Figure 1. Turn-On Delay Time

Figure 2. Rise Time

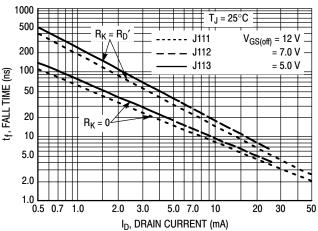

Figure 3. Turn-Off Delay Time

Figure 4. Fall Time

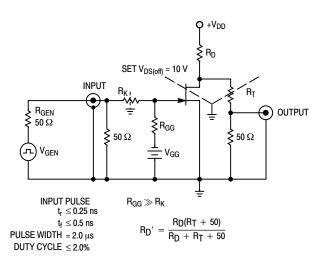

Figure 5. Switching Time Test Circuit

#### NOTE 1

The switching characteristics shown above were measured using a test circuit similar to Figure 5. At the beginning of the switching interval, the gate voltage is at Gate Supply Voltage ( $-V_{GG}$ ). The Drain–Source Voltage ( $V_{DS}$ ) is slightly lower than Drain Supply Voltage ( $V_{DD}$ ) due to the voltage divider. Thus Reverse Transfer Capacitance ( $C_{rss}$ ) or Gate–Drain Capacitance ( $C_{gd}$ ) is charged to  $V_{GG} + V_{DS}$ .

During the turn–on interval, Gate–Source Capacitance  $(C_{gs})$  discharges through the series combination of  $R_{Gen}$  and  $R_K$ .  $C_{gd}$  must discharge to  $V_{DS(on)}$  through  $R_G$  and  $R_K$  in series with the parallel combination of effective load impedance  $(R'_D)$  and Drain–Source Resistance  $(r_{ds})$ . During the turn–off, this charge flow is reversed.

Predicting turn—on time is somewhat difficult as the channel resistance  $r_{ds}$  is a function of the gate—source voltage. While  $C_{gs}$  discharges,  $V_{GS}$  approaches zero and  $r_{ds}$  decreases. Since  $C_{gd}$  discharges through  $r_{ds}$ , turn—on time is non—linear. During turn—off, the situation is reversed with  $r_{ds}$  increasing as  $C_{gd}$  charges.

The above switching curves show two impedance conditions; 1)  $R_K$  is equal to  $R_D$ , which simulates the switching behavior of cascaded stages where the driving source impedance is normally the load impedance of the previous stage, and 2)  $R_K = 0$  (low impedance) the driving source impedance is that of the generator.

Figure 10. Effect of I<sub>DSS</sub> On Drain-Source Resistance and Gate-Source Voltage

#### NOTE 2

The Zero–Gate–Voltage Drain Current ( $I_{DSS}$ ), is the principle determinant of other J-FET characteristics. Figure 10 shows the relationship of Gate–Source Off Voltage ( $V_{GS(off)}$  and Drain–Source On Resistance ( $r_{ds(on)}$ ) to  $I_{DSS}$ . Most of the devices will be within  $\pm 10\%$  of the values shown in Figure 10. This data will be useful in predicting the characteristic variations for a given part number.

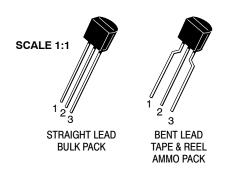

For example:

Unknown

 $r_{ds(on)}$  and  $V_{GS}$  range for an J112  $\,$ 

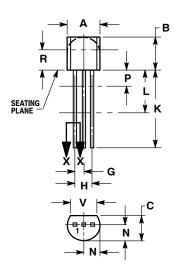

The electrical characteristics table indicates that an J112 has an  $I_{DSS}$  range of 25 to 75 mA. Figure 10, shows  $r_{ds(on)}\!=\!52~\Omega$  for  $I_{DSS}\!=\!25$  mA and 30  $\Omega$  for  $I_{DSS}\!=\!75$  mA. The corresponding  $V_{GS}$  values are 2.2 V and 4.8 V.
