

Features

- ESD Protect for 5 Lines with Uni-directional
- Provide ESD protection for the protected line to IEC 61000-4-2 (ESD) $\pm 18\text{kV}$ (air), $\pm 18\text{kV}$ (contact)
IEC 61000-4-4 (EFT) 60A (5/50ns)
Cable Discharge Event (CDE)
- Small SOT563 package saves board space
- Protect five I/O lines or five power lines
- Fast turn-on and Low clamping voltage
- Low operating voltage: 3.3V and below
- Solid-state silicon-avalanche and active circuit triggering technology
- Green part available

Applications

- Audio Interfaces Protection
- Computer Interfaces Protection
- Microprocessors Protection
- Serial and Parallel Ports Protection
- Control Signal Lines Protection
- Power lines on PCB Protection
- Latchup Protection

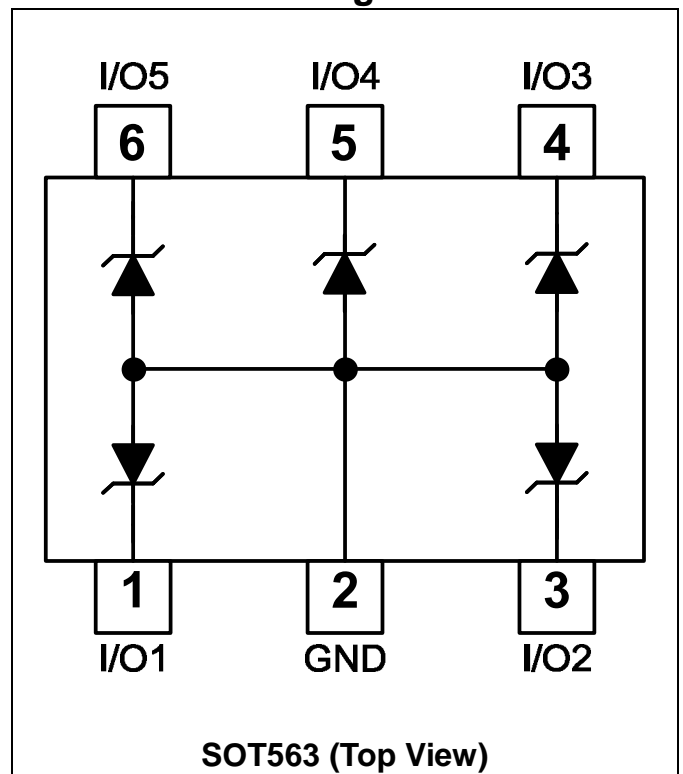

Description

AZ2013-05R is a design which includes five uni-directional ESD rated clamping cells to protect five power lines, or five control lines, or five low speed data lines in an electronic systems. The AZ2013-05R has been specifically designed to protect sensitive components which are connected to power and control lines from over-voltage damage and latch-up caused by Electrostatic Discharging (ESD), Electrical Fast Transients (EFT), and Cable Discharge Event (CDE).

AZ2013-05R is a unique design which includes proprietary clamping cells in a single package. During transient conditions, the proprietary clamping cells prevent over-voltage on the power lines or control/data lines, protecting any downstream components.

AZ2013-05R may be used to meet the ESD immunity requirements of IEC 61000-4-2, Level 4 ($\pm 15\text{kV}$ air, $\pm 8\text{kV}$ contact discharge).

Applications Information

The AZ2013-05R is designed to protect five lines against System ESD/EFT/CDE pulses by clamping them to an acceptable reference.

The usage of the AZ2013-05R is shown in Fig. 1. Protected lines, such as data lines, control lines, or power lines, are connected at pin 1, 3, 4, 5 and 6. The pin2 should be connected directly to a ground plane on the board. In order to minimize parasitic inductance in the board traces, all path lengths connected to the pins of AZ2013-05R should be kept as short as possible.

In order to obtain enough suppression of ESD induced transient, good circuit board is critical.

Thus, the following guidelines are recommended:

- Minimize the path length between the protected lines and the AZ2013-05R.
- Place the AZ2013-05R near the input terminals or connectors to restrict transient coupling.
- The ESD current return path to ground should be kept as short as possible.
- Use ground planes whenever possible.
- NEVER route critical signals near board edges and near the lines which the ESD transient easily injects to.
