# 1 Product Info

## General Description

The **TUA 6045-2** integrates the mixer-oscillator, AGC amplifier and a digitally programmable phase lock loop (PLL). This makes the **TUA 6045-2** an ideal product for applications where size and low power consumption are required design key factors. Typical applications include TV's, VCR's, Set Top Boxes (STB) and also a range of portable products.

## Features

### General

- Suitable for PAL, NTSC, SECAM, DVB, DMB, DAB, ISDB-T and ATSC
- High band covers frequency range for L-Band up to 1.5 GHz
- Supply voltage range from 3 to 5.5 V
- Combined small - wide AGC detection
- AGC + AGC buffer output
- Low phase noise
- Full ESD protection
- Qualified according to JEDEC for consumer applications

### Mixer/Oscillator

- Three band tuner
- Unbalanced highohmic LOW band input
- Balanced lowohmic MID band input
- Balanced lowohmic HIGH band input
- Two pin oscillators for LOW/MID band
- Four pin oscillator for HIGH band

### IF-Amplifier

- 4 IF pins to connect a 2 pole bandpass
- Symmetrical SAW driver
- Fully balanced IF AGC amplifier

### PLL

- I<sup>2</sup>C / three wire combi bus
- 4 independent I<sup>2</sup>C addresses
- High voltage VCO tuning output
- Two PMOS ports
- One voltage referred port
- Internal LOW/MID/HIGH band switch
- Xtal oscillator, range from 4 to 16 MHz
- Xtal buffer output with programmable level and output divider
- Clock generator for DC/DC converter with programmable low and high time

### Power management

- Bus controlled stand by mode

### Application

- The IC is suitable for PAL, NTSC, SECAM, DVB-C, DVB-T, DVB-H, DMB-T, DAB, ISDB-T, ATSC and L-Band tuners.

## Ordering Information

Type	Ordering Code	Package
TUA 6045-2	SP000250164	PG-VQFN-48

## **2 Product Description**

The **TUA 6045-2** integrates the mixer-oscillator, variable AGC output amplifier and a digitally programmable phase lock loop (PLL) not requiring an external high voltage buffer. Furthermore, the **TUA 6045-2** integrates a buffered RF AGC and programmable clock signals for an external DC-DC up converter.

The integrated mixer oscillator function comprises of three balanced mixers. The first mixer has an unbalanced high impedance input while the other two have balance low impedance inputs. The tuner also has firstly, 2-pin asymmetric oscillators for both Low and Mid bands and secondly a 4-pin symmetrical oscillator for High band operations including a band selector switch.

The output signal from the mixer is amplified via a SAW filter driver followed by variable gain amplifier stage in order to achieve a constant output level used for A/D conversion. All functions can be programmed with up to four different IC addresses. Also, the PLL connected to a 4-16 MHz reference crystal which is buffered on-chip, allows the setting of the tuner oscillator with a minimum step size of 20 kHz. A Lock flag will be set once the PLL is locked and communicated via the I2C/3-Wire bus.

The complete control setting of the IC is done by a microprocessor via the I2C/3-Wire bus. The device also has three output ports of which P2 can be configured as a programmable output voltage port.

### **2.1 Features**

#### **2.1.1 General**

- Supply voltage range 3 to 5.5 V.
- Suitable for PAL, NTSC, SECAM, DVB-T/H/C, DAB, ISDB-T, ATSC and L-Band.
- Wideband and Narrow AGC detectors for tuner RF AGC
  - 5 programmable take-over points
  - 2 programmable time constants.
- Low phase noise.
- Full ESD protection.

#### **2.1.2 Mixer/Oscillator**

- High impedance mixer input (common emitter) for LOW band.
- Low impedance mixer input (common base) for MID band.
- Low impedance mixer input (common base) for HIGH band.
- 2 pin oscillator for LOW band.
- 2 pin oscillator for MID band.
- 4 pin oscillator for HIGH band.
- Oscillator for HIGH band divided by 3 available for MID band mixer.

### 2.1.3 SAW Filter Driver

- Symmetrical IF preamplifier with low output impedance able to drive a compensated SAW filter (500  $\Omega$ /40 pF).

### 2.1.4 IF AGC Amplifier

- Symmetrical variable gain IF output amplifier with low noise, high linearity, high dynamic range.

### 2.1.5 PLL

- 4 independent I<sup>2</sup>C addresses, or 3-Wire bus mode.
- I<sup>2</sup>C bus protocol compatible with 3.3 V and 5V micro-controllers up to 400 kHz.
- High voltage VCO tuning output.
- 3 PNP ports, one of them realized as programmable voltage output.
- 1 clock output for external DC/DC upconversion to generate the tuning supply voltage, may be used as NPN port.
- Stand-by programmable for functional blocks allows customized ramping.
- Internal LOW/MID/HIGH band switch.
- Lock-in flag.
- 4 to 16 MHz crystal oscillator with programmable output buffer.
- programmable reference divider ratios.
- 4 charge pump currents, programmable in 15 steps.

### 2.1.6 IF switch and Loop through for tuner alignment

- 2 programmable switches to bypass the bandpass/SAW filter to facilitate the tuner pre-stage alignment.

## 2.2 Application

- The IC is suitable for PAL, NTSC, SECAM, DVB-T/H/C, DAB, ISDB-T, ATSC and L-Band tuners.
- The integrated RF AGC control has wide band detectors at the mixer inputs and a narrowband detector at the saw filter driver output.

## 2.2.1 Recommended band limits in MHz

**Table 1 ATSC tuners**

Band	RF input		Oscillator	
	min.	max.	min.	max.
LOW	55.25	157.25	101	203
MID	163.25	451.25	201	479
HIGH	457.25	861.25	503	907

**Table 2 DVB-T and analog tuners**

Band	RF input		Oscillator	
	min.	max.	min.	max.
LOW	48.25	154.25	87.15	193.15
MID	161.25	439.25	200.15	478.15
HIGH	447.25	863.25	486.15	902.15

**Table 3 ISDB-T tuners**

Band	RF input		Oscillator	
	min.	max.	min.	max.
LOW	93	167	150	224
MID	173	467	230	524
HIGH	473	767	530	824

*Note: Tuning margin of 3 MHz not included.*

### 3.3 Functional Block Diagram

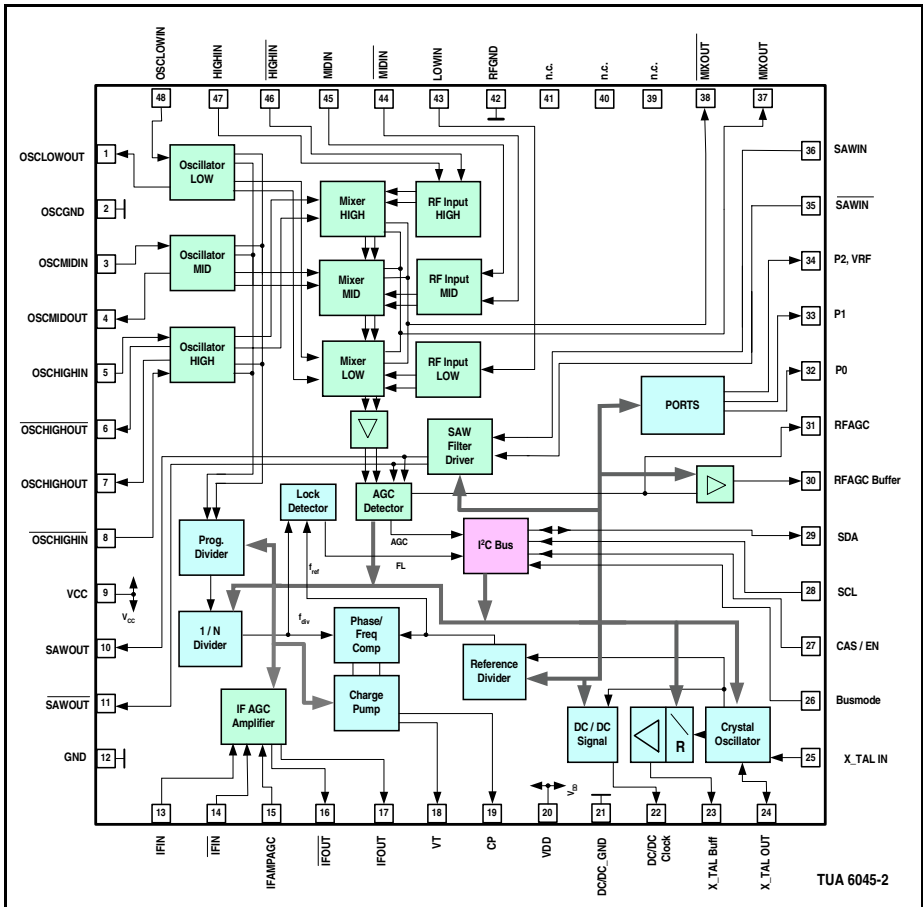

Figure 2 Block Diagram TUA 6045-2 in VQFN-48 package

## 3.4 Circuit Description

### 3.4.1 Mixer-Oscillator-block, SAW filter driver

The mixer-oscillator block includes three balanced mixers (one mixer with an unbalanced high-impedance input and two mixers with a balanced low-impedance input), two 2-pin asymmetrical oscillators for the LOW and the MID band, one 4-pin symmetrical oscillator for the HIGH band, a reference voltage, and a band switch.

Filters between tuner input and IC separate the TV frequency signals into three bands. The band switching in the tuner front-end is done by using three PNP port outputs. In the selected band, the signal passes through a tuner input stage with a MOSFET amplifier, a double-tuned bandpass filter and is finally fed to the mixer input of the IC. The impedance of the mixer at LOW band has high ohmic, while MID or HIGH band has a low ohmic input. The input signal is mixed there with the signal from the activated on chip oscillator to the IF frequency.

The IF is filtered by means of an external SAW filter (Surface Acoustic Waves filter) in between the 2 mixer output pins and the 2 input pins of the following SAW filter driver. The SAW filter driver has a low output impedance to drive the SAW filter directly.

### 3.4.2 RF AGC

The RF AGC stage combines a wide band and a narrow band detection. The wide band detector (WB) detects the input signal directly at the RF input for each band. The narrow band detector (NB) detects the level of the SAW filter driver output signal. If both detected levels are below the RF AGC take-over points, an external capacity will be charged with the source current of 300 nA or 9  $\mu$ A (release current). If one of the detected levels is above the RF AGC take-over points, the external capacity will be discharged with the sink current of 100  $\mu$ A (attack current). The integrated current generates an AGC voltage for gain control of the tuners input transistors. The AGC take-over and the time constant are selectable by the I<sup>2</sup>C bus as shown in [Table 17 "Subaddress 03H, AGC control and IF Signal Processing Control" on Page 52](#).

An integrated RF AGC buffer allows to monitor the AGC voltage without any influence on the tuner gain control. This buffer can be disabled as shown in [Table 16 "Subaddress 02H, Reference Divider R and Crystal Oscillator Control" on Page 50](#)

### 3.4.3 IF AGC amplifier

Coming out of the SAW filter the IF signal is sent through a VGA (Variable Gain Amplifier) which will set the differential IF output signal to the desired level (preferably 1 Vpp). The gain of the VGA is determined by the DC-voltage at pin IFAMPAGC

### 3.4.4 PLL block, XTAL oscillator

The VCO frequency  $f_{OSC}$  is stabilized by a digital CMOS PLL (Phase Locked Loop, Frequency Synthesizer). The oscillator signal is internally DC-coupled as a differential signal to the programmable divider input. The signal subsequently passes through a programmable divider (N) and then the divided VCO signal:

$$f_{div} = \frac{f_{OSC}}{N}, (N = 240 \dots 65535)$$

is compared in a digital frequency/phase detector (PD, frequency detector) with a programmable reference frequency:

$$f_{ref} = \frac{f_{XTAL}}{R}, (R = 2 \dots 1023)$$

which is derived from a quartz reference  $f_{XTAL}$  divided by a programmable reference divider (R).

The phase detector has a linear operating range without a dead zone for very small phase deviations. A programmable ABL pulse width (Anti BackLash) works against the delay of the charge pump cell. The selectable ABL pulse width values have been implemented for test purpose only and have no performance effects.

The phase detector has two outputs (up & down) that drive two current sources of opposite polarity as charge pump (CP). If the negative edge of the divided VCO signal appears prior to the negative edge of the reference signal, the positive current source ( $I_{source}$ ) pulses for the duration of the phase difference. In the reverse case the negative current source ( $I_{sink}$ ) pulses. If the two signals are in phase (PLL is locked), the integrated charge pump current is approximately zero. In case of active closed loop control the charge pump provides programmable output current drive capability to optimize the loop requirements. The charge pump currents are programmable from 0 to 1.125 mA in steps of 75  $\mu$ A.

The PLL contains an integrated lock detector. A lock-in flag is set when the loop is locked. It can be read by the processor via the common I<sup>2</sup>C/3-Wire bus.

The crystal oscillator (XTAL) is an unbalanced Pierce oscillator which operates in parallel resonance with quartz crystals from 4...16 MHz. By programming it's possible to pass the oscillator frequency  $f_{XTAL}$  through a divider stage to a buffered output pin or to use an external quartz clock for the reference oscillator via a switchable preamplifier for test purpose only.

### 3.4.5 Bus Interface

The programming of the CMOS frequency synthesizer is done via a combined serial I<sup>2</sup>C/3-Wire bus interface. The choice of the desired bus is made by a bus mode select signal at pin BUSMODE.

## Functional Description

In I<sup>2</sup>C-bus mode four different chip addresses can be set by appropriate DC levels at pin CAS (Chip Address Select), while in 3-Wire mode the chip is addressed by a low active enable signal at pin EN.

The content of the bus telegram (serial data format) is controlled by software programming and assigned to the registers of the functional units according to the several sub addresses. The most significant bit (MSB) of the data protocol is shifted in first.

The clock is generated by the processor (input pin SCL/Clock), while pin SDA/Data functions as an input or an output (open drain, external pull-up resistor) depending on the direction of the data (write or read mode). Both inputs have schmitt-trigger circuits with hysteresis and furthermore a low-pass characteristic, which suppress a certain noise level on the bus lines and enhance so the noise immunity of the combi-bus.

A detailed description of the chip address organization in I<sup>2</sup>C-mode as well as the used sub addresses of the data registers is given in [chapter 5.2 "Bus Interface" on page 41](#) - and the programmable I<sup>2</sup>C/3-Wire bus data format is shown in [chapter 5.3 "Bus Data Format" on page 43](#).

### 3.4.6 DC/DC clock output

To drive a bipolar NPN switching transistor of an external DC/DC converter directly, a programmable DC/DC clock generator is integrated. The clock frequency and the duty cycle of the DC/DC clock generator can be set over the I<sup>2</sup>C/3-Wire bus as shown in [Table 18 "Subaddress 04H, DC-DC Converter" on Page 54](#).

### 3.4.7 Power-on Reset, Stand-by Condition

While applying the supply voltage, integrated power-on reset circuits ensure a defined state after initial power-up. The required programming data will be set to default values.

When  $V_{CC}$  fall below approximately 1.2 V (typ.) the power-on resets go active and tie all write data registers to their power-on defaults (= power-down reset). While power-on reset is active no programming is possible.

The power-on flags (POFx) are set at power-on and when  $V_{VCCx}$  falls below appr. 1.2 V (typ.). They will be reset at the end of a READ operation of the status register.

By programmable stand-by control bits it's possible to reduce the current consumption of the IC up to 99%. In the full stand-by mode only bus interface is staying active and the current consumption is reduced below 200  $\mu$ A. After power-on reset only bus interface and XTAL-oscillator with bandgap are active and the current consumption is about 2.6 mA (typ.).

### 3.4.8 IF switch, Loop thru

For the alignment procedure of the tuner module two programmable switches are integrated to bypass the bandpass, the SAW driver and the SAW filter. The first switch called “IF switch” can switch between the mixer output signal and the bandpass output signal. The second switch called “Loop thru” can switch between the signal after the first stage of the IF AGC amplifier and the SAW filter output signal.

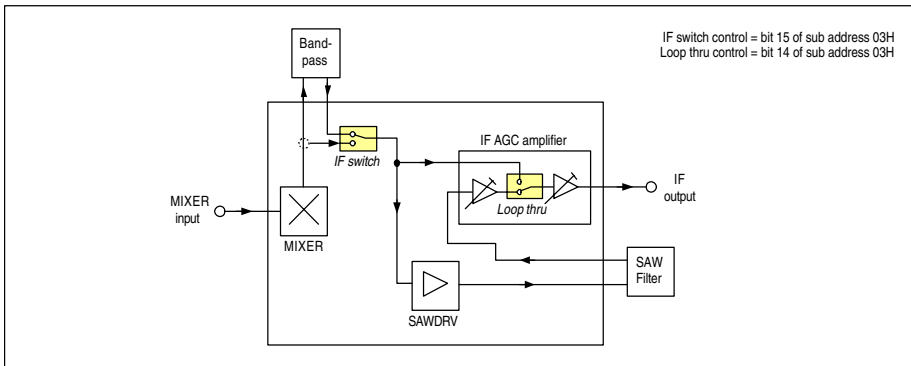

Figure 3 Functional Block Diagram of IF switch and Loop thru

135.		$L_{IF/IF}$		120		nH		

- 1) Values are referred to **Figure 4.2 "Application circuit for hybrid application" on Page 27** and  $f_{IF} = 36$  MHz, unless stated otherwise.
- 2) The RF frequency range is defined by the oscillator frequency range and the intermediate frequency (IF).
- 3) Local oscillator FM modulation resulting from I<sup>2</sup>C communication is measured at the IF output using a modulation analyzer with a peak to peak detector  $((P_+ + P_-) / 2)$  and a post detection filter 20 Hz - 100 kHz. The I<sup>2</sup>C messages are sent to the tuner in such a way that the tuner is addressed but the content of the PLL registers are not altered. The refresh interval between each data set shall be 20 ms to 1 s.
- 4) (N+5) -1 MHz is defined as the input level of channel N+5, at frequency 1 MHz lower, causing 100 kHz FM sidebands 30 dB below the wanted carrier.
- 5) Impedance measured with differential 2-port measurement at input or output. Input and output pins directly connected to measurement equipment with 50  $\Omega$  strip lines.
- 6) Limits are related to the tank circuit used in the application board. Frequency bands may be adjusted by the choice of external components.
- 7) The supply ripple susceptibility is a sideband measurement using a spectrum analyzer connected to the IF output. An unmodulated RF signal with a level of 80 dB $\mu$ V is applied to the test board RF input. A sinewave signal with a defined frequency is superposed onto the supply voltage (see **Figure 16 "Ripple susceptibility measurement" on Page 62**). The specified value is the worst case in the frequency range.
- 8) This is the level of divider interferences close to the IF frequency. For example channel S3:  $f_{OSC} = 158.15$  MHz,  $1/4 f_{OSC} = 39.5375$  MHz. The rejection has to be greater than 60 dB for an SAW driver output of 100 dB $\mu$ V.
- 9) Crystal oscillator interference means the 4 MHz sidebands caused by the crystal oscillator. The rejection has to be greater than 60 dB for an SAW driver output of 100 dB $\mu$ V.
- 10) The reference frequency rejection is the level of reference frequency sidebands (e.g. 62.5 kHz) related to the carrier. The rejection has to be greater than 60 dB for an SAW driver output of 100dB $\mu$ V.
- 11) Channel S02 beat is the interfering product of  $f_{RFpix}$ ,  $f_{IF}$  and  $f_{OSC}$  of channel S02,  $f_{BEAT} = 37.35$  MHz. The possible mechanisms are  $f_{OSC} - 2 \times f_{IF}$  or  $2 \times f_{RFpix} - f_{OSC}$ .

## 5.2 Bus Interface

**Table 7 Pin Function**

Pin Designation	BUSMODE	SDA / Data	SCL / Clock	CAS / EN
Function	bus mode select	serial data	clock	I <sup>2</sup> C: chip address select, 3-W: enable
I <sup>2</sup> C mode	0	data in/out	clock in	four chip addresses <sup>1)</sup>
3-Wire mode	1 or open			0: chip is addressed

## 5.4 Bus Timing

Figure 7 I<sup>2</sup>C Bus

Figure 8 3-Wire Bus

**Table 13 Bus Timing**

#	Parameter	Symbol	Limit Values		Unit
			min.	max.	
1.	LOW level input voltage (SDA, SCL, CAS/EN, BUSMODE)	$V_{IL}$	-0.5	0.54	V
2.	HIGH level input voltage (SDA, SCL, CAS/EN, BUSMODE)	$V_{IH}$	1.26	5.5	V
3.	Hysteresis of Schmitt trigger inputs	$V_{Hys}$	0.15		V
4.	Pulse width of spikes which must be suppressed by the input filter	$t_{SP}$	0	50	ns
5.	LOW level output voltage (SDA), only I2C-bus at 3mA sink current at 6mA sink current	$V_{OL}$	0	0.4 0.6	V V
6.	Output fall time from $V_{IH\ min}$ to $V_{IL\ max}$ with a bus capacitance from 10pF to 400pF with up to 3mA sink current at $V_{OL}$	$t_{OF}$	$20+0.1C_b^{1)}$	250	ns
7.	SCL clock frequency	$f_{SCL}$	0	400	kHz
8.	Bus free time between a STOP and START condition <sup>2)</sup>	$t_{BUF}$	1.3	-	$\mu$ s
9.	Hold time (repeated) START/ENABLE ON condition. After this period, the first clock pulse is generated.	$t_{HD,STA}$	0.6	-	$\mu$ s
10.	LOW period of the SCL clock pulse	$t_{LOW}$	1.3	-	$\mu$ s
11.	HIGH period of the SCL clock pulse	$t_{HIGH}$	0.6	-	$\mu$ s
12.	Set-up time for a repeated START condition 2)	$t_{SU,STA}$	0.6	-	$\mu$ s
13.	Data hold time	$t_{HD,DAT}$	0	-	ns
14.	Data set-up time	$t_{SU,DAT}$	100	-	ns
15.	Rise time, fall time of SDA and SCL signals	$t_R, t_F$	$20+0.1C_b^{1)}$	300	ns
16.	Set-up time for STOP/ENABLE OFF condition	$t_{SU,STO}$	0.6	-	$\mu$ s

#	Parameter	Symbol	Limit Values		Unit
			min.	max.	
17.	Setup time CAS/EN to SDA <sup>3)</sup>	$t_{SU,ENASD}$ A	0.6	-	$\mu$ s
18.	Setup time SCL to CAS/EN	$t_{SU,SCLEN}$ A	0.6	-	$\mu$ s
19.	H-pulse width (CAS/EN) for new data protocol <sup>3)</sup>	$t_{WHEN}$	0.6	-	$\mu$ s
20.	Capacitive load for each bus line	$C_b$	--	400	pF

1)  $C_b$  = capacitance of one bus line in pF.

Note that the maximum  $t_f$  for the SDA and SCL bus lines quoted in table above (300ns) is longer than the specified maximum  $t_{OF}$  for the output stages (250ns). This allows series protection resistors to be connected between the SDA/SCL pins and the SDA/SCL bus lines without exceeding the maximum specified  $t_f$ .

2) only for I<sup>2</sup>C bus mode.

3) only for 3-Wire bus mode.

## 5.5 Data Byte Specification, Function and Defaults

### 5.5.1 Write Data Registers

Table 14 Subaddress 00H, Main Divider

Bit	Symbol	Bits	V	Function	Description	Defaults
15	N15		$2^{15}$		Synthesizer N-counter programmable divider bits:  $N = 2^{15} \times N15$ $+ \dots + N0$  $N = 240 \dots 65535$	0
14	N14		$2^{14}$			0
13	N13		$2^{13}$			0
12	N12		$2^{12}$			1
11	N11		$2^{11}$			1
10	N10		$2^{10}$			1
9	N9		$2^9$			1
8	N8		$2^8$			0
7	N7		$2^7$			1
6	N6		$2^6$			1
5	N5		$2^5$			1
4	N4		$2^4$			0
3	N3		$2^3$			0
2	N2		$2^2$			0
1	N1		$2^1$			1
0	N0	$2^0$	0			

Default divider ratio  
 $N = 7906^{1)}$

1) Default:  $f_{RF} = 458\text{MHz}$  with  $f_{ref} = 62.5\text{kHz}$ ,  $f_{IF} = 36.125\text{MHz}$ .

**Table 15 Subaddress 01H, Control Bytes**

Bit	Symbol	Bits		V	Function	Description	Defaults		
15					not used	not used	0		
		P2_4 ... P2_0			analog output				
14	P2_4	00000		0V	to 0V		1		
13	P2_3	11011		2.7 V	to 2.7V		1

		1	1	0			don't use			
		1	1	1			don't use			

**Table 18 Subaddress 04H, DC-DC Converter**

Bit	Symbol	Bits	V	Function	Description	Defaults
15		1		Output HIGH	High current or tristate	0
14	DCh_6		$2^6$		Output high time:	0
13	DCh_5		$2^5$		High count register	0
12	DCh_4		$2^4$		$DCh = \sum(DCh_i * 2^i); 2^i = 1 \text{ to } 127$	0
11	DCh_3		$2^3$		$t_{High} = DCh / f_{Crystal}$	0
10	DCh_2		$2^2$			1
9	DCh_1		$2^1$			0
8	DCh_0		$2^0$			0
7		1		Output LOW	If bit15 = 0, load count registers;	0
6	DCI_6		$2^6$		Output low time:	0
5	DCI_5		$2^5$		Low count register	0
4	DCI_4		$2^4$		$DCI = \sum(DCI_i * 2^i); 2^i = 1 \text{ to } 127$	1
3	DCI_3		$2^3$		$t_{Low} = DCI / f_{Crystal}$	0
2	DCI_2		$2^2$			0
1	DCI_1		$2^1$			0
0	DCI_0		$2^0$			0

Default  $f_{DCDC} = 4 \text{ MHz} / (4 + 16) = 200 \text{ kHz}$ , 20% duty cycle

**Table 19 Subaddress 06H, Mode Bytes, Test Mode and Standby Control**

Bit	Symbol	Bits	V	Function	Description	Defaults
15	CPT	0		Charge pump test mode control	CP is in normal mode (=bipolar)	0
		1			CP current sink or source (=monopolar)	
14	CPP	0			CP = sinking current if CPT=1	0
		1			CP = sourcing current if CPT=1	
13	PT	0		Ports test mode control	Ports in normal mode (=bits P0, P1 to ports)	0
		1			Ports in test mode (=RFAGC Detector or $f_{PD/2}$ )	
12	PTSEL	0		Ports test output select	RFAGC_WB, RFAGC_NB to P0, P1 if PT=1	0
		1			$f_{PD/2}$ to P0, P1 if PT=1 <sup>1)</sup>	
11				not used	not used	
10				not used	not used	
9	STBY9	1		Standby for:	Integrator	1
8	STBY8	1		Standby for:	IFAGC	1
7	STBY7	1		Standby for:	SAW driver	1
6	STBY6	1		Standby for:	Mixer + RFAGC	1
5	STBY5	1		Standby for:	Ports	1
4	STBY4	1		Standby for:	PLL (and $R_{fosc}/3$ )	1
3	STBY3	1		Standby for:	RF oscillator	1
2	STBY2	1		Standby for:	DCDC converter	1

Bit	Symbol	Bits	V	Function	Description	Defaults
1	STBY1	1		Standby for:	Crystal oscillator	0
0	STBY0	1		Standby for:	BIAS (disables all except bus)	0

1) P0, P1 are outputs for  $f_{ref}$ ,  $f_{div}$ .

P0 is output for  $f_{ref}$  divided by 2. P1 is output for  $f_{div}$  divided by 2.

## 5.5.2 Read Data Registers

Table 20 Subaddress 80H, Status

Bit	Symbol	Bits	V	Function	Description
7	POF			Power-on flag	=1 after power-on. Reset after first read of register
6	LF			Lock-in flag	=1 if lock-in
5				not used	
4	RFAGC			RFAGC flag	=1 if RFAGC is active (< 3V)
3	RFAGC_NB			NB detector flag	=1 if NB detector is above threshold =0 if NB detector is below threshold
2	RFAGC_WB			WB detector flag	=1 if WB detector is above threshold =0 if WB detector is below threshold
1	P1			Port P1 input	=1 if P1 is high
0	P0			Port P0 input	=1 if P0 is high

**Table 21** Subaddress 8EH, Chip Code "6045"

## 5.6 Measurement Circuits

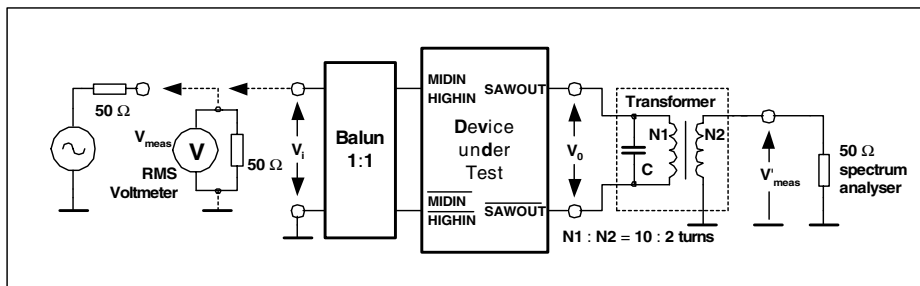

### 5.6.1 Gain ( $G_V$ ) measurement in LOW band

**Figure 9** Gain ( $G_V$ ) measurement in LOW band

- $Z_i \gg 50 \Omega \Rightarrow V_i = 2 \times V_{\text{meas}} = 80 \text{ dB}\mu\text{V}$
- $V_i = V_{\text{meas}} + 6\text{dB} = 80 \text{ dB}\mu\text{V}$
- $V_0 = V'_{\text{meas}} + 17 \text{ dB}$  (transformer ratio  $N1:N2$  and transformer loss)
- $G_V = 20 \log(V_0 / V_i)$

### 5.6.2 Gain ( $G_V$ ) measurement in MID and HIGH bands

**Figure 10** Gain ( $G_V$ ) measurement in MID and HIGH bands

- $V_i = V_{\text{meas}} = 70 \text{ dB}\mu\text{V}$
- $V_0 = V'_{\text{meas}} + 17 \text{ dB}$  (transformer ratio  $N1:N2$  and transformer loss)
- $G_V = 20 \log(V_0 / V_i) + 1 \text{ dB}$  (1 dB = insertion loss of balun)

### 5.6.3 Matching circuit for optimum noise figure in LOW band

For  $f_{RF} = 50 \text{ MHz}$   
 loss = 0 dB  
 image suppression = 16 dB

For  $f_{RF} = 150 \text{ MHz}$   
 loss = 1.3 dB  
 image suppression = 13 dB

Figure 11 Matching circuit for optimum noise figure in LOW band

### 5.6.4 Noise figure (NF) measurement in LOW band

Figure 12 Noise figure (NF) measurement in LOW band

### 5.6.5 Noise figure (NF) measurement in MID and HIGH bands

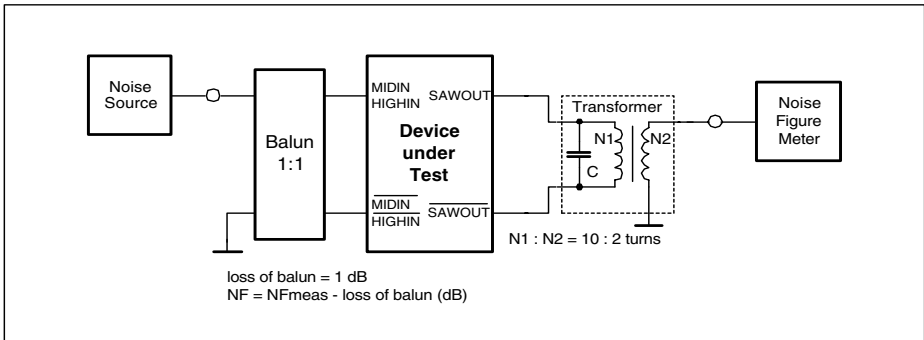

Figure 13 Noise figure (NF) measurement in MID and HIGH bands

### 5.6.6 Cross modulation measurement in LOW band

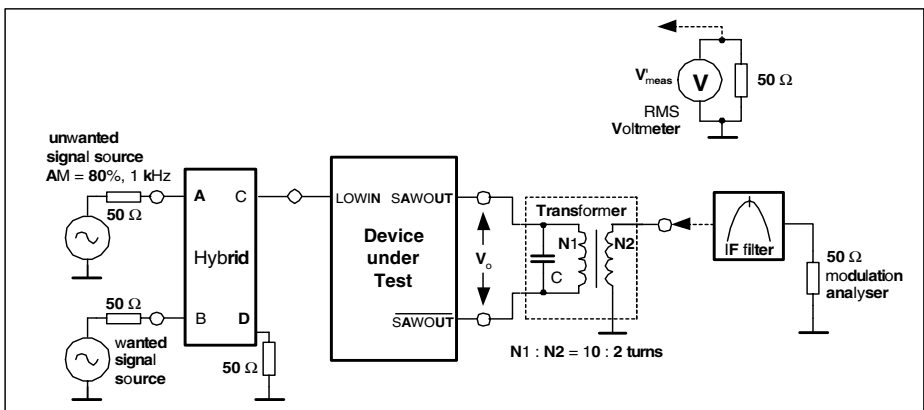

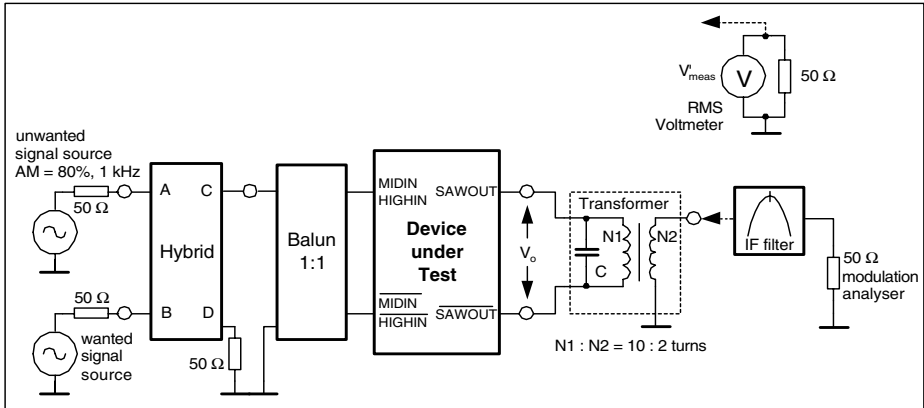

Figure 14 Cross modulation measurement in LOW band

- $V'_{\text{meas}} = V_0 - 17 \text{ dB}$  (transformer ratio  $N1:N2$  and transformer loss)
- wanted output signal at  $f_{\text{pix}}$ ,  $V_0 = 100 \text{ dB}\mu\text{V}$
- unwanted output signal at  $f_{\text{snd}}$

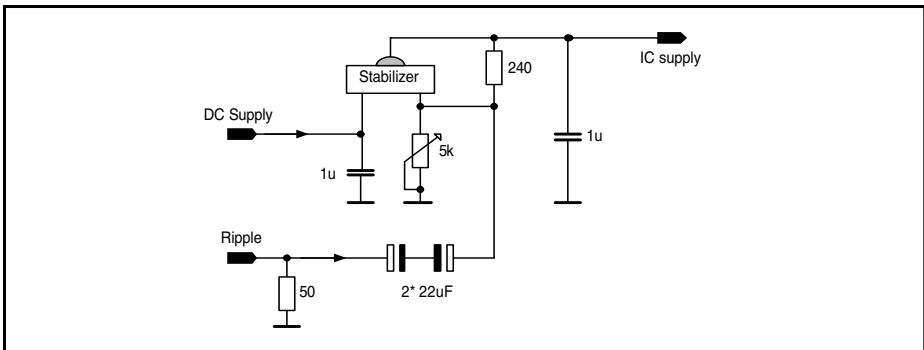

### 5.6.7 Cross modulation measurement in MID and HIGH bands

**Figure 15 Cross modulation measurement in MID and HIGH bands**

- $V'_{meas} = V_o - 17 \text{ dB}$  (transformer ratio  $N1:N2$  and transformer loss)
- wanted output signal at  $f_{pix}$ ,  $V_o = 100 \text{ dB}\mu\text{V}$
- unwanted output signal at  $f_{snd}$

### 5.6.8 Ripple susceptibility measurement

**Figure 16 Ripple susceptibility measurement**

## 6 Package PG-VQFN-48

Figure 17 PG-VQFN-48 Vignette

Figure 18 PG-VQFN-48 Outline Drawing

You can find all of our packages, sorts of packing and others in our Infineon Internet Page “Products”: <http://www.infineon.com/products>.

SMD = Surface Mounted Device

Dimensions in mm
