## 2 Overview

The Trenz Electronic TE0782 is a high-performance, industrial-grade SoM (System on Module) with industrial temperature range based on Xilinx Zynq-7000 SoC (XC7Z035, XC7Z045 or XC7Z100).

These highly integrated modules with an economical price-performance-ratio have a form-factor of 8,5 x 8,5 cm and are available in several versions.

All parts cover at least industrial temperature range of -40°C to +85°C. The module operating temperature range depends on customer design and cooling solution. Please contact us for options and for modified PCB-equipping due increasing cost-performance-ratio and prices for large-scale order.

Refer to <http://trenz.org/te0782-info> for the current online version of this manual and other available documentation.

### 2.1 Key Features

- Xilinx Zynq-7000 XC7Z035, XC7Z045 or XC7Z100 SoC
- Rugged for shock and high vibration
- Large number of configurable I/Os are provided via rugged high-speed stacking strips
- Dual ARM Cortex-A9 MPCore
  - 1 GByte RAM (32-Bit wide DDR3)
  - 32 MByte QSPI Flash memory
  - 2 x Hi-Speed USB2 ULPI transceiver PHY
  - 2 x Gigabit (10/100/1000 Mbps) Ethernet transceiver PHY
  - 4 GByte eMMC (optional up to 64 GByte)
- 2 x MAC-address EEPROMs
- Optional 2x 64 MByte HyperFLASH or 2x 8 MByte HyperRAM (max 2x 32 MByte HyperRAM)
- Temperature compensated RTC (real-time clock)
- Si5338A programmable quad PLL clock generator for GTX transceiver clocks
- Plug-on module with 3 x 160-pin high-speed strips
  - 16 GTX high-performance transceiver
  - 2x GT transceiver clock inputs
  - 254 FPGA I/O's (125 LVDS pairs)
- On-board high-efficiency switch-mode DC-DC converters
- System management
- eFUSE bit-stream encryption
- AES bit-stream encryption
- Evenly-spread supply pins for good signal integrity
- User LED

Assembly options for cost or performance optimization available upon request.

Additional assembly options are available for cost or performance optimization upon request.

## 3 Boot Process

4 of the 7 boot mode strapping pins (MIO2 ... MIO8) of the Xilinx Zynq-7000 SoC device are hardware programmed on the board, 3 of them are set by the SC CPLD firmware. They are evaluated by the Zynq device soon after the 'PS\_POR' signal is deasserted to begin the boot process (see section "Boot Mode Pin Settings" of Xilinx manual UG585).

The TE0782 board is programmed in the SC CPLD firmware to boot initially from the on-board QSPI Flash memory U38. See section Bootmode in the TE0782 SC CPLD reference Wiki page.

The JTAG interface of the module is provided for storing the data to the QSPI Flash memory through the Zynq-7000 device.

## 4 Signals, Interfaces and Pins

### 4.1 Board to Board (B2B) I/Os

Zynq-7000 SoC's I/O banks signals connected to the B2B connectors:

Bank	Type	B2B Connector	I/O Signal Count	Differential	Voltage	Notes
10	HR	J3	44	22	User	Max voltage 3.3V
11	HR	J3	40	20	User	Max voltage 3.3V
12	HR	J2	40	20	User	Max voltage 3.3V
13	HR	J2	40	20	User	Max voltage 3.3V
33	HP	J1	48	23	User	Max voltage 1.8V
34	HP	J1	42	20	User	Max voltage 1.8V

**Table 2:** General overview of board to board I/O signals

For detailed information about the pin-out, please refer to the [Pin-out table](#).

### 4.2 MGT Lanes

The Xilinx Zynq-7000 SoC used on the TE0782 module has 16 MGT transceiver lanes. All of them are wired directly to B2B connectors J1 and J3. MGT (Multi Gigabit Transceiver) lane consists of one transmit and one receive (TX/RX) differential pairs, four signals total per one MGT lane with data transmission rates up to 12.5Gb/s per lane (Xilinx GTX transceiver). Following table lists lane number, FPGA bank number, transceiver type, signal schematic name, board-to-board pin connection and FPGA pins connection:

Bank	Type	Lane	Signal Name	B2B Pin	FPGA Pin

**Table 3:** MGT lanes

There are 2 clock sources for the GTX transceivers. MGT\_CLK1 and MGT\_CLK4 are connected directly to B2B connector J3 and J1, so the clock can be provided by the carrier board. Clocks MGT\_CLK0, MGT\_CLK3, MGT\_CLK5

and MGT\_CLK6 are provided by the on-board clock generator (U2). As there are no capacitive coupling of the data and clock lines that are connected to the connectors, these may be required on the user's PCB depending on the application.

Bank	Type	Clock signal	Source	FPGA Pin	Notes
109	GTX	MGT_CLK3_P	U2, CLK3A	MGTREFCLK1P_109, AF10	Supplied by on-board Si5338A

## 4.3 JTAG Interface

JTAG access to the Xilinx Zynq-7000 is provided through B2B connector J3.

JTAG Signal	B2B Connector Pin
TMS	J3-142
TDI	J3-147
TDO	J3-148
TCK	J3-141

**Table 5:** Zynq JTAG interface signals

JTAG access to the LCMXO2-1200HC System Controller CPLD U14 is provided through B2B connector J3.

JTAG Signal	B2B Connector Pin
M_TMS	J3-82
M_TDI	J3-87
M_TDO	J3-88

## 4.6 Gigabit Ethernet

The TE0782 is equipped with two Marvell Alaska 88E1512 Gigabit Ethernet PHYs (U18 (ETH1) and U20 (ETH2)). The transceiver PHY of ETH1 is connected to the Zynq PS Ethernet GEM0. The I/O Voltage is fixed at 1.8V for HSTL signaling. The reference clock input for both PHYs is supplied from an on board 25MHz oscillator (U11), the 125MHz output clock of both PHYs are connected to Zynq's PL bank 35.

### ETH1 PHY connection:

PHY PIN	Zynq PS / PL	System Controller CPLD	Notes
MDC/MDIO	MIO52, MIO53	-	-
LED0	Bank 35, Pin B12	-	-
LED1	Bank 35, Pin C12	-	-
Interrupt	Bank 35, Pin A15	-	-
CONFIG	Bank 35, Pin F14	-	When pin connected to GND, PHY Address is strapped to 0x00 by default

## 4.7 USB Interface

The TE0782 is equipped with two USB PHY's USB3320 from Microchip (U4 (USB0) and U8 (USB1)). The ULPI interface of USB0 is connected to the Zynq PS USB0, ULPI interface of USB1 to Zynq PS USB1. The I/O Voltage is fixed at 1.8V.

The reference clock input of both PHY's is supplied from an on board 52MHz oscillator (U7).

### USB0 PHY connection:

PHY Pin	Zynq PS / PL	CPLD	B2B Connector J2	Notes
ULPI	MIO28..39	-	-	Zynq USB0 MIO pins are connected to the PHY
REFCLK	-	-	-	52MHz from on board oscillator (U7)
REFSEL[0..2]	-	-	-	000 GND, select 52MHz reference Clock
RESETB	MIO0	OTG_RESET33	-	OTG_RESET33 -> SC CPLD -> OTG_RESET
CLKOUT	MIO36	-	-	Connected to 1.8V selects reference clock operation mode
DP,DM	-	-	USB1_D_P, USB1_D_N	USB Data lines
CPEN	-	-	VBUS1_V_EN	External USB power switch active high enable signal
VBUS	-	-	USB1_VBUS	Connect to USB VBUS via a series resistor. Check reference schematic.
ID	-	-	OTG1_ID	For an A-Device connect to ground, for a B-Device left floating

## 4.8 I2C Interface

The on-board I<sup>2</sup>C components are connected to bank 35 pins L15 (I2C\_SDA) and L14 (I2C\_SCL).

I<sup>2</sup>C addresses for on-board components:

Device	IC	Designator	I2C-Address	Notes
EEPROM	24LC128-I/ST	U26	0x53	user data

**Table 13:** Address table of the I<sup>2</sup>C bus slave devices

## 4.9 Pin Definitions

Pins with names ending with \_VRN and \_VRP are connected to Zynq PL HP bank special purpose pins VRN/VRP and can be routed to DCI calibration resistors on the baseboard. Otherwise they are usable as general purpose I/Os.

Bank 35 has 100 ohm DCI calibration resistors installed, it is also possible to "borrow" the DCI calibration from bank 35 for banks 34 and 33. For more detailed information about the DCI check Xilinx documentation.

## 5 On-board Peripherals

### 5.1 System Controller CPLD

The System Controller CPLD (U14) is provided by Lattice Semiconductor LCMXO2-1200HC (MachXO2 product family). It is the central system management unit with module specific firmware installed to monitor and control various signals of the FPGA, on-board peripherals, I/O interfaces and module as a whole.

See also TE0782 CPLD reference Wiki page.

### 5.2 eMMC Flash Memory

eMMC Flash memory device (U15) is connected to the Zynq PS MIO bank 500 pins MIO10..MIO15. eMMC chips MTFC4GMVEA-4M IT (Flash NAND-IC 2x 16 Gbit) is used with 4 GByte of memory density.

### 5.3 DDR4 Memory

By default TE0782-02 module has two 16-bit wide IM (Intelligent Memory) IM4G16D3FABG-125I DDR3L SDRAM (DDR3-1600 Speedgrade) chips arranged into 32-bit wide memory bus providing total of 1 GBytes of on-board RAM.

### 5.4 Quad SPI Flash Memory

Two quad SPI compatible serial bus flash memory for FPGA configuration file storage is provided by Spansion S25FL256SAGBHI20 with 256 Mbit (32 MByte) memory density. After configuration completes the remaining free memory can be used for application data storage. All four SPI data lines are connected to the FPGA allowing x1, x2 or x4 data bus widths to be used. The maximum data transfer rate depends on the bus width and clock frequency.

### 5.5 Gigabit Ethernet PHYs

On-board Gigabit Ethernet PHYs (U18, U20) are provided by Marvell Alaska 88E1512. The Ethernet PHYs' RGMII interfaces are connected to the Zynq's PS MIO bank 501 and to PL bank 9. I/O voltage is fixed at 1.8V for HSTL signaling. The reference clock input of both PHYs is supplied from an on-board 25.000000 MHz oscillator (U11).

### 5.6 High-speed USB ULPI PHYs

Hi-speed USB ULPI PHYs (U4, U8) are provided with USB3320 from Microchip. The ULPI interfaces are connected to the Zynq PS USB0 and USB1 via MIO28..51, bank 501 (see also section USB interface). The I/O voltage is fixed at 1.8V and PHY reference clock input is supplied from the on-board 52.000000 MHz oscillator (U7).

### 5.7 MAC Address EEPROMs

Two Microchip 24AA025E48 serial EEPROMs (U22, U24) contain globally unique 48-bit node address, which are compatible with EUI-48(TM) specification. The devices are organized as two blocks of 128 x 8 Kbit memory. One of the blocks stores the 48-bit node address and is write protected, the other block is available for application use. The MAC address EEPROMs are accessible over I<sup>2</sup>C bus (see also section I<sup>2</sup>C interface).

## 5.8 Configuration EEPROM

The TE0782 board contains one EEPROM (U26) for configuration and general user purposes. The EEPROMs is provided by Microchip 24LC128-I/ST with 128 KBit memory density, the EEPROM is areaccessible over I<sup>2</sup>C bus (see also section I<sup>2</sup>C interface).

## 5.9 Programmable Clock Generator

There is a Silicon Labs I<sup>2</sup>C programmable clock generator Si5338A (U2) chip on-board. It's output frequencies can be programmed using the I<sup>2</sup>C bus address 0x70 or 0x71. Default address is 0x70, IN4/I2C\_LSB pin must be set to high for address 0x71.

A 25.000000 MHz oscillator (U3) is connected to the pin IN3 and is used to generate the output clocks. The output voltage of the oscillator is provided by the 1.8V power rail, thus making output frequency available as soon as 1.8V is present. All 4 of the Si5338 clock outputs are connected to the MGT banks of the Zynq device. It is possible to use the clocks connected to the GTR bank in the user's logic design. This is achieved by instantiating a IBUFDSGTE buffer in the design.

Once running, the frequency and other parameters can be changed by programming the device using the I<sup>2</sup>C bus connected between the FPGA (master) and clock generator (slave). For this, proper I<sup>2</sup>C bus logic has to be implemented in FPGA.

Signal	Frequency	Notes
IN1/IN2	user	External clock signal supply from B2B connector J3, pins J3-38 / J3-40

**Table 14:** General overview of the on-board quad clock generator I/O signals

## 5.10 Oscillators

The module has following reference clock signals provided by on-board oscillators and external source from carrier board:

Clock Source	Schematic Name	Frequency	Clock Destination
SiTime SiT8008AI oscillator, U61	PS_CLK	33.333333 MHz	Zynq SoC U1, pin A22
SiTime SiT8008BI oscillator, U21	-	25.000000 MHz	Quad PLL clock generator U2, pin 3
SiTime SiT8008AI oscillator, U7	-	52.000000 MHz	USB2 PHYs U4 and U8, pin 26
SiTime SiT8008BI oscillator, U11	-	25.000000 MHz	GbE PHYs U18 and U20, pin 34

**Table 15:** Reference clock signals

## 5.11 On-board LEDs

LED	Color	Connected to	Description and Notes
D1	Red	System Controller CPLD U14, bank 3	Exact function is defined by SC CPLD firmware
D2	Green	System Controller CPLD U14, bank 3

## 6 Power and Power-on Sequence

### 6.1 Power Supply

Power supply with minimum current capability of 4A for system startup is recommended.

### 6.2 Power Consumption

Power Input	Typical Current
VIN	TBD*
C3.3V	TBD*

**Table 17:** Power consumption

\* TBD - To Be Determined soon with reference design setup.

 To avoid any damage to the module, check for stabilized on-board voltages should be carried out (i.e. power good and enable signals) before powering up any Zynq's I/O bank voltages VCCO\_x. All I/Os should be tri-stated during power-on sequence.

### 6.3 Power Distribution Dependencies

The Trenz TE0782 SoM is equipped with two quad DC-DC voltage regulators to generate required on-board voltage levels 1V, 3.3V, 1.8V, 1.2V\_MGT, 1V\_MGT. Additional voltage regulators are used to generate voltages 1.5V, VTT, VTTREF and 1.8V\_MGT.

The power supply voltage 'C3.3V' of System Controller CPLD of the SoM have to be externally supplied with 3.3V nominal.

There are following dependencies how the initial voltages of the power rails on the B2B connectors are distributed to the on-board DC-DC converters, which power up further DC-DC converters and the particular on-board voltages:

**Figure 3: TE0782-02 Power Distribution Diagram**

See also Xilinx datasheet DS191 for additional information. User should also check related base board documentation when intending base board design for TE0782 module.

## 6.4 Power-On Sequence

Power-on sequence is handled by the System Controller CPLD using "Power good"-signals from the voltage regulators:

**Figure 4: TE0782-02 Power-on Sequence Diagram**

### 11.7 REACH, RoHS and WEEE

#### **REACH**

Trenz Electronic is a manufacturer and a distributor of electronic products. It is therefore a so called downstream user in the sense of **REACH**. The products we supply to you are solely non-chemical products (goods). Moreover and under normal and reasonably foreseeable circumstances of application, the goods supplied to you shall not release

any substance. For that, Trenz Electronic is obliged to neither register nor to provide safety data sheet. According to present knowledge and to best of our knowledge, no [SVHC \(Substances of Very High Concern\) on the Candidate List](#) are contained in our products. Furthermore, we will immediately and unsolicited inform our customers in compliance with REACH - Article 33 if any substance present in our goods (above a concentration of 0,1 % weight by weight) will be classified as SVHC by the [European Chemicals Agency \(ECHA\)](#).

#### **RoHS**

Trenz Electronic GmbH herewith declares that all its products are developed, manufactured and distributed RoHS compliant.

#### **WEEE**

Information for users within the European Union in accordance with Directive 2002/96/EC of the European Parliament and of the Council of 27 January 2003 on waste electrical and electronic equipment (WEEE).

Users of electrical and electronic equipment in private households are required not to dispose of waste electrical and electronic equipment as unsorted municipal waste and to collect such waste electrical and electronic equipment separately. By the 13 August 2005, Member States shall have ensured that systems are set up allowing final holders and distributors to return waste electrical and electronic equipment at least free of charge. Member States shall ensure the availability and accessibility of the necessary collection facilities. Separate collection is the precondition to ensure specific treatment and recycling of waste electrical and electronic equipment and is necessary to achieve the chosen level of protection of human health and the environment in the European Union. Consumers have to actively contribute to the success of such collection and the return of waste electrical and electronic equipment. Presence of hazardous substances in electrical and electronic equipment results in potential effects on the environment and human health. The symbol consisting of the crossed-out wheeled bin indicates separate collection for waste electrical and electronic equipment.

Trenz Electronic is registered under WEEE-Reg.-Nr. DE97922676.
