

# High-Current, High & Low-Side, Gate-Driver IC

## FAN73912A

### Description

The FAN73912A is a monolithic high and low-side gate-drive IC designed for high-voltage and high-speed driving for MOSFETs and IGBTs that operate up to +1200 V.

The advanced input filter of HIN provides protection against short-pulsed input signals caused by noise.

An advanced level-shift circuit offers high-side gate driver operation up to  $V_S = -9.8$  V (typical) for  $V_{BS} = 15$  V. The UVLO circuit prevents malfunction when VCC and VBS are lower than the specified threshold voltage.

Output drivers typically source and sink 2 A and 3 A, respectively.

### Features

- Floating Channel for Bootstrap Operation to +1200 V
- Typically 2 A/ 3 A Sourcing/Sinking Current Driving Capability for Both Channels
- Gate Driver Supply (VCC) Range from 12 V to 20 V
- Separate Logic Supply (VDD) Range from 3 V to 20 V
- Extended Allowable Negative  $V_S$  Swing to -9.8 V for Signal Propagation at  $V_{CC} = V_{BS} = 15$  V
- Built-in Cycle-by-Cycle Edge-Triggered Shutdown Logic
- Common-Mode  $dv/dt$  Noise Canceling Circuit
- UVLO Functions for Both Channels
- Built-in Advanced Input Filter
- Matched Propagation Delay Below 60 ns
- Outputs in-Phase with Input Signal
- Logic and Power Ground  $\pm 10$  V Offset

### Typical Application

- Electrical Contactor
- Industrial Motor Driver
- UPS
- Solar Inverter
- Ballast
- General-Purpose Half-Bridge Topology

**Table 2. MAXIMUM RATINGS** ( $T_J = 25^\circ\text{C}$ , unless otherwise specified. All voltage parameters are referenced to COM unless otherwise stated in the table.)

Symbol	Parameter	Min	Max	Unit
$V_B$	High-Side Floating Supply Voltage	-0.3	1225.0	V
$V_S$	High-Side Floating Offset Voltage	$T_J = 150^\circ\text{C}$ $T_J = 25^\circ\text{C}$ $T_J = -40^\circ\text{C}$	$V_B + 0.3$ $V_B + 0.3$ $V_B + 0.3$	V
$V_{HO}$	High-Side Floating Output Voltage	$V_S - 0.3$	$V_B + 0.3$	V
$V_{CC}$	Low-Side Supply Voltage	-0.3	25	V
$V_{LO}$	Low-Side Floating Output Voltage	-0.3	$V_{CC} + 0.3$	V
$V_{DD}$	Logic Supply Voltage	-0.3 $V_{SS} - 0.3$	25 $V_{SS} + 25$	V
$V_{SS}$	Logic GND	$V_{DD} - 25$	$V_{DD} + 0.3$	V
$V_{IN}$	Logic Input Voltage (HIN, LIN and SD)	-0.3 $V_{SS} + V_{DD} - 25.3$	25 $V_{DD} + 0.3$	V
$dV_S/dt$	Allowable Offset Voltage Slew Rate	-	$\pm 50$	V/ns
$P_D$ (Note 3, 4, 5)	Power Dissipation	-	1.3	W
$\theta_{JA}$	Thermal Resistance	-	95	$^\circ\text{C}/\text{W}$
$T_J$	Junction Temperature	-	150	$^\circ\text{C}$
$T_{STG}$	Storage Temperature	-55	150	$^\circ\text{C}$

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

3. Mounted on 76.2 x 114.3 x 1.6 mm PCB (FR-4 glass epoxy material).

4. Refer to the following standards:

JESD51-2: Integral circuit's thermal test method environmental conditions, natural convection;

JESD51-3: Low effective thermal conductivity test board for leaded surface-mount packages.

5. Do not exceed maximum power dissipation ( $P_D$ ) under any circumstances.

**Table 3. RECOMMENDED OPERATING CONDITIONS** (All voltage parameters are referenced to COM unless otherwise stated in the table.)

Symbol	Parameter	Min	Max	Unit
$V_B$	High-Side Floating Supply Voltage	$V_S + 12$	$V_S + 20$	V
$V_S$	High-Side Floating Supply Offset Voltage (Note 6)	$8 - V_{CC}$	1200	V
$V_{HO}$	High-Side (HO) Output Voltage	$V_S$	$V_B$	V
$V_{CC}$	Low-Side Supply Voltage	12	20	V
$V_{LO}$	Low-Side (LO) Output Voltage	0	$V_{CC}$	V
$V_{DD}$	Logic Supply Voltage	$V_{SS} + 3$	$V_{SS} + 20$	V
$V_{SS}$	Logic Ground (Note 7)	-10	10	V
$V_{IN}$	Logic Input Voltage (HIN, LIN, SD)	0 $V_{SS} + V_{DD} - 20$	20 $V_{DD}$	V
$T_J$	Junction Temperature	-40	+125	$^\circ\text{C}$

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

6. Referenced to  $T_J = 25^\circ\text{C}$ .

7. When  $V_{DD} < 10$  V, the minimum  $V_{SS}$  offset is limited to  $-V_{DD}$ .

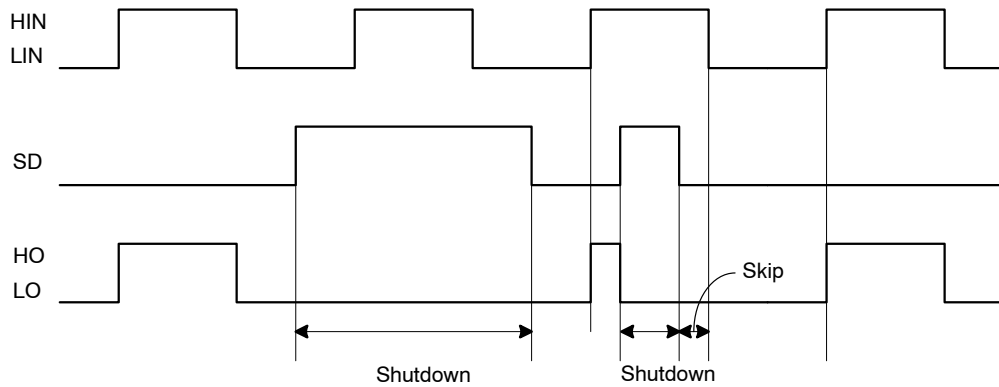

Figure 36. Input/Output Timing Diagram

# FAN73912A

Figure 37. Switching Time Definition

Figure 38. Shutdown Waveform Definition

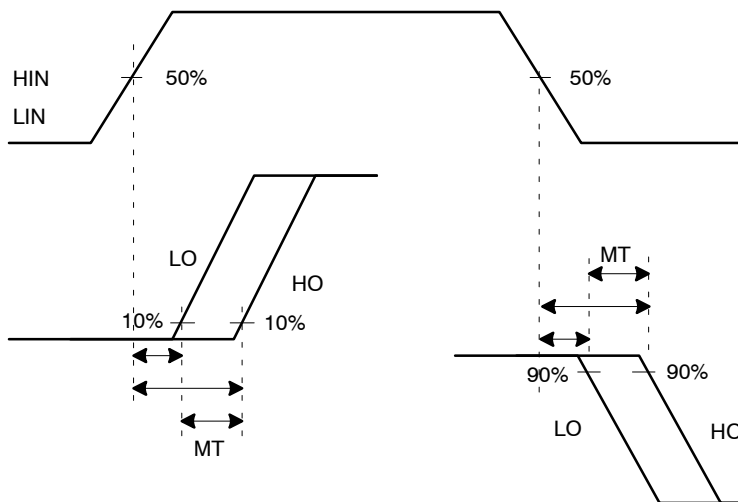

Figure 39. Delay Matching Waveform Definitions

APPLICATIONS INFORMATION

**Shutdown Input**

When the SD pin is in LOW state, the gate driver operates normally. When a condition occurs that should shut down the gate driver, the SD pin should be HIGH. The Shutdown circuitry has an input filter; the minimum input duration is specified by  $t_{FLTIN}$  (typically 250 ns).

Figure 40. Output Shutdown Timing Waveform

**Noise Filter**

*Input Noise Filter*

Figure 41 shows the input noise filter method, which has symmetry duration between the input signal ( $t_{INPUT}$ ) and the output signal ( $t_{OUTPUT}$ ) and helps to reject noise spikes and short pulses. This input filter is applied to the HIN, LIN, and EN inputs. The upper pair of waveforms (Example A) shows an input signal duration ( $t_{INPUT}$ ) much longer than input filter time ( $t_{FLTIN}$ ); it is approximately the same duration between the input signal time ( $t_{INPUT}$ ) and the output signal time ( $t_{OUTPUT}$ ). The lower pair of waveforms (Example B) shows an input signal time ( $t_{INPUT}$ ) slightly longer than input filter time ( $t_{FLTIN}$ ); it is approximately the same duration between input signal time ( $t_{INPUT}$ ) and the output signal time ( $t_{OUTPUT}$ ).

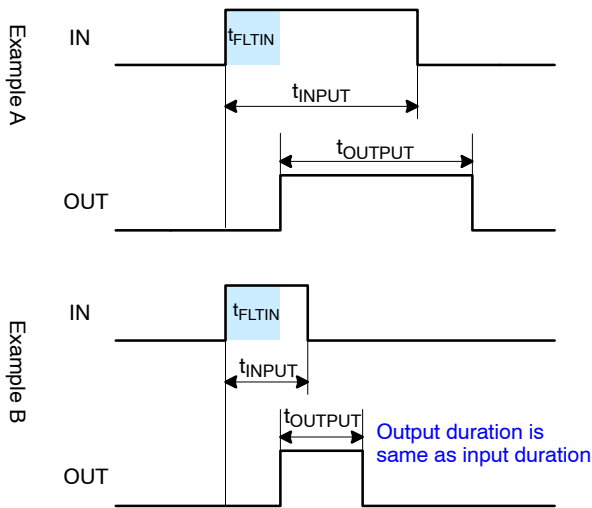

Figure 41. Input Noise Filter Definition

**Short-Pulsed Input Noise Rejection Method**

The input filter circuitry provides protection against short-pulsed input signals (HIN, LIN, and SD) on the input signal lines by applied noise signal.

If the input signal duration is less than input filter time ( $t_{FLTIN}$ ), the output does not change states.

Example A and B of the Figure 42 show the input and output waveforms with short-pulsed noise spikes with a duration less than input filter time; the output does not change states.

Figure 42. Noise Rejecting Input Filter Definition

**Negative VS Transient**

The bootstrap circuit has the advantage of being simple and low cost, but has some limitations. The biggest difficulty with this circuit is the negative voltage present at the emitter of the high-side switching device when high-side switch is turned-off in half-bridge application. If the high-side switch, Q1, turns-off while the load current is flowing to an inductive load, a current commutation occurs from high-side switch, Q1, to the diode, D2, in parallel with the low-side switch of the same inverter leg. Then the negative voltage present at the emitter of the high-side switching device, just before the freewheeling diode, D2, starts clamping, causes load current to suddenly flow to the low-side freewheeling diode, D2, as shown in Figure 43.

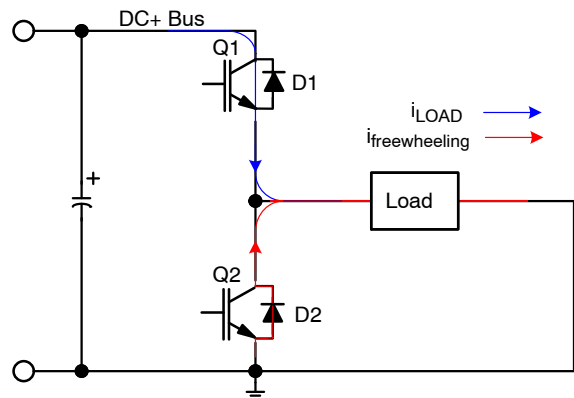

Figure 43. Half-Bridge Application Circuits

This negative voltage can be trouble for the gate driver's output stage, there is the possibility to develop an over-voltage condition of the bootstrap capacitor, input signal missing and latch-up problems because it directly affects the source VS pin of the gate driver, shown in Figure 44. This undershoot voltage is called "negative VS transient".

Figure 44. VS Waveforms During Q1 Turn-Off

Figure 45 and Figure 46 show the commutation of the load current between high-side switch, Q1, and low-side freewheeling diode, D3, in same inverter leg. The parasitic inductances in the inverter circuit from the die wire bonding to the PCB tracks are jumped together in LC and LE for each IGBT. When the high-side switch, Q1, and low-side switch, Q4, are turned on, the VS1 node is below DC+ voltage by the voltage drops associated with the power switch and the parasitic inductances of the circuit due to load current is flows from Q1 and Q4, as shown in Figure 45. When the high-side switch, Q1, is turned off and Q4, remained turned on, the load current to flows the low-side freewheeling diode, D3, due to the inductive load connected to VS1 as shown in Figure 46. Q1 Turn-Off and D3 Conducting. The current flows from ground (which is connected to the COM pin of the gate driver) to the load and the negative voltage present at the emitter of the high-side switching device. In this case, the COM pin of the gate driver is at a higher potential than the VS pin due to the voltage drops associated with freewheeling diode, D3, and parasitic elements, LC3 and LE3.

Figure 45. Q1 and Q4 Turn-On

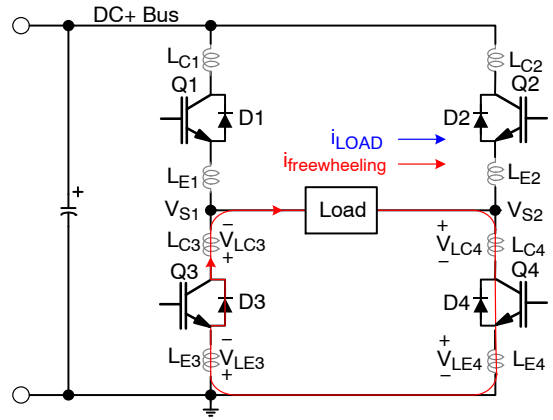

Figure 46. Q1 Turn-Off and D3 Conducting

The FAN73912A has a typical negative VS transient characteristics, as shown in Figure 47.

Figure 47. Negative VS Transient Characteristic

Even though the FAN73912A has been shown able to handle these negative VS transient conditions, it is strongly recommended that the circuit designer limit the negative VS transient as much as possible by careful PCB layout to minimize the value of parasitic elements and component use. The amplitude of negative VS voltage is proportional to the parasitic inductances and the turn-off speed, di/dt, of the switching device.

**General Guidelines**

*Printed Circuit Board Layout*

The layout recommended for minimized parasitic elements is as follows:

- Direct tracks between switches with no loops or deviation.
- Avoid interconnect links. These can add significant inductance.
- Reduce the effect of lead-inductance by lowering package height above the PCB.
- Consider co-locating both power switches to reduce track length.

## FAN73912A

- To minimize noise coupling, the ground plane should not be placed under or near the high-voltage floating side.
- To reduce the EM coupling and improve the power switch turn-on/off performance, the gate drive loops must be reduced as much as possible.

### *Placement of Components*

The recommended placement and selection of component as follows:

- Place a bypass capacitor between the  $V_{CC}$  and  $V_{SS}$  pins. A ceramic 1  $\mu$ F capacitor is suitable for most applications. This component should be placed as close as possible to the pins to reduce parasitic elements.
- The bypass capacitor from  $V_{CC}$  to  $V_{SS}$  supports both the low-side driver and bootstrap capacitor recharge. A value at least ten times higher than the bootstrap capacitor is recommended.
- The bootstrap resistor,  $R_{BOOT}$ , must be considered in sizing the bootstrap resistance and the current developed during initial bootstrap charge. If the resistor is needed in series with the bootstrap diode, verify that  $V_B$  does not fall below COM (ground). Recommended use is typically 5 ~ 10  $\Omega$  that increase the  $V_{BS}$  time constant. If the voltage drop of bootstrap resistor and diode is too high or the circuit topology does not allow a sufficient charging time, a fast recovery or ultra-fast recovery diode can be used.
- The bootstrap capacitor,  $C_{BOOT}$ , uses a low-ESR capacitor, such as ceramic capacitor. It is strongly recommended that the placement of components is as follows:
  - Place components tied to the floating voltage pins ( $V_B$  and  $V_S$ ) near the respective high-voltage portions of the device and the FAN73912A. Not Connected (NC) pins in this package maximize the distance between the high-voltage and low-voltage pins (see Figure 3).
  - Place and route for bypass capacitors and gate resistors as close as possible to gate drive IC.
  - Locate the bootstrap diode,  $D_{BOOT}$ , as close as possible to bootstrap capacitor,  $C_{BOOT}$ .
  - The bootstrap diode must use a lower forward voltage drop and minimal switching time as soon as possible for fast recovery or ultra-fast diode.

ON Semiconductor does not convey any license under its patent rights nor the rights of others.

**onsemi**, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at [www.onsemi.com/site/pdf/Patent-Marking.pdf](http://www.onsemi.com/site/pdf/Patent-Marking.pdf). **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
