GENERAL DESCRIPTION

The HTCCG is a high temperature clock oscillator fabricated in Honeywell's HTMOS™ high temperature process. The chip contains a crystal controlled oscillator driver, divider chain, low voltage monitor, and enable and reset lines. Using an external crystal, it is intended to provide reliable precision performance throughout the -55 to +225°C temperature band. All parts are burned in at 250°C to eliminate infant mortality. Typically, parts will operate up to +300°C for a year, with derated performance.

The HTCCG operates from input crystal frequencies of 48KHz to 40MHz. The base frequency output ranges from 24KHz to 20Mhz, with divide by two, four, and eight frequency outputs also provided. An Enable pin is included for extremely low power applications, and a Reset pin for prototyping purposes. The crystal driver may be bypassed for applications requiring only a precision divider chain.
