
7 + 7 W dual bridge amplifier

Multiwatt15

Features

- Wide supply voltage range (3 - 18 V)
- Minimum external components
 - No SWR capacitor
 - No bootstrap
 - No boucherot cells
 - Internally fixed gain
- Standby and mute functions
- Short-circuit protection
- Thermal overload protection

Description

The [TDA7266](#) is a dual bridge amplifier specially designed for TV and portable radio applications.

5 Application suggestion

Standby and mute functions

(A) Microprocessor application

Turn-on/off transients, guarantee the right ST-BY and mute signal sequence.

This function can be got thanks to a microprocessor (Figure 3. Microprocessor application and Figure 4. Microprocessor driving signals).

At first ST-BY signal (from microprocessor) goes high and the voltage across the ST-BY terminal (Pin 7) starts to increase exponentially. The external RC network turns on slowly the biasing circuits of the amplifier, to avoid "POP" and "CLICK" on the outputs.

When this voltage reaches the ST-BY threshold level, the amplifier is switched on and the external capacitors in series to the input terminals (C3, C5) start to charge.

The mute signal must be kept low until the capacitors are fully charged, so to avoid that the device goes to play mode causing a loud "Pop Noise" on the speakers.

A delay of 100 - 200 ms between ST-BY and mute signals is suitable for a proper operation.

Figure 3. Microprocessor application

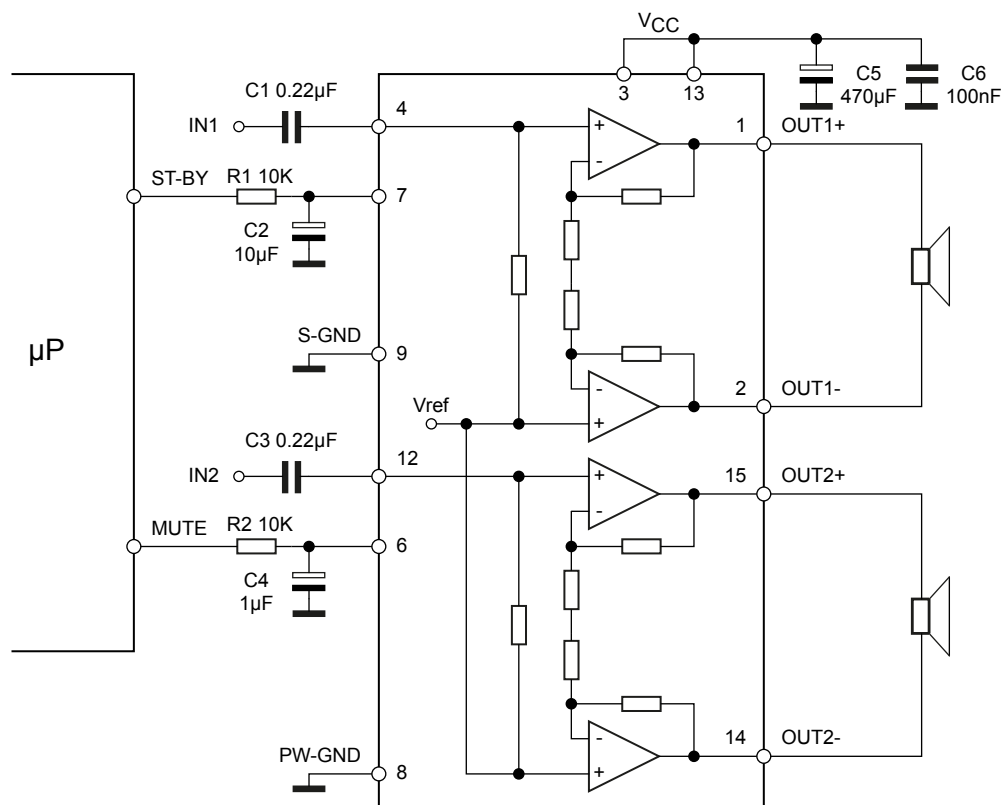

Figure 4. Microprocessor driving signals

(B) Low cost application

In low cost applications where the microprocessor is not present, the suggested circuit is shown in [Figure 5. Stand-alone low-cost application.](#)

The ST-BY and mute terminals are tied together and they are connected to the supply line via an external voltage divider.

The device is switched on/off from the supply line and the external capacitor C4 is intended to delay the ST-BY and mute threshold exceeding, avoiding "Popping" problems.
