# **WDELPHI SERIES**

## Delphi Series E48SC, Eighth Brick Family DC/DC Power Modules: 48V in, 3.3V/20A out

The Delphi Series E48SC, Eighth Brick, 48V input, single output, isolated DC/DC converter is the latest offering from a world leader in power systems technology and manufacturing -- Delta Electronics, Inc. This product family provides up to 85 watts, improved and very cost effective power solution of either 3.3V or 5V in an industry standard footprint and pinout. With creative design technology and optimization of component placement, these converters possess outstanding electrical and thermal performances, as well as extremely high reliability under highly stressful operating conditions. All models are fully protected from abnormal input/output voltage, current, and temperature conditions. The Delphi Series converters meet all safety requirements with basic insulation.

#### **FEATURES**

- High efficiency: 91% @ 3.3V/20A
- Size: 58.4mmx22.8mmx9.0mm
   (2.30"x0.90"x0.35")
- Standard footprint
- Industry standard pin out
- Fixed frequency operation
- Input UVLO, Output OCP, OVP, OTP
- 2250V isolation
- Basic insulation
- No minimum load required
- ISO 9001, TL 9000, ISO 14001, QS 9000, OHSAS 18001 certified manufacturing facility
- UL/cUL 60950-1 (US & Canada) Recognized, and TUV (EN60950-1) Certified

#### **OPTIONS**

- Positive on/off logic
- SMT or through-hole version

#### **APPLICATIONS**

- Telecom / Datacom
- Wireless Networks
- Optical Network Equipment
- Server and Data Storage
- Industrial / Testing Equipment

DATASHEET DS\_E48SC3R320\_05182011

# **TECHNICAL SPECIFICATIONS**

(T<sub>A</sub>=25°C, airflow rate=300 LFM, V<sub>in</sub>=48Vdc, nominal Vout unless otherwise noted.)

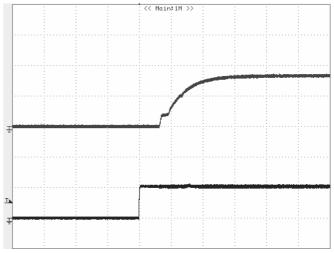

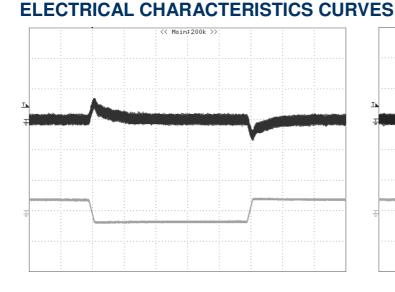

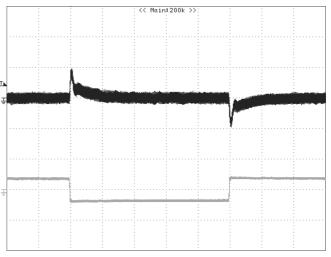

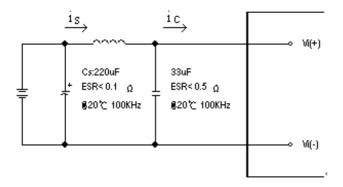

Figure 7: Turn-on transient at zero load current (10 ms/div). Vin=48V.Top Trace: Vout, 2V/div, Bottom Trace: ON/OFF input, 5V/div

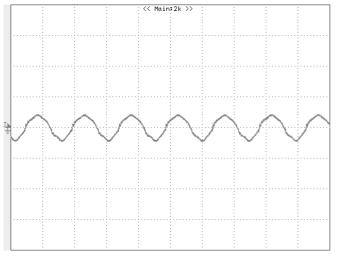

**Figure 8:** Output voltage response to step-change in load current (75%-50%-75% of lo, max; di/dt =  $0.1A/\mu$ s). Load cap:  $10\mu$ F, tantalum capacitor and  $1\mu$ F ceramic capacitor. Top Trace: Vout (100mV/div, 200us/div), Bottom Trace: I out (5A/div). Scope measurement should be made using a BNC cable (length shorter than 20 inches). Position the load between 51 mm to 76 mm (2 inches to 3 inches) from the module

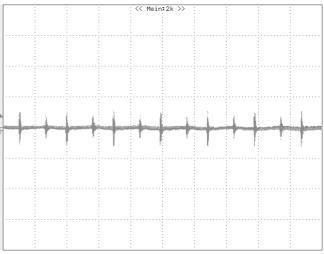

**Figure 9:** Output voltage response to step-change in load current (75%-50%-75% of lo, max; di/dt =  $2.5A/\mu$ s). Load cap:  $330\mu$ F,  $35m\Omega$  ESR solid electrolytic capacitor and  $1\mu$ F ceramic capacitor. Top Trace: Vout (100mV/div, 200us/div), Bottom Trace: I out (5A/div). Scope measurement should be made using a BNC cable (length shorter than 20 inches). Position the load between 51 mm to 76 mm (2 inches to 3 inches) from the module

**Figure 10:** Test set-up diagram showing measurement points for Input Terminal Ripple Current and Input Reflected Ripple Current.

Note: Measured input reflected-ripple current with a simulated source Inductance ( $L_{TEST}$ ) of 12  $\mu$ H. Capacitor Cs offset possible battery impedance. Measure current as shown above

**Figure 11:** Input Terminal Ripple Current,  $i_c$ , at full rated output current and nominal input voltage with  $12\mu$ H source impedance and  $33\mu$ F electrolytic capacitor (500 mA/div, 2us/div)

**Figure 12:** Input reflected ripple current,  $i_s$ , through a  $12\mu$ H source inductor at nominal input voltage and rated load current (50 mA/div, 2us/div)

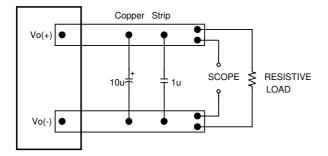

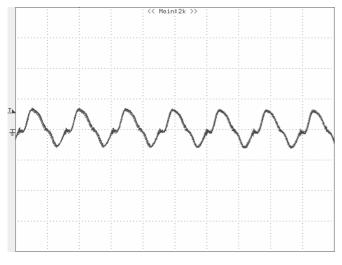

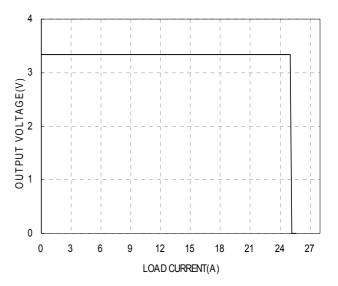

Figure 13: Output voltage noise and ripple measurement test setup

*Figure 14:* Output voltage ripple at nominal input voltage and rated load current (*lo=20A*)(20 mV/div, 2us/div)

Load capacitance:  $1\mu$ F ceramic capacitor and  $10\mu$ F tantalum capacitor. Bandwidth: 20 MHz. Scope measurements should be made using a BNC cable (length shorter than 20 inches). Position the load between 51 mm to 76 mm (2 inches to 3 inches) from the module

*Figure 15:* Output voltage vs. load current showing typical current limit curves and converter shutdown points

# **DESIGN CONSIDERATIONS**

#### **Input Source Impedance**

The impedance of the input source connecting to the DC/DC power modules will interact with the modules and affect the stability. A low ac-impedance input source is recommended. If the source inductance is more than a few  $\mu$ H, we advise adding a 10 to 100  $\mu$ F electrolytic capacitor (ESR < 0.7  $\Omega$  at 100 kHz) mounted close to the input of the module to improve the stability.

#### Layout and EMC Considerations

Delta's DC/DC power modules are designed to operate in a wide variety of systems and applications. For design assistance with EMC compliance and related PWB layout issues, please contact Delta's technical support team. An external input filter module is available for easier EMC compliance design. Application notes to assist designers in addressing these issues are pending release.

#### **Safety Considerations**

The power module must be installed in compliance with the spacing and separation requirements of the end-user's safety agency standard, i.e., UL60950-1, CSA C22.2 NO. 60950-1 2nd and IEC 60950-1 2nd : 2005 and EN 60950-1 2nd: 2006+A11+A1: 2010, if the system in which the power module is to be used must meet safety agency requirements.

Basic insulation based on 75 Vdc input is provided between the input and output of the module for the purpose of applying insulation requirements when the input to this DC-to-DC converter is identified as TNV-2 or SELV. An additional evaluation is needed if the source is other than TNV-2 or SELV.

When the input source is SELV circuit, the power module meets SELV (safety extra-low voltage) requirements. If the input source is a hazardous voltage which is greater than 60 Vdc and less than or equal to 75 Vdc, for the module's output to meet SELV requirements, all of the following must be met:

- The input source must be insulated from the ac mains by reinforced or double insulation.
- The input terminals of the module are not operator accessible.
- A SELV reliability test is conducted on the system where the module is used, in combination with the module, to ensure that under a single fault, hazardous voltage does not appear at the module's output.

When installed into a Class II equipment (without grounding), spacing consideration should be given to the end-use installation, as the spacing between the module and mounting surface have not been evaluated.

The power module has extra-low voltage (ELV) outputs when all inputs are ELV.

This power module is not internally fused. To achieve optimum safety and system protection, an input line fuse is highly recommended. The safety agencies require a fuse with 10A maximum rating to be installed in the ungrounded lead. A lower rated fuse can be used based on the maximum inrush transient energy and maximum input current.

#### Soldering and Cleaning Considerations

Post solder cleaning is usually the final board assembly process before the board or system undergoes electrical testing. Inadequate cleaning and/or drying may lower the reliability of a power module and severely affect the finished circuit board assembly test. Adequate cleaning and/or drying is especially important for un-encapsulated and/or open frame type power modules. For assistance on appropriate soldering and cleaning procedures, please contact Delta's technical support team.

### **FEATURES DESCRIPTIONS**

#### **Over-Current Protection**

The modules include an internal output over-current protection circuit, which will endure current limiting for an unlimited duration during output overload. If the output current exceeds the OCP set point, the modules will automatically shut down (hiccup mode).

The modules will try to restart after shutdown. If the overload condition still exists, the module will shut down again. This restart trial will continue until the overload condition is corrected.

#### **Over-Voltage Protection**

The modules include an internal output over-voltage protection circuit, which monitors the voltage on the output terminals. If this voltage exceeds the over-voltage set point, the module will shut down (hiccup mode) $_{\circ}$ 

The modules will try to restart after shutdown. If the over voltage condition still exists, the module will shut down again. This restart trial will continue until the over voltage condition is corrected.

#### **Over-Temperature Protection**

The over-temperature protection consists of circuitry that provides protection from thermal damage. If the temperature exceeds the over-temperature threshold the module will shut down. The module will restart if the temperature is within specification.

#### Remote On/Off

The remote on/off feature on the module can be either negative or positive logic. Negative logic turns the module on during a logic low and off during a logic high. Positive logic turns the modules on during a logic high and off during a logic low.

Remote on/off can be controlled by an external switch between the on/off terminal and the Vi(-) terminal. The switch can be an open collector or open drain.

For negative logic if the remote on/off feature is not used, please short the on/off pin to Vi(-). For positive logic if the remote on/off feature is not used, please leave the on/off pin to floating.

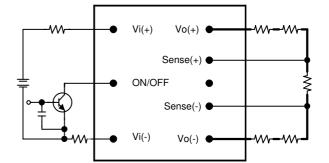

Figure 16: Remote on/off implementation

#### **Remote Sense**

Remote sense compensates for voltage drops on the output by sensing the actual output voltage at the point of load. The voltage between the remote sense pins and the output terminals must not exceed the output voltage sense range given here:

 $[Vo(+) - Vo(-)] - [SENSE(+) - SENSE(-)] \le 10\% \times Vout$ 

This limit includes any increase in voltage due to remote sense compensation and output voltage set point adjustment (trim).

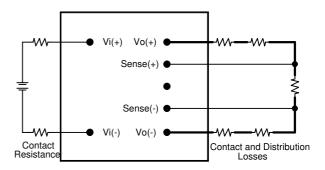

Figure 17: Effective circuit configuration for remote sense operation

If the remote sense feature is not used to regulate the output at the point of load, please connect SENSE(+) to Vo(+) and SENSE(-) to Vo(-) at the module.

The output voltage can be increased by both the remote sense and the trim; however, the maximum increase is the larger of either the remote sense or the trim, not the sum of both.

When using remote sense and trim, the output voltage of the module is usually increased, which increases the power output of the module with the same output current.

Care should be taken to ensure that the maximum output power does not exceed the maximum rated power.

### **FEATURES DESCRIPTIONS (CON.)**

#### Output Voltage Adjustment (TRIM)

To increase or decrease the output voltage set point, the modules may be connected with an external resistor between the TRIM pin and either the SENSE(+) or SENSE(-). The TRIM pin should be left open if this feature is not used.

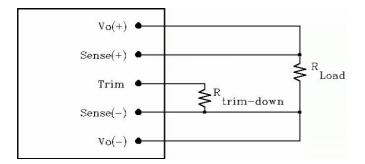

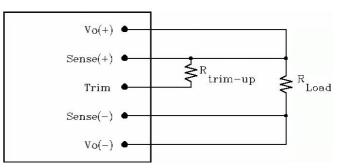

Figure 18: Circuit configuration for trim-down (decrease output voltage)

If the external resistor is connected between the TRIM and SENSE (-) pins, the output voltage set point decreases (Fig. 18). The external resistor value required to obtain a percentage of output voltage change  $\triangle$  % is defined as:

$$Rtrim - down = \frac{511}{\Delta} - 10.2(K\Omega)$$

Ex. When Trim-down -20%(3.3V×0.8=2.64V)

$$Rtrim - down = \frac{511}{20} - 10.2 = 15.4 (K\Omega)$$

*Figure 19:* Circuit configuration for trim-up (increase output voltage)

If the external resistor is connected between the TRIM and SENSE (+) the output voltage set point increases (Fig. 19). The external resistor value required to obtain a percentage output voltage change  $\triangle$  % is defined as:

Rtrim 
$$-up = \frac{5.11 \operatorname{Vo} (100 + \Delta)}{1.225 \Delta} - \frac{511}{\Delta} - 10.2 (K\Omega)$$

Ex. When Trim-up +10%(3.3V×1.1=3.63V)

$$Rtrim - up = \frac{5.11 \times 3.3 \times (100 + 10)}{1.225 \times 10} - \frac{511}{10} - 10.2 = 90.1(K\Omega)$$

The output voltage can be increased by both the remote sense and the trim, however the maximum increase is the larger of either the remote sense or the trim, not the sum of both.

When using remote sense and trim, the output voltage of the module is usually increased, which increases the power output of the module with the same output current.

Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power.

### THERMAL CONSIDERATIONS

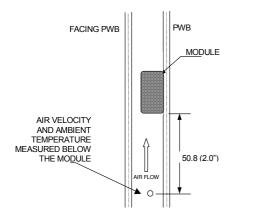

Thermal management is an important part of the system design. To ensure proper, reliable operation, sufficient cooling of the power module is needed over the entire temperature range of the module. Convection cooling is usually the dominant mode of heat transfer.

Hence, the choice of equipment to characterize the thermal performance of the power module is a wind tunnel.

#### **Thermal Testing Setup**

Delta's DC/DC power modules are characterized in heated vertical wind tunnels that simulate the thermal environments encountered in most electronics equipment. This type of equipment commonly uses vertically mounted circuit cards in cabinet racks in which the power modules are mounted.

The following figure shows the wind tunnel characterization setup. The power module is mounted on a test PWB and is vertically positioned within the wind tunnel. The space between the neighboring PWB and the top of the power module is constantly kept at 6.35mm (0.25").

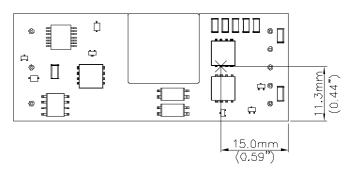

Note: Wind Tunnel Test Setup Figure Dimensions are in millimeters and (Inches) Figure 20: Wind tunnel test setup

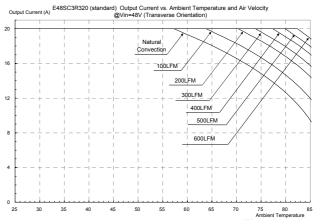

#### **Thermal Derating**

Heat can be removed by increasing airflow over the module. To enhance system reliability; the power module should always be operated below the maximum operating temperature. If the temperature exceeds the maximum module temperature, reliability of the unit may be affected.
