

XMC4300 Relax EtherCAT[®] Kit

For XMC4000 family

About this document

Scope and purpose

This document provides a hardware description of the XMC4300 Relax EtherCAT[®] Kit including schematics and list of material. For fast software development you can find the mapping of XMC4300 functions to the on-board components in various tables.

Intended audience

This document is intended for anyone who wants to develop software on the XMC4300 Relax EtherCAT[®] Kit or wants to use this kit for evaluating and demonstrating the capabilities of the XMC4300 microcontroller.

1 Introduction

This document describes the features and hardware details of the XMC4300 Relax EtherCAT® Kit equipped with an ARM® Cortex®-M4 based XMC™ microcontroller from Infineon Technologies AG.

It can be used with a wide range of development tools including Infineon's free of charge Eclipse based IDE DAVE™. The XMC4300 Relax EtherCAT® Kit is designed to evaluate the capabilities of the XMC4300 microcontroller especially in EtherCAT® slave applications. Table 1 shows the kit specification.

Table 1 Kit specification

Processor	Infineon's ARM® Cortex®-M4 XMC4300 microcontroller running at 144 MHz in LQFP100 package (order number XMC4300-F100K256)
Flash memory	256 kB
Data memory	128 kB
Dimensions	75 x 138 mm (91 x 144mm with connectors incl. Phy-2-Phy)

(table continues...)

Power	<ul style="list-style-type: none"> Via USB connector (Micro-AB USB) or Via On-Board Debugger (Micro-AB USB)
Connectors	<ul style="list-style-type: none"> EtherCAT® Slave IN and OUT interface via RJ45 jack mikroBUS™ socket (2x8-pin) Arduino compatible connectors (1x10-pin, 2x8-pin, 1x6pin, 2x3pin) USB connector (Micro-AB USB) CAN connector (D-Sub DE-9) EtherCAT® Phy-2-Phy connector (not assembled) Serial Wire Debug interface (2x5, 50 mil pitch) to XMC™ (not assembled) (on board debugger can be overridden by externally connected debugger)
Debugger	On-Board J-Link debug probe via USB supporting <ul style="list-style-type: none"> Serial Wire Debug (SWD) UART-to-USB bridge (virtual COM)
Others	<ul style="list-style-type: none"> On-board debug probe, based on XMC4200 microcontroller 2x EtherCAT® Phys CAN transceiver 2 user push-buttons, 2 user LED Reset push-button

1.1 Key features

The XMC4300 Relax EtherCAT® Kit has the following key features and components:

- XMC4300 microcontroller (ARM® Cortex®-M4 based), 144 MHz, 256 kB Flash, 128 kB SRAM, LQFP100 package
- On-board debug probe with USB interface supporting SWD + SWO
- Virtual COM port via on-board debug probe
- EtherCAT® slave components: 2 EtherCAT® phys and 2 RJ45 jacks
- Prepared for EtherCAT® Phy-2-Phy connection for backplane applications (assembly option)
- Arduino compatible connector and voltage level shifter for 3.3 V / 5 V Arduino shields
- mikroBUS™ socket for plug-and-play click boards™
- CAN transceiver and CAN connector (D-Sub DE-9)
- USB interface (Micro-AB USB plug)
- Voltage regulator 5 V -> 3.3
- 2 x User push-buttons
- 2 x User LED
- Reset push-button
- 12 MHz crystal
- 32.768 kHz RTC crystal

2 Hardware description

1.2 Block diagram

The block diagram in [Figure 1](#) shows the main components of the XMC4300 Relax EtherCAT® Kit and their interconnections.

There are following main building blocks:

- XMC4300 microcontroller in a LQFP100 package
- On-board USB debug probe based on XMC4200 for SWD, SWV and Virtual COM port support
- 2 EtherCAT® Phy with 2 RJ45 plugs
- Connection Header for Arduino
- mikroBUS™ socket
- 2 User push-buttons, 2 User LEDs, Reset push-button
- Micro-AB USB Plug
- CAN transceiver

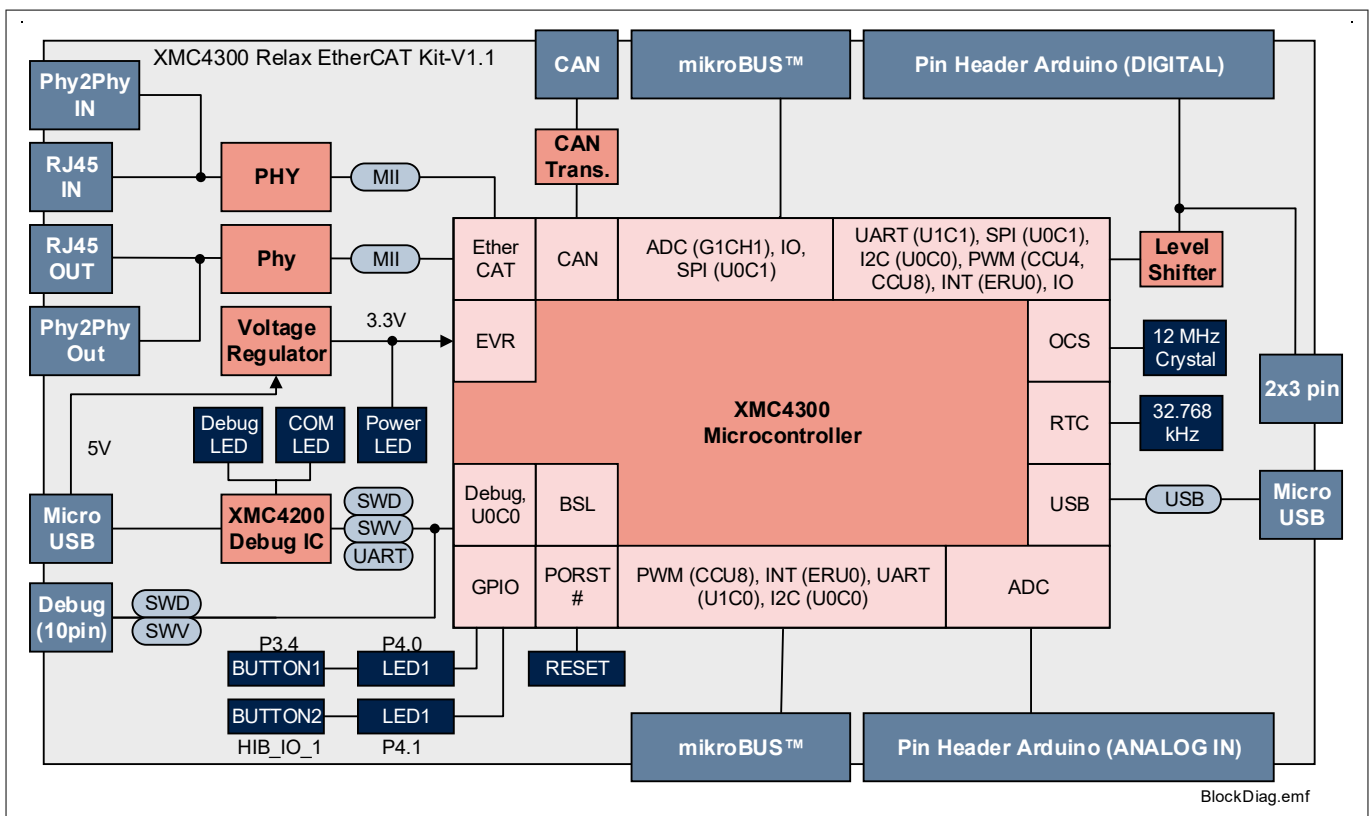

Figure 1 Block diagram of the XMC4300 Relax EtherCAT® Kit

2 Hardware description

The following chapters provide a detailed description of the hardware and how it can be used. The hardware is depicted in [Figure 2](#).

2 Hardware description

Figure 2 PCB of the XMC4300 Relax EtherCAT® kits

2.1 Power supply

The XMC4300 Relax EtherCAT® Kit must be supplied by an external 5 volt DC power supply connected to any of the micro USB plugs (X100, X101). Out of the box with the pre-programmed EtherCAT® slave application and the on-board debug probe in operation, the XMC4300 Relax EtherCAT® Kit typically draws about 440 mA in an EtherCAT® environment. This current can be delivered via the USB plug of a PC, which is specified to deliver up to 500 mA. The green Power LED (VDD3.3) indicates the presence of the generated 3.3 V supply voltage.

On-board reverse current protection diodes will ensure safe operation when power is provided through both USB plugs at the same time. These protection diodes allows to use the on-board debug probe connected with a PC/Notebook via X101 and a second host PC/Laptop connected with the XMC4300 Relax EtherCAT® Kit via X100.

If the board is powered via a USB plug, it is not recommended to apply an additional 5 Volt power supply to one of the 5 Volt power pins (VDD5, 5 V) on the Arduino headers or mikroBUS™ socket, because there is no protection against reverse current into the external power supply. These power pins can be used to power an external circuit, but care must be taken not to draw more current than USB can deliver. A PC acting as a USB host can typically deliver up to 500 mA current. If higher currents are required and in order to avoid damage to the USB

2 Hardware description

host, the use of an external USB power supply which is able to deliver higher currents than 500 mA is strongly recommended.

After power-up the green DEBUG LED starts blinking. When there is a connection to a PC via the Debug USB plug X101 and the USB Debug Device drivers are installed on this PC, the DEBUG LED will turn from blinking to constant illumination.

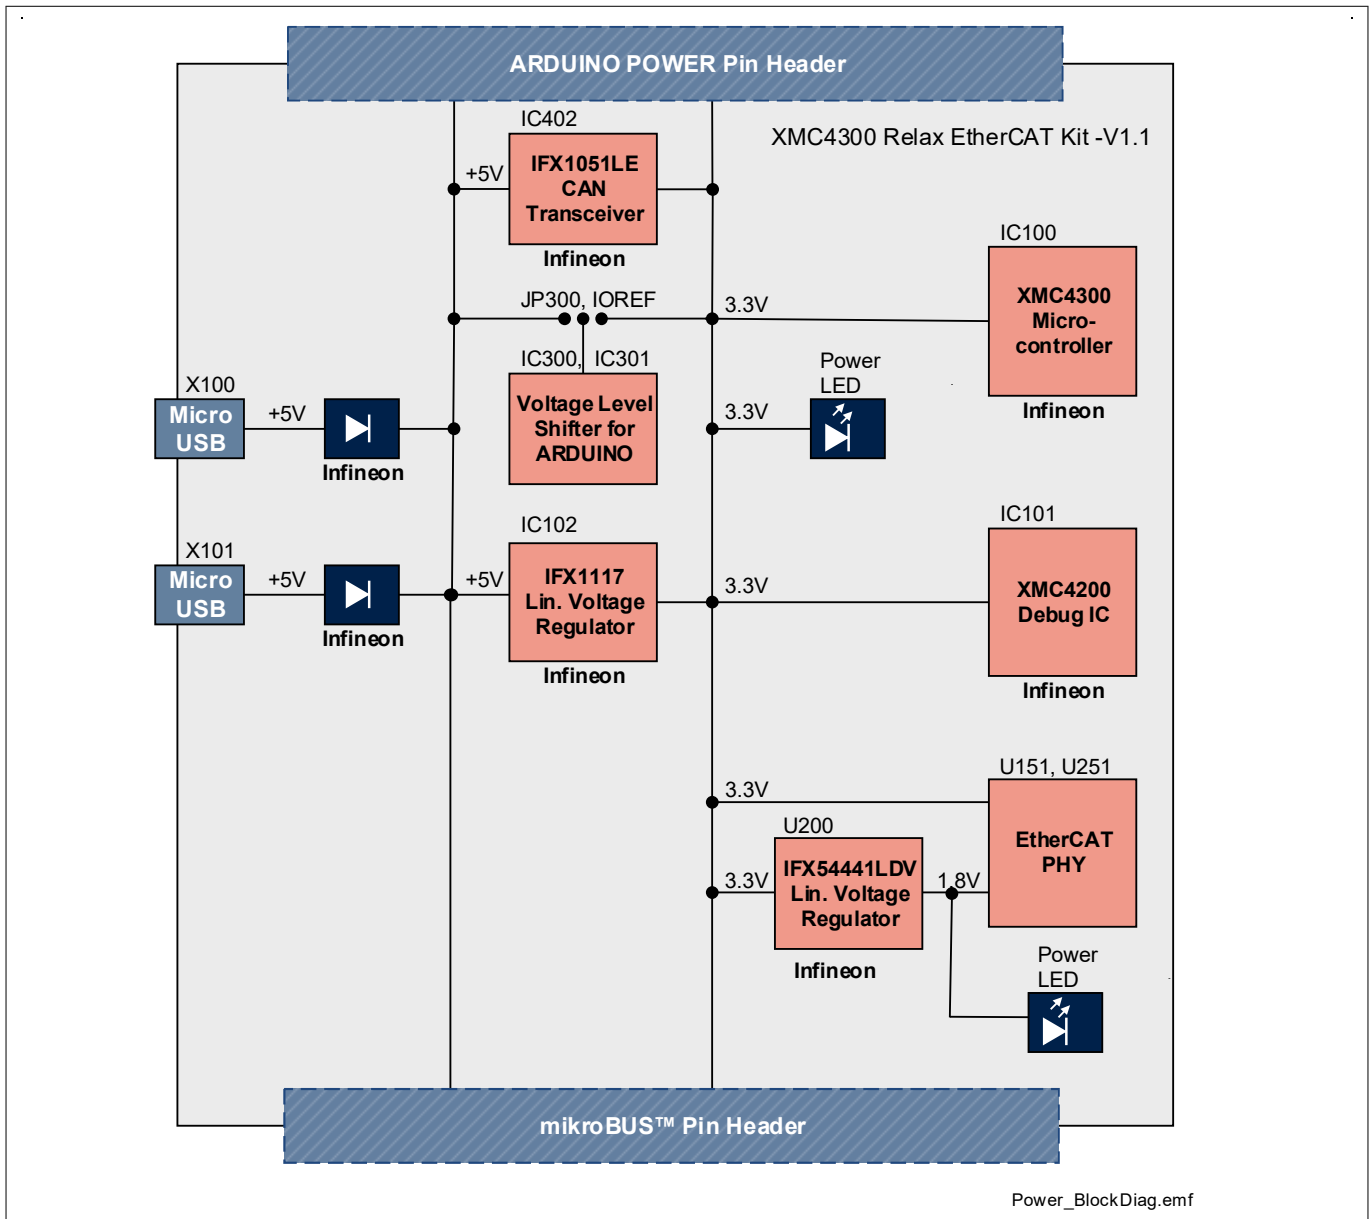

Figure 3 Power supply concept

2.2 Arduino compatible connector

The mapping of GPIOs and XMC™ pin functions to Arduino compatible functions can be found in [Figure 4](#). The Arduino compatible connector supports

- SPI interface (SPI_XXX)
- I2C interface (I2C_XXX)
- UART interface (UART_XXX)
- PWM signal outputs (PWM0-5)

2 Hardware description

- ADC input (ADC0-5)
- Interrupt input (INT0-1)
- Reset

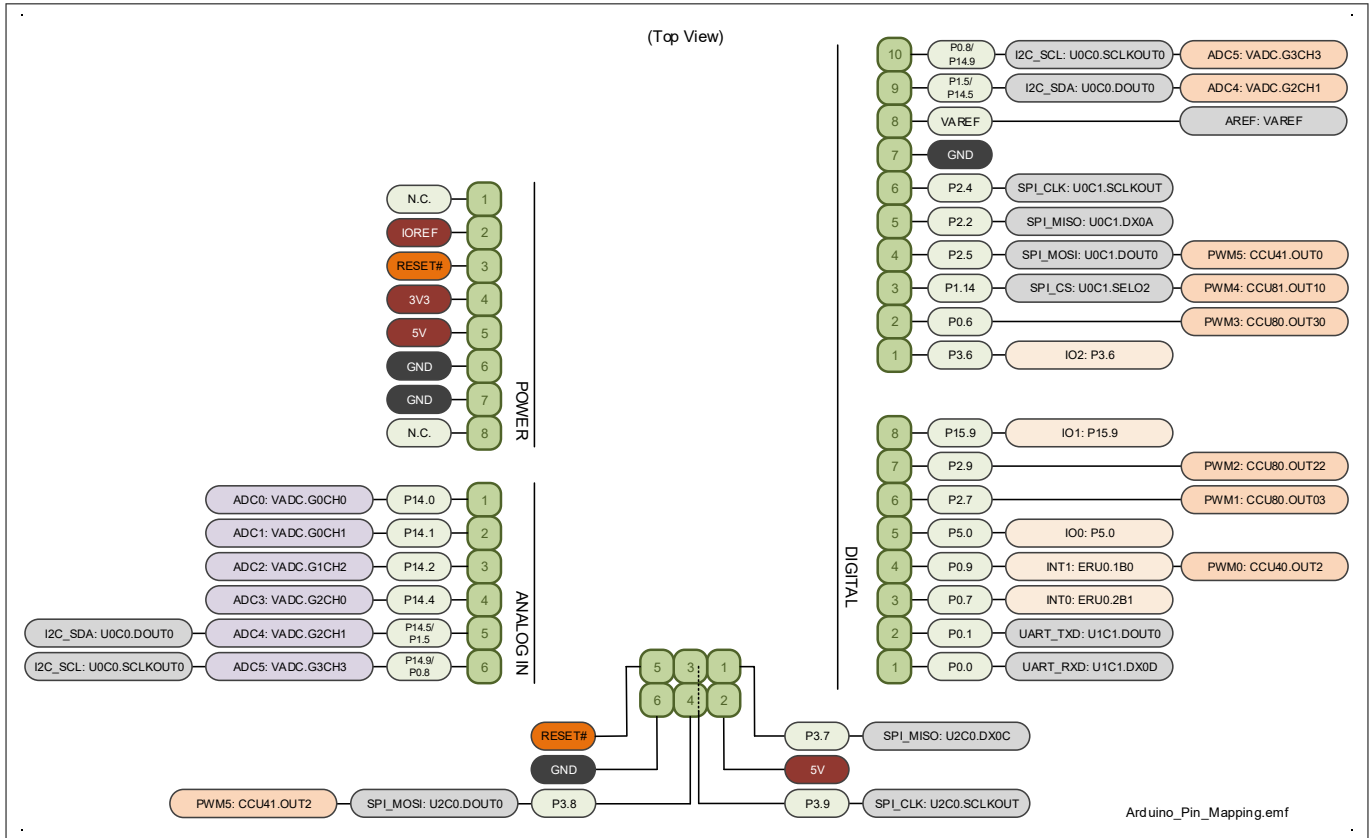

Figure 4 Mapping of Arduino™ functions to XMC™ pin functions

The XMC4300 Relax EtherCAT® Kit features a bi-directional voltage level shifter and therefore supports 5 V Arduino shields as well as 3.3 V Arduino shields. Jumper JP300 (IOREF) determines whether the Arduino shield is driven with 5 V or 3.3 V.

The analog input signals (ADC0-5) are limited to 3.3 V input voltage. A serial 100 Ohm resistor protects the analog input pin against overcurrent.

Primarily, ADC0 to ADC3 should be used as analog inputs, because there is no additional circuit connected to these pins, whereas ADC4 and ADC5 have additional circuitry and require an input signal with low input impedance (<500 Ohm).

Note: Parallel operation of I2C and ADC4/ADC5 is not possible, because they share the same Arduino pins.

2.3 mikroBUS™ socket

The mapping of GPIOs and XMC™ pin functions to mikroBUS™ functions can be found in [Table 5](#). The mikroBUS™ connector supports

- SPI interface with one chip select (SPI_XXX)
- I2C interface (I2C_XXX)
- UART interface (UART_XXX)
- PWM signal output (PWM)
- ADC input (ADC)

2 Hardware description

- Interrupt input (INT)
- Reset (RST)

Attention: *Jumper JP300 (IOREF) must be set to 3.3 V (VDD3.3) when using click™ boards. 5 V click™ boards cannot be used with the XMC4300 Relax EtherCAT® Kit.*

Note: *The mikroBUS™ UART and debugger’s UART shares the same USIC channel (U1C0) of the XMC4300 device, but do not share the same pins. Parallel operation by time multiplexing is possible.*

Figure 5 Mapping of Arduino™ functions to XMC™ pin functions

2.4 User push buttons and user LEDs

The XMC4300 Relax EtherCAT® Kit provides two push buttons and two LEDs. The port pins used can be found in [Table 2](#) and [Table 3](#). These pins are used exclusively for this function and they are not mapped to other devices or connectors.

Table 2 XMC4300 pin mapping for user LEDs

LED	XMC™ pin
LED1	P4.0
LED2	P4.1

Table 3 XMC4300 pin mapping for user push buttons

Button	XMC™ pin
BUTTON1	P3.4
BUTTON2	HIB_IO_1

2 Hardware description

2.5 Debugging and UART-to-USB communication

The XMC4300 Relax EtherCAT® Kit supports debugging via 2 different channels:

- On-board debug probe
- 10-pin Cortex® Debug connector (not assembled)

2.5.1 On-board debug probe

The on-board debug probe supports Serial Wire Debug (SWD) and UART communication. Both require the installation of Segger's J-Link Driver which is part of the DAVE™ installation. DAVE™ is a highly efficient development platform for the XMC® microcontroller families to simplify and shorten software development. It can be downloaded at <http://www.infineon.com/dave>. The latest Segger J-Link Driver can be downloaded at <http://www.segger.com/jlink-software.html>. Table 4 shows the pin assignment of the XMC4300 used for debugging and UART communication.

Table 4 XMC4300 pins mapping for debugging and UART-communication

Pin function	Input/Output	XMC™ Pin
Data pin for debugging via SWD	I/O	TMS
Clock pin for debugging via SWD	O	TCK
Transmit pin for UART communication (PC_RXD)	O	P0.5 (U1C0.DOUT0)
Receive pin for UART communication (PC_TXD)	I	P0.4 (U1C0.DX0A)

2.5.2 Cortex® debug connector (10-pin)

The 10-pin Cortex® debug connector supports Serial Wire Debug (SWD) and Serial Wire Viewer (SWV). The pin assignment of the Cortex® debug connector is shown in Table 5.

Table 5 Pin assignment of the Cortex® Debug Connector (X102)

Pin No.	Signal name	Description
1	VCC	+3.3 V
2	TMS	Serial Wire Data I/O
3	GND	Ground
4	TCK	Serial Wire Clock
5	GND	Ground
6	SWV	Serial Wire Viewer (Trace Data Out
7	Key	Key
8	NC	Not connected
9	GND_Detect	Ground detect
10	RESET	Reset (active low)

2 Hardware description

2.6 Reset

The reset pin (PORST#) of the XMC4300 is a bi-directional pin in open drain mode. An internal pull-up resistor keeps the PORST# pin high during normal operation. A low level at this pin will force a hardware reset. In case of a MCU internal reset the PORST# pin will drive a low signal.

A reset signal can be issued by

- the on-board Reset Button (SW102, “RESET”)
- the on-board debug probe (IC101.46)
- the external debugger connected to the 10-pin Cortex® debug probe connector (X102)
- the Arduino Power Header (RESET)
- the mikroBUS™ socket (RST)

An XMC™ internal circuit always ensures a safe Power-on-Reset. The XMC™ does not require any additional external components to generate a reset signal during power-up.

2.7 CAN transceiver

The XMC4300 Relax EtherCAT® Kit provides a CAN interface via a D-Sub DE-9 connector. Infineon’s high speed CAN transceiver {IFX1051LE) for industrial applications supports 3.3V I/O logic and is suitable for 12 V and 24 V bus systems with an excellent EMC performance. The CAN bus (signals CANH, CANL) are terminated by a 120 Ohm resistor.

Table 6 CAN signals and XMC4300 pin mapping

Signal name	Pin no. at D-Sub DE-9 (X400)	XMC™ Pin, XMC™ function
CANH	X400.7	-
CANL	X400.2	-
CAN_TX	-	P2.0, CAN.N0_TXD
CAN_RX	-	P14.3, CAN.N0_RXDB
GND	X400.3, X400.6	-
VDD5	X400.9 (needs to be connected)	-

2.8 Phy-2-Phy EtherCAT® connection

For backplane/mid-plane oriented EtherCAT® applications, communication can be implemented without using isolation transformers. Instead, low-cost ceramic capacitors can be used. The PCB layout of the XMC4300 Relax EtherCAT® Kit has been prepared for EtherCAT® operation through direct Phy-2-Phy connection.

For this purpose two XMC4300 Relax EtherCAT® kits are required and some modifications must be made to the kits (see [Figure 6](#)). All components required for this modification can be found attached to the kit.

- Remove four 0 Ohm resistors from each XMC4300 Relax EtherCAT® Kit
- Solder two 0 Ohm resistors onto each XMC4300 Relax EtherCAT® Kit
- Solder the connectors onto the XMC4300 Relax EtherCAT® Kits

Note: After this modification EtherCAT® communication through the RJ45 is disabled.

3 Production data
