- <2> Do not use our components outside of the corresponding specifications.

■ When using this capacitor in a product where safety is critical

We take great care in the quality of this product. However, performance may deteriorate and short-circuiting or open-circuiting may occur if it will be used in transportation equipment (e.g. trains, cars, traffic lights), medical equipment airborne equipment, aerospace equipment, electric heating appliances, combustion/gas equipment, rotating equipment, disaster/crime prevention equipment, or other equipment where a defect in this component may cause the loss of human life or other significant damage. Ensure that the target equipment has a failsafedesign and is provided with the following systems to guarantee adequate safety.

- (1) * Ensure the safety of the whole system by installing a protection circuit and a protection device.
- (2) Redundant circuits, etc. to maintain the safety of the entire system so that a single independent failure will not lead to unsafe conditions.

■ Conditions of use:

This product is intended to be used in electronic equipment for general-purpose standard applications and is not designed for use in any special environments.
When this capacitor is used in a special environment or under special conditions, its performance may be affected.
Before use, verify the performance and reliability of the capacitor

⚠ Application Guidelines

1. Circuit design

1-1 Prohibited circuits for use

Polymer Aluminum capacitors (SP-Cap) are expected to malfunction in the following circuits. Therefore, their use is prohibited.

- (1) Time constant circuits
- (2) Coupling circuits
- (3) Capacitors connected in series
- (4) Circuits significantly affected by leakage current
- (5) High-impedance voltage retention circuits

1.2 Polarity and voltage The SP-Cap has polarities.

Do not apply a reversed or alternating-current voltage.

If the polarity is reversed, then a leakage current may occur, leading to short-circuiting or capacitor breakdown.

Do not apply an excessive voltage (a voltage exceeding the rating).

"Applied voltage" refers to a voltage containing a peak transient instantaneous voltage and a peak ripple voltage. It does not only refer to a stationary line voltage. Design circuits so that peak voltages do not exceed the specified voltage.

1.3 Ripple current

Observe the allowable ripple current.

If an excessive ripple current passes through the SP-Cap, then self-generated heat may cause a current leak or a short-circuit. While observing the allowable ripple current, do not apply a ripple voltage as described in paragraph 1.2.

1.4 Leakage current

The leakage current may increase even if the following usage environment is within the specified requirements.

However, even if the leakage current increases, the capacitor's self-repairing function will reduce the leakage current in most cases when a voltage is applied.

- (1) After reflow soldering
- (2) Unloading conditions such as unloading at a high temperature, high temperature and humidity, rapid temperature change, etc.

1.5 Temperature

Use capacitors within the specified temperature range. If they are used outside the specified temperature range, then the electrical characteristics may vary or deteriorate significantly, leading to failure.

The temperature referred to here includes the ambient temperature including heat produced by heat generating devices (power transistors, resistors, etc.), self-heating due to ripple currents, etc.

Take these factors into consideration when checking the capacitor temperature.

1.6 Failure rate

Most failure modes are "short-circuits" and "leakage current increase". The main causes of failure include thermal stress due to reflow soldering, the temperature of the environment they are being used in, and/or electrical or mechanical stress. Using lower temperatures and voltages even within the specified range enables the defect rate to be reduced. Therefore, provide such allowances during design.

[Estimated defect rate] (Reference)

- (1) Data in our reliability tests/46 Fits or less
(Estimation with a rated voltage being applied at 105 °C)
- (2) Estimated defect rate in the market/0.13 Fits or less
(c=0, estimation with a reliability level of 60 %)

1.7 Mounting area consideration

Isolate the surface of PCB under the mounted capacitor.

2. Mounting

2.1 When mounting

- (1) Check the capacitor ratings (capacitance and voltage) before mounting.
- (2) Check the capacitor polarity before mounting.
- (3) Check the land size for the capacitor before mounting.
- (4) When using a moulder, if the pressure for mounting is too high, then the current leak may increase, short-circuiting may occur, or the capacitor may break down or come off.

2.2 Soldering (reflow soldering)

- (1) The SP-Cap is to be used exclusively for reflow soldering. When reflow soldering, use an ambient heat conduction system such as the simultaneous use of infrared and hot-air and not a steam heat conduction system (VPS).

* This capacitor cannot be used for flow or dip soldering.

- (2) Solder capacitors under these soldering conditions (pre-heating, main-heating temperatures and time) described in the specifications.
- (3) Reflow-solder up to twice.
- (4) Do not reuse the mounted SP-Cap.
- (5) When modifying or correcting by using a soldering iron, etc.:
Use a soldering iron of 30 W or less, whose iron tip temperature is 350 °C or less. Total soldering time should be no longer than 10 seconds. Do not apply excessive force to the capacitor.

2.3 Circuit board cleaning

Apply the following conditions for flux cleaning after soldering.

Temperature: 60 °C or less, duration: Five minutes or less

However, rinse sufficiently and dry the boards (at 100 °C for 20 minutes or less).

2: Please do not use ozone-depleting chemicals in order to protect the environment.

3: In the case of using ultrasonic cleaning, the terminals may be broken. Therefore, please test before using in mass production.

2.4 Capacitor handling after soldering

(1) Do not apply an excessive force to the capacitor.

Deformed electrode terminals can affect mounting. Short-circuiting, wire breaking, leakage current increase, or damage to the exterior may be caused.

After mounting the capacitor, do not hold its body or apply a force to it.

3. Precautions for using equipment

3.1 Avoid using equipment to which capacitors are fitted in the following environments.

<1> Capacitors are directly exposed to water, salt water, or oil.

<2> Capacitors are exposed to direct sunlight.

<3> Capacitors are exposed to high temperature and humidity and the capacitor surface is condensed.

<4> Capacitors are exposed to various active gases.

<5> Acidic or alkaline environments

<6> Capacitors are subject to high-frequency induction.

<7> Capacitors are subject to excessive vibrations or shocks.

4. Emergency procedures

If the capacitors generate heat, smoke may come out of the exterior resin. If this is the case, then turn off the equipment immediately and stop using it.

Do not place your face or hands close to the capacitor. Otherwise, burns may be caused.

5. Storage

This product must be stored in an environment with controlled moisture protection.

This product must be stored as follows before and after moisture-protection packing is applied.

(If these requirements are not met, then thermal stress caused by moisture absorption of the package may damage the exterior or the internal elements.)

[Storage environment]

Temperature: 5 to 30 °C, humidity: 70 % or less

Storage period before opening the moisture protection seal: 2 years after manufacturing

Storage period after opening the moisture protection seal: 7 days*

* The capacitors for reflow 240 °C soldering except FD and CD (12.5 V and 16 V) products must be used within 14 days

6. Discarding

Dispose of capacitors as industrial waste because they consist of various metals and resin.

The precautions for the use of functional polymer aluminum electrolytic capacitors follow the "Precautionary guidelines for the use of fixed aluminum electrolytic capacitors for electronic equipment", RCR- 2367B issued by EIAJ in March 2002. Please refer to the above guidelines for details.

⚠ Application Guidelines

1. Circuit design

Verify the usage and fitting environments and make sure to observe the rated performance specified in the corresponding catalog or specifications.

1.1 Operating temperature and frequency

Variations in temperature and frequency can affect the electrical characteristics of capacitors. Design circuits allowing for these variations.

- (1) At high temperatures leakage current increases.
- (2) At low temperatures the capacitance decreases and an increase in the tangent of the loss angle and impedance.
- (3) As frequency increases, capacitance decreases and the tangent of the loss angle increases, while the capacitive portion of impedance decreases till the resonant frequency is reached.
- (4) At low frequency there is temperature rise caused by ripple currents accompanying the increase in equivalent series resistance.

1.2 Operating temperature and life expectancy

- (1) The capacitor life is affected by usage temperature.
In general, the capacitor life is approximately doubled when the temperature decreases by 10 °C.
Reduce the usage temperature as much as possible.
- (2) The use of capacitors beyond the guaranteed range may cause rapid deterioration in the characteristics and break down may occur.
The temperature referred to here includes the ambient temperature (within equipment), including heat produced by heat generating devices (power transistors, resistors, etc.), self-heating due to ripple currents, etc. Take these factors into consideration when checking the temperature of capacitors.
Do not place any heat generating devices, etc. on the back of capacitors.
- (3) The life acceleration can be calculated with the following equation:

$$L_2 = L_1 \times 2^{\frac{T_1 - T_2}{10}}$$

L₁: Life at a temperature T₁ °C (h)

L₂: Life at a temperature T₂ °C (h)

T₁: Category upper limit temperature + heat generation due to ripple currents (°C)

T₂: Ambient temperature to calculate the life + heat generation due to ripple currents (°C)

1.3 Common application conditions to avoid

If the loads shown below are applied to a capacitor, then its characteristics may degrade rapidly or it may short-circuit. Rapid heat or gas generation may occur, which leads to the activation of the pressure valve. Electrolytes will then leak from the sealing section. In the worst case, an explosion or ignition may occur.

When the capacitor breaks down, combustible materials (electrolytes, element fixing materials, etc.) may flow externally in all directions.

(1) Polarity

Aluminum electrolytic capacitors have polarities.

Do not apply a reversed or alternating-current voltage.

If the polarity is reversed, then short-circuiting may occur in the initial state or the pressure valve may be activated, leading to capacitor breakdown.

Check the polarity when using a polar capacitor.

If the polarity is unstable or unclear in a circuit, then use bipolar capacitors. However, bipolar capacitors cannot be used in alternating current circuits.

(2) Applied voltage

Do not apply an excessive voltage (voltage exceeding the rating).

The peak direct current voltage superposed with a ripple voltage (alternating current component) must be equal to or less than the rated voltage. A surge voltage exceeding the rated voltage is allowed and specified. However, the allowable conditions are limited and the specifications do not guarantee the application of such a surge voltage for a long time.

(3) Ripple current

Do not allow an excessive current (current exceeding the rated ripple current) to pass.

If an excessive ripple current passes through, then the amount of internally generated heat will grow, the capacitor life will be reduced, or the pressure valve will be activated, leading to breakdown.

Even if the current is equivalent to or less than the allowable level, a reversed voltage may be applied when a direct current bias voltage is low.

Use capacitors so that a reversed voltage is not applied.

- (4) Charging/discharging applications
Do not use general-purpose capacitors in rapid charging/discharging circuits.
Please contact us for capacitors to be used in circuits where rapid charging/discharging is repeated.
- (5) ON-OFF circuit
Do not use capacitors in circuit where ON-OFF switching is repeated more than 10000 times/per day.
In case of applying to the theses ON-OFF circuit, consult with us about circuit condition and so on.
- (6) Series/parallel connection
 - [Parallel connection]
If capacitors are connected in parallel, then the balance of currents between these capacitors may be disrupted and an excessive ripple current may pass through only part of these capacitors.
Wire your circuits such that excessive ripple current does not pass through the capacitors.
 - [Series connection]
If capacitors are connected in series, then the balance of voltages between these capacitors may be disrupted and excessive voltage may be applied. Add a bleeder resistor in parallel with each capacitor. By taking leak currents into consideration the balance of voltages will not be disrupted.
- (7) Electrical isolation of the capacitors
 - Isolate capacitors completely in a circuit in the following cases.**
 - Between the housing and cathode and anode terminals and between circuit traces.
 - Between stand-alone non-connected terminals (for reinforcing) and cathode and anode terminals and between circuit traces.
- (8) Capacitor sleeve
Exterior sleeves or lamination covering capacitors are for indication purposes only and do not guarantee electrical insulation.

1.4 Capacitor mounting considerations

For aluminum electrolytic capacitors, conductive electrolysis whose main solvent is combustible organic solvent and combustible electrolytic paper is used.

If the electrolysis leaks onto a printed circuit board, then it may corrode or short-circuit the traces, leading to smoke or fire. Check the following points when designing products.

- 1) Double-sided circuit board
If capacitors are used in double-sided boards, then do not lay wiring traces immediately below the capacitors.
If the sealed part of a capacitor adheres to the surface of a through-hole printed circuit board, then the solder may be absorbed into the gap during dip soldering and the anode and cathode terminals may be short-circuited.
- 2) Circuit board hole positioning
Solder may protrude from the through-holes or holes for post-mounted component leads and damage the capacitor exterior sleeves. Be mindful of the hole positions.
- 3) Circuit board hole spacing
Make holes for capacitors with a gap equivalent to that of capacitor leads (terminals) during design. Otherwise, there will be stress on the capacitor leads when they are inserted into these holes, leading to current leaks, short-circuiting, or electrolysis leakage.
- 4) Surface-mount types
For surface-mount type capacitors, design land traces with reference to the recommended board land sizes described in the delivery specifications, etc.
- 5) Capacitors equipped with pressure valves
Provide a space above the pressure valve so that it can operate properly.
For capacitors equipped with a pressure valve (as per the shape and dimensional descriptions of each series), provide a space as follows. If the space is smaller than the requirements, then the pressure valve may not operate properly, leading to an explosion.

Product diameter	Space
$\phi 6.3$ to $\phi 16$ mm	2 mm or more
$\phi 18$ to $\phi 35$ mm	3 mm or more
$\phi 40$ mm or more	5 mm or more

- 6) Clearance for seal mounted pressure relief vents
When the pressure valve section of a capacitor faces the printed wiring, provide a degassing hole aligned with the pressure valve position for proper operation of the valve.
- 7) Wiring near the pressure relief vent.
Considerations must be taken in designing circuits so that there are no traces, particularly for high-voltage or large-current wiring, above the pressure valve sections.
When a pressure valve is activated, combustible high-temperature gas exceeding 100°C will be released. Gas may condense or the wiring covers may melt and secondary accidents may occur.
- 8) Circuit board patterns under the capacitor.
If electrolysis leaks, then the circuit traces may short-circuit and tracking or migration may occur.

Design and specifications are each subject to change without notice. Ask factory for the current technical specifications before purchase and/or use.
Should a safety concern arise regarding this product, please be sure to contact us immediately.

2. Mounting

2.1 Considerations before using

- 1) Do not reuse capacitors that have been installed and energized.
- 2) Capacitors may generate transient recovery voltages. In this case, discharge them using a resistor of approx. 1 k Ω .
- 3) Capacitors stored for a long time may have a larger current leak.
In this case, dispose the voltage using a resistor of approx. 1 k Ω .
- 4) Do not drop capacitors onto a floor, etc.
Do not use dropped capacitors because they may be damaged mechanically or electrically.
- 5) Do not use corrupted capacitors.
If a capacitor's seal is deteriorated, then its performance will be degraded, life reduced, and/or the electrolyte will leak.

2.2 Capacitor insertion

- 1) Check the capacitor ratings (capacitance and voltage) before mounting.
- 2) Check the capacitor polarity before mounting.
- 3) Check the capacitor lead and hole intervals and land size before mounting.
If these intervals are different, then stress will be applied to the inside of the capacitor through its leads when they are inserted into the board holes, leading to short-circuiting or other failures.
- 4) When an automatic mounter is used, the force to clinch and fix capacitor leads must not be excessive.
When capacitor leads are clinched and fixed onto a circuit board, the leads may be pulled and a large force applied to the capacitor if there are missing cogs or the gap between the clinching section and the circuit board is too small.
If this is the case, then the capacitor may break down.
For surface-mount type capacitors, if the mounting pressure is excessive, then current leaks may increase, short-circuiting may occur, or the capacitor may break down and come off.
- 5) Self-standing capacitors must be mounted so that they come in contact with the circuit board (do not leave it lifted).

2.3 Manual soldering

- 1) Solder capacitors under the soldering conditions (temperature and time) as described in the specifications or at 350 °C for three seconds or less.
- 2) If the capacitor lead terminals must be pre-processed in order to align the gaps between the terminals and holes, place them before soldering to prevent stress from being applied to the capacitor body.
- 3) If it is necessary to manually remove soldered capacitors, repair them after the solder has sufficiently melted to prevent stress from being applied to the capacitor terminals.
- 4) Do not touch the capacitor body with the soldering iron tip. Otherwise, a hole may occur on the capacitor exterior sleeve. The sleeve may break or become damaged.

2.4 Flow soldering

- 1) Do not immerse the capacitor body in a solder bath. The capacitor's inner pressure could increase and the capacitor will break down.
- 2) Solder capacitors under the soldering conditions (temperature and time) described in the specifications.
- 3) When soldering, do not allow other components to fall or touch the capacitors.
When soldering, if resistors, ceramic capacitors, or other components (with a high heat conductance) fall and their lead terminals or metallic sections touch the capacitor, then local thermal stress can occur causing the capacitor's exterior sleeve to break down. This phenomenon is identical to short-circuiting.
- 4) Prevent flux from adhering to anything other than the terminals.

2.5 Reflow soldering for chip capacitors

- 1) Surface-mount type capacitors are exclusively for reflow soldering. When reflow solder is used an ambient heat condition system such as the simultaneous use of infrared and hot-air is recommended.
* This system cannot be used for flow or dip soldering.
- 2) Soldering capacitors under the soldering conditions (pre-heating, soldering temperature and time) described in the specifications.
- 3) Reflow-solder only once.
If you need to apply reflow soldering twice, then make sure to contact us.
- 4) Do not reuse the installed surface-mount type capacitors.
- 5) The crack on top marking might be occurred by reflow heat stress.
But please acknowledge that it does not influence the reliability of the product.
- 6) VPS (Vapor Phase Soldering) reflow can cause significant characteristics change and/ or mounting failure due to deformation by acute temperature rise. VPS is acceptable provided that the process does not exceed recommended reflow profile and temperature rise is less than 3degC/sec. Please contact Panasonic for detailed conditions.

2.6 Other soldering considerations

If the chip capacitor temperature becomes very high due to pre-heating or hardening of the fixing resin, then the capacitor exterior sleeve may shrink or crack. If capacitors are passed through a heat-curing furnace, then the ambient temperature must be 150°C or less and the duration must be two minutes or less.

2.7 Capacitor handling after soldering

- 1) Do not tilt, bring down, or twist the capacitors soldered to the printed circuit board; otherwise a torque will be generated with the capacitor circumference as the fulcrum. As a result, a large force will be applied to the inside of the element through the terminals and the capacitor may break down.
- 2) Do not hold the capacitors soldered to the printed circuit board to carry the board; otherwise the board's entire weight will be applied to the inside of the element through the terminals and the capacitor may break down.
- 3) Do not hit the capacitors soldered to the printed circuit board with foreign objects. When stacking printed circuit boards, do not hit the capacitors with circuit boards or other components (terminals, etc.)

2.8 Circuit board cleaning

- 1) Apply the following conditions to flux cleaning after soldering
Temperature: 60°C or less, duration: Five minutes or less (Ultrasonic waves may be used.)
However, rinse sufficiently and dry the boards (at 100°C for 20 minutes or less).

Remarks

- 1 : If you wish to use solvents other than the above or Deionized water, please contact us.
- 2 : Please do not use ozone-depleting chemicals in order to protect the environment.
- 3 : Depending on the cleaning method, the marking on a capacitor may be erased or blurred.

- 2) **Avoid using the following solvent groups unless specifically allowed for in the specification**

Halogen solvents: Corrode the inside capacitors.

The solvent may enter (diffuse) inside the capacitor, decompose and cause a reaction. Then, the released chlorine ions may react with the aluminum and corrode it.

For capacitors for which we guarantee cleaning, use solvents under the cleaning conditions (temperature, time, etc.) described in the specifications.

Alkaline solvents: Corrode (melt) aluminum housings.

Petroleum solvents: Deteriorate sealing rubber.

Xylene solvents: Deteriorate sealing rubber.

Acetone: Erases indications.

- 3) Be sure to dry the printed circuit boards immediately after cleaning so that the solvent does not remain between the capacitor's sealed section and the circuit board.
- 4) Manage the contamination of solvents (conductance, PH, specific gravity, amount of water, etc.)
If the solvent is contaminated, then the chlorine concentration will become high and the inside capacitor may be corroded. Control the flux concentration against the solvent to 2 %wt or less.

2.9 Mounting adhesives and coating agents

- 1) If bond or coating agents are used to fix capacitors or prevent moisture, then solvents contained in these materials may corrode the capacitors. Select solvents other than halogen compounds. Do not use chloroprene-derived polymers.
- 2) If fixing or coating agents are used for capacitors, then check the following points.
 1. Do not allow flux residue or contaminants to remain between the capacitor's sealed section and the circuit board.
 2. Harden and dry bond or coating agents so that the solvents do not remain. Do not completely block the sealed section of a capacitor. (At least 1/3 of the sealed section must be exposed.)

2.10 Fumigation process

When electronic equipment incorporating aluminum electrolytic capacitors is exported, wooden packing materials may be fumigated using halogen compounds such as bromomethane. If drying after the fumigation process is insufficient, halogen remaining in the packing materials may be released, enter and corrode the capacitors.

If the fumigation process is carried out, then check carefully for remaining halogen after processing and drying.

Make sure not to apply the fumigation process to completely packed electronic equipment.

3. Precautions for Usage

- 1) This product is intended to be used for electronic equipment for general-purpose standard applications and not designed for usage in the following special environments. Therefore, when this capacitor is used in the following special environments or under special conditions, the performance may be affected. Verify the performance and reliability of the capacitor in your company before use.
 - (1) Capacitors are directly exposed to water, salt water, or oil.
 - (2) Capacitors are exposed to direct sunlight.
 - (3) Capacitors are exposed to high temperature and humidity conditions and the capacitor surface condenses.
 - (4) Capacitors are exposed to various active gases.
 - (5) Acidic or alkaline environments
 - (6) Capacitors are exposed to high-frequency induction.
 - (7) Capacitors are exposed to excessive vibrations or shocks.
- 2) A low-molecular-weight-shiroxane which is included in a silicon material shall causes abnormal electrical characteristics.
- 3) Do not touch the capacitor terminals directly.
If you touch the capacitor terminals, you will receive an electric shock. Do not touch the exposed aluminum sections of a capacitor, such as the pressure valve sections because they are not insulated.
- 4) Do not short-circuit the capacitor terminals.
Do not spill conductive solutions such as acidic or alkaline solutions on the capacitors. Otherwise, short-circuiting will occur. The circuit will malfunction and the capacitors break down.

4. Precautions for checks and maintenance

- 1) Periodically check the capacitors used in industrial equipment. When checking and maintaining capacitors, turn off the equipment and discharge the capacitors beforehand. In this case, do not apply stress to the capacitor lead terminals, etc.
- 2) Periodically check the following items.
 1. Significant appearance abnormalities (deformation, electrolysis leakage, etc.)
 2. Electrical characteristics (described in the corresponding catalog or delivery specifications)If any abnormalities are found, then replace the capacitors or take appropriate actions.

5. Emergency procedures

- 1) Capacitors of a certain size or larger are equipped with a pressure valve to release excessive pressure. If the capacitor pressure valve is activated and gas becomes visible when using equipment, then turn off the equipment or unplug it. If the power is not turned off, then the short-circuited capacitors may damage the circuit or the gas may become liquefied and cause a short-circuit. In the worst case, secondary disasters such as equipment damage may occur.

Gases released from the capacitor's pressure valve is not fume but liquefied electrolysis.
- 2) When a pressure valve is activated, a high-temperature gas exceeding 100 °C will be released. Do not place your face close to the capacitor.

If the gas gets into your eyes or you inhale it, then immediately wash your eyes with water or gargle. If the gas comes in contact with your skin, then wash it with soap.

6. Long Term Storage

- 1) Leakage current of a capacitor increases with long storage times. The aluminum oxide film deteriorates as a function of temperature and time.

If used without reconditioning, an abnormally high current will be required to restore the oxide film.
This surge current could cause the circuit or the capacitor to fail.
Storage period is one year. When storage period is over 12 months, a capacitor should be reconditioned by applying the rated voltage in series with a 1000 Ω current limiting resistor for a time period of 30 minutes.
For storage condition, keep room temperature (5 °C to 35 °C) and humidity (45% to 85%) where direct sunshine doesn't reach.
- 2) Environmental Conditions
 1. Exposure to temperatures above the upper category or below the lower category temperature of the capacitor.
 2. Direct contact with water, salt water, or oil
 3. High humidity conditions where water could condense on the capacitor.
 4. Exposure to toxic gases such as hydrogen sulfide, sulfuric acid, nitric acid, chlorine, Chlorine compound, Bromine, Bromine compound or ammonia.
 5. Exposure to ozone, radiation, or ultraviolet rays.
 6. Vibration and shock conditions exceeding specified requirements.

7. Discarding

- When discarding capacitors, use either of the following procedures.
- Make holes on the capacitor or break it up completely.
Then burn it at a temperature of 800°C or higher.
If capacitors are burnt as is, then they may explode.
 - If you do not burn them, then ask professional waste disposer.

The precautions in using aluminum electrolytic capacitors follow the Precautionary Guidelines for the Use of Fixed Aluminum Electrolytic Capacitors for Electronic equipment, RCR-2367B issued by EIAJ in March 2002. Please refer to the above guidelines for details.

⚠ Application Guidelines

1. Circuit design

1.1 Product Life

Electric Double-Layer Capacitors (Gold Capacitors, hereafter referred to as capacitors) have a limited life.

The life of an electric double layer capacitor is limited. Its capacitance will decrease and its internal resistance will increase over time.

The life of a capacitor greatly depends on the ambient temperature, humidity, applied voltage and discharging currents. Capacitor life can be extended when these parameters are set well below the ratings.

The guaranteed durability of electric double-layer capacitors is between 1000 hours at 70 °C and 2000 hours at 85 °C, depending on product series. Generally, it is 1000 hours at 70 °C. The life of the capacitor is guaranteed to be 16000 hours at a normal temperature (30 °C) by applying the acceleration double for every 10 °C. Please choose the product that is suitable for the reliability that you need.

If your application incorporates this capacitor over a long period of time, then check it periodically and replace it when necessary.

1.2 Polarity and voltage

Capacitors have polarities.

Do not apply a reverse or AC voltage. If a reversed voltage is applied to a capacitor for a long period of time, then its life will be reduced and critical failures such as electrolyte leakage might occur.

Do not apply an over-voltage (a voltage exceeding the rated voltage).

If voltage exceeding the rating is applied to the capacitor for a long time, then its life will be reduced and critical failures such as electrolyte leakage or physical damage due to gas generated by electrochemical reaction or explosion might occur.

1.3 Circuits through which ripple currents pass

When using a capacitor in a circuit through which ripple currents pass, please note following matters.

- (1) The internal resistance of electric double-layer capacitors is higher than that of electrolytic capacitors. Electric double-layer capacitors may generate heat due to ripple currents.
- (2) Please do not exceed the maximum operating voltage when the voltage changes from ripple.
- (3) Because internal resistance is high, the gold capacitor is not basically suitable for the absorption of ripple current.

1.4 Ambient temperature and product life

Capacitor life is affected by usage temperatures. Generally speaking, capacitor life is approximately doubled when the temperature is decreased by 10 °C. Therefore, lower the usage temperature as much as possible. Using capacitors beyond the guaranteed range might cause rapid deterioration of their characteristics and cause them to break down. The temperature referred to here includes the ambient temperature within the equipment, the heat produced by heat generating devices (power transistor, resistors, etc.), self-heating due to ripple currents, etc. Take all of these factors into consideration when checking the capacitor's temperature.

Do not place any heat generating devices on the back of the capacitors. Life acceleration can be calculated with the following equation :

$$L_2 = L_1 \times 2^{\left(\frac{T_1 - T_2}{10}\right)}$$

L₁ : Life at temperature T₁ °C (h)

L₂ : Life at temperature T₂ °C (h)

T₁ : Category s upper limit temperature

T₂ : Ambient temperature to calculate the life + heat generation due to ripple current (°C)

- * Humidity also affects the capacitor's life. When using capacitors outside the following conditions, please contact us.
A temperature at +55 °C and a relative humidity of 90 % to 95% for 500 hours.

1.5 Voltage drop

Pay particular attention to the instantaneous working current and the voltage drop due to the capacitor's internal resistance when used in backup mode. The discharging current level is different depending on the capacitor's internal resistance. Use a capacitor with a discharging current below what is specified by the corresponding capacitor.

Series	Max. Discharging Current				
	0.047 F or less	0.1 to 0.33 F	0.47 to 1.5 F	3.3 to 4.7 F	10 to 50 F
SG/SD/SE/NF/F	200 μA	300 μA	1 mA	—	—
RF	—	3 mA	20 mA	—	—
RG	—	1 mA	20 mA	—	—
HZ/HW	—	—	—	300 mA	1 A

1.6 Series connection

When connecting capacitors in series, add a bleeder resistor in parallel with each capacitor by taking the leakage current into consideration so that the balance of voltages is not disrupted.

1.7 Electrolyte is used in the products

Electrolyte is used in the capacitors. Therefore, misuse can result in rapid deterioration of characteristics and functions of each product. Electrolyte leakage will damage printed circuit boards and can affect their performance, characteristics, and functions.

1.8 External sleeve

The external sleeve is not electrical insulation, and thus capacitors should not be used in an environment that requires electrical insulation. The sleeve is covered only for showing ratings.

2. Mounting

2.1 Heat stress at the soldering

When soldering a capacitor to a printed circuit board, excessive heat stress could cause the deterioration of the capacitor's electrical characteristics. For example the integrity of the seal can be compromised causing the electrolyte to leak, and short circuits could occur in addition to and failure of the appearance.

Please observe the following guidelines.

(1) Manual soldering

Do not touch the capacitor body with a soldering iron. Solder the capacitor using a soldering tip temperature of 350 °C or less for 4 seconds or less. Solder a the capacitor three times or less at intervals of 15 seconds or more.

(2) Flow soldering

- 1) Do not dip the body of the products into a soldering bath.
- 2) Keep the product's surface temperature at or below 100 °C for no more than 60 seconds (the peak 105 °C) when soldering. Please refer to the chart at right to set soldering temperature and time. It is recommended to check the product temperature before you use.
- 3) The terminals of the NF/F/RF type are designed so the bottom of the product floats from the PWB. This is to protect against heat stress during soldering. Do not touch the bottom of the product directly to the PWB.

(3) Other heat stress

- 1) Keep the product's surface temperature at or below 100 °C for no more than 60 seconds (the peak 105 °C) when applying heat to bake the PWB or fixing resin, etc. The capacitor voltage must be 0.3 V or less.

- 2) Do not use a product more than once after it has been mounted on the PWB. Excessive heat stress is applied when detaching it from the PWB. Please observe "(1)Manual soldering" when you adjusting it.
- 3) Be sure that excessive heat stress is not applied to the Gold capacitor when other parts in its surroundings of the Gold capacitor are detached or adjusted.

(4) Others

- 1) The lead wires and terminals are plated for solderability. Rasping or filing lead wires or terminals might damage the plating layer and degrade the solderability.
- 2) Do not apply a large mechanical force to the lead wires or terminals. Otherwise, they may break or come off or the capacitor characteristics may be damaged.
- 3) There is a possibility that the sealing performance of the product is deteriorated if a coating material that contains an organic solvent is used.

2.2 Circuit Design

Do not set wiring pattern directly under the mounted capacitor, and pass between terminals. If the electrolyte leaks, short circuit might occur and tracking or migrations are anticipated. If a capacitor is directly touching a PWB, then the bottom of the capacitor and the circuit pattern may short-circuit. On PWBs, blowing flux or solder may cause the capacitor's external sleeve to break or shrink, potentially affecting the internal structure. In addition, please refer to application guidelines for the aluminum electrolytic capacitor.

2.3 Residual voltage

Gold Capacitors can hold a large charge and could have residual voltage. Therefore, some electronic components with a low withstand voltage, such as semi-conductors, might be damaged.

2.4 Circuit board cleaning

Apply the following conditions for flux cleaning after soldering. (Excepted for NF,F and RF series)

Temperature : 60 °C or less

Duraiton : 5 minutes or less

Rinse sufficiently and dry the boards.

[Recommended cleaning solvents include]

Pine Alpha ST-100s, Sunelec B-12, DK be-clear CW-5790, Aqua Cleaner 210SEP, Cold Cleaner P3-375, Cclear-th-ru 750H, Clean-thru 750L, Clean-thru 710M, Techno Cleaner219, Techno Care FRW-17, Techno Care FRW-1, Techno Care FRV1

- Consult with us if you are using a solvent other than any of those listed above or Deionized water.
- The uses of ozone depleting cleaning agents is not recommended in the interest protecting the environment.

3. Precautions for using equipment

Avoid using mounting equipment in environments where :

- (1) Capacitors are exposed to water, salt water or oil.
- (2) Capacitors are exposed to direct sunlight.
- (3) Capacitors are exposed to high temperature and humidity where water can condense on the capacitor surface.
- (4) Capacitors are subject to various active gases.
- (5) Capacitors are exposed to acidic or alkaline environments.
- (6) Capacitors are subject to high-frequency induction.
- (7) Capacitors are subject to excessive vibrations or mechanical impact.

A brown excretion might be caused around the sealing, depending on the conditions of use. This excretion is insulation and does not. have influence on the electrical characteristics.

4. Maintenance Precautions

Periodically check capacitors used in industrial equipment. When checking and maintaining capacitors, turn off the equipment and discharge the capacitors beforehand. Do not apply stress to the capacitor lead terminals.

Periodically check the following items.

- 1) Significant appearance abnormalities (deformation, electrolyte leakage, etc.)
- 2) Electrical characteristics (described in the catalog or delivery specifications)

If any abnormalities are found, then replace the capacitors or take appropriate actions.

5. Emergency procedures

If the capacitors generate heat, then smoke may come out of the exterior resin. Under these conditions turn off the equipment immediately and stop using it.

Do not place your face or hands close to the capacitor, burns might be caused.

6. Storage

Do not store capacitors in a high-temperature or high-humidity environment. Store capacitors at a room temperature of 5 to 35 °C and a relative humidity of 85 % or less. (Recommended storage term: 1year or less.) Store capacitors in their packaging as long as possible. Avoid storing capacitors under the following conditions.

- (1) Exposed to water, high temperatures or humidity, or when condensation can occurs.
- (2) Exposed to oil or in environments filled with gaseous oil contents.
- (3) Exposed to salt water or environments filled with saline substances.
- (4) In environments filled with harmful gases
(hydrogen disulfide, sulfurous acid, nitrous acid, chlorine, bromine, bromomethane, etc.)
- (5) In environments filled with harmful alkaline gases such as ammonia.
- (6) Exposed to acid or alkaline solvents.
- (7) Exposed to direct sunlight, ozone, ultraviolet or radial rays.
- (8) Exposed to vibration or mechanical impact.

7. Discarding

Dispose of capacitors as industrial waste. They are comprised of various metals and resin.

The precautions for the use of Electric Double Layer Capacitors (Gold Capacitors) follow the "Precautionary guidelines for the use of fixed Electric Double Layer Capacitors for electronic equipment", RCR-2370C issued by EIAJ in July 2008. Please refer to the above guidelines for details.
