FUNCTIONAL DESCRIPTION — The '18 8-input priority encoder accepts data from eight active LOW inputs and provides a binary representation on the three active LOW outputs. A priority is assigned to each input so that when two or more inputs are simultaneously active, the input with the highest priority is represented on the output, with input line 7 having the highest priority. A HIGH on the Enable Input ($\overline{EI}$) will force all outputs to the inactive (HIGH) state and allow new data to settle without producing erroneous information at the outputs. A Group Signal output ($\overline{GS}$) and Enable Output ($\overline{EO}$) are provided with the three data outputs. The $\overline{GS}$ is active LOW when any input is LOW; this indicates when any input is active. The $\overline{EO}$ is active LOW when all inputs are HIGH. Using the output enable along with the input enable allows priority encoding of N input signals. Both $\overline{EO}$ and $\overline{GS}$ are in the inactive HIGH state when the input enable is HIGH.
