### QUICK START GUIDE

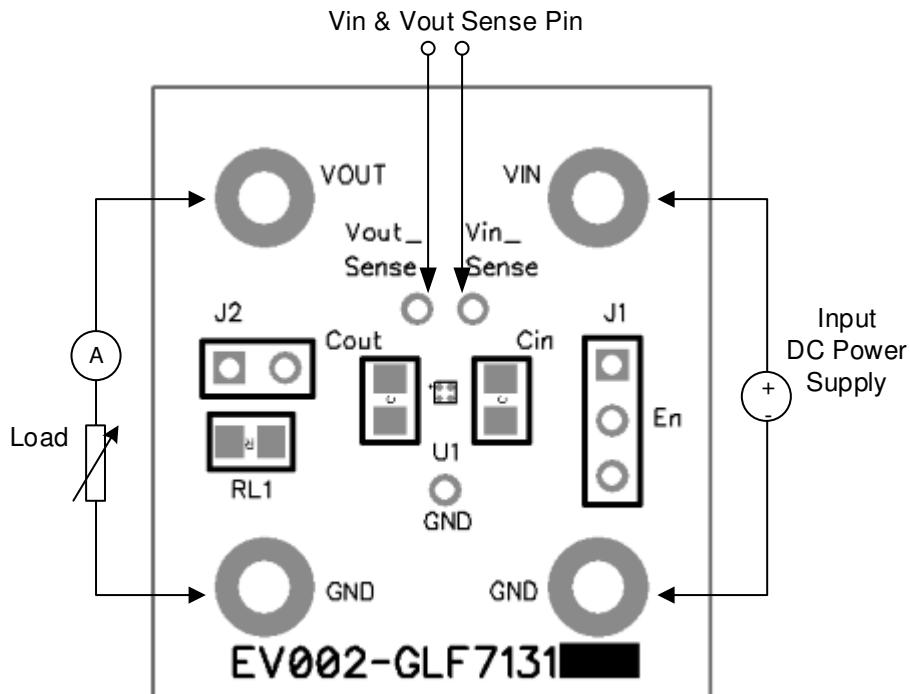

The evaluation board EV002 is easy to set up to evaluate the performance of GLF71311T.

1. Preset the input power supply to the desired voltage between 1.1V to 5.5V.
2. The load resistor,  $RL1=500\Omega$ , has been populated on the bottom of the PC board. Short the J2 to use the  $RL1=500\Omega$  or  $RL2$  which is not populated. To increase the output current, connect an electronic load to  $VOUT$  and GND. The output current for the GLF71311T is rated for 2A maximum output continuous current. Please ensure this absolute

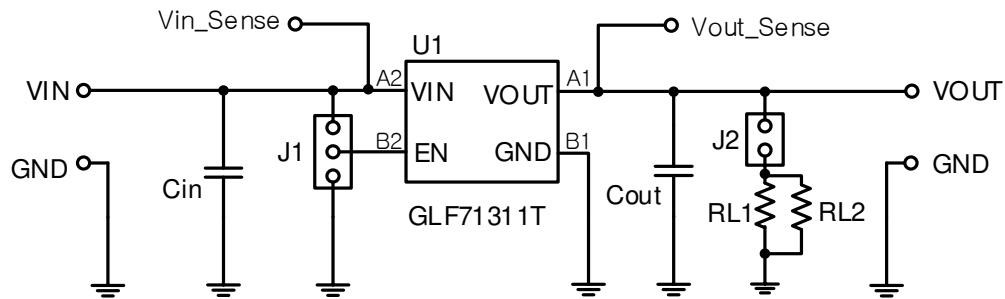

maximum is not exceeded.

3. Connect the positive and negative terminals of the input power supply to  $VIN$  and  $GND$  terminals respectively.  $VIN\_Sense$  and  $VOUT\_Sense$  can be used for measurement points.
4. Turn on the input power supply.
5. Configure the J1, EN jumper as required. Note - GLF71311T has an internal EN pull-down resistor to ensure the part is in a defined state.
