## Dual Input, Single Output Power Source Multiplexer

The NCP3901 integrated circuit is a dual input, single output power source multiplexer. It is optimized for multiplexing 2 different charging inputs to feed a single input battery charger. To address all types of applications, the device is able to support autonomous and slave modes of operation. Reverse USB on-the-go is fully supported.

### Features

- 3 A DC Minimum Current through Power Paths
- Reverse 5 V OTG Support through VINA Path
- Maximum 20 V Over Voltage Threshold
- 28 V Absolute Maximum Voltage on VINA
- Compliance with IEC61000-4-5 at 100 V for VINA
- Indication of Presence of Second Input
- Autonomous Priority Selection and Switch Over Lock
- Small Footprint: 3.1 x 1.65 mm WLCSP28 0.4 mm Pitch
- 30 ms Minimum Break-before-make Time
- This is a Pb-Free Device

### Typical Applications

- Handheld Devices
- Tablets
- Smart Phone
- PDAs

## Functional Description

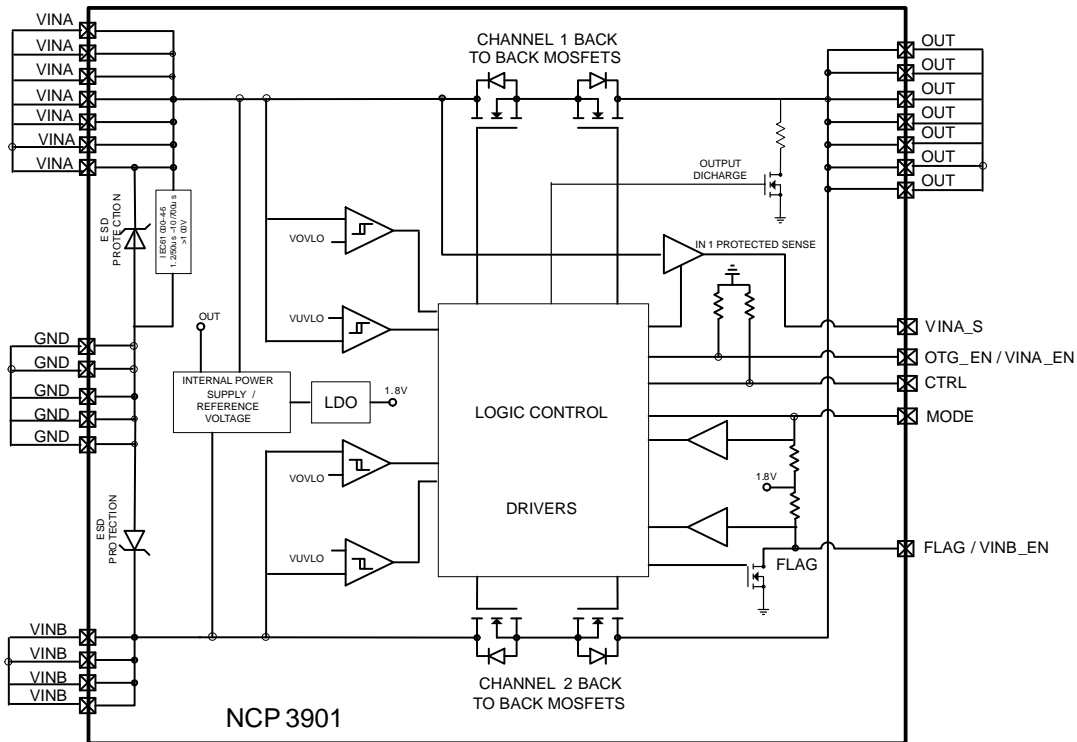

Figure 3. Block Diagram

### Overview

The NCP3901 is a 2 to 1 flexible power source selector with arbitration logic. A primary power path (VINA) and secondary power path (VINB) are switched to a single pin (OUT) that provides power to a system (battery charger input). The two inputs (VINA and VINB) are Over Voltage protected. The Over Voltage Threshold is set in such a way that, considering pass MOSFET turn off time, the absolute highest voltage at the OUT pin with a 3 V/ $\mu$ s rising input voltage will be 20 V.

In addition, VINA is connected to an active clamp that protects all downstream circuitry up to a high voltage surge of 100 V as defined by the IEC61000-4-5 1.2/50  $\mu$ s and 10/700  $\mu$ s standard. The IC is protected against reverse voltage applied to the OUT pin on both inputs by use of back to back power MOSFETs.

When a valid voltage is applied to the OUT pin, a digital input VINA\_EN/OTG\_EN pin will allow this voltage to pass through the power channel 1 from OUT to VINA.

The IC contains a VINB\_EN/FLAG input that informs the controlling logic if the secondary channel is conducting or not. The VINB\_EN/FLAG pin can also be used as an input signal in order to enable both inputs at the same time.

The IC features a VINA\_S protected and current limited output as soon as the VINA voltage is valid (operating range).

Depending on the MODE pin level, the IC will operate in “Autonomous” or “Slave” mode.

- If MODE pin is high the part operates in Slave Mode
- If MODE pin is low the part operates in Autonomous Mode

In Autonomous mode, the CTRL pin will prevent, if pulled high, the part from switching from one input to the other one. MODE digital pin, if pulled high, can also be used to do this.

Finally, a thermal protection will stop the IC when exceeding the TSD threshold. The IC function will be enabled automatically when the part cools down.

# NCP3901

## Mode Selection

Mode selection to support multiple applications is based on the CTRL and MODE pins, as depicted in the table below. If no external components are connected to the CTRL and MODE pins, the device is configured in slave mode.

MODE Pin	CTRL Pin	PMUX behavior
Low	Low	Autonomous mode – Not Locked
Low	High	Autonomous mode – Locked
High	Low	Slave mode
High	High	

## Mode 1 – Slave Mode

In slave mode, the NCP3901 is directly control by the host. The OTG and FLAG pins are respectively assigned to VINA\_EN and VINB\_EN, directly controlling input channel A and input channel B.

VINA_EN	VINB_EN	Selected Path
Low	Low	None
Low (default)	High (default)	VINB Conducting
High	Low	VINA Conducting
High	High	VINB and VINA Conducting

Figure 4. Signal Timing in Slave Mode

**Mode 2 – Autonomous Mode**

**Autonomous Mode – Not Locked**

In autonomous not locked mode, the device uses its own logic to determine which input path is conducting and provides information to the system and priority is given to the VINA channel. If a VINA supply is detected valid while VINB is conducting, the PMUX will automatically switch the conducting input from VINB to VINA. During this

transition, a break-before-make operation is performed within 30 ms in order to avoid cross conduction between VINA and VINB and to ensure proper operation. A 500 Ω pull-down resistor on OUT is enabled for the entire duration of the break-before-make time. As the PMUX is able to turn on channel VINA or VINB, a FLAG pin indicates to the system the active path. When the VINB path is active, FLAG pin is high. As a consequence, if a valid voltage is present on the OUT pin and if FLAG is low, VINA is active.

**Figure 5. Signal Timing in Autonomous Mode – Charging Example**

**Autonomous Mode – Locked**

Autonomous locked mode is set when the CTRL pin is high. In this mode, the first valid input is active till this input becomes not valid. This feature can be used to lock the VINB channel in case of a weak battery for example.

**OTG Mode**

5 V is applied on the output of the device during OTG mode. This 5 V will pass through the VINA path when the OTG\_EN pin is driven high. When enabling the OTG mode,

the VINA output is powered from VOUT and is soft-started for 1 ms.

For VINB to supply the OTG accessory (connected on VINA) though OUT, both channels must be activated. This can be done by asserting the FLAG pin low. Usually used as an output, the FLAG pin is also sensed by the PMUX in autonomous mode. When VINB is valid, the FLAG pin open drain is open. Thus asserting the FLAG pin low will turn on the VINA path with VINB already active.

**Figure 6. FLAG Functional Diagram**

## Autonomous Mode Functional Diagram

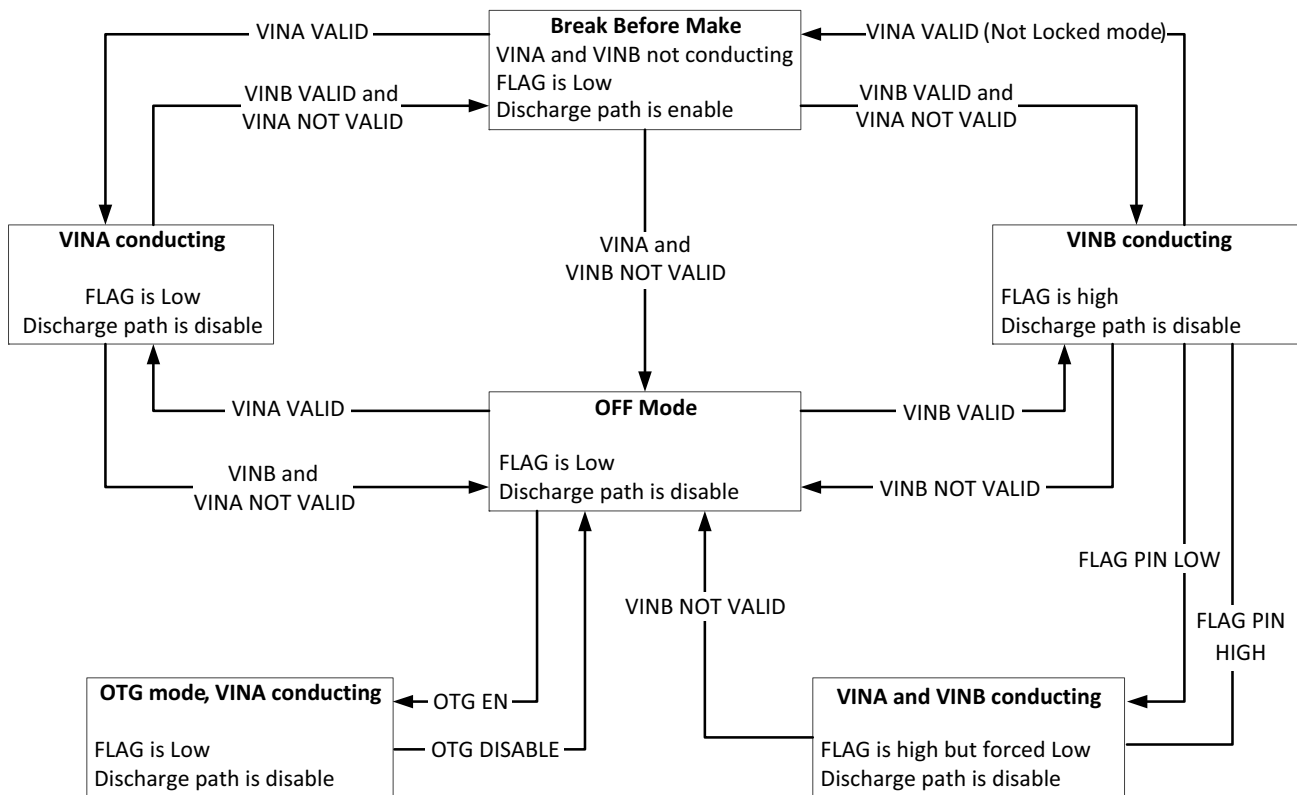

Figure 8. Functional Diagram

## NCP3901

### VINA Sense Output

The IC features a protected VINA Sense to the processor. This output is 0V when the VINA voltage level is lower than  $V_{UVLO}$  and higher than  $V_{OVLO}$  and equal to VINA when the VINA voltage is within the operation range.

### Input Voltage Protection

The device can withstand a maximum of 28 V DC on VINA and 20 V DC on VINB. Embedded OVP thresholds

will disable both VINA and VINB when the voltage applied to VINA or VINB will exceed the OVLO thresholds. The response time of the overvoltage lock out is fast enough to prevent a voltage of maximum of 20 V at VOUT.

In compliance with IEC 61000-4-5, both 1.2/50  $\mu$ s and 10/700  $\mu$ s surge waveforms up to 100 V, the PMUX clamp input voltage surges on VINA to 28 V and hold off the voltage. During these surges, the voltage at VOUT will not exceed 20 V.
