for the STAC9766/9767 functions including, but not limited to, mixer settings and power management. AC-link input frame slot 1's stream echoes the control

1. There are several subsections within an AC'97 CODEC that can independently go busy/ready. It is the responsibility of the AC'97 controller to probe more deeply into the AC'97 CODEC's register file to determine which subsections are actually ready (refer to section 6.3 for more information).

register index, for historical reference, for the data to be returned in slot 2. (Assuming that slots 1 and 2 had been tagged "valid" by the AC'97 CODEC during slot 0.

**Table 9. Status Address Port Bit Assignments**

Bit	Description	Comments
19	Reserved	Stuffed with 0
18:12	Control Register Index	Echo of register index for which data is being returned
11:2	SLOTREQ	See Next Section
1:0	Reserved	Stuffed with 0

The first bit (MSB) generated by AC'97 is always stuffed with a 0. The following 7 bit positions communicate the associated control register address, the next 10 bits support AC'97's variable sample rate signaling protocol, and the trailing 2 bit positions are stuffed with 0 by AC'97.

#### 5.4.2.2. SLOTREQ signaling bits

AC-link input frame Slot 1, the Status Address Port, now delivers CODEC control register read address *and* variable sample rate slot request flags for all output slots. Ten of the formerly reserved least significant bits have been defined as data request flags for output slots 3-12.

The AC-link input frame Slot 1 tag bit is independent of the bit 11-2 slot request field, and ONLY indicates valid Status Address Port data (Control Register Index). The CODEC should only set SDATA\_IN tag bits for Slot 1 (Address) and Slot 2 (Data) to 1 when returning valid data from a previous register read. They should otherwise be set to 0. SLOTREQ bits have validity independent of the Slot 1 tag bit.

SLOTREQ bits are always 0 in the following cases

- Fixed rate mode (VRA = 0)
- Inactive (powered down) ADC channel

SLOTREQ bits are only set to 1 by the CODEC in the following case

- Variable rate audio mode (VRA = 1) AND active (power ready) ADC AND a non-48 KHz ADC sample rate and CODEC does not need a sample

#### 5.4.3. Slot 2: Status Data Port

The status data port delivers 16-bit control register read data.

**Table 10. Status Data Port Bit Assignments**

Bit	Description	Comments
19:4	Control Register Read Data	Stuffed with 0 if tagged "invalid"
3:0	Reserved	Stuffed with 0

If Slot 2 is tagged invalid by AC'97, then the entire slot will be stuffed with 0 by AC'97.

#### 5.4.4. Slot 3: PCM Record Left Channel

Audio input frame slot 3 is the left channel output of STAC9766/9767 input MUX, post-ADC. STAC9766/9767 ADCs are implemented to support 20-bit resolution.

*NOTE: The ADC can be assigned to slots 3&4, 6&9, 7&8, or 10&11.*

#### 5.4.5. Slot 4: PCM Record Right Channel

Audio input frame slot 4 is the right channel output of STAC9766/9767 input MUX, post-ADC. STAC9766/9767 ADCs are implemented to support 20-bit resolution.

*NOTE: The ADC can be assigned to slots 3&4, 6&9, 7&8, or 10&11.*

#### 5.4.6. Slot 5: Modem Line 1 ADC

Audio input frame slot 5 is not used by the STAC9766/9767 and is always stuffed with 0.

#### 5.4.7. Slot 6-9: ADC

The left and right ADC channels of the STAC9766/9767 may be assigned to slots 6&9 by Register 6Eh.

*NOTE: The ADC can be assigned to slots 3&4, 6&9, 7&8, or 10&11.*

#### 5.4.8. Slots 7-8: Vendor Reserved

The left and right ADC channels of the STAC9766/9767 may be assigned to slots 7&8 by Register 6Eh.

*NOTE: The ADC can be assigned to slots 3&4, 6&9, 7&8, or 10&11.*

#### 5.4.9. Slot 10 & 11: ADC

The left and right ADC channels of the STAC9766/9767 may be assigned to slots 10&11 by Register 6Eh.

*NOTE: The ADC can be assigned to slots 3&4, 6&9, 7&8, or 10&11.*

#### 5.4.10. Slot 12: Reserved

AC-link input frame slot 12 contains the GPIO status inputs and allows for audio interrupts. Audio output frame slot 12 is Reserved for modem operations and is not used by the STAC9766/9767.

## 5.5. AC-link Interoperability Requirements and Recommendations

### 5.5.1. "Atomic slot" Treatment of Slot 1 Address and Slot 2 Data

Command or Status Address and Data cannot be split across multiple AC-link frames. The following transactions require that valid Slot 1 Address and valid Slot 2 Data be treated as "atomic" (inseparable) with Slot 0 Tag bits for Address and Data set accordingly (that is, both valid):

1. AC'97 Digital Controller write commands to Primary CODECs
2. AC'97 CODEC status responses

Whenever the AC'97 Digital Controller addresses a Primary CODEC or an AC'97 CODEC responds to a read command, Slot 0 Tag bits should always be set to indicate actual Slot 1 and Slot 2 data validity.

**Table 11. Primary CODEC Addressing: Slot 0 Tag Bits**

Function	Slot 0, bit 15 (Valid Frame)	Slot 0, bit 14 (Valid Slot 1 Address)	Slot 0, bit 13 (Valid Slot 2 Data)	Slot 0, Bits 1-0 (CODEC ID)
AC'97 Digital Controller Primary Read Frame N, SDATA_OUT	1	1	0	00
AC'97 Digital Controller Primary Write Frame N, SDATA_OUT	1	1	1	00
AC'97 CODEC Status Frame N+1, SDATA_IN	1	1	1	00

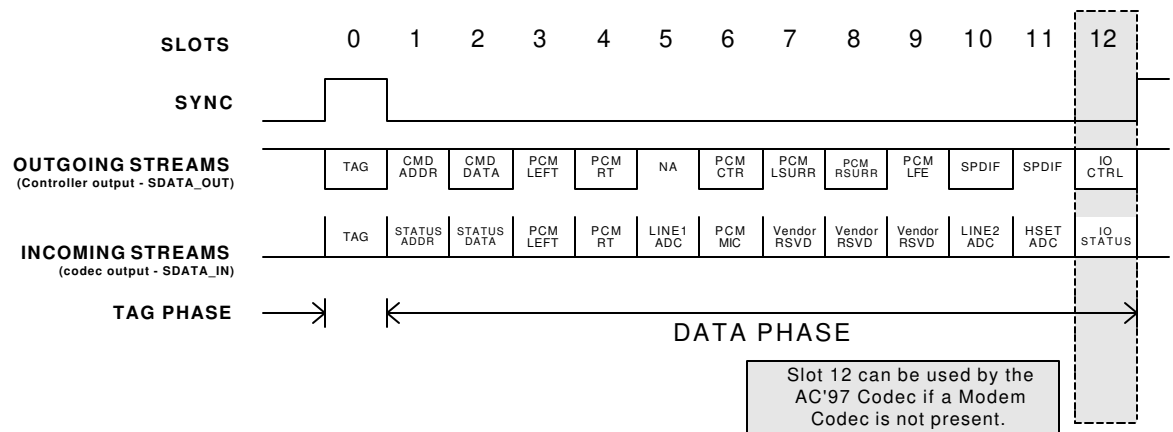

When the AC'97 Digital Controller addresses a Secondary CODEC, the Slot 0 Tag bits for Address and Data must be 0. A non-zero, 2-bit CODEC ID in the LSBs of Slot 0 indicates a valid Read or Write Address in Slot 1, and the Slot 1 R/W bit indicates presence or absence of valid data in Slot 2.

**Table 12. Secondary CODEC Addressing: Slot 0 tag bits**

Function	Slot 0, bit 15 (Valid Frame)	Slot 0, bit 14 (Valid Slot 1 Address)	Slot 0, bit 13 (Valid Slot 2 Data)	Slot 0, Bits 1-0 (CODEC ID)
AC'97 Digital Controller Secondary Read Frame N, SDATA_OUT	1	0	0	01, 10, or 11
AC'97 Digital Controller Secondary Write Frame N, SDATA_OUT	1	0	0	01, 10, or 11
AC'97 CODEC Status Frame N+1, SDATA_IN	1	1	1	00

## 5.6. Slot Assignments for Audio

Figure 19. Bi-directional AC-link Frame with Slot assignments

Note: The DAC & ADC can be assigned to slots 3&4, 6&9, 7&8, or 10&11.

The AC-link input slots (transmitted to the Codec) are defined as follows:

Table 13. AC-link Input Slots To CODEC

Slot	Name	Description
0	SDATA_OUT TAG	MSBs indicate which slots contain valid data; LSBs convey Codec ID
1	Control CMD ADDR write port	Read/write command bit plus 7-bit Codec register address
2	Control DATA write port	16-bit command register write data
3,4	PCM L & R DAC playback	16, 18, or 20-bit PCM data for left and right channels
5	Modem Line 1 DAC	16-bit modem data for modem line 1 output
6, 7, 8, 9	PCM Center, Rear, LFE	16, 18, or 20-bit PCM data for Center, L & R Rear, LFE channels
10	Modem Line 2 DAC	16-bit modem data for modem line 2 output
11	Modem handset DAC	16-bit modem data for modem handset output
12	Modem IO control	GPIO write port for modem control
10-12	Double rate audio	Optional AC-link bandwidth for 88.2 or 96 kHz on L, C, R channels

The AC-link input slots (transmitted from the Codec) are defined as follows:

Table 14. AC-link Input Slots From CODEC

Slot	Name	Description
0	SDATA_IN TAG	MSBs indicate which slots contain valid data
1	STATUS ADDR read port	MSBs echo register address; LSBs indicate which slots request data
2	STATUS DATA read port	16-bit command register read data
3,4	PCM L & R ADC record	16-bit PCM data from left and right inputs
5	Modem Line 1 ADC	16-bit modem data from modem line 1 input
6	Dedicated Microphone ADC	16-bit PCM data from optional 3rd ADC input

Table 14. AC-link Input Slots From CODEC

Slot	Name	Description
7, 8, 9	Vendor reserved	Vendor specific (enhanced input for docking, array mic, etc.)
10	Modem Line 2 ADC	16-bit modem data from modem line 2 input
11	Modem handset input	16-bit modem data for modem handset input
12	Modem IO status	GPIO read port for modem control

The AC-link output slots dedicated to audio are defined as follows:

Table 15. AC-link Output Slots Dedicated To Audio

Slot	Name	Description
3	PCM L DAC playback	20-bit PCM data for left channel
4	PCM R DAC playback	20-bit PCM data for right channel
6	PCM Center	20-bit PCM data for Center channel
7	PCM L Surround	20-bit PCM data for L Surround channel
8	PCM R Surround	20-bit PCM data for R Surround channel
9	PCM LFE	20-bit PCM data for LFE channel
10:11	SPDIF Out	20-bit SPDIF Output
12	Reserved	Reserved

The AC-link input slots dedicated to audio are defined as follows:

Table 16. AC-link Input Slots Dedicated To Audio

Slot	Name	Description
3	PCM L ADC record	20-bit PCM data from left input
4	PCM R ADC record	20-bit PCM data from right inputs
6	Dedicated Microphone ADC	20-bit PCM data from optional 3rd ADC input
7	Vendor reserved	vendor specific (enhanced input for docking, array mic, etc.)
8	Vendor reserved	vendor specific (enhanced input for docking, array mic, etc.)
9	Vendor reserved	vendor specific (enhanced input for docking, array mic, etc.)
12	Audio Interrupt	Provides optional interrupt capability for Audio CODEC (not usable when a modem is present)

*Note: The ADC can be assigned to slots 3&4, 6&9, 7&8, or 10&11.*

Table 17. Audio Interrupt Slot Definitions

Bit	Description
19-1	Reserved (Audio CODEC will return zeros in bits 19-1)
0	Optional: Assertion = 1 will cause interrupt to be propagated to Audio controller system interrupt. See register 24h definition for enabling mechanism.

## 6. STAC9766/9767 MIXER

### 6.1. Mixer Description

The STAC9766/9767 includes an analog mixer for maximum flexibility. The analog mixer is designed to the AC'97 specification to manage the playback and record of all digital and analog audio sources in the PC environment. The analog mixer also includes several extensions of the AC'97 specification to support "all analog record" capability as well as "POP BYPASS" mode for all digital playback. The analog sources include:

- **System Audio** : Digital PCM input and output for business, games & multimedia
- **CD/DVD**: Analog CD/DVD-ROM audio with internal connections to CODEC mixer
- **Stereo or Mono microphone**: Choice of desktop mic, with programmable boost and gain
- **Speakerphone**: Use of system mic and speakers for telephone, DSVD, and video conferencing
- **Video**: TV tuner or video capture card with internal connections to CODEC mixer
- **AUX/Synth**: Analog FM or wavetable synthesizer, or other internal source
- **Line in**: External analog line level source from consumer audio, video camera, etc.

Source	Function	Connection
PC_BEEP	PC BEEP pass through to LINE_OUT	From PC_BEEP output
PHONE	MONO input	From telephony subsystem
MIC1	Desktop microphone	From stereo or mono mic jack
MIC2	Second microphone	From stereo or second mono mic jack
LINE_IN	External audio source	From line-in jack
CD	Audio from CD-ROM	Cable from CD-ROM
VIDEO	Audio from TV tuner or video camera	Cable from TV or VidCap card
AUX	Upgrade synth or other external source	Internal connector
PCM out	Digital audio output from AC'97 Controller	AC-Link

Destination	Function	Connection
HP_OUT	Stereo mix of all sources	To headphone out jack
LINE_OUT	Stereo mix of all sources	To output jack
MONO_OUT	Mic or MONO Analog mixer output	To telephony subsystem
PCM in	Digital data from the CODEC to the AC'97 Controller	AC-Link
SPDIF	SPDIF digital audio output	To SPDIF output connector

## 6.2. Mixer Functional Diagrams

Figure 20. STAC9766 2-Channel Mixer Functional Diagram

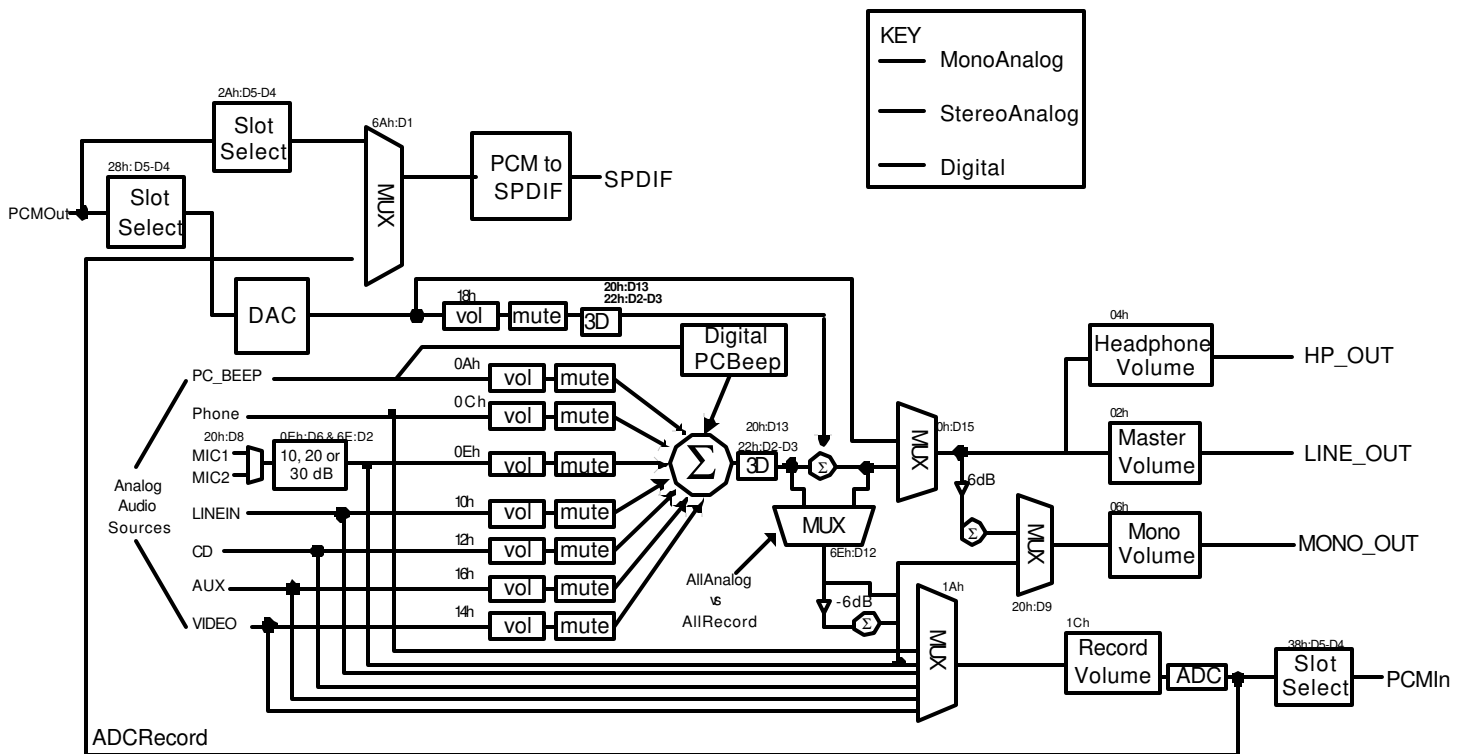

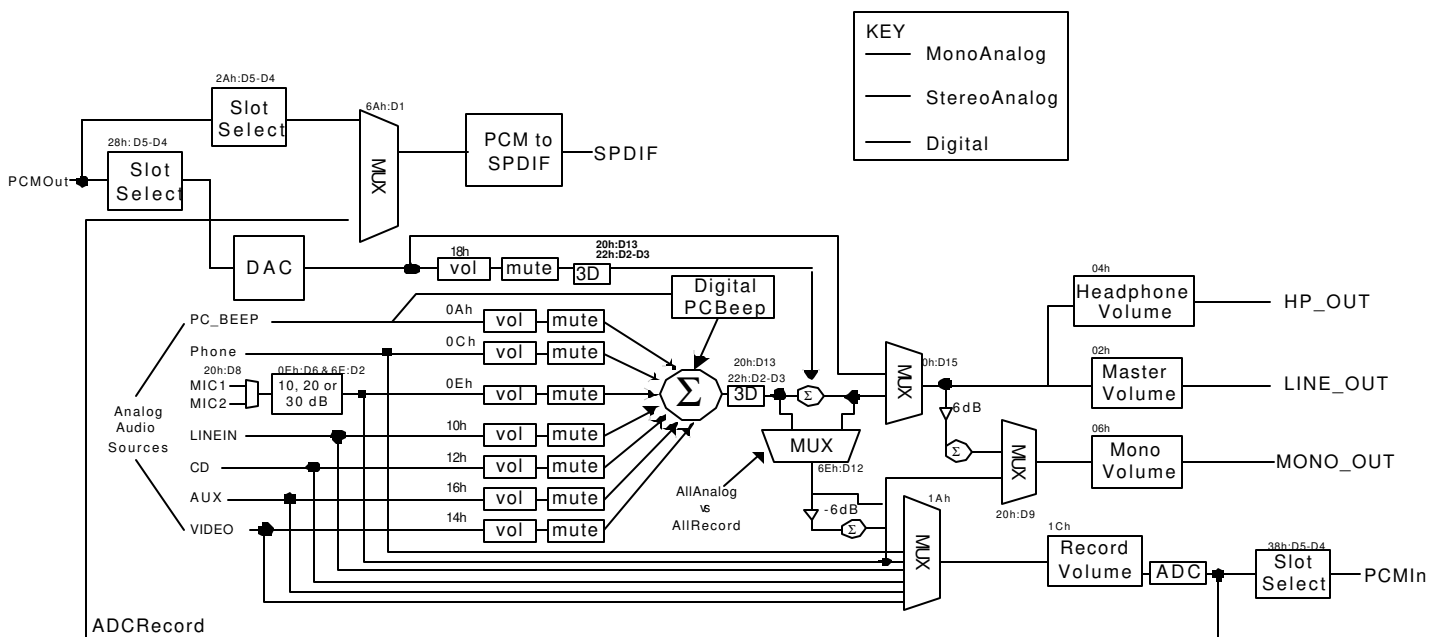

Figure 21. STAC9767 2-Channel Mixer Functional Diagram

### 6.3. Mixer Analog Input

The mixer provides recording and playback of any audio sources or output mix of all sources. The STAC9766/9767 supports the following input sources:

- Any mono or stereo source
- Mono or stereo mix of all sources
- Two-channel input with mono output reference (mic or stereo mix)

*Note: All unused inputs should be tied together and connected to ground through a capacitor (0.1  $\mu$ F suggested).*

*Note: The MIC should be tied to ground separately through its own 0.1  $\mu$ f capacitor.*

### 6.4. Mixer Analog Output

The Mixer generates three distinct outputs:

- A stereo mix of all sources for output to the LINE\_OUT
- A stereo mix of all sources for output to HP\_OUT
- A mono, mic only or mix of all sources for MONO\_OUT

## 7. SPDIF AND PC BEEP

### 7.1. SPDIF Digital Mux

The STAC9766/9767 incorporates a digital output that supports SPDIF formats. A multiplexer determines which of two digital input streams are used for the digital output conversion process. These two streams include the PCM OUT data from the audio controller and the ADC recorded output. The normal analog LINE\_OUT signal can be converted to the SPDIF formats by using the internal ADC to record the "MIX" output, which is the combination of all analog and all digital sources. In the case of digital controllers with support for four or more channels, the SPDIF output mode can be used to support compressed 6-channel output streams for delivery to home theater systems. These can be routed on alternate AC-Link slots to the SPDIF output, while the standard 2-channel output is delivered as selected by bits D5 and D4 in Register 6E. If the digital controller supports 6 channels, a SPDIF output with four analog channels can also be configured.

If the Digital Controller has independent DMA engines, SPDIF and Analog can be used simultaneously and independently.

### 7.2. PC Beep Implementation

The STAC9766/9767 offers two styles of PC BEEP, Analog and Digital. The digital PC Beep is a new feature added to the AC'97 Specification Rev 2.3. This style of PC Beep will eventually replace the Analog style, thus eliminating the need for a PC Beep pin. Until this feature is widely accepted, IDT will provide BOTH styles of PC Beep. Both PC Beep styles use Reg 0Ah. Additional information about Reg0Ah can be found in Section8.1.5: page50.

#### 7.2.1. Analog PC Beep

PC Beep is active on power up and defaults to an un-muted state. The PC-BEEP input is routed directly to the MONO\_OUT, LINE\_OUT and HP\_OUT pins of the CODEC. Because the PC\_BEEP input drive is often a full scale digital signal, some resistive attenuation of the PC\_BEEP input is recommended to keep the beep tone within reasonable volume levels. The user should mute this input before using any other mixer input because the PC Beep input can contribute noise to the lineout during normal operation. This style of PC Beep is related to the AC'97 Specification Rev 2.2. To use the analog PC Beep, write a value of 00h to bits F[7:0](D[12:5]) to disable generation of the Digital PC Beep. PV[3:0] (D[4:1]) controls the volume level from 0dB to 45dB of attenuation in 3dB steps.

#### 7.2.2. Digital PC Beep

The Digital PC Beep uses the identical register as the Analog style, Reg 0Ah. This register controls the level and frequency for the PC Beep. The beep frequency is the result of dividing the 48 KHz clock by 4 times the number specified in F[7:0], allowing tones from 47Hz to 12 KHz. A value of 00h written to bits F[7:0] disables the digital PC Beep generation and enables the analog style PC Beep. The volume control bits, PV[3:0] operate identically to the analog PC Beep mode. Applying a signal to the PC Beep pin, pin 12, may cause the digital PC Beep signal to become distorted or inaudible. When using the digital PC Beep feature, leave the PC Beep input pin unconnected or connected to analog ground through a capacitor. Connecting a capacitor from the PC Beep input pin to ground will create a more pleasing sound by changing the digital output to a more sinusoidal output.

Table 18. Digital PC Beep Examples

Value	Reg 0Ah	Frequency
1	0x01	12,000Hz
10	0x0A	1200Hz
25	0x19	480Hz
50	0x32	240Hz
100	0x64	120Hz
127	0x0F	94.48Hz
255	0xFF	47.05Hz

This will be programmed directly by the BIOS.

## 8.1. Register Descriptions

### 8.1.1. Reset (00h)

Default: 6A90h

D15	D14	D13	D12	D11	D10	D9	D8
RSRVD	SE4	SE3	SE2	SE1	SE0	ID9	ID8
D7	D6	D5	D4	D3	D2	D1	D0
ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0

Writing any value to this register performs a register reset, which causes all registers to revert to their default values. This register reset also resets all the digital block. Reading this register returns the ID code of the part.

Bit(s)	Reset Value	Name	Description
15	0	RESERVED	Bit not used, should read back 0
14:10	11010	SE4:SE0	IDT ID for SS3D
9	1	ID9	20 bit ADC resolution (supported)
8	0	ID8	18 bit ADC resolution
7	1	ID7	20 bit DAC resolution (supported)
6	0	ID6	18 bit DAC resolution
5	0	ID5	Loudness (bass boost)
4	1	ID4	Headphone out (supported)
3	0	ID3	Simulated stereo (mono to stereo)
2	0	ID2	Bass & treble control
1	0	ID1	Reserved
0	0	ID0	Dedicated MIC PCM in channel

### 8.1.2. Master Volume Registers (02h)

Default: 8000h

D15	D14	D13	D12	D11	D10	D9	D8
Mute	RSRVD	ML5	ML4	ML3	ML2	ML1	ML0
D7	D6	D5	D4	D3	D2	D1	D0
RESERVED		MR5	MR4	MR3	MR2	MR1	MR0

Bit(s)	Reset Value	Name	Description
15	1	Mute	0 = no mute 1 = Mutes both left & right channels
14	0	RESERVED	Bit not used, should read back 0
13	0	ML5	0 = Lineout attenuation is a function of bits12-8 1 = Forces register bits 12-8 to be 11111 Always reads back 0
12:8	0	ML<4:0>	Left Lineout Volume Control 00000 = 0dB attenuation 00001 = 1.5dB attenuation ..... 11111 = 46.5dB attenuation
7:6	0	RESERVED	Bits not used, should read back 0
5	0	MR5	0 = Lineout attenuation is a function of bits 4-0 1 = Forces register bits 4-0 to be 11111 Always reads back 0
4:0	0	MR<4:0>	Right Channel Lineout Volume Control 00000 = 0dB attenuation 00001 = 1.5dB attenuation ..... 11111 = 46.5dB attenuation

### 8.1.3. Headphone Volume Registers (04h)

Default: 8000h

D15	D14	D13	D12	D11	D10	D9	D8
Mute	RSRVD	HPL5	HPL4	HPL3	HPL2	HPL1	HPL0
D7	D6	D5	D4	D3	D2	D1	D0
RESERVED		HPR5	HPR4	HPR3	HPR2	HPR1	HPR0

Bit(s)	Reset Value	Name	Description
15	1	Mute	0 = no mute 1 = Mutes both left & right channels
14	0	RESERVED	Bit not used, should read back 0
13	0	ML5	0 = Headphone attenuation is a function of bits12-8 1 = forces register bits 12-8 to be 11111 Always reads back 0

Bit(s)	Reset Value	Name	Description
12:8	0	ML<4:0>	Left Headphone Volume Control 00000 = 0dB attenuation 00001 = 1.5dB attenuation ..... 11111 = 46.5dB attenuation
7:6	0	RESERVED	Bits not used, should read back 0
5	0	MR5	0 = Headphone attenuation is a function of bits 4-0 1 = forces register bits 4-0 to be 11111 Always reads back 0
4:0	0	MR<4:0>	Right Channel Headphone Volume Control 00000 = 0dB attenuation 00001 = 1.5dB attenuation ..... 11111 = 46.5dB attenuation

#### 8.1.4. Master Volume MONO (06h)

Default: 8000h

D15	D14	D13	D12	D11	D10	D9	D8
Mute	RESERVED						
D7	D6	D5	D4	D3	D2	D1	D0
RESERVED	MM5	MM4	MM3	MM2	MM1	MM0	

Bit(s)	Reset Value	Name	Description
15	1	Mute	0 = No mute 1 = Mute mono
14:6	0	RESERVED	Bit not used, should read back 0
5	0	MM5	0 = Mono attenuation is a function of bits 4-0 1 = Forces register bits 4-0 to be 11111 Always reads back 0
4:0	0	MM<4:0>	Mono Volume Control 00000 = 0dB attenuation 00001 = 1.5dB attenuation ..... 11111 = 46.5dB attenuation

**8.1.5. PC BEEP Volume (0Ah)**

Default: 0000h

Additional information on the PC Beep can be found in Section 7.2: page44.

D15	D14	D13	D12	D11	D10	D9	D8	
Mute	RESERVED			F7	F6	F5	F4	F3
D7	D6	D5	D4	D3	D2	D1	D0

Bit(s)	Reset Value	Name	Description
15	1	Mute	0 = No mute 1 = Mute PC BEEP
14:13	0	RESERVED	Bit not used, should read back 0
12:5	00h	F[7:0]	The Beep frequency is the result of dividing the 48KHz clock by 4 times the number specified in F[7:0] allowing tones from 47Hz to 12KHz.  A value of 00h in bits F[7:0] disables internal PC BEEP generation and enables external PC BEEP input if available.
4:1	0	PV(3:0)	PCBEEP Volume Control 0000 = 0dB attenuation 0001 = 3dB attenuation ..... 1111 = 45dB attenuation
0	0	RESERVED	Bit not used, should read back 0

**8.1.6. Phone Volume (Index 0Ch)**

Default: 8008h.

D15	D14	D13	D12	D11	D10	D9	D8
Mute	RESERVED						
D7	D6	D5	D4	D3	D2	D1	D0
RESERVED			GN4	GN3	GN2	GN1	GN0

Bit(s)	Reset Value	Name	Description
15	1	Mute	0 = No mute 1 = Mute phone
14:5	0	RESERVED	Bit not used, should read back 0
4:0	0	GN<4:0>	Phone Volume Control 00000 = 12dB gain 00001 = 10.5dB gain ..... 01000 = 0dB gain ..... 11111 = -34.5dB gain

**8.1.7. Stereo or Mic Volume (Index 0Eh)**

To enable Stereo Mic, Register 78h (unlocked), bit D6 must be enabled.

In Stereo mode, the left and right volume are controlled by GN4:GN0.

Default: 8008h.

D15	D14	D13	D12	D11	D10	D9	D8
Mute	RESERVED						
D7	D6	D5	D4	D3	D2	D1	D0

Bit(s)	Reset Value	Name	Description				
15	0	POP BYPASS	0 = Normal 1 = DAC bypasses mixer and connects directly to Line Out, Headphone Out and Mono Out.				
14	0	RESERVED	Bit not used, should read back 0				
13	0	3D	0 = 3D Effect Disabled 1 = 3D Effect Enabled				
12:10	0	RESERVED	Bit not used, should read back 0				
9	0	MIX	Mono Output select (0 = Mix, 1 = Mic)				
8	0	MS	Mic select (0 = Mic1, 1 = Mic2)				
7	0	LOOPBACK	1 = Enables ADC to DAC loopback test 0 = Loopback Disabled Do not send in conflicting data on AC-LINK while running this.				
6:0	0	RESERVED	Bit not used, should read back 0				

**8.1.16. 3D Control (22h)**

Default: 0000h

D15	D14	D13	D12	D11	D10	D9	D8
RESERVED							
D7	D6	D5	D4	D3	D2	D1	D0
RESERVED				DP3	DP2	RESERVED	
Bit(s)	Reset Value	Name	Description				
15:4	0	RESERVED	Bits not used, should read back 0				
3:2	0	DP3,DP2	LINE_OUT SEPARATION RATIO DP3 DP2 effect 0 0 0 ( OFF ) 0 1 3 ( LOW ) 1 0 4.5 ( MED ) 1 1 6 ( HIGH )				
1:0	0	RESERVED	Bits not used, should read back 0				

This register is used to control the 3D stereo enhancement function, IDT Surround 3D (SS3D), built into the AC'97 component. Note that register bits DP3-DP2 are used to control the separation ratios in the 3D control for LINE\_OUT. SS3D provides for a wider soundstage extending beyond the normal 2-speaker arrangement. Note that the 3D bit in the general purpose register (20h) must be set to 1 to enable SS3D functionality to allow the bits in 22h to take effect.

The three separation ratios are implemented. The separation ratio defines a series of equations that determine the amount of depth difference (High, Medium, and Low) perceived during two-channel playback. The ratios provide for options to narrow or widen the soundstage.

### 8.1.17. Audio Interrupt and Paging (24h)

Default: 0000h

D15	D14	D13	D12	D11	D10	D9	D8
I4	I3	I2	I1	I0	RESERVED		
D7	D6	D5	D4	D3	D2	D1	D0
RESERVED				PG3	PG2	PG1	PG0

Bit(s)	Reset Value	Access	Name	Description
15	0	Read / Write	I4	0 = Interrupt is clear 1 = Interrupt is set Interrupt event is cleared by writing a 1 to this bit. The interrupt bit will change regardless of condition of interrupt enable (I0) status. An interrupt in the GPI in slot 12 in the ACLink will follow this bit change when interrupt enable (I0) is unmasked.
14-13	0	Read Only	I3-I2	Interrupt Cause 00 = Reserved 01 = Sense cycle complete, sense info available. 10 = Change in GPIO input status 11 = Sense cycle complete and change in GPIO input status. These bits will reflect the general cause of the first interrupt event generated. It should be read after interrupt status has been confirmed as interrupting. The information should be used to scan possible interrupting events in proper pages.
12	0	Read / Write	I1	Sense Cycle 0 = Sense Cycle not in Progress 1 = Sense Cycle Start. Writing a 1 to this bit causes a sense-cycle start, if supported. If sense cycle is not supported, this bit is read only.
11	0	Read / Write	I0	Interrupt Enable 0 = Interrupt generation is masked. 1 = Interrupt generation is un-masked. The driver should not un-mask the interrupt unless ensured by the AC'97 controller that no conflict is possible with modem slot 12 - GPI functionality. Some AC'97 2.2 compliant controllers will not likely support audio CODEC interrupt infrastructure. In either case, software should poll the interrupt status after initiating a sense cycle and wait for Sense Cycle Max Delay to determine if an interrupting event has occurred.

Bit(s)	Reset Value	Access	Name	Description
10:4	0	Read Only	RESERVED	Bits not used, should read back 0
3:0	0	Read / Write	PG3:PG0	<p>Page Selector            0h = Vendor Specific            1h = Page ID 01 (See Section 8.4 for additional information on the Paging Registers)            Fh = Reserved Pages</p> <p>This register is used to select a descriptor of 16 word pages between registers 60h to 6Fh. ### 8.1.18. Powerdown Ctrl/Stat (26h)

Default: 000Fh

D15	D14	D13	D12	D11	D10	D9	D8
EAPD	PR6	PR5	PR4	PR3	PR2	PR1	PR0
D7	D6	D5	D4	D3	D2	D1	D0
RESERVED				REF	ANL	DAC	ADC

Bit(s)	Reset Value	Name	Description
15	0	EAPD	1 = Forces EAPD pad to VDDD 0 = Forces EAPD pad to GNDD
14	0	PR6	0 = Headphone Amp powered up 1 = Headphone Amp powered down
13	0	PR5	0 = Digital Clk active 1 = Digital Clk disable
12	0	PR4	0 = Digital active 1 = Powerdown: PLL, AC-Link, crystal oscillator
11	0	PR3	0 = VREF and VREFOUT are active 1 = VREF and VREFOUT are powered down, and PR2 is asserted in analog block
10	0	PR2	0 = Analog active 1 = All signal path analog is powered down
9	0	PR1	0 = DAC powered up 1 = DAC powered down
8	0	PR0	0 = ADC powered up 1 = ADC powered down
7:4	0	RESERVED	Bit not used, should read back 0
3	1	REF	Read Only --- VREF status 1 = VREF enabled
2	1	ANL	Read Only ---- ANALOG MIXERS, etc. Status 1 = Analog mixers ready.

Bit(s)	Reset Value	Name	Description
1	1	DAC	Read Only ---- DAC Status 1 = DAC ready to playback
0	1	ADC	Read Only ---- ADC Status 1 = ADC ready to record

#### 8.1.18.1. Ready Status

The lower half of this register is read only status, a 1 indicating that each subsection is “ready”. Ready is defined as the subsection's ability to perform in its nominal state. When this register is written, the bit values that come in on AC-Link will have no effect on read only bits 0-7.

When the AC-Link “CODEC Ready” indicator bit (SDATA\_IN slot 0, bit 15) is a 1, it indicates that the AC-Link and AC'97 control and status registers are in a fully operational state. The AC'97 controller must further probe this Powerdown Control/Status Register to determine exactly which subsections, if any, are ready. When this register is written, the bit values that come in on AC-Link will have no effect on read only bits 0-7.

#### 8.1.18.2. Powerdown Controls

The STAC9766/9767 is capable of operating at reduced power when no activity is required. The power-down state is controlled by the Powerdown Register (26h). See the section “Low Power Modes” for more information.

#### 8.1.18.3. External Amplifier Power Down Control Output

The EAPD bit 15 of the Powerdown Control/Status Register (Index 26h) directly controls the output of the EAPD output, pin 45, and produces a logical 1 when this bit is set to logic high. This function is used to control an external audio amplifier power down. EAPD = 0 places approximately 0 V on the output pin, enabling an external audio amplifier. EAPD = 1 places approximately DVdd on the output pin, disabling the external audio amplifier. Audio amplifiers that operate with reverse polarity will likely require an external inverter to maintain software driver compatibility.

EAPD can also act as a GPIO. See Section 8.4.11: page78. The GPIO controls in Section 8.2: page65 have no effect on EAPD.

### 8.1.19. Extended Audio ID (28h)

Default: 0A05h

D15	D14	D13	D12	D11	D10	D9	D8
ID1	ID0	RESERVED				AMAP	RSVD
D7	D6	D5	D4	D3	D2	D1	D0
RESERVED		DSA1	DSA0	RESVD	SPDIF	RSVD	VRA

The Extended Audio ID register is a read only register except for bits D4 and D5. ID1 and ID0 echo the configuration of the CODEC as defined by the programming of pins 45 and 46 externally. The primary CODEC returns 00, while any other code (01, 10, 11) identifies the CODEC as one of three secondary CODEC possibilities. The AMAP bit, D9, will return a 1 indicating that the CODEC sup-

ports the optional “AC'97 2.3 compliant AC-link slot to audio DAC mappings”. The default condition assumes that 0, 0 are loaded in the DSA0 and DSA1 bits of the Extended Audio ID (Index 28h). With 0s in the DSA1 and DSA0 bits, the CODEC slot assignments are as per the AC'97 specification recommendations. If the DSA1 and DSA0 bits do not contain 0s, the slot assignments are as per the table in the section describing the Extended Audio ID (Index 28h). The VRA bit, D0, will return a 1 indicating that the CODEC supports the optional variable sample rate conversion as defined by the AC'97 specification.

**Table 20. Extended Audio ID Register Functions**

Bit	Name	Access	Reset Value	Function
15:14	ID [1,0]	Read only	Variable	00 = XTAL_OUT grounded ( <b>Note 1</b> ) CID1#,CID0# = XTAL_OUT crystal or floating
13:12	RESERVED	Read only	00	Bits not used, should read back 00
11:10	REV[1:0]	Read only	10	Indicates CODEC is AC'97 Rev 2.3 compliant
9:6	RSVD	Read only	0	Reserved
5:4	DSA [1,0]	Read/Write	00	DAC slot assignment  If CID[1:0] = 00 then DSA[1:0] resets to 00 If CID[1:0] = 01 then DSA[1:0] resets to 01 If CID[1:0] = 10 then DSA[1:0] resets to 01 If CID[1:0] = 11 then DSA[1:0] resets to 10  00 = left slot 3, right slot 4 01 = left slot 7, right slot 8 10 = left slot 6, right slot 9 11 = left slot 10, right slot 11
3	RSVD	Read only	0	Reserved
2	SPDIF	Read only	1	0 = SPDIF pulled high on reset, SPDIF disabled 1 = default, SPDIF enabled ( <b>Note 2</b> )
1	RSVD	Read only	0	Reserved
0	VRA	Read only	1	Variable sample rates supported (Always = 1)

- External CID pin status (from analog) these bits are the logical inversion of the pin polarity (pin 45-46). These bits are zero if XTAL\_OUT is grounded with an alternate external clock source in primary mode only. Secondary mode can either be through BIT CLK driven or 24MHz clock driver, with XTAL\_OUT floating.
- If pin 48 is held high at powerup, this bit will be held to zero, to indicate the SPDIF is not available. **Pin 48: To Enable SPDIF, use a 1K $\Omega$  - 10 K $\Omega$  external pull-down. To Disable SPDIF, use a 1 K $\Omega$  - 10 K $\Omega$  external pullup. Do NOT leave Pin 48 floating.**

### 8.1.20. Extended Audio Control/Status (2Ah)

Default: 0400h\* (\*default depends on CODEC ID)

D15	D14	D13	D12	D11	D10	D9	D8
VCFG	RESERVED				SPCV	RESERVED	
D7	D6	D5	D4	D3	D2	D1	D0
RESERVED		SPSA1	SPSA0	RSRVD	SPDIF	RSRVD	VRA enable

Note: If pin 48 is held high at powerup, the SPDIF is not available and bits D15:D1 can not be written and will read back zero. Pin 48: To Enable SPDIF, use a 1K $\Omega$  - 10 K $\Omega$  external pulldown. To Disable SPDIF, use a 1K $\Omega$  - 10 K $\Omega$  external pullup. Do NOT leave Pin 48 floating.

Bit(s)	Reset Value	Name	Description
15		VCFG	Determines the SPDIF transmitter behavior when data is not being transmitted. When asserted, this bit forces the deassertion of the SPDIF "Validity" flag, which is bit 28 transmitted by the SPDIF sub-frame. The "V" bit is defined in the SPDIF Control Register (Reg 3Ah). If "V" = 1 and "VCFG" = 0, then for each S/PDIF sub-frame (Left & Right), bit<28> "Validity" flag reflects whether or not an internal CODEC transmission error has occurred. Specifically an internal CODEC error should result in the "Validity" flag being set to 1. If "V" = 0 and "VCFG" = 1, In the case where the S/PDIF transmitter does not receive a valid sample from the AC'97 controller, (Left or Right), the S/PDIF transmitter should set the "Validity" flag to 0 and pad the "Audio Sample Word" with 0 for sub-frame in question. If a valid sample (Left or Right) was received and successfully transmitted, the "Validity" flag should be 0 for that sub-frame. Default state, coming out of reset, for "V" and "VCFG" should be 0 and 0. These bits are set via driver .inf options.
14-11		RESERVED	Reserved
10	0	SPCV	0 = Invalid SPDIF configuration 1 = Valid SPDIF configuration
9:6	0	RESERVED	Bit not used, should read back 0
5:4	0	SPSA1:SPSA0	SPDIF slot assignment  If CID[1:0] = 00 then SPSA[1:0] resets to 01 If CID[1:0] = 01 then SPSA[1:0] resets to 10 If CID[1:0] = 10 then SPSA[1:0] resets to 10 If CID[1:0] = 11 then SPSA[1:0] resets to 11  00 = Left slot 3, right slot 4 01 = Left slot 7, right slot 8 10 = Left slot 6, right slot 9 11 = Left slot 10, right slot 11
3		RESERVED	Reserved
2	0	SPDIF	0 = Disables SPDIF (SPDIF_OUT is high Z) (note 1) 1 = Enable SPDIF SPDIF is a control register for Reg 3Ah, this bit must be set low i.e. SPDIF disabled in order to write to Reg 3Ah Bits D15,D13:D0.
1	0	RESERVED	Bit not used, should read back 0
0	0	VRA Enable	0 = VRA disabled, DAC and ADC set to 48 KHz (Registers 2Ch and 32h loaded with the value BB80h) 1 = VRA ENABLED, Reg. 2Ch & 32h control sample rate

#### 8.1.20.1. Variable Rate Sampling Enable

The Extended Audio Status Control register also contains one active bit to enable or disable the Variable Sampling Rate capabilities of the DACs and ADCs. If the VRA, bit D0, is 1, the variable

sample rate control registers (2Ch and 32h) are active, and “on-demand” slot data required transfers are allowed. If the VRA bit is 0, the DACs and ADCs will operate at the default 48 KHz data rate.

The STAC9766/9767 supports “on-demand” slot request flags. These flags are passed from the CODEC to the AC'97 controller in every audio input frame. Each time a slot request flag is set (active low) in a given audio frame, the controller will pass the next PCM sample for the corresponding slot in the audio frame that immediately follows. The VRA enable bit must be set to 1 to enable “on-demand” data transfers. If the VRA enable bit is not set, the CODEC will default to 48 KHz transfers and every audio frame will include an active slot request flag and data is transferred every frame.

For variable sample rate output, the CODEC examines its sample rate control registers, the state of the FIFOs, and the incoming SDATA\_OUT tag bits at the beginning of each audio output frame to determine which SLOTREQ bits to set active (low). SLOTREQ bits are asserted during the current audio input frame for active output slots, which will require data in the next audio output frame.

For variable sample rate input, the tag bit for each input slot indicates whether valid data is present or not. Thus, even in variable sample rate mode, the CODEC is always the master: for SDATA\_IN (CODEC to controller), the CODEC sets the TAG bit; for SDATA\_OUT (controller to CODEC), the CODEC sets the SLOTREQ bit and then checks for the TAG bit in the next frame. When VRA is set to 0, the PCM rate registers (2Ch and 32h) are overwritten with BB80h (48 KHz).

#### 8.1.20.2. SPDIF

The SPDIF bit in the Extended Audio Status Control Register is used to enable and disable the SPDIF functionality within the STAC9766/9767. If the SPDIF is set to a 1, then the function is enabled. When set to a 0, it is disabled.

#### 8.1.20.3. SPCV (SPDIF Configuration Valid)

The SPCV bit is read only and indicates whether or not the SPDIF system is set up correctly. When SPCV is a 0, it indicates the system configuration is invalid. When SPCV is a 1, it indicates the system configuration is valid.

#### 8.1.20.4. SPSA1, SPSA0 (SPDIF Slot Assignment)

SPSA1 and SPSA0 combine to provide the slot assignments for the SPDIF data. The following details the slot assignment relationship between SPSA1 and SPSA0.

The STAC9766/9767 are AMAP compliant with the following table.

**Table 21. AMAP Compliant**

CODEC ID	Function	SPSA = 00 slot assignment	SPSA = 01 slot assignment	SPSA = 10 slot assignment	SPSA = 11 slot assignment
00	2-ch Primary w/SPDIF	3 & 4	7 & 8*	6 & 9	10 & 11
01	2-ch Dock CODEC w/SPDIF	3 & 4	7 & 8	6 & 9*	10 & 11
10	+2-ch Surr w/ SPDIF	3 & 4	7 & 8	6 & 9*	10 & 11
11	+2-ch Cntr/LFE w/ SPDIF	3 & 4	7 & 8	6 & 9	10 & 11*

Note: \* is the default slot assignment

### 8.1.21. PCM DAC Rate Registers (2Ch and 32h)

The internal sample rate for the DACs and ADCs is controlled by the value in these read/write registers that contain a 16-bit unsigned value between 0 and 65535 representing the conversion rate in Hertz (Hz). In VRA mode (register 2Ah bit D0 = 1), if the value written to these registers is supported, that value will be echoed back when read, otherwise the closest (higher in the case of a tie) sample rate is supported and returned. Per PC 99 / PC 2001 specification, independent sample rates are supported for record and playback.

Whenever VRA is set to 0 the PCM rate registers (2Ch and 32h) will be loaded with BB80h (48 KHz).

If VRA is set to a 0, any write to this address will be ignored and the rate remains at 48 KHz.

**Table 22. Hardware Supported Sample Rates**

Sample Rate	SR15-SR0 Value
8 KHz	1F40h
11.025 KHz	2B11h
16 KHz	3E80h
22.05 KHz	5622h
32 KHz	7D00h
44.1 KHz	AC44h
48 KHz	BB80h

### 8.1.22. PCM DAC Rate (2Ch)

Default: BB80h (see table22: page63)

D15	D14	D13	D12	D11	D10	D9	D8
SR15	SR14	SR13	SR12	SR11	SR10	SR9	SR8

11	0	Read & Write	L	Generation Level is defined by the IEC standard, or as appropriate.
10:4	0	Read & Write	CC[6, 0]	Category Code is defined by the IEC standard or as appropriate by media.
3	0	Read & Write	PRE	0 = 0 $\mu$ sec Pre-emphasis 1 = Pre-emphasis is 50/15 $\mu$ sec
2	0	Read & Write	COPY	0 = Copyright not asserted 1 = Copyright is asserted
1	0	Read & Write	/AUDIO	0 = PCM data 1 = Non-Audio or non-PCM format
0	0	Read & Write	PRO	0 = Consumer use of the channel 1 = Professional use of the channel

## 8.2. General Purpose Input & Outputs

### 8.2.1. EAPD

EAPD can act as a GPIO, but is unaffected by the following registers. To use EAPD as a GPIO, use Register 74h, the EAPD Access Register (see Section 8.4.11: page 78). Additional information about EAPD can also be found in Section 8.1.18.3: page 59.

### 8.2.2. GPIO Pin Definitions

GPIO pins are programmable to have input/output functionality. The data values (status) for these pins are all in one register with input/output configuration in a separate register. Control of GPIO pins configured for output is achieved by setting the corresponding bit in output slot 12; status of GPIO pins configured for input is returned on input slot 12. The CODEC must constantly set the GPIO pins that are configured for output, based upon the value of the corresponding bit position of the control slot 12. The CODEC should ignore output slot 12 bits that correspond to GPIO control pins configured as inputs. The CODEC must constantly update status on input slot 12, based upon the logic level detected at each GPIO pin configured for input. A GPIO output pin value that is written via slot 12 in the current frame will not affect the GPIO status that is returned in that particular write frame.

This slot-12 based control/status protocol minimizes the latency and complexity, especially for host-based Controllers and host data pump software, and provides high speed monitoring and control, above what could be achieved with command/status slots. For host-based implementations, most AC'97 registers can be shadowed by the driver in order to provide immediate response when read by the processor, and GPIO pins configured as inputs should be capable of triggering an interrupt upon a change of status.

The AC-link request for GPIO pin status is always delayed by at least one frame time. Read-Modify-Writes across the AC-link incur latency issues which must be accounted for by the software driver or AC'97 Digital Controller firmware. PCI retries should be kept to a minimum wherever possible.

### 8.2.3. GPIO Pin Implementation

The GPIOs are set to a high impedance state on power-on or a cold reset. It is up to the AC'97 Digital Controller to first enable the output after setting it to the desired state.

When GPIO1 is configured as output and Register h74 bit[0] = 1, the GPIO1 pad will get its value from slot12. When GPIO1 is configured as input and configured as a sticky, writing a 1 does nothing, writing a 0 clears this bit. When GPIO1 is configured as input, this register reflects the value on the GPIO1 pad after interpretation of the polarity and sticky configurations.
0	Read / Write	x	GI0	When GPIO0 is configured as output and Register h74 bit[0] = 0 (default), the value of this register will be placed on the GPIO0 pad. When GPIO0 is configured as output and Register h74 bit[0] = 1, the GPIO0 pad will get its value from slot12. When GPIO0 is configured as input and configured as a sticky, writing a 1 does nothing, writing a 0 clears this bit. When GPIO0 is configured as input, this register reflects the value on the GPIO0 pad after interpretation of the polarity and sticky configurations.

### 8.3. Extended CODEC Registers Page Structure Definition

Registers 60h-68h are the Extended CODEC Registers: These registers allow for the definition of further capabilities. These bits provide a paged address space for extended CODEC information. The Page Selector bits in the Audio Interrupt and Paging register (Register 24h bits 3:0) control the page of information viewed through this page window.

#### 8.3.1. Extended Registers Page 00

Page 00 of the Extended CODEC Registers is reserved for vendor specific use. Driver writers should not access these registers unless the Vendor ID register has been checked first to ensure that the vendor of the AC '97 component has been identified and the usage of the vendor defined registers understood.

#### 8.3.2. Extended Registers Page 01

The usage of Page 01 of the Extended CODEC Registers is defined in Register 24h found in Section 8.1.17: page 57.

#### 8.3.3. Extended Registers Page 02, 03

Pages 02 and 03 of the Extended CODEC Registers are reserved for future use.

## 8.4. STAC9766/9767 Paging Registers

The AC'97 Specification Rev 2.3 uses a paging mechanism in order to increase the number of registers. The registers currently used in the paging are 60h to 6Eh. Additional information about the Extended CODEC Registers, please refer to Section 8.3: page68.

One of two pages can be made active at any time, set in Register 24h. Register 24h is the Audio Interrupt and Paging Register. Additional details about Register 24h is located in Section 8.1.17: page57.

**If page 00h is active, registers 60h to 6Eh are Vendor Specific.**

**If page 01h is active, registers 60h to 6Eh have the following functionality:**

Reg	NAME	FUNCTION	Location
60h	CODEC Class/Revision	Provides the CODEC Class and a Vendor specified revision identifier.	8.4.1: page69
62h	PCI SVID	Allows for population by the system BIOS to identify the PCI Sub System Vendor ID.	8.4.2: page70
64h	PCI SSID	Allows for population by the system BIOS to identify the PCI Sub System ID.	Note:: page70
66h	Function Select	Provides the type of audio function being selected and which jack conductor the selected value is measured from.	Note:: page71
68h	Function Information	Includes information about Gain, Inversion, Buffer delays, Information Validity, and Function Information presence.	8.4.5: page72
6Ah	Sense Register	Includes information about the connector/jack location, Input verses Output sensing, the Order of the sense results, and the IDT specific sense results.	8.4.7: page74
6Ch		Reserved	
6Eh		Reserved	

### 8.4.1. CODEC Class/Rev (60h Page 01h)

Register 24h must be set to Page 01h to access this register.

Default: 12xxh

D15	D14	D13	D12	D11	D10	D9	D8
RESERVED			CL4	CL3	CL2	CL1	CL0
D7	D6	D5	D4	D3	D2	D1	D0
RV7	RV6	RV5	RV4	RV3	RV2	RV1	RV0
Bit(s)	Reset Value	Name	Description				
15-13		RESERVED	Reserved - not defined				

Bit(s)	Reset Value	Name	Description
12-8		CL4:CL0	CODEC Compatibility Class (RO) This is a CODEC vendor specific field to define software compatibility for the CODEC. Software read this field together with CODEC vendor ID (reg 7C-7Eh) to determine vendor specific programming interface compatibility. Software can rely on vendor specific register behavior to be compatible among vendor CODECs of the same class. 00h - Field not implemented 01h-1Fh - Vendor specific compatibility class code Equals Vendor ID2(Reg 7Eh) bits D7 to D0
7-0		RV7:RV0	Revision ID: (RO) This register specifies a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. This field should be viewed as a vendor defined extension to the CODEC ID. This number changes with new CODEC stepping of the same CODEC ID. Equals Major Rev bits (Reg 6Ch) bits D7 to D0.

#### 8.4.2. PCI SVID (62h Page 01h)

Register 24h must be set to Page 01h to access this register.

Default: FFFFh

D15	D14	D13	D12	D11	D10	D9	D8

RESERVED			FC3	FC2	FC1	FC0	T/R

Bit(s)	Reset Value	Name	Description
15-5		Reserved	Reserved
4-1	00h	FC3:FC0	Function Code bits: 00h - Line Out (Master Out) 01h - Head Phone Out (AUX Out) Setting the T/R bit to 0 = Left, 1 = Right 02h - DAC 3 (C/LFE) - Not Supported 03h - SPDIF out 04h - Phone In 05h - Mic1 (Mic select = 0) 06h - Mic2 (Mic select = 1) 07h - Line In 08h - CD In 09h - Video In 0Ah - Aux In 0Bh - Mono Out 0C-0Fh - Reserved For supported Jack and Mic Sense Functions, see Table23: page72.  The Function Code Bits are used to read Register 68h (Page 01h) and Register 6Ah (Page 01h).  Mono I/O should report relevant sense and function information on Tip, and report not supported on Ring.  Setting the function code to unsupported values will return a 0 when accessing the Information Valid Bit in page 01 register 68h bit 5.
0	0	T/R	Tip or Ring selection Bit. This bit sets which jack conductor the sense value is measured from. Software will program the corresponding the Ring/Tip selector bit together with the I/O number in bits FC[3:0]. 0 - Tip (Left) 1 - Ring (Right)

Note: This register does not reset on RESET#.

Function Code	I/O	Sense Capability
00h	Line_Out	Jack Sense
01h	Headphone_Out	Jack Sense
05h	Mic1	Mic Sense
06h	Mic2	Mic Sense

Table 23. Supported Jack and Mic Sense Functions

#### 8.4.5. Function Information (68h Page 01h)

Register 24h must be set to Page 01h to access this register.

Default: 00xxh, see table 24: page73.

D15	D14	D13	D12	D11	D10	D9	D8
G4	G3	G2	G1	G0	INV	DL4	DL3
D7	D6	D5	D4	D3	D2	D1	D0
DL2	DL1	DL0	IV	RESERVED			FIP

Bit(s)	Reset Value	Name	Description
15	0	G4	Gain Sign Bit: The CODEC updates this bit with the sign of the gain value present in G[3:0]. The BIOS updates this to take into consideration external amplifiers or other external logic when relevant. G[4] indicates whether the value is a gain or attenuation. Gain in the G4 bit is in terms of dB. This bit is Read/Write and only reset on POR and not by RESET#.
14-11	0	G3:G0	Gain Bits: The CODEC updates these bits with the gain value (dB relative to level-out) in 1.5dBV increments. The BIOS updates these to take into consideration external amplifiers or other external logic when relevant. G[0:3] indicates the magnitude of the gain. G[4] indicates whether the value is a gain or attenuation. For Gain/Attenuation settings, see Table 25: page74. These bits are read/write and are not reset on RESET#.
10		INV	Inversion bit: Indicates that the CODEC presents a 180 degree phase shift to the signal. 0h - No inversion reported 1h - Inverted This bit is read/write and is not reset on RESET#. BIOS should invert for each inverting gain stage.

Bit(s)	Reset Value	Name	Description
9-5		DL4:DL0	<p>Buffer delays: CODEC will provide a delay measurement for the input and output channels. Software will use this value to accurately calculate audio stream position with respect to what is been reproduced or recorded. These values are in 20.83 microsecond (1/48000 second) units.</p> <p>For output channels, this timing is from the end of AC Link frame in which the sample is provided, until the time the analog signal appears at the output pin. For input streams, this is from when the analog signal is presented at the pin until the representative sample is provided on the AC Link.</p> <p>Analog in and out paths are not considered as part of this delay. The measurement is a 'typical' measurement, at a 48 KHz sample rate, with minimal in-CODEC processing (i.e., 3D effects are turned off.)</p> <p>00h - Information not provided 01h...1Eh - Buffer delay in 20.83 <math>\mu</math>s units 1Fh - reserved</p> <p>These bits are read/write and are not reset on RESET#. The default value is the delay internal to the CODEC. The BIOS may add to this value the known delays external to the CODEC, such as for an external amplifier.</p>
4	1	IV	<p>Information Valid Bit: Indicates whether a sensing method is provided by the CODEC and if information field is valid. This field is updated by the CODEC.</p> <p>0h--After CODEC RESET# de-assertion, it indicates the CODEC does NOT provides sensing logic and this bit will be Read Only. After a sense cycle is completed indicates that no information is provided on the sensing method.</p> <p>1h--After CODEC RESET# de-assertion, it indicates the CODEC provides sensing logic for this I/O and this bit is Read/Write. After clearing this bit by writing 1, when a sense cycle is completed the assertion of this bit indicates that there is valid information in the remaining descriptor bits. Writing "0" to this bit has no effect.</p> <p>BIOS should NOT write this bit, as it is reset on RESET#.</p>
3-1	0	RESERVED	Bit not used, should read back 0
0	NA	FIP	<p>Function Information Present</p> <p>This bit is set to a 1 indicates that the G[4:0], INV, DL[4:0](Register 68h, Page 01h) and ST[2:0](register 6Ah, Page 01h) are supported and R/W capable. This bit is Read Only.</p>

Table 24. Reg 68h Default Values

Reg 66h Function Code	Reg 68h Default Value
00h Line Out	0010h
01h Headphone Out	0010h
05h Mic1	0010h
06h Mic2	0010h
All other Function Codes	0000h
For RESET#: Reg 68h default value is 0000h.	

Table 25. Gain or Attenuation Examples

G[4:0]	Gain or Attenuation (dB relative to level-out)
00000	0 dBV
00001	+1.5 dBV
01111	+24 dBV
10001	-1.5 dBV
11111	-24 dBV

Table 26. Register 68h/Page 01h Bit Overview

Bit	Bit R/W Overview
D5:D15	Read/Write and only reset on POR (Power on Reset) and not by RESET#.
D4	Read/Write and should NOT be set by the BIOS
D3:1	Reserved
D0	Read Only.

#### 8.4.6. Digital Audio Control (6Ah, Page 00h)

To access Register 6Ah, Page 00h must be selected in Register 24h.

Default: 0000h

15:3	0	RESERVED	Bits not used, should read back 0				
2	0	SPOR	Over-ride Register 2Ah, D12 write-lock when SPDIF_EN = 1. All bits except SPDIF sample-rate are affected (D13-D12). Allows for sub-code changing on-the-fly.				
1	0	DO1	SPDIF Digital Output Source Selection: DO1 = 0; PCM data from the AC-Link to SPDIF DO1 = 1; ADC record data to SPDIF				
0	0	RESERVED	Bits not used, should read back 0				

#### 8.4.7. Sense Details (6Ah Page 01h)

Register 24h must be set to Page 01h to access this register.

Default: NA

D15	D14	D13	D12	D11	D10	D9	D8
ST2	ST1	ST0	S4	S3	S2	S1	S0
D7	D6	D5	D4	D3	D2	D1	D0
OR1	OR0	SR5	SR4	SR3	SR2	SR1	SR0

Bit(s)	Reset Value	Name	Description
15-13		ST2:ST0	Connector/Jack location bits This field describes the location of the jack in the system. 0h - Rear I/O Panel 1h - Front Panel 2h - Motherboard 3h - Dock/External 4h:6h - Reserved 7h - No Connection/unused I/O These bits are Read/Write.
12-8		S4:S0	Sensed bits meaning relates to the I/O being sense as output or inputs. Sensed bits (outputs): See Table 27: page75. This field allows for the reporting of the type of output peripheral/device plugged in the jack. Values specified below should be interrogated in conjunction with the SR[5:0] and OR[1:0] bits for accurate reporting. Sensed bits (inputs): See Table 28: page76. This field allows for the reporting of the type of input peripheral/device plugged in the jack. Values specified below should be interrogated in conjunction with the SR[5:0] and OR[1:0] bits for accurate reporting. This field is Read Only.
7-6		OR1:0	Order Bits. These bits indicate the order the sense result bits SR[5:0] are using. 00 - $10^0$ (i.e., Ohms) 01 - $10^1$ (i.e., 10 Ohms) 10 - $10^2$ (i.e., 100 Ohms) 11 - $10^3$ (i.e., 1K Ohms)
5-0		SR5:SR0	Sense Result bits These bits are used to report a vendor specific fingerprint or value. (Resistance, impedance, reactance, etc.) This field is Read Only.

**Table 27. Sensed Bits (Outputs)**

Reported Value	Output Peripheral/Device
0h	Data not valid. Indicates that the reported value(s) is invalid.
1h	No connection. Indicates that there are no connected devices.
2h	Fingerprint. Indicates a specific fingerprint value for devices that are not specified or unknown.
3h	Speakers (8 ohms)
4h	Speakers (4 ohms)
5h	Powered Speakers
6h	Stereo Headphone
7h	RESERVED
8h	RESERVED
9h	Headset (mono speaker left channel and mic.)
Ah	Other. Allows a vendor to report sensing other type of devices/peripherals. SR[5:0] together with OR[1:0] provide information regarding the type of device sensed.
Bh-Eh	Reserved
Fh	Unknown (use fingerprint)

Table 28. Sensed Bits (Inputs)

Reported Value	Input Peripheral/Device
0h	Data not valid. Indicates that the reported value(s) is invalid.
1h	No connection. Indicates that there are no connected devices.
2h	Fingerprint. Indicates a specific fingerprint value for devices that are not specified.
3h	Microphone (mono)
4h	Reserved
5h	Stereo Line In (CE device attached)
6h	Reserved
7h	Reserved
8h	Reserved
9h	Headset (mono speaker left channel and mic.)
Ah	Other. Allows a vendor to report sensing other type of devices/peripherals. SR[5:0] together with OR[1:0] provide information regarding the type of device sensed.
Bh-Eh	Reserved
Fh	Unknown (use fingerprint)

#### 8.4.8. Revision Code (6Ch)

To access Register 6Ch, Page 00h must be selected in Register 24h.

Default: 00xxh

D15	D14	D13	D12	D11	D10	D9	D8
MINORREV							
D7	D6	D5	D4	D3	D2	D1	D0
MAJORREV							
Bit(s)	Reset Value	Name	Description				
15:8	00h	MINORREV	Minor Revision ID. These bits are read only and will be updated based on minor device changes which will not require software changes.				
7:0	xx	MAJORREV	Major Revision ID. These bits are read only and will be updated based on major device changes.				

#### 8.4.9. Analog Special (6Eh)

To access Register 6Eh, Page 00h must be selected in Register 24h.

Default: 1000h

D15	D14	D13	D12	D11	D10	D9	D8
RESERVED			AC97MIX	RESERVED			
D7	D6	D5	D4	D3	D2	D1	D0
RSVD	MUTEFIX DISABLE	ADCSLT1	ADCSLT0	RSVD	MIC GAIN VAL	SPLYOVR EN	SPLYOVR VAL

Bit(s)	Reset Value	Name	Description
15:13	0	RESERVED	Bits not used, should read back 0
12	1	AC97MIX	0 = mixer record contains a mix of all mono and stereo analog input signals, not the DAC (ALL ANALOG mode) 1 = mixer record contains a mix of all mono and stereo analog input signals plus the DAC signal (AC97 mode) This bit only has an effect when either Stereo Mix or Mono Mix is selected as the record source in Reg. 1Ah. The "ALL" mode is useful in conjunction with the POP BYPASS mode (Reg. 20h;D15) to record all analog sources, perform further processing in the digital domain, including combining with other PCM data, and routing through the DACs directly to Line Out, Headphone Out, or Mono Out. A Stereo Mix recording will be affected by the setting of the 3D Effects bit (Reg. 20h;D13)
11:7	0	RESERVED	Bits not used, should read back 0
6	0	MUTEFIX DISABLE	0 = MUTE FIX Enabled 1 = MUTE FIX Disabled When this bit is zero, and either channel is set to -46.5dB attenuation, 1Fh, then that channel is fully muted. When this bit is one, then operation is per AC'97 specification.
5:4	0	ADCSLT1:0	Select slots for ADC data on ACLINK 00 = left slot 3, right slot 4 01 = left slot 7, right slot 8 10 = left slot 6, right slot 9 11 = left slot 10, right slot 11
3	0	RESERVED	Reserved
2	0	MIC GAIN VAL	Adds +10dB gain to the selected MIC input. Use in conjunction with BOOSTEN (Reg. 0Eh;D6) BOOSTEN MICGAINVAL 0            0            = 0 dB 0            1            = 10 dB 1            0            = 20 dB 1            1            = 30 dB
1	0	SPLYOVR_EN	Supply Override bit allows override of the supply detect. 0 = no override on supply detect 1 = override supply detect with bit 0
0	0	SPLYOVR_VAL	Supply Override Value provides the analog voltage operation values. 0 = force 3.3V operation 1 = force 5V operation

#### 8.4.10. Analog Current Adjust (72h)

To unlock Register 72h, write 0xABBA to Register 70h.

Default: 0000h

D15	D14	D13	D12	D11	D10	D9	D8
RESERVED							
D7	D6	D5	D4	D3	D2	D1	D0
INT APOP	RESERVED						

Bit(s)	Reset Value	Name	Description
15:8	0	RESERVED	Reserved
7	0	INT_APOP	0 = Anti Pop Enabled 1 = Anti Pop Disabled The STAC9766/9767 includes an internal power supply anti-pop circuit that prevents audible clicks and pops from being heard when the CODEC is powered on and off. This function is accomplished by delaying the charge/discharge of the VREF capacitor (Pin 27). $C_{VREF}$ value of 1 $\mu$ F will cause a turn-on delay of roughly 3 seconds, which will allow the power supplies to stabilize before the CODEC outputs are enabled. The delay will be extended to 30 seconds if a $C_{VREF}$ value of 10 $\mu$ F is used. The CODEC outputs are also kept stable for the same amount of time at power-off to allow the system to be gracefully turned off. The INT_APOP bit allows this delay circuit to be bypassed for rapid production testing. Any external component anti-pop circuit is unaffected by the internal circuit.
6:0	0	RESERVED	Reserved

#### 8.4.11. EAPD Access Register (74h)

Default: 0800h

D15	D14	D13	D12	D11	D10	D9	D8
EAPD	RESERVED			EAPD_OEN	RESERVED		
D7	D6	D5	D4	D3	D2	D1	D0
RESERVED					INTDIS	GPIOACC	GPIOSLT12

Bit(s)	Reset Value	Name	Description
15	0	EAPD	EAPD data Enable EAPD data output on EAPD when bit D11 = 1 EAPD data input from pin when bit D11 = 0
14:12	0	RESERVED	Bit not used, should read back 0
11	1	EAPD_OEN	EAPD Pin Enable 0 = EAPD configured as input pin 1 = EAPD configured as output pin
10:3	0	RESERVED	Bit not used, should read back 0
2	0	INTDIS	Interrupt disable option. Interrupts cleared by writing a 1 to I4 (Reg24h:D15)  0 = will clear both SENSE and GPIO interrupts 1 = will only clear SENSE interrupts. GPIO interrupts will have to be cleared in Reg54h.
1	0	GPIOACC	GPIO ACCESS 0 = ACLINK access from GPIO Pads 1 = ACLINK access from GPIO Register 54h
0	0	GPIOSLT12	0 = GPIO0/1 access via Reg54h when GPIO is set as an output, for input Slot12 data will be 0h. 1 = GPIO0/1 access via Slot 12 when GPIO is set as an output, for inputs Reg54h will not be updated.  This can only be used if a modem CODEC is not present in the system and using Slot12.

#### 8.4.12. High Pass Filter Bypass (78h\*)

To unlock portion of Register 78h, write 0xABBA to Register 76h.

Default: 0000h

D15	D14	D13	D12	D11	D10	D9	D8
RESERVED							
D7	D6	D5	D4	D3	D2	D1	D0

Bit(s)	Reset Value	Name	Description				
15:1	0	RESERVED	Bits not used, should read back 0				
0	0	ADC HPF BYP	0 = Normal operation, (ADC High Pass Filter active) 1 = ADC High Pass Filter Bypass				

#### 8.4.13. Stereo Mic Enable Register (78h\*)

To unlock portion of Register 78h, write 0x7272 to Register 72h.

Default: 0000h

D15	D14	D13	D12	D11	D10	D9	D8
RESERVED							
D7	D6	D5	D4	D3	D2	D1	D0
RSVD	STEREO_MIC	RESERVED					
Bit(s)	Reset Value	Name	Description				
15:7	0	RESERVED	Bits not used, should read back 0				
6	0	STEREO_MIC	0 = Stereo Mic Disabled (default) 1 = Stereo Mic Enabled				

### 8.5. Vendor ID1 and ID2 (Index 7Ch and 7Eh)

These two registers contain four 8-bit ID codes. The first three codes have been assigned by Microsoft using their Plug and Play Vendor ID methodology. The fourth code is a IDT, Inc. assigned code identifying the STAC9766/9767. The ID1 register (index 7Ch) contains the value 8384h, which is the first (83h) and second (84h) bytes of the Microsoft ID code. The ID2 register (index 7Eh) contains the value 7666h, which is the third (76h) byte of the Microsoft ID code, and 66h which is the STAC9766/9767 ID code.

**8.5.1. Vendor ID1 (7Ch)**

Default: 8384h

D15	D14	D13	D12	D11	D10	D9	D8
1	0	0	0	0	0	1	1
D7	D6	D5	D4	D3	D2	D1	D0
1	0	0	0	0	1	0	0

**8.5.2. Vendor ID2 (7Eh)**

Default: 7666h

D15	D14	D13	D12	D11	D10	D9	D8
0	1	1	1	0	1	1	0
D7	D6	D5	D4	D3	D2	D1	D0
0	1	1	0	0	1	1	0

## 9. LOW POWER MODES

The STAC9766/9767 is capable of operating at reduced power when no activity is required. The power-down state is controlled by the Powerdown Register (26h). There are seven separate power-down commands. The power down options are listed in Table 29. The first three bits, PR0..PR2, can be used individually or in combination with each other, and control power distribution to the ADCs, DACs and Mixer. The last analog power control bit, PR3, affects analog bias and reference voltages, and can only be used in combination with PR1, PR2 and PR3. PR3 essentially removes power from all analog sections of the CODEC and is generally only asserted when the CODEC will not be needed for long periods. PR0 and PR1 control the PCM ADCs and DACs only. PR2 and PR3 do not need to be “set” before a PR4, but PR0 and PR1 should be “set” before PR4. PR5 disables the DSP clock and does not require an external cold reset for recovery. PR6 disables the headphone driver amplifier for additional analog power saving.

**Table 29. Low Power Modes**

GRP Bits	Function
PR0	PCM in ADCs & Input Mux Powerdown
PR1	PCM out DACs Powerdown
PR2	Analog Mixer power down (VREF still on)
PR3	Analog Mixer power down (VREF off)
PR4	Digital Interface (AC-Link) power down (BIT_CLK forced low)
PR5	Digital Clock disable, BIT_CLK still on
PR6	Powerdown HEADPHONE_OUT

**Figure 22. Example of STAC9766/9767 Powerdown/Powerup Flow**

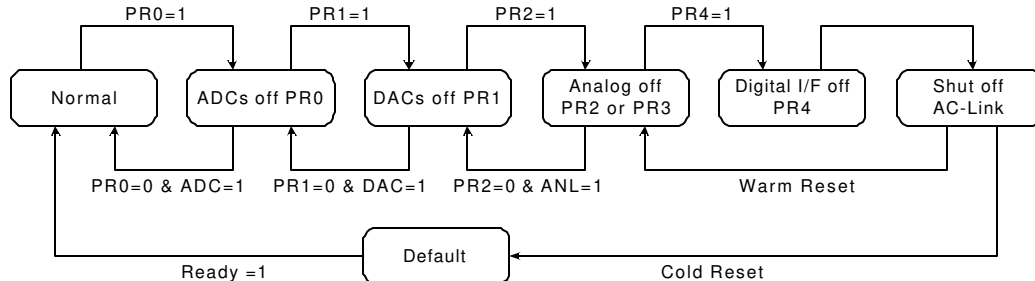

Figure 22 illustrates an example procedure to do a complete power down of STAC9766/9767. From normal operation, sequential writes to the Powerdown Register are performed to power down STAC9766/9767 a section at a time. After everything has been shut off, a final write (of PR4) can be executed to shut down the AC-Link. The part will remain in sleep mode with all its registers holding their static values. To wake up, the AC'97 controller will send an extended pulse on the sync line, issuing a warm reset. This will restart the AC-Link (resetting PR4 to zero). The STAC9766/9767 can also be woken up with a cold reset. A cold reset will reset all of the registers to their default states (Paged Registers are semi-exempt). When a section is powered back on, the Powerdown Control/Status register (index 26h) should be read to verify that the section is ready (stable) before attempting any operation that requires it.

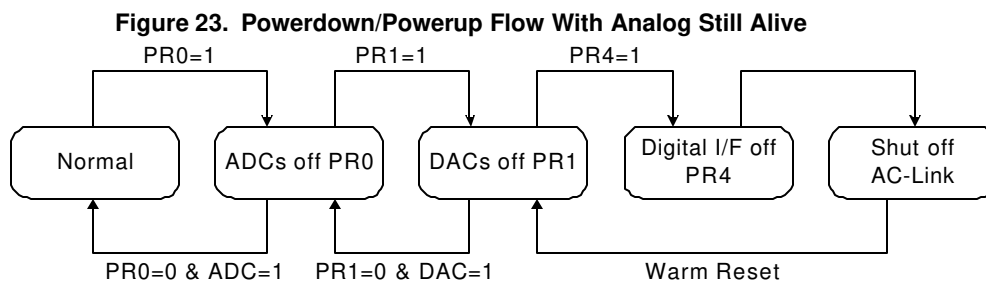

Figure 23 illustrates a state when all the mixers work with the static volume settings that are contained in their associated registers. This configuration can be used when playing a CD (or external LINE\_IN source) through STAC9766/9767 to the speakers, with most of the system in low power mode. The procedure for this follows the previous example except that the analog mixer is never shut down.

## 10. MULTIPLE CODEC SUPPORT

The STAC9766/9767 provides support for the multi-CODEC option according to the Intel AC'97, rev 2.3 specification. By definition there can be only one Primary CODEC (CODEC ID 00) and up to three Secondary CODECs (CODEC IDs 01, 10 and 11). The CODEC ID functions as a chip select. Secondary devices therefore have completely orthogonal register sets; each is individually accessible and they do not share registers.

### 10.1. Primary/Secondary CODEC Selection

In a multi-CODEC environment the CODEC ID is provided by external programming of pins 45 and 46 (CID0 and CID1). The CID pin electrical function is logically inverted from the CODEC ID designation. The corresponding pin state and its associated CODEC ID are listed in the "CODEC ID Selection" table. Also see slot assignment discussion, "Multi-Channel Programming Register (Index 74h)".

**Table 30. CODEC ID Selection**

CID1 State	CID0 State	CODEC ID	CODEC Status
Dvdd or floating	Dvdd or floating	00	Primary
Dvdd or floating	0V	01	Secondary
0V	Dvdd or floating	10	Secondary
0V	0V	11	Secondary

#### 10.1.1. Primary CODEC Operation

As a Primary device the STAC9766/9767 is completely compatible with existing AC'97 definitions and extensions. Primary CODEC registers are accessed exactly as defined in the AC'97 Component Specification and AC'97 Extensions. The STAC9766/9767 operates as Primary by default, and the external ID pins (45 and 46), have internal pull-ups so that these pins may be left as no-connects for primary operation.

When used as the Primary CODEC, the STAC9766/9767 generates the master AC-Link BIT\_CLK for both the AC'97 Digital Controller and any Secondary CODECs. The STAC9766/9767 can support up to four loads of 10 K $\Omega$  / 50 pF on the BIT\_CLK output. This is to ensure that up to four CODECs will not load down the clock output.

#### 10.1.2. Secondary CODEC Operation

When the STAC9766/9767 is configured as a Secondary device the BIT\_CLK pin is configured as an input at power up. Using the BIT\_CLK provided by the Primary CODEC insures that everything on the AC-Link will be synchronous. As a Secondary device it can be defined as CODEC ID 01, 10, or 11 in the two-bit field(s) of the Extended Audio and/or Extended Modem ID Register(s).

## 10.2. Secondary CODEC Register Access Definitions

The AC'97 Digital Controller can independently access Primary and Secondary CODEC registers by using a 2-bit CODEC ID field (chip select) which is defined as the LSBs of Output Slot 0. For Secondary CODEC access, the AC'97 Digital Controller must *invalidate* the tag bits for Slot 1 and 2 Command Address and Data (Slot 0, bits 14 and 13) and place a *non-zero* value (01, 10, or 11) into the CODEC ID field (Slot 0, bits 1 and 0).

As a Secondary CODEC, the STAC9766/9767 will disregard the Command Address and Command Data (Slot 0, bits 14 and 13) tag bits when it sees a 2-bit CODEC ID value (Slot 0, bits 1 and 0) that matches its configuration. In a sense the Secondary CODEC ID field functions as an alternative Valid Command Address (for Secondary reads and writes) and Command Data (for Secondary writes) tag indicator.

Secondary CODECs must monitor the Frame Valid bit, and ignore the frame (regardless of the state of the Secondary CODEC ID bits) if it is not valid. AC'97 Digital Controllers should set the frame valid bit for a frame with a secondary register access, even if no other bits in the output tag slot except the Secondary CODEC ID bits are set.

This method is designed to be backward compatible with existing AC'97 controllers and CODECs. There is no change to output Slot 1 or 2 definitions.

**Table 31. Secondary CODEC Register Access Slot 0 Bit Definitions**

Output Tag Slot (16-bits)	
Bit	Description
15	Frame Valid
14	Slot 1 Valid Command Address bit (†Primary CODEC only)
13	Slot 2 Valid Command Data bit (†Primary CODEC only)
12-3	Slot 3-12 Valid bits as defined by AC'97
2	Reserved (Set to "0")
†1-0	2-bit CODEC ID field (00 reserved for Primary; 01, 10, 11 indicate Secondary)

**Note:** † New definitions for Secondary CODEC Register Access

Using three CODECs typically requires a controller to support SDATA\_IN2.

## 11. TESTABILITY

The STAC9766/9767 has two test modes. One is for ATE in-circuit test and the other is restricted for IDT's internal use. STAC9766/9767 enters the ATE in-circuit test mode if SDATA\_OUT is sampled high at the trailing edge of RESET#. Once in the ATE test mode, the digital AC-Link outputs (BIT\_CLK and SDATA\_IN) are driven to a high impedance state. This allows ATE in-circuit testing of the AC'97 controller. Use of the ATE test mode is the recommended means of removing the CODEC from the AC-Link when another CODEC is to be used as the primary. This case will never occur during standard operating conditions. Once either of the two test modes have been entered, the STAC9766/9767 must be issued another RESET# with all AC-link signals held low to return to the normal operating mode.

**Table 32. Test Mode Activation**

SYNC	SDATA_OUT	Description
0	0	Normal AC '97 operation
0	1	ATE Test Mode
1	0	IDT Internal Test Mode
1	1	Reserved

### 11.1. ATE Test Mode

ATE test mode allows for in-circuit testing to be completed at the board level. For this to work, the outputs of the device must be driven to a high impedance state (Z). Internal pullups for digital I/O pins must be disabled in this mode. This mode initiates on the rising edge of RESET# pin. Only a cold reset will exit the ATE Test Mode.

**Table 33. ATE Test Mode Operation**

Pin Name	Pin #	Function	Description
SDATA_OUT	5	1	Must be held high at the rising edge of RESET#
BIT_CLK	6	Z	
SDATA_IN	8	Z	
SYNC	10	0	Must be held low at rising edge of RESET#
RESET#	11	1	
No Connect	31	Z	Always an input
No Connect	33	Z	Always an input
No Connect	34	Z	Always an input
GPIO0	43	Z	
GPIO1	44	Z	
CID0	45	Z	
CID1	46	Z	
EAPD	47	Z	
SPDIF	48	Z	

## 12. ORDERING INFORMATION

### 12.1. STAC9766/9767 Family Options and Part Order Numbers

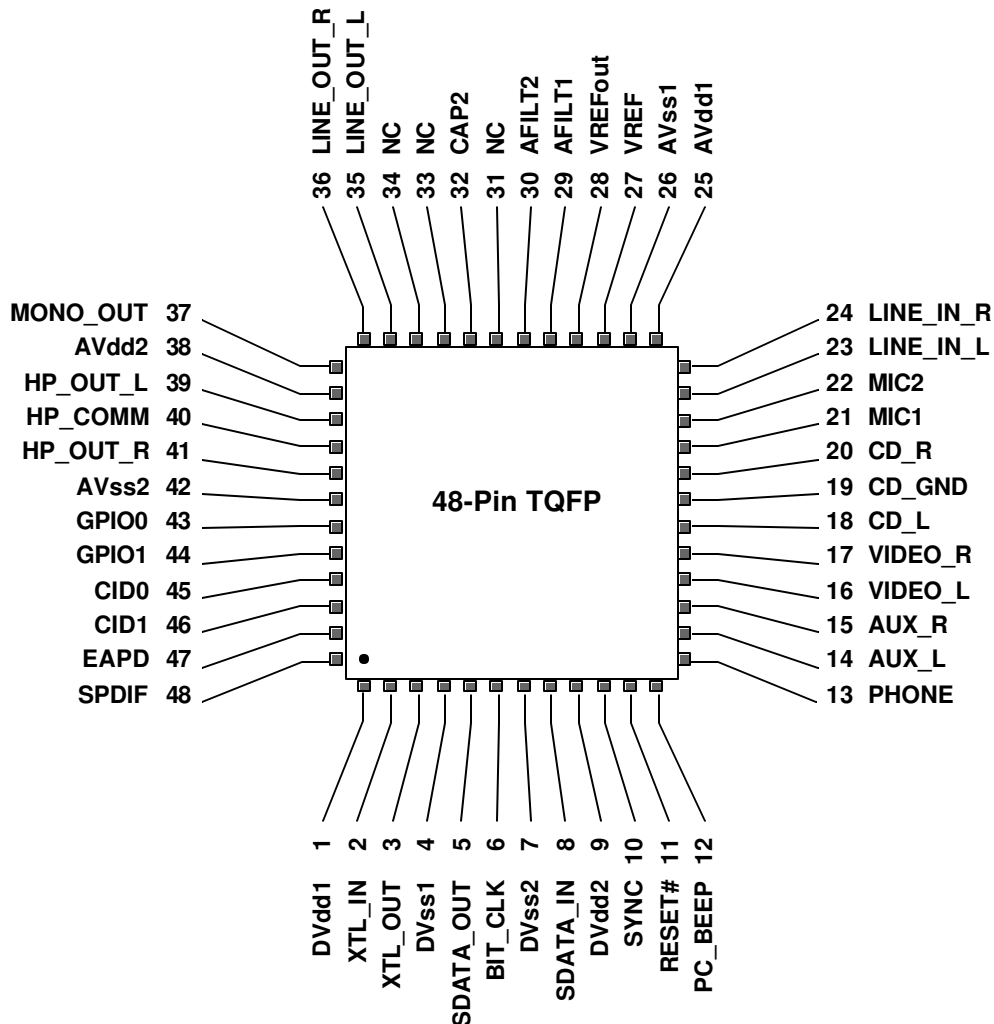

Table 34. STAC9766/9767 Ordering Information

Part Order Number	Supply Range	Package
STAC9766XXTAEyyX	DVdd = 3.3V, AVdd = 5.0V	48-pin RoHS QFP 7mm x 7mm x 1.4mm
STAC9767XXTAEyyX	DVdd = 3.3V, AVdd = 3.3V	48-pin RoHS QFP 7mm x 7mm x 1.4mm

NOTE: When ordering these parts the “yy” will be replaced with the CODEC revision. Add an “R” to the end of any of these part numbers for delivery on Tape and Reel. The minimum order quantity for Tape and Reel is 2,000 units for both package options.

## 13. PIN DESCRIPTION

Figure 24. Pin Description Drawing

Pin 48: To Enable SPDIF, use a 1K $\Omega$  - 10 K $\Omega$  external pulldown. To Disable SPDIF, use a 1 K $\Omega$  - 10 K $\Omega$  external pullup. Do NOT leave Pin 48 floating.

The CD\_GND signal is an AC signal return for the two CD input channels. It is normally biased at about 2.5V. The name of the pin in the AC97 specification is CD\_GND, and this has confused many designers. It should not have any DC path to GND. Connecting the CD\_GND signal directly to ground will change the internal bias of the entire CODEC, and cause significant distortion. If there is no analog CD input, then this pin can be No-Connect.

## 13.1. Digital I/O

These signals connect the STAC9766/9767 to its AC'97 controller counterpart, an external crystal, multi-CODEC selection and external audio amplifier.

**Table 35. Digital Connection Signals**

Pin Name	Pin #	Type	Description
XTL_IN	2	I	24.576 MHz Crystal or External Clock Source
XTL_OUT	3	I/O	24.576 MHz Crystal
SDATA_OUT	5	I	Serial, time division multiplexed, AC'97 input stream
BIT_CLK	6	I/O	12.288 MHz serial data clock
SDATA_IN	8	O	Serial, time division multiplexed, AC'97 output stream
SYNC	10	I	48 KHz fixed rate sample sync
RESET#	11	I	AC'97 Master H/W Reset
No Connect	31	I	IDT Internal Test mode only.
No Connect	33	I	IDT Internal Test mode only
No Connect	34	I/O	IDT Internal Test mode only
GPIO0	43	I/O	General Purpose I/O
GPIO1	44	I/O	General Purpose I/O
CID0	45	I	Multi-CODEC ID select – bit 0
CID1	46	I	Multi-CODEC ID select – bit 1
EAPD	47	I/O	External Amplifier Power Down/GPIO
SPDIF	48	I/O	SPDIF digital output Pin 48: To Enable SPDIF, use a 1K $\Omega$ - 10 K $\Omega$ external pulldown. To Disable SPDIF, use a 1K $\Omega$ - 10 K $\Omega$ external pullup. Do NOT leave Pin 48 floating.

## 13.2. Filter/References

These signals are connected to resistors, capacitors, or specific voltages.

**Table 36. Filtering and Voltage References**

Signal Name	Pin Number	Type	Description
VREF	27	O	Analog ground (0.45*Vdd, at 5V; 0.41*Vdd at 3V)
VREFOUT	28	O	Reference Voltage out 5mA drive (intended for mic bias) (~Vdd/2)
AFILT1	29	O	Anti-Aliasing Filter Cap - ADC left channel
AFILT2	30	O	Anti-Aliasing Filter Cap - ADC right channel
CAP2	32	O	ADC Reference Cap

### 13.3. Analog I/O

These signals connect the STAC9766/9767 to analog sources and sinks, including microphones and speakers.

**Table 37. Analog Connection Signals**

Pin Name	Pin #	Type	Description
PC-BEEP	12	I*	PC Speaker beep pass-through
PHONE	13	I*	From telephony subsystem speakerphone
AUX_L	14	I*	Aux Left Channel
AUX_R	15	I*	Aux Right Channel
VIDEO_L	16	I*	Video Audio Left Channel
VIDEO_R	17	I*	Video Audio Right Channel
CD_L	18	I*	CD Audio Left Channel
CD_GND <sup>†</sup>	19	I*	CD Audio analog signal return <sup>†</sup>
CD_R	20	I*	CD Audio Right Channel
MIC1	21	I*	Desktop Stereo or Mono Microphone Input
MIC2	22	I*	Stereo or Second Mono Microphone Input
LINE_IN_L	23	I*	Line In Left Channel
LINE_IN_R	24	I*	Line In Right Channel
LINE_OUT_L	35	O	Line Out Left Channel
LINE_OUT_R	36	O	Line Out Right Channel
MONO_OUT	37	O	To telephony subsystem speakerphone
HP_OUT_L	39	O	Headphone Out Left Channel
HP_COMM	40	O	Headphone Ground Return
HP_OUT_R	41	O	Headphone Out Right Channel

*Note:* \* Any unused input pins should be tied together through a capacitor (0.1  $\mu$ F suggested) to ground, except the MIC inputs which should have their own capacitor to ground if not used.

*Note:* <sup>†</sup> The CD\_GND signal is an AC signal return for the two CD input channels. It is normally biased at about 2.5V. The name of the pin in the AC97 specification is CD\_GND, and this has confused many designers. It should not have any DC path to GND. Connecting the CD\_GND signal directly to ground will change the internal bias of the entire CODEC, and cause significant distortion. If there is no analog CD input, then this pin can be No-Connect.

## 13.4. Power and Ground Signals

Table 38. Power and Ground Signals

Pin Name	Pin #	Type	Description
AVdd1	25	I	Analog Vdd = 5.0 V or 3.3 V
AVdd2	38	I	Analog Vdd = 5.0 V or 3.3 V
AVss1	26	I	Analog Gnd
AVss2	42	I	Analog Gnd
DVdd1	1	I	Digital Vdd = 3.3 V
DVdd2	9	I	Digital Vdd = 3.3 V
DVss1	4	I	Digital Gnd
DVss2	7	I	Digital Gnd

## 17. REVISION HISTORY

Revision	Date	Description of Change
7.1		History not included in Datasheet
7.2	October 2003	Removed BIT_CLK as an input option from clocking table, it was incorrectly included in 3-1 version Added CD_GND elaboration note on connection diagram, pin list and pin out diagrams: "The CD_GND signal is an AC signal return for the two CD input channels. It is normally biased at about 2.5V. The name of the pin in the AC'97 specification is CD_GND, and this has confused many designers. It should not have any DC path to GND. Connecting the CD_GND signal directly to ground will change the internal bias of the entire CODEC, and cause significant distortion. If there is no analog CD input, then this pin can be No-Connect."
7.3	03 November 2006	Released in IDT format.
7.4	Dec 2006	corrected orderable part number
