

TPPM0115 SWITCH MODE SYNCHRONOUS BUCK CONTROLLER

SLVS371A– MARCH 2001 – REVISED JUNE 2001

features

- DC-DC Synchronous Buck Controller
- Switching Frequency, 200 kHz (Typ)
- Programmable Output Voltage, 1 V to 2.5 V $\pm 2\%$
- Power Good Function (PWRGD)
- Input Voltage, 12 V $\pm 5\%$
- Drive High Load Current With External Components

applications

- PC Motherboard, Voltage Regulation for System Power
- DDR Memory Supply (V_{DDQ} or V_{TT})
- RDRAM Memory Supply (V_{DDQ})
- General Purpose Synchronous Switch Mode Controller

description

The TPPM0115 is a synchronous buck controller capable of driving two external power FETs 180° out of phase. The device requires a minimum of external standard filter components and switching FETs to regulate the desired output voltage. This is achieved with an internal switching frequency of 200 kHz (typical).

The TPPM0115 switch mode controller and associated circuitry provide efficient voltage regulation of greater than 85%. The output voltage is set by two external resistors. During power up, when the output voltage reaches 90% of the desired value, the power good (PWRGD) output is transitioned high after a short delay of 1 ms to 5 ms. During power down, when the output voltage falls below 90% of the set value, the PWRGD output is pulled low without any delay.

In the event the set output is in an over-voltage condition due to a system fault, the drive to the lower FET turns on to correct the fault. There is a dead time between switching one FET ON while the other FET is switching OFF to prevent cross conduction.

The TPPM0115 is capable of driving high static load currents with minimal ripple on the output (<2%). The phase sense input is used to sense the flow of current through the inductor during flyback to minimize ripple on the output.

To optimize output filter capacitance, the voltage mode control is based on a fixed ON time during the start of the cycle and hysteretic control during load transients. This allows the device to respond and maintain the set regulation voltage.

absolute maximum ratings over operating free-air temperature (unless otherwise noted)†

Unregulated input voltage, V_{CC} (see Notes 1 and 2)	24 V
Drive output voltage, $V_{(DRVH)}$ and $V_{(DRVL)}$ (see Notes 1 and 3)	12.6 V
Power good voltage, $V_{(PWRGD)}$ (see Notes 1 and 2)	7 V
Feedback voltage, $V_{(SEN)}$ (see Notes 1 and 2)	7 V
Phase sense voltage, $V_{(PHASE)}$ (see Note 3)	7 V
Continuous power dissipation, P_D	0.4 W
Electrostatic discharge susceptibility, $V_{(HBMESD)}$ (see Note 4)	2 kV
Operating ambient temperature range, T_A	0°C to 70°C
Storage temperature range, T_{stg}	–65°C to 150°C
Lead temperature (soldering, 10 sec) T_{LEAD}	260°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES:
1. All voltage values are with respect to GND.
 2. Absolute negative voltage values on these terminals should not be below –0.5 V.
 3. Absolute negative voltage values on these terminals should not be below –1 V.
 4. The human body model is a 100-pF capacitor discharged through a 1.5-kΩ resistor into each terminal.

APPLICATION INFORMATION

- NOTES:
- A. The heavy lines must be kept short and connected to the ground plane construction for efficient results.
 - B. The feedback (sense) trace should be kept from the inductor flux.
 - C. The 1500-µF capacitor should have a low ESR to minimize output voltage ripple.
 - D. External FETs are MTD3302 or PHD55N03LT.
 - E. Set the resistor values on the SEN terminal using the following formulas:

$$V_{OUT} = \frac{V_{ref}(R1 + R2)}{R2}, \text{ where } V_{ref} = 1 \text{ V}$$

- F. Maximum efficiency is dependent on proper selection of external components.
- G. Line and load regulation is dependent on proper selection of external components.

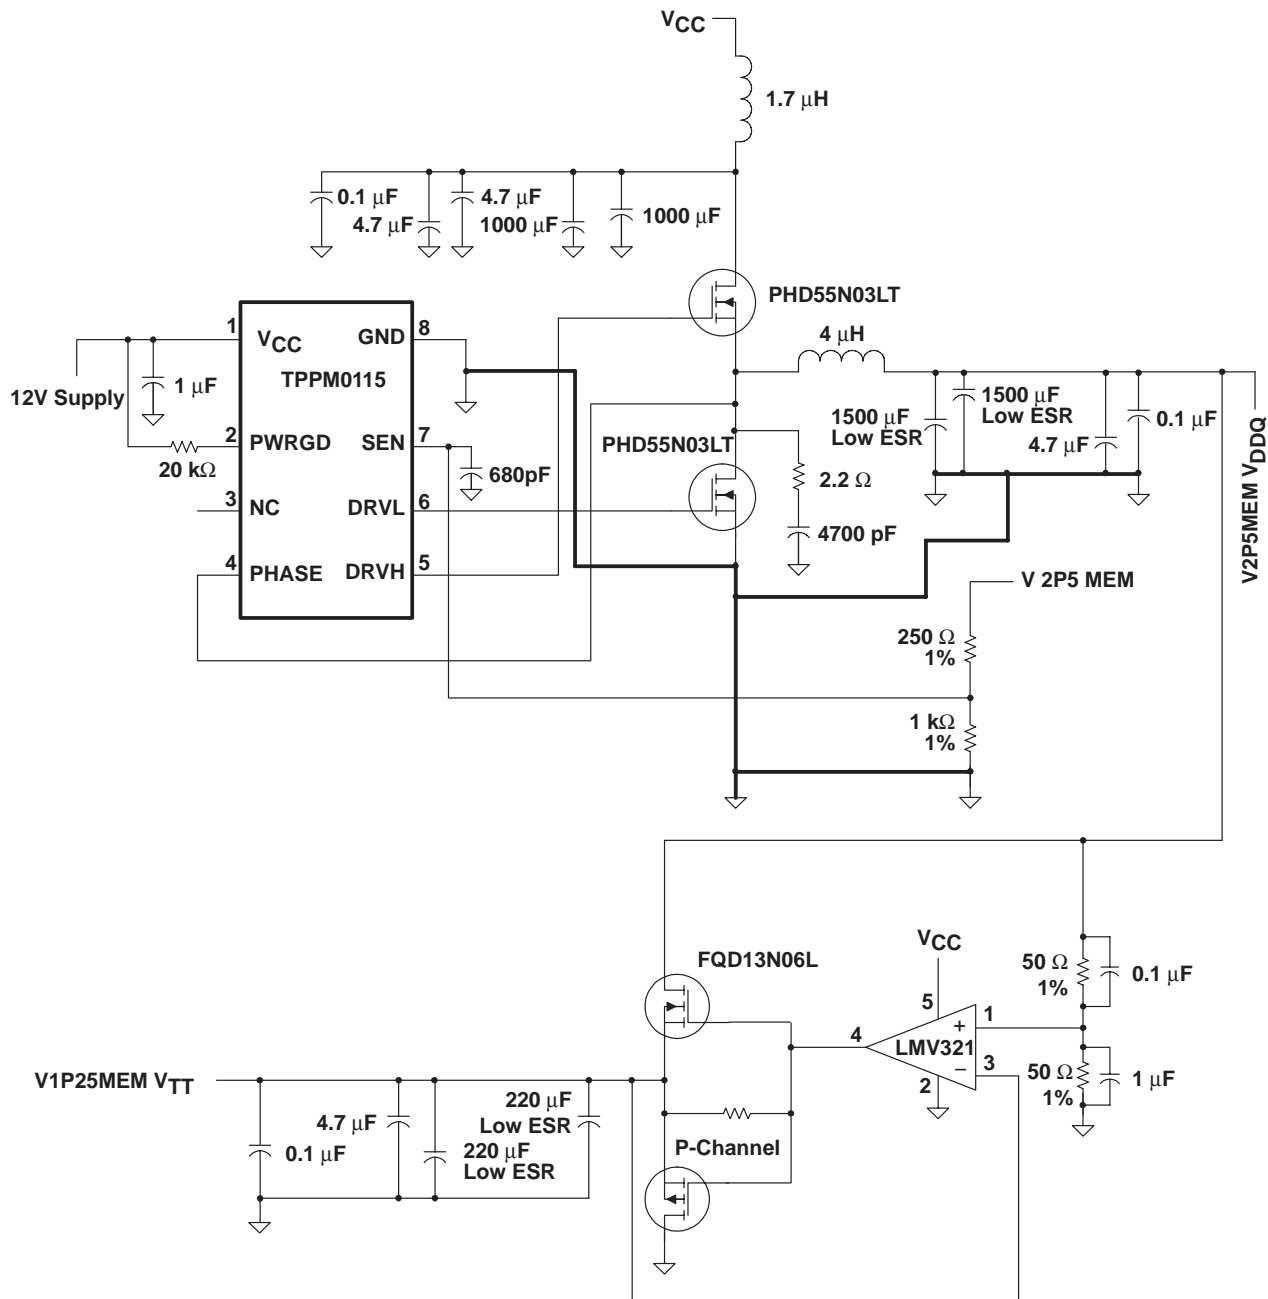

Optional: When resistor feedback network is not used, V_{OUT} must be connected directly to SEN input to provide output regulation at $V_{OUT} = V_{ref}$.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
