

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

S6J32E/S6J32F/S6J32G/S6J32H Series

32-bit Microcontroller TRAVEO™ T1G

Datasheet

The S6J32E/S6J32F/S6J32G/S6J32H series is an extension of the existing S6J3200 series with 4-MB Flash, 512-KB RAM, and Ethernet RMII support.

The S6J3200 series microcontrollers are members of the 55-nm TRAVEO™ T1G family targeting Cluster and Head-Up Display (HUD). They are built as a single-chip solution to drive a complete mid-range instrument cluster. They can control up to six gauges and drive up to two Thin Film Transistor (TFT) displays with WVGA resolution (854 × 480 pixels each). For connecting a HUD, one display output can be warped on-the-fly for the necessary correction of the windshield bulge. A powerful 2.5D graphics engine enables the device to be used for many mid-range graphics applications.

Features

Key Features

- 240-MHz Arm® Cortex® R5F CPU
- 4-MB internal high-speed Flash memory, 512-KB RAM
- Supports 2.7 V to 5.5 V and 2.7 V to 3.6 V I/O supply voltage
- 1.2-V core power supply
- 50-channel 12-bit SAR A/D converter with 1-Msp conversion rate
- Embedded 4-channel CAN FD controller
- 12-channel Multi-Function Serial (MFS) communication block
- Optional Ethernet AVB with MII and RMII interface
- Two-channel DDR HSSPI
- Optional HyperBus™ interface
- Optional Media-LB (MOST25) interface
- Six-channel Stepper Motor Controller
- Enhanced sound function for high quality

- 2D/2.5D graphics subsystem with video capture, 2-MB VRAM, dual-display support, on-the-fly-warping
- Optional embedded Secure Hardware Extension (SHE) with AES-128 encryption and decryption
- Flash memory retention time up to 20 years
- ASIL-B support on ISO26262 specification
- 216-pin and 208-pin TEQFP packages
- Power domain control

Applications

- Automotive cluster application
- Classic Cluster Control
- Head-Up Display

Notes:

- Refer to all the documents for system development.
- The "primary user" is most likely the engineer who will find the document useful.
- The description of the datasheet and the S6J3200 hardware manual should precede the duplicated description of TRAVEO™ T1G platform hardware manual.
- The TRAVEO™ T1G platform hardware manual is expected to be used as a dictionary of platform specification.
- Document code usually includes its revision.
- Information from the previous revision can be seen in the supplementary documents.

2. Function List

2.1 Function List Table

The following table shows the functions implemented in the S6J32E, S6J32F, S6J32G and S6J32H series.

Notes:

- The options are described in Section 2.2.
- The specifications related to the electric characteristics in the table only show the typical values. They do not necessarily include the width of characteristics, errors, and so on. For details, refer to the electrical characteristics sections in this document.
- Target resolution of graphics is WVGA 800 × 480, WQVGA 480 × 272.
- Target capture resolution of graphics is WVGA 800 × 480.

2.2 Optional Function

2.2.1 Basic Option

The following figure shows the optional function and the part number relations of the combined S6J3200 and S6J32E, S6J32F, S6J32G, S6J32H series.

Notes:

- This table only shows the relations between the optional function and the part numbers. That is, all products are not necessarily available for orders. See the order number on the datasheet and confirm actual availability of products.
- The sound system is composed of the sound waveform generator, the sound mixer, the audio DAC, PCM-PWM, and I2S0.
- The CLK_CPU is assigned to the CPU clock. The CLK_CD3A0 is assigned to the graphic clock. They are defined in the Clock Configuration chapter.

2.2.2 ID

Each function digit has an ID and revision, which is defined in [Figure 2-1](#).

Chip ID can be read from SYSC0_SYSIDR. For SYSC0_SYSIDR (see the TRAVEO™ T1G Platform [hardware manual](#)).

- The optional restriction will be added without notification.

3. Product Description

3.1 Overview

This section explains the product features of the S6J3200 series. The description of this section should precede the duplicated description on the platform manual.

3.2 Product Description

The following table describes the product features.

Table 3-1: Feature Description

Feature	Description
Technology	55-nm CMOS technology with embedded FLASH Fully automotive-qualified according to ISO/TS 16949 and AEC-Q100
Functional Safety	The product series has some functional safety features suited for ASIL-B application.
Peripherals	See function list.
Power Domain (PD)	Refer to the platform manual and the <i>State Transition</i> section for details. The product series supports the power-off control of PD1, PD2 (including PD3 and 5), and PD6. The power domain resets of PD3 and PD5 included in PD2 are not supported in the product series, and "0" is always read from the reset factor flags of them. This series does not support partial wakeup for PD6.
Debug and Trace	Refer to the platform manual for details. <ul style="list-style-type: none"> - Standard 5-pin JTAG interface - 4k Word Embedded Trace Buffer 4-bit trace support for TEQFP package.
System Control	Refer to the platform manual for details. Main and sub oscillator is available. <ul style="list-style-type: none"> - A wide range of 3.6 - 16MHz is available for main oscillator - 32 kHz is available for sub oscillator Sub clock is enabled/disabled by register settings
Clock	Refer to the platform manual for details. CLK_CLKO (Clock Output Function) is not supported. Main Oscillation Stabilization Wait Time (at 4 MHz):8.19 ms (Initial value)
Embedded CR oscillation	Refer to the platform manual for details. Stabilization time is as follows: <ul style="list-style-type: none"> - 5 μs for 4 MHz (Fast clock) - 20 μs for 100 kHz (Slow clock)
Clock Supervisor	Refer to the platform manual for details. This product series does not support the clock supervisor output port. (Related register and internal circuit is implemented.)
Reset	Refer to the platform manual for details. The following resets are not mounted on this device. <ul style="list-style-type: none"> - INITX - SRSTX (and nSRST pin) This product series does not support EX5VRST and writing EX5VRSTCNT bits in SYSC0_SPECFGR has no effect.
Hardware Watchdog	Refer to the platform manual for details. The hardware watchdog function stops during the PSS mode. In the related register of HWDG_CFG, the bit ALLOWSTOPCLK is always read as 1 (HWDG_CFG.ALLOWSTOPCLK=1). The product series does not support the Watchdog Counter Monitor Output port. (Related register and internal circuit is implemented.)

Feature	Description
Software Watchdog	Refer to the platform manual for details. The product series does not support the Watchdog Counter Monitor Output port. (Related register and internal circuit is implemented.)
Standby Mode	Refer to the platform manual for details. Standby mode with 5-V single power supply is available. Turning off the 3.3-V supply and the external 1.2-V supply in standby mode is available. The long-term pulse of the indicator PWM can be outputted during RTC Standby mode.
PLL / SSCG PLL	Refer to the platform manual for details. Use case assumption follows. <ul style="list-style-type: none"> - PLL <ul style="list-style-type: none"> ➤ Sound system clock ➤ Sound frequency master clock ➤ Peripherals ➤ Display clock ➤ Trace clock - SSCG <ul style="list-style-type: none"> ➤ CPU core ➤ GDC core ➤ HyperBus ➤ DDR-HSSPI <p>This product supports down spread and center spread modes with the conditions defined in the Internal Clock Timing section.</p>
External Interrupts	Refer to the platform manual for details.
NMI	Refer to the platform manual for details. 1 NMI pin.
Memory Protection	MPU16 AHB: Refer to the platform manual for details. MPU for AXI: ch.0 (Supervise Ethernet) MPU for AHB: ch.1 (Supervise Media LB) Additional MPU for graphic subsystem, MediaLB, and Ethernet AVB. These are described in the MPU for AHB and MPU for AXI chapters in the hardware manual. To configure Lock or Unlock for both MPUXn_UNLOCK and MPUHn_UNLOCK, <ul style="list-style-type: none"> - Lock: 0x112ABB56 - Unlock: 0xACCABB56
Peripheral Protection	Refer to the platform manual for details. Protected peripherals are described in the base address map.
Internal Memories System RAM	Refer to the platform manual for details. 1 wait cycle is necessary for RAM read at over 160 MHz. Do not insert wait cycles for RAM write.
Internal Memories TCRAM	Refer to the platform manual for details.
Internal Memories Backup RAM	16 KB Backup RAM can only be operated in RUN mode (normal operation mode). In other modes, the memory content should be retained, but it cannot be operated. SLEEP control for Backup RAM is not supported and cannot be used.
Internal Memories VRAM	ECC region is shared with the user region. Memory size available for the user program is less when ECC is enabled. User can define ECC enabled area and ECC disabled area. Single error correction, double error detection (SECDED) ECC support per 32-bit word.

Feature	Description
Embedded Program/Work Flash Memory	<p>Embedded Program Flash can be accessed with 0-wait-cycle if CPU frequency is 80 MHz or less. 0-wait cycle: 80 MHz or less. 1-wait cycle: 160 MHz or less. 2-wait cycle: more than 160 MHz.</p> <p>Erase suspend is supported. Reading and writing to the other sectors are possible when Flash Erase is suspended. Serial Flash programming and Parallel Flash programming are supported. Margin mode is not supported.</p>
Internal Power Domains	<p>PD1: Always ON PD2: Cortex R5F platform/ GDC/ additional peripherals PD4: Backup RAM PD6: Peripherals * The block diagram section of the TRM explains this in detail.</p>
Power Supply	<p>External 5 V, 3 V, 1.2 V is required. Built-in LDO provides internal 1.2 V for Always On region (PD1). External 1.2-V power supply control pin is supported. External 3.3-V power supply should be controlled by GPIO. There are constraints of power on/off sequence.</p>
Low-voltage Detection	<p>LVD for external voltage is supported. LVD for internal voltage is supported. See the specification of the detected level on the datasheet.</p>
Low-voltage Detection for RAM Retention (RVD)	<p>RVD for RAM retention is effective only during the standby mode. That is, the function is available only for the Backup RAM of 16 KB.</p>
Resource inter-connect	<p>The output signal of some resources can be inputted to the other resource.</p>
I/O Ports	<p>5-V GPIO 3-V GPIO Multi input level and multi output drivability Pull-up, pull-down function is available. Resource input and output is multiplexed. +B input is allowed many pins of the 3.3 V, 5 V, and 3.3 V/5 V I/O domains.</p>
A/D Converter	<p>12-bit resolution, 1 unit 50 channels of analog input for TEQFP-216 46 channels of analog input for TEQFP-208 24 channels of them are shared with the SMC for TEQFP-216/208 External trigger and timer trigger are available. The description of the A/D converter function should be referred in the S6J3200 hardware manual. Do not refer to the description of another A/D converter function in the I/O port chapter of the TRAVEO™ T1G PF V3 hardware manual</p>
CRC	<p>Refer to the platform manual for details.</p>
Programmable CRC	<p>DMA support</p>
Sound Generator	<p>Produces sound/melody with varying frequency and amplitude for convenient duration Square wave sound output Automatic linear amplitude increment or decrement Interrupt request generated when specified sound length ends</p>
Sound Waveform Generator	<p>Sine waveform, saw-tooth waveform, and square waveform are generated with easy configuration of the parameters, which specifies sound sources. Fade-in and fade-out control for reverberation.</p>

3.2.1 Ethernet

The following functions are not supported.

Functions	Remark
External FIFO Interface	
Additional Low Latency TX FIFO Interface for DMA configurations	
MAC Transmit Block - half-duplex - collision - back_pressure	
MAC Filtering Block - external address match - Wakeup On Lan	
Energy Efficient Ethernet support	
LPI Operation in Cadence IP	
PHY Interface - GMII - SGMII - TBI	
10/100/1000 Operation - 1000 M	
SGMII Operation	
Jumbo Frames	
Physical Control Sub-Layer

6.2 Remarks

Notes:

- The port description list shows the port function of the description, which is mounted and supported on the product. The function, which is not described in this table, is not supported and assured.
- Only the specified GPIOs can be used as inputs. Otherwise, undesired chip behavior can occur.
- See the function list of the product as well.

7. Precautions and Handling Devices

7.1 Handling Precautions

All semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, and so on.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

7.1.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, and so on.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the datasheet. Users considering applications outside the listed conditions are advised to contact their sales representative beforehand.

Processing and Protection of Pins

Follow these precautions when handling the pins, which connect semiconductor devices to power supply and input/output functions.

1. Preventing overvoltage and overcurrent conditions
Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases, leads to permanent damage of the device. Try to prevent such overvoltage or overcurrent conditions at the design stage.
2. Protection of Output Pins
Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions, if present, for extended periods of time can damage the device. Therefore, avoid this type of connection.
3. Handling of Unused Input Pins
Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

7.1.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

Lead Insertion Type

You can mount lead-insertion type packages on printed circuit boards by two methods: direct soldering on the board or mounting by using a socket.

Direct mounting on boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress-recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason, it is recommended that you verify the surface treatment of socket contacts and IC leads before mounting.

Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

Use appropriate mounting techniques. Cypress recommends the solder reflow method and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

Pb-free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

1. Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
2. Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5 °C and 30 °C. For dry packages, the recommended relative humidity range is 40% to 70%.
3. When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
4. Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125 °C/24 h

Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

1. Maintain relative humidity in the working environment between 40% and 70%.
You may need to use an apparatus for ion generation to remove electricity.
2. Electrically ground all conveyors, solder vessels, soldering irons, and peripheral equipment.
3. Eliminate static body electricity by using rings or bracelets connected to the ground through high resistance (on the level of 1 MΩ). Wearing conductive clothing and shoes, use of conductive floor mats, and other measures to minimize shock loads is recommended.
4. Ground all fixtures and instruments, or protect with anti-static measures.
5. Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

7.1.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

1. Humidity
Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.
2. Discharge of Static Electricity
When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.
3. Corrosive Gases, Dust, or Oil
Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.
4. Radiation, Including Cosmic Radiation
Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.
5. Smoke, Flame
CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

7.2 Handling Devices

For Latch-Up Prevention

The latch-up phenomenon may occur on a CMOS IC in the following cases: the voltage applied to an input or output pin is higher than VCC or lower than VSS; or the voltage applied between a VCC pin and a VSS pin exceeds the rating. A latch-up causes a rapid increase in the power supply current, possibly resulting in thermal damage to an element. When using the device, take sufficient care not to exceed the maximum rating.

Take care that analog power supplies (AVCC, AVRH) and analog inputs do not exceed the digital power supply (VCC) at the analog system power-on and power-off times.

The power-on sequence is as follows. Simultaneously, turn on the digital supply voltage (VCC) and analog supply voltages (AVCC, AVRH).

Handling Unused Pins

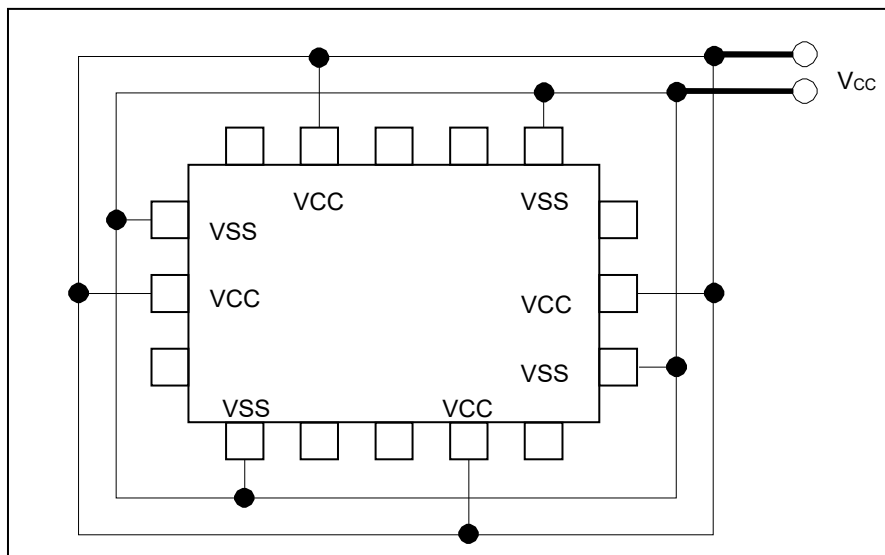

Leaving unused input pins open may cause permanent damage from a malfunction or latch-up. Take measures for unused pins, such as pulling up or pulling down the voltage with resistors of 2 kilo ohms or higher.

If there are any unused input/output pins, set them to the output state and then open them, or set them to the input state and handle them in the same way as input pins.

Power Supply Pins

If the device has multiple VCC and VSS pins, the device is designed in such a way that the pins that should be at the same potential are connected to each other inside the device to prevent malfunctions such as latch-up. However, to reduce unwanted emissions, prevent malfunctions of strobe signals caused by an increase of the ground level, and observe standards on total output current. Be sure to connect all the VCC and VSS pins to the power source and ground externally. Also, handle all the VSS power supply pins as shown in the following diagram. If there are multiple VCC or VSS systems, the device does not operate normally even within the guaranteed operating range.

Figure 7-1 Pin Assignment

In addition, consider connecting with low impedance from the power supply source to the VCC and VSS of this device. We recommend connecting a ceramic capacitor as a bypass capacitor between VCC and VSS, near this device.

Crystal Oscillation Circuit

Noise entering the X0 or X1 pin may cause a malfunction. Design the printed circuit board in such a way that the X0 and X1 pins, the crystal oscillator (or ceramic resonator), and a bypass capacitor to ground are located very close to the device.

We recommend that the printed circuit board artwork have the X0 and X1 pins enclosed by ground.

Mode Pin (MD)

Use mode pin MD by directly connecting it to a VCC or VSS pin. To prevent noise from causing the device to accidentally enter test mode, reduce the pattern length between each mode pin and a VCC or VSS pin on the printed circuit board, and connect them with low impedance.

PLL Clock Operation

While a PLL clock is selected, if the oscillator breaks off or input stops, the PLL clock may continue operating with the free running frequency of the internal self-oscillator circuit. This operation is outside of the guaranteed range.

Power Supply Pin Processing of an A/D Converter

Even when no A/D converter is used, establish a connection such that $AVCC = AVRH = VCC$ and $AVSS/AVRL5 = VSS$.

Using External Clocks

External clocks are not supported.

External direct clock input cannot be used.

Power-on Sequence of the Power Supply Analog Inputs of an A/D Converter

Be sure to turn on the digital power supply (VCC) before the application of the power supplies (AVCC, AVRH, and AVRL5) and analog inputs (AN0 to AN63) of an A/D converter.

At the power-off time, turn off the power supplies and analog inputs of the A/D converter, and then turn off the digital power supply (VCC). Perform these power-on and power-off operations without AVRH exceeding AVCC. Even when using a pin shared with an analog input as an input port, do not allow the input voltage to exceed AVCC. (Turning on or off the analog supply voltage and digital supply voltage simultaneously is not a problem.)

Method to Switch off VCC12 during Power-off Sequence

During power-off sequence, it is necessary to switch off VCC12 by driving the PSC1 pin low by entering PSS mode (power domain 2 off). If VCC12 needs to be switched off by other means, RSTX needs to be asserted before switching off VCC12 to deactivate the operation of the VCC12 supplied domain below the operation assurance range.

C Pin Processing

This device has a built-in voltage step-down circuit. Be sure to connect a capacitor to the C pin for internal stabilization of the device. For the standard values, see "Recommended operating conditions" in the latest datasheet.

Precautions on Designing a Mounting Substrate

Take measures against heat generation from the package for the mounting substrate to observe the absolute maximum rating (operating temperature). Design a mounting substrate with 4 or more layers. Connect the back of the package stage and the substrate pad with solder paste. Arrange thermal via holes on the substrate pad.

Writing to a Register Containing a Status Flag

In writing to a register containing a status flag (particularly an interrupt request flag) to control a function, it is important to take care not to accidentally clear the status flag.

Therefore, before the write operation, configure the status bit such that the flag is not cleared, and then set the control bit to the desired value.

Especially for control bits configured as a set of multiple bits, bit instructions cannot be used (bit instructions have only 1-bit access). In such cases, byte, half-word, or word access is used to write to the control bits and a status flag simultaneously. However, at this time, be careful not to accidentally clear bits other than the intended ones (the status flag bit in this case).

Note: Bit instructions take this point into account for registers that support bit-band units, so it does not need to be a concern. You need to take care when using bit instructions for registers that do not support bit-band units.

- *1: These parameters are based on the condition that VSS = AVSS = DVSS = 0.0 V.
- *2: Take care that DVCC and AVCC5 do not exceed VCC5 at, for example, the power-on time. It is strongly recommended to set VCC5, DVCC, and AVCC5 to the same voltage during operation (see *13).
- *3: The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.
- *4: The average output current is defined as the value of the average current flowing through any one of the corresponding pins for a 10 ms period. The average value is the operation current × the operation ratio.
- *5: The total output current is defined as the maximum current value flowing through all of corresponding pins.
- *6: Output of 5-V pins.
- *7: Output of SMC pins.
- *8: Output of 5-V/3-V pins.
- *9: Output of 3-V pins.
- *10: Output of I²C.
- *11: Output of Media LB pins
- *12: VI or VO should never exceed the specified ratings. However, if the maximum current to/from an input is limited by a suitable external resistor, the ICLAMP rating supersedes the VI rating.
- *13: Take care that the output voltage of ADC shared pins does not exceed AVCC5+0.3 V because ADC Analog input pins (AN0-49) are internally connected to the analog elements. It is strongly recommended to set VCC5, DVCC, and AVCC5 to the same voltage.
- *14: Only permitted for S6J32JEKSNSE20000 and S6J32JELNSNC20000
- *A: Relevant pins: All general-purpose ports and analog input pins
 - Corresponding pins: all general-purpose ports
 - Use within the operation assurance condition (See 8.2. Operation Assurance).
 - Use at DC voltage (current).
 - The +B signal should always be applied by connecting a limiting resistor between the +B signal and the microcontroller.
 - The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed rated values at any time regardless of instantaneously or constantly when the +B signal is input.
 - Note that when the microcontroller drive current is low, such as in the low power consumption modes, the + B input potential can increase the potential at the VCC pin via a protective diode, possibly affecting other devices.
 - Note that if the +B signal is input when the microcontroller is off (not fixed at 0 V), since the power is supplied through the pin, the microcontroller may operate incompletely.

- Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.
- Do not leave +B input pins open.
- It is recommended to confirm that the maximum ratings at the pins is not exceeded using simulation based on the IBIS model. Variation of the resistance and voltages shall be included for this simulation.
- Example of a recommended circuit

**WARNING:**

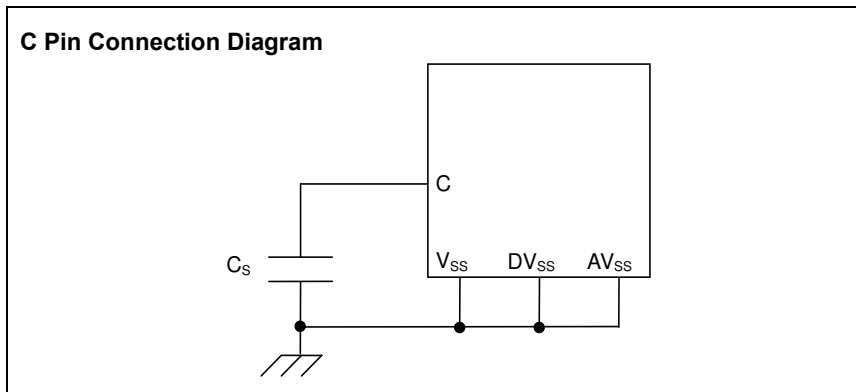

- Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

Notes:

- *1. For the connections of smoothing capacitor C_s, see the following diagram.
- *2: Only permitted for S6J32JEKSNSE20000 and S6J32JELSNSE20000
- Power supply sequence is recommended as
V_{CC5} → [DV_{CC} or AV_{CC5} or V_{CC3} or AV_{CC3}] → V_{CC12} → [AV_{CC3_LVDS_PLL} or V_{CC3_LVDS_TX}]
V_{CC5} → [AV_{CC5} or DV_{CC}] → [V_{CC12} or V_{CC3} or AV_{CC3_DAC}] → [AV_{CC3_LVDS_PLL} or V_{CC3_LVDS_TX}]
V_{CC5} → AV_{CC5} → [DV_{CC} or V_{CC12} or V_{CC3} or AV_{CC3_DAC}] → [AV_{CC3_LVDS_PLL} or V_{CC3_LVDS_TX}]
- Note that power supplies inside "[]" can be turned on in arbitrary order.
- It is recommended to set AV_{CC5} and V_{CC5} to the same voltage.
- If you are connecting V_{CC3_LVDS_Tx} and AV_{CC3_LVDS_PLL} to the same supply source, it is recommended to use a R/C noise filter to ensure the Ripple on the FPD-Link PLL supply.

WARNING:

1. The recommended operating conditions are required to ensure the normal operation of the semiconductor device. All the device's electrical characteristics are warranted when the device is operated under these conditions.
2. Any use of semiconductor devices will be under their recommended operating condition.
3. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure.
4. No warranty is made with respect to any use, operating conditions or combinations not represented on this datasheet. If you are considering application under any conditions other than listed herein, contact a sales representative before you implement the settings.

Notes:

- T_A : Ambient temperature (JEDEC)
- T_C : Case temperature (JEDEC), the maximum measured temperature of package case top.
- Both rating of T_A and T_C should simultaneously be satisfied as maximum operation temperature.
- The following conditions should be satisfied to facilitate heat dissipation.
 1. Four or more layers PCB should be used.
 2. The area of PCB should be 114.3 mm x 76.2 mm or more, and the thickness should be 1.6 mm or more. (JEDEC standard)
 3. One layer of middle layers at least should be used for dedicated layer to radiate heat with residual copper rate 90% or more. The layer can be used for system ground.
 4. 35% or more of the die stage area which is exposed at back surface of package should be soldered to a part of 1st layer.
 5. The part of 1st layer should be connected to the dedicated heat radiation layer with more than 10 thermal via holes.

Figure 8-1: Example Thermal via Holes on PCB.

Notes:

- Figure 8-1 is a schematic diagram showing PCB in section.
- Figure 8-2, Figure 8-3, and Figure 8-4 in the following pages are recommended land patterns for each package series. Thermal via holes should be placed closely and aligned with lands.
- When thermal via holes cannot be with lands, the following are recommended as represented by Figure 8-4 which is an example for LEQ-216.
 - (1). Increase pattern area size as much as possible inside the package outline.
 - (2). Place thermal via holes to be with lands as close as possible.
- $0.25 \text{ mm} \leq a \leq 0.30 \text{ mm}$ in Figure 8-2, Figure 8-3, and Figure 8-4.

Notes:

- The output port current is not included in the specified value
- *1. A few mA, which depend on usage for FPD-Link data transfer, should be estimated for each port in an actual application, and then it should be added to the current consumption at VCC3_LVDS_Tx.
- The current consumption at VCC3_LVDS_Tx is specified under RL= 100 ohm, CL= 5 pF, f = 50 MHz, and 0/1 alternation pattern output.
- *2 This current consumption assumes extremely high activity, which is unlikely to be achieved in real application. Actual current consumption is dependent on actual application.
- *3 Example use case at following conditions
 CPU: 240 MHz, HPM: 120 MHz, GDC: 200 MHz
 (Clock settings according to ch 8.4.3 Internal Clock Timing Max*1)
 Active peripherals: Ethernet, 1ch HyperBus (Flash+RAM), PWMs, ADC, 6ch SMCs, I²C, 2ch CAN, 2ch LIN and 2ch SPI

Notes:

- *1: Maximum clock frequencies when CPU clock = 240 MHz.
- For SSCG, down spread and center spread modes are supported with following conditions:
 - For down spread mode, clock frequency setting can be up to max SSCG frequency defined in above table.
 - For center spread mode, an appropriate clock frequency setting has to be chosen so that the modulated clock does not exceed the max SSCG frequency defined in above table.
- 240 MHz or less is available for PLL.
- *2: Maximum clock frequencies when CPU clock = 200 MHz.
- *3: Maximum clock frequencies when CPU clock = 160 MHz. This is also a combination of maximum clock frequencies for TC FLASH Programming or Erasing.
- Even if a combination of clock frequency is able to be configured by software, the frequency should be configured under maximum frequency described in [Table 8-1](#). For example, 80 MHz of CLK_LCP0A seems to be configurable from both divided 240 MHz and 160 MHz of CLK_CPU. But each duty ratio of configured 80 MHz as an internal signal is different from one another. In this series, the 80 MHz from the 160 MHz divided by 2 can only be assured, but the 240 MHz divided by 3 cannot be assured from the internal timing design point of view.
- $F_{CLK_TRC}/2$ (half frequency of F_{CLK_TRC}) comes out of the trace clock port of package external pin.
- The frequency described in () is maximum output frequency of SSCG PLL / PLL multiplier circuit.
- The configurable minimum frequency of PLLn and SSCGn output is 400 MHz.
- "Unused" means a clock source, which does not have any supply destinations. Configure these clocks to a lower clock frequency than the described maximum.

- Relationship between the oscillation clock frequency and internal clock frequency (example)

		Internal Operation Clock Frequency								
		Main Clock	PLL Clock						Multiplied by 40	Multiplied by 60
			Multiplied by 1	Multiplied by 2	Multiplied by 3	Multiplied by 4	...			
Oscillation clock frequency [MHz]	4	2	4	8	12	16	...	160	240	

- Oscillation circuit example

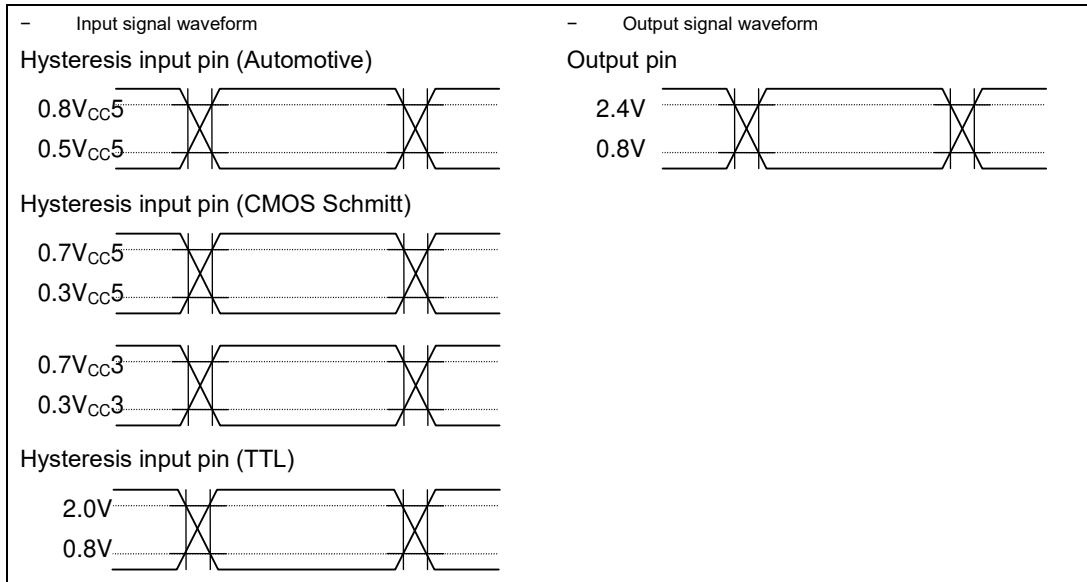

Note:

For the configuration of an oscillation circuit, request the oscillator manufacturer to perform a circuit matching evaluation before designing.

8.4.4 Reference Voltages for AC Characteristics of I/O Cells

AC characteristics are specified by the following measurement reference voltage values.

DDR-HSSPI and HyperBus AC characteristics are specified with the following reference voltages regardless of the automotive input-level configuration, CMOS Schmitt, and TTL.

8.4.5 Reset

8.4.5.1 Reset Input

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Max		
VCC5 stability time after RSTX assertion	t _{FV5}	VCC5	-	35	-	μs	VCC5 ≥ 2.7 V
VCC12 stability time after RSTX assertion	t _{FV12}	VCC12		35	-	μs	VCC12 ≥ 1.1 V

8.4.6 Power-On Conditions

8.4.6.1 Power-On Conditions

(Condition: See 8.2. Operation Assurance)

Parameter	Symbol	Pin Name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Level detection voltage	-	VCC5	-	2.15	2.35	2.55	V	
Reset release voltage	-	VCC5	-	2.25	2.45	2.65	V	
Level detection time	-	-	-	-	-	540	μs	*1
Power off time	t_{OFF}	VCC5	$VCC5 < 0.2 V$	1	-	-	ms	*2
Power ramp rate	dV/dt	VCC5	VCC5: Between 0.2 V to 2.65 V	-	-	6	$mV/\mu s$	*3
Power ramp rate	dV/dt	VCC5	VCC5: Between 0.2 V to 2.65 V	-	-	100	$mV/\mu s$	*4
Maximum ramp rate guaranteed to not generate power-on reset	$ dV/dt $	VCC5	VCC5: Between 2.65 V and 4.5 V	-	-	50	$mV/\mu s$	*5

Notes:

*1: If a power fluctuation precedes the low-voltage detection time, the detection may occur or be cancelled after the supply voltage passes the detection voltage range.

*2: If Vcc is held below 0.2 V for a minimum period of t_{OFF} , power-on reset will occur. If t_{OFF} is not satisfied, power-on reset will still occur if the power ramp rate is kept below 6 $mV/\mu s$.

*3: This is the power ramp rate with which power-on reset will always occur regardless of power-off time, as mentioned in *2.

*4 If power ramp rate is below this value power on reset is guaranteed.

*5: When VCC5 is within the 2.65 V to 4.5 V range, and VCC5 fluctuation is below 50 mV/μs, the power-on reset is suppressed. Between 4.5 V to 5.5 V, the power-on reset does not occur with any VCC5 fluctuation.

Note:

When neither *2 nor *3 can be satisfied, assert external reset (RSTX) at power-up and at any brownout event.

Notes:

- *1: This LVD cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage (3.5 V).
- *2: After the brown-out event where the voltage level dips below the detection threshold for less than this time, the detection may occur or be canceled.
- *3: Suppress the change of the power supply within the range of the power-supply voltage regulation to do a low-voltage detection by detecting voltage.

– Following power supply voltage stability conditions need to be ensured

8.5.2 Notes on A/D Converters

About the Output Impedance of an External Circuit for Analog Input

When the external impedance is too high, the analog voltage sampling time may become insufficient. In this case, we recommend attaching a capacitor (about 0.1 μF) to an analog input pin.

8.5.3 Glossary

Resolution: Analog change that can be identified by an A/D converter

Integral linearity error: Deviation of the straight line connecting the zero transition point ("0000 0000 0000" \leftrightarrow "0000 0000 0001") and full-scale transition point ("1111 1111 1110" \leftrightarrow "1111 1111 1111") from actual conversion characteristics, includes zero transition error, full-scale transition error, and non linearity error.

Differential linearity error: Deviation from the ideal value of the input voltage required for changing the output code by 1 LSB.

Total error: Difference between the actual value and the theoretical value. The total error includes zero transition error, full-scale transition error, and linear error.

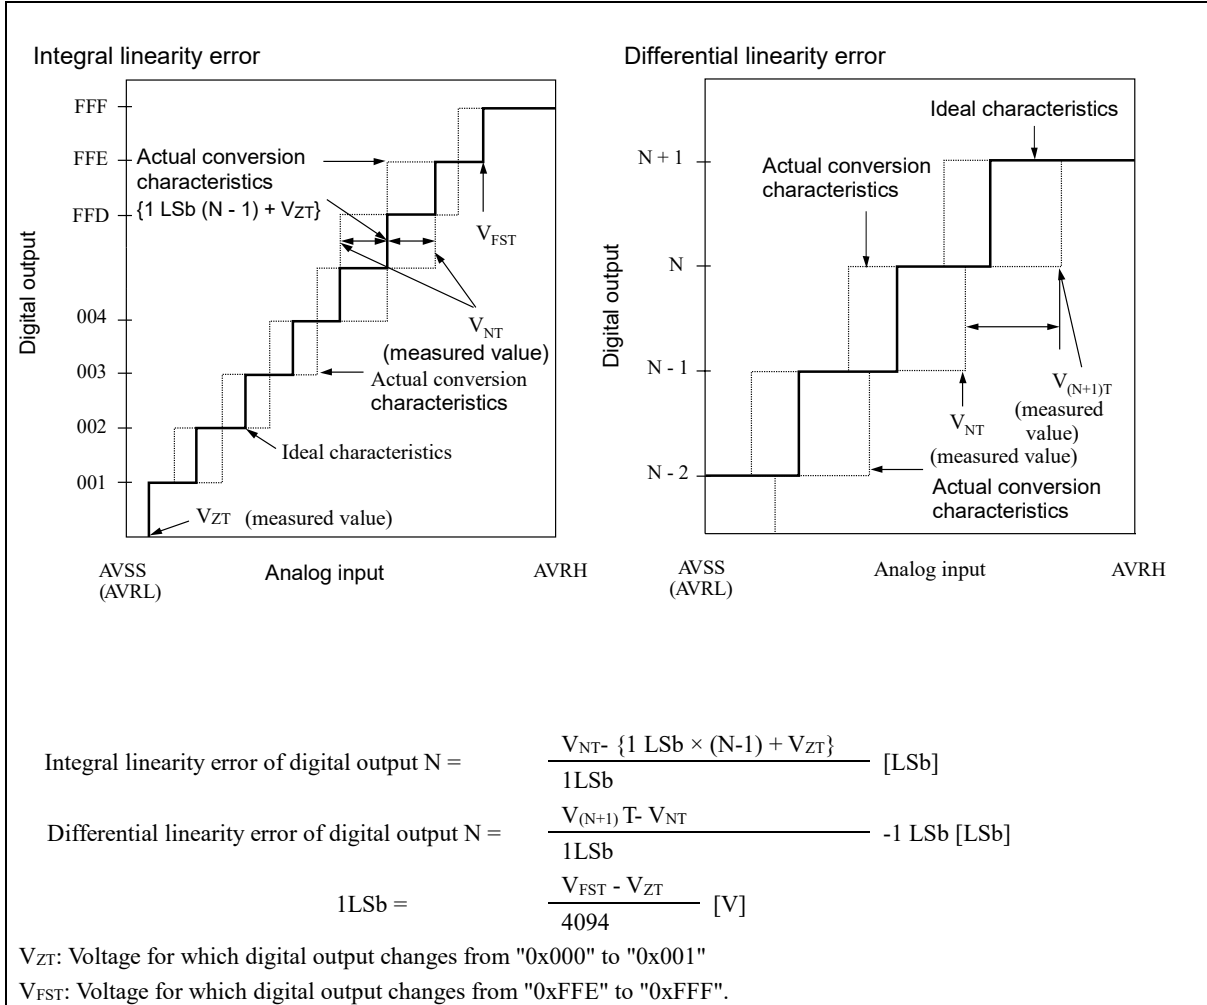

8.5.4 Calibration Condition

Calibration Condition should be the following

- $AV_{CC} = 5.0 \text{ V}$
- $AV_{RH} = 5.0 \text{ V}$
- $T_A = 25 \text{ }^\circ\text{C}$
- System clock frequency (CLK_LCP1A) = 10 MHz

See the A/D Converter Calibration section in the S6J3200 hardware manual.

Notes:

- *1: All parameters specified f_s = 44.1 kHz, system clock 256f_s and 16-bit data, R_L-20 kΩ, C_L = 100 pF, unless otherwise noted.
- *2: Refer to Note 3 on R_L load connection.
- *3: These values do not include the noise caused by the analog power supply. (Refer to Section 7. Use examples)
- *4: 10 μF is connected to C_L, C_R.
- *5: Startup time (Figure 8-7)

Figure 8-7: Startup Time

Startup time can be calculated as follows.

1. Startup time (typ) = 650[ms]
2. $CCOM = 10 \mu F \times (1 \pm \alpha/100)$

CCOM is a capacitor connected to Terminal C_L/C_R including capacitance variance.

α = Capacitance variance[%]

3. Startup time = Start up time (typ) $\times (1 \pm \alpha)$ [ms]

For example, CCOM = 11 μF then $\alpha = (11 \mu F - 10 \mu F)/10 \mu F = 10$ [%]

So, Startup time = 650 ms $\times (1 + 10/100) = 715$ [ms]

Notes:

- Two uses of R_L load connection:
 - Case1: R_L is connected to AVCC3_DAC /2 (Figure 8-8)
 - Case2: The coupling capacitance must be inserted as shown in (Figure 8-9).

Figure 8-8: R_L is Connected to AVCC_DAC/2 (Example)

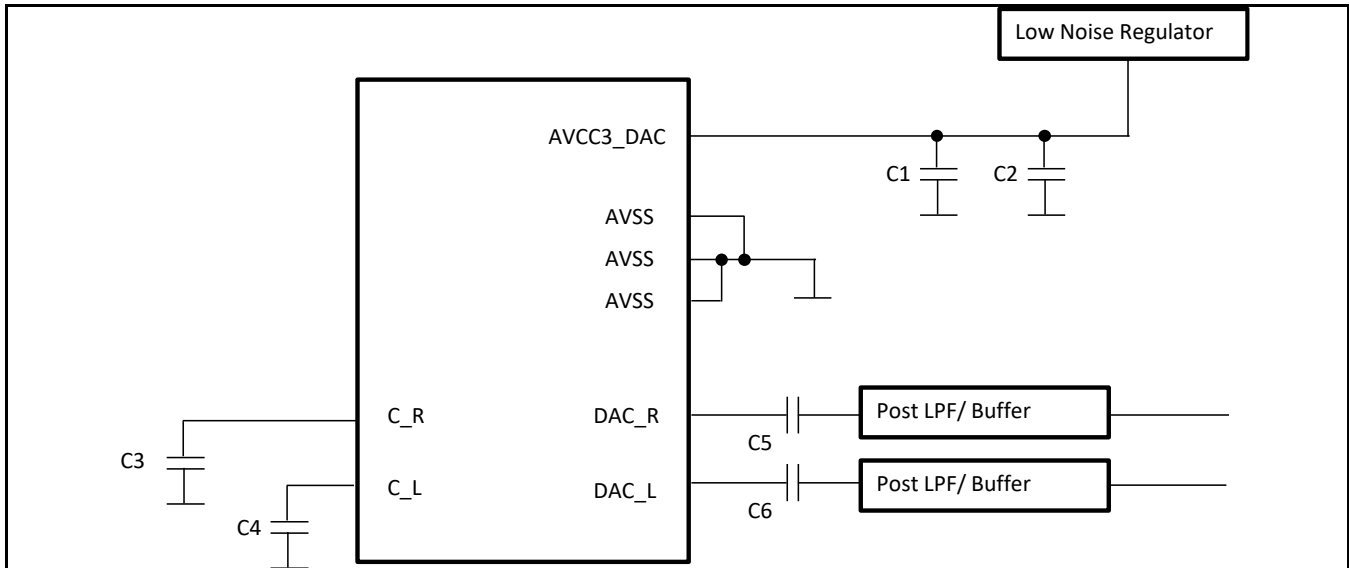

Figure 8-9: Coupling Capacitance (Example)

Notes:

- C1: more than 10 μ F low ESR capacitors
- C2: 0.1 μ F ceramic capacitors
- C3, C4, C5, C6: 10 μ F low ESR capacitors
- Impedance of each power line must be as low as possible.

Notes:

- When DAC is not used in your system, the related pins should be
- AVCC3_DAC = GND and AVSS = GND
- C_L = OPEN and C_R = OPEN
- DAC_L = OPEN and DAC_R = OPEN

- *2: Number of erases for each sector

8.7.2 Notes

While the Flash memory is written or erased, shutdown of the external power (VCC5 or VCC12) is prohibited.

In the application system, where VCC5 or VCC12 might be shut down while writing or erasing, be sure to turn the power off by using an external voltage detection function or external reset (RSTX).

For external power supply voltage stability conditions, see chapter 8.4.5.2 and 8.4.11.4.

1. MCAN wrong message transmission

■ Problem Definition

There is a possibility a message with an ID (arbitration field) and a format and DLC (control field) is transmitted which was not configured by the application. The message itself is syntactically correct and can be received by other nodes.

The occurrence of the limitation requires a certain relationship in time between a transmission request for sending a message and the coincidence of noise in the 3rd bit of intermission field which is treated as the start of new message transmission (SoF).

■ Trigger Condition

Under the following conditions a message with wrong ID, format and DLC is transmitted:

- M_CAN is in state "Receiver" (PSR.ACT = "10"), no pending transmission.
- A new transmission is requested after sample point of 2nd bit of intermission but before the 3rd bit of Intermission is reached.
- The CAN bus is sampled dominant at the third bit of Intermission which is treated as SoF (see ISO11898-1:2015 Section 10.4.2.2).

■ Scope of Impact

Under the conditions listed above it may happen, that:

- The shift register is not loaded with ID, format, and DLC of the requested message.
- The M_CAN will start arbitration with wrong ID, format, and DLC.
- In case the ID won arbitration, a CAN message with valid CRC is transmitted.
- In case this message is acknowledged, the ID stored in the Tx Event FIFO is the ID of the requested Tx message and not the ID of the message transmitted on the CAN bus
- Neither an error is detected by the transmitting node nor at the receiving node.

■ Workaround

Workaround 1:

This workaround avoids submitting a transmission request in the critical time window of about one bit time before the sample point of the 3rd bit of intermission field when on other pending transmission request exists:

- Request a new transmission if another transmission is already pending or when the M_CAN / M_TTCAN is not in state "Receiver" (when PSR.ACT \neq "10").
- If no pending transmission request exists, the application software needs to evaluate the Rx Interrupt flags IR.DRX, IR.RF0N, IR.RF1N which are set at the last bit of EoF when a received and accepted message gets valid.
- A new transmission may be requested by writing to TXBAR once the Rx interrupt occurred and the application waited another 3 bit times before submitting its Tx request. Note the Rx interrupt is generated at the last bit of EoF which is followed by three bits of Intermission.
- The application has to take care that the transmission request for the CAN Protocol Controller is activated before the critical window of the following reception is reached.

A supplemental action can be applied in order to detect messages which contain wrong ID and control field information:

- A checksum covering arbitration and control fields can be added to the data field of the message to be transmitted, to detect frames transmitted with wrong arbitration and control fields.

Workaround 2:

This workaround ensures that always at least one pending Tx request exists. If that is the case, the application may launch its Tx requests at any time without suffering from the limitation.

- Define a low priority message with DLC = 0 that can be sent without harm. E.g. loses arbitration against all other application messages, does not pass any acceptance filter of nodes in the same network. DLC = 0 shall reduce latency for other application messages.
- Configure sufficient Tx buffers – at least two - for this message type thus that there is always another one waiting to be sent. E.g. an application that cannot react quickly enough with the time a single message of this type is sent, more than 2 Tx buffer may become necessary.
- The application uses the standard interfaces of the CAN / CAN FD stack to feed these messages.
- Whenever Tx confirmation is indicated for the second but last message of this type with pending Tx request, the application needs to submit at least one new Tx request. Note Tx confirmation is a standard feature in the AUTOSAR SW architecture.
- Before initially leaving INIT state of the M_CAN IP by clearing CCCR.INIT bit, make sure to activate a Tx request after having cleared CCCR.CCE. This will ensure that the conditions for the occurrence of the limitation when synchronizing to the CAN bus the first time after RESET are prevented.

■ Fix Status

Not be planned.

2. CAN FD controller message order inversion when transmitting from dedicated Tx Buffers configured with same Message ID

■ Problem Definition

CAN FD controller message order inversion when multiple Tx Buffers that are configured with the same Message ID have pending Tx requests.

■ Configuration

Several Tx Buffers are configured with the same Message ID. Transmission of these Tx Buffers is requested sequentially with a delay between the individual Tx requests.

■ Expected behavior

When multiple Tx Buffers that are configured with the same Message ID have pending Tx requests, they shall be transmitted in ascending order of their Tx Buffer numbers. The Tx Buffer with lowest buffer number and pending Tx request is transmitted first.

■ Observed behavior

It may happen, depending on the delay between the individual Tx requests, that where multiple Tx Buffers are configured with the same Message ID the Tx Buffers are not transmitted in order of the Tx Buffer number (lowest number first).

■ Workaround

First, write the group of Tx messages with the same Message ID to the Message RAM and then request transmission of all these messages concurrently by a single write access to TXBAR. Before requesting a group of Tx messages with this Message ID, ensure that no message with this Message ID has a pending Tx request.

Applications not able to use the above workaround can implement a counter within the data section of their messages sent with same ID in order to allow the recipients to determine the correct sending sequence.

■ Fix Status

Not be planned

3. CAN FD incomplete description of Dedicated Tx Buffers and Tx Queue related to transmission from multiple buffers configured with the same Message ID

■ Problem Definition

There was an incomplete description related to transmission from multiple buffers configured with the same Message ID in Section 3.5.2 Dedicated Tx Buffers and Section 3.5.4 Tx Queue of the Hardware Manual.

■ Detailed explanation

The following is the updated description in Section 3.5.2 Dedicated Tx Buffers and Section 3.5.4 Tx Queue of the Hardware Manual.

Section 3.5.2 Dedicated Tx Buffers:

- Original content in the Hardware Manual:

In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first.

- Enhancement:

These Tx buffers shall be requested in ascending order with the lowest buffer number first. Alternatively, all Tx buffers configured with the same Message ID can be requested simultaneously by a single write access to TXBAR.

Section 3.5.4 Tx Queue:

- Original content in the Hardware Manual:

In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

- Replacement:

In case that multiple Tx Queue buffers are configured with the same Message ID, the transmission order depends on the numbers of the buffers where the messages were stored for transmission. As these buffer numbers depend on the then current states of the PUT index, a prediction of the transmission order is not possible.

- Original content in the Hardware Manual:

An Add Request cyclically increments the Put Index to the next free Tx Buffer.

- Replacement:

The Put Index always points to that free buffer of the Tx Queue with the lowest buffer number.

■ Workaround

In case a defined order of transmission is required, the Tx FIFO shall be used for transmission of messages with the same Message ID. Alternatively dedicated Tx buffers with the same Message ID shall be requested in ascending order with the lowest buffer number first or by a single write access to TXBAR. Alternatively, a single Tx Buffer can be used to transmit those messages one after the other.

■ Fix Status

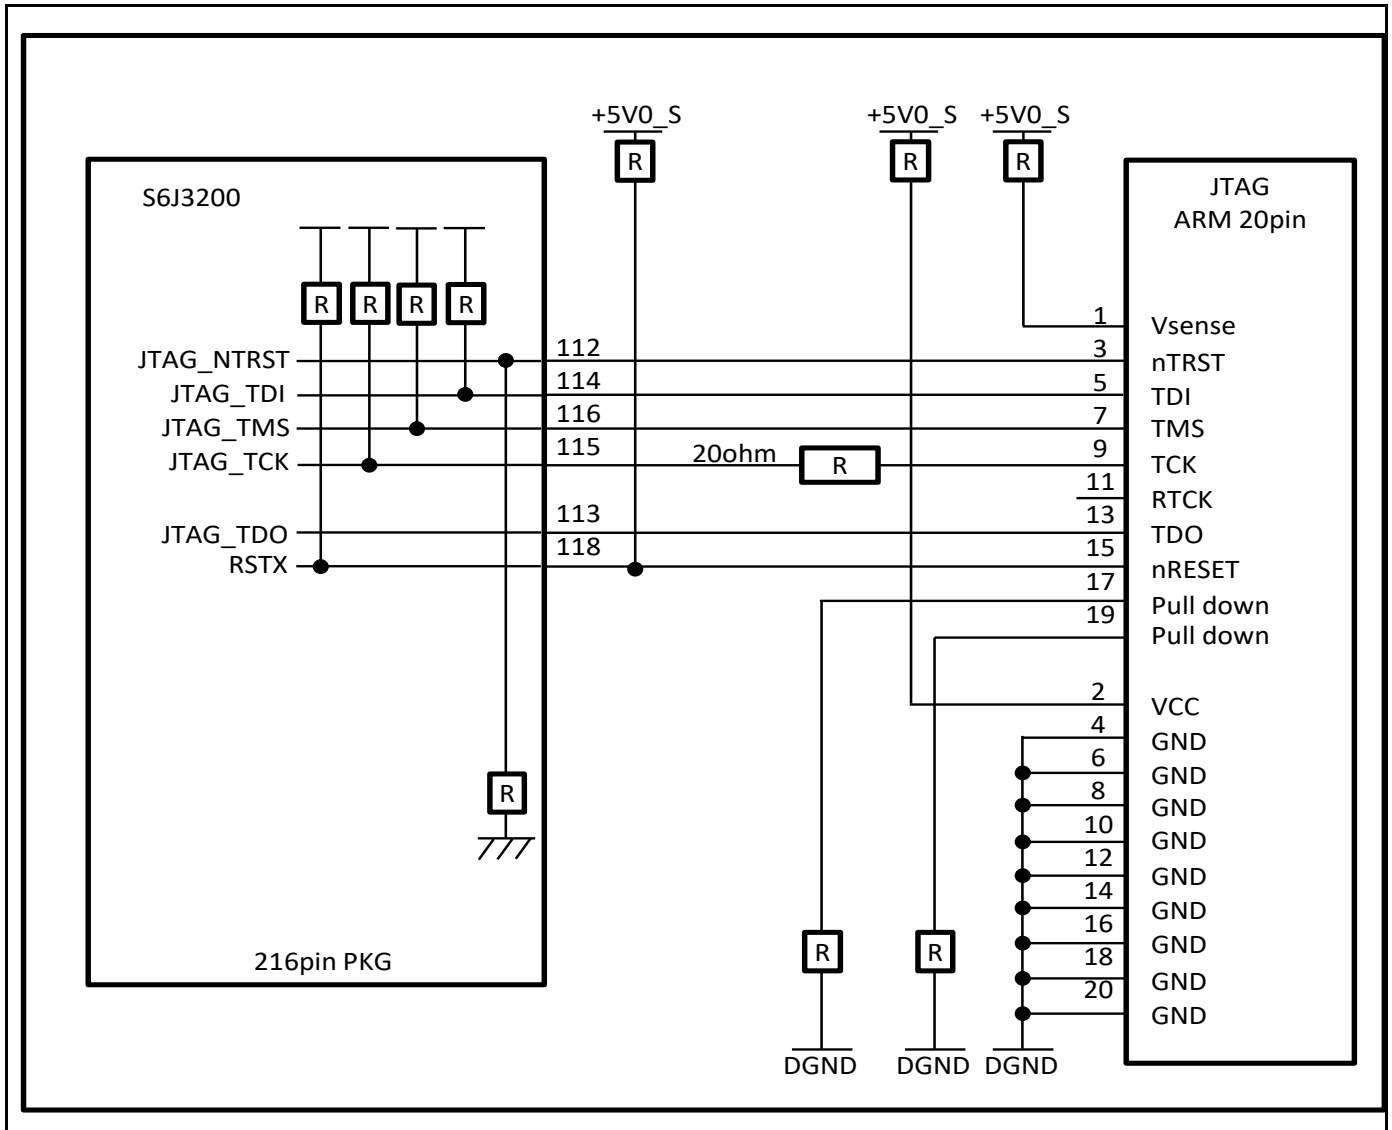

No silicon fix planned. Use workaround.

Hardware Manual will be updated accordingly.

*F	5727929	05/08/2017	<p>Section 8.3.2.2, Section 8.3.2.3 Power supply current: Removed note "The values will be evaluated after engineering samples release" because evaluation is complete.</p> <p>Section 8.3.2.2, Section 8.3.2.3 Power supply current: For modes with only PD1=ON, added information that PD4_0/1 are OFF not make the condition clearer</p> <p>Section 3.2.2: Moved the Ethernet-pin table to chapter 3.2.1 (content not changed)</p> <p>Section 7.2 "Method to Switch off VCC12 during Power-off Sequence" Corrected typo of reset pin (RTSX -> RSTX)</p> <p>Section 8.4.11.4: Added note below waveform about PSC_1</p> <p>Section 8.4.23.2 I2S Slave timing: Added timing chart fir I2S slave timing</p> <p>Section 9 "Abbreviation": Added TIC because it is used in TRM's Master access table now</p> <p>Section 8.3.2.2 "PPS Timer mode Shutdown": Added note that the current consumption values are with Regulator in standby mode.</p> <p>Section 8.3.2.2 "PPS Stop mode Shutdown": Added note that the current consumption values are with Regulator in standby mode.</p> <p>Section 8.3.2.3 "PPS Stop mode Shutdown": Added note that the current consumption values are with Regulator in standby mode.</p> <p>Section 8.4.16.2 "Hyper Bus Write Timing (HyperRAM): Added note to consider HyperRAM refresh interval</p> <p>Section 8.4.16.4 "Hyper Bus Read Timing (HyperRAM): Added note to consider HyperRAM refresh interval</p> <p>Section 8.3.2.2 "PSS Timer Mode Shutdown (PD6=OFF)": Added note that values are with CR-oscillator disabled</p> <p>Added Section 8.3.2.4 "Internal CR oscillator current consumption</p> <p>Section 3.2.1 "Ethernet" (pin list): Removed duplicated line for RXER</p> <p>Section 4.2.1 / 4.2.2 "Package dimensions": Exchanged pictures to correct values for A1 from (0.00 .. 0.20)mm to (0.05 .. 0.15)mm</p> <p>Section 8.3.2.1 "Run mode current": Added current consumption for a specific realistic</p>

Revision	ECN	Submission Date	Description of Change
			<p>use case (635mA) ("Example use case *3")</p> <p>Section 8.3.2.1 "Run mode current": Added note and footnote *2 for the worst case scenarios, explaining that this is an 'unlikely condition'.</p> <p>Section 8.3.2.3 "PSS Stop Mode current": Updated values to latest char results</p> <p>Section 8.7.1 Flash Memory/Electrical Characteristics: removed *3 at 'Max' because there is no footnote *3</p>
*G	5917755	10/12/2017	<p>Section 2.2.2 ID: Added new table for IDs for and changed Chip-IDs and JTAG-IDs for S6J32xxxxN</p> <p>Section 6.1 Port description: removed CRS pin because it's only required for Ethernet-Half duplex mode which is not supported</p> <p>Section 6.1 Port description: Added alternative pin 34 for RXDV except for revision M</p> <p>Section 3.2.1. Ethernet: removed CRS and COL pin from the pin list because it's only required for Ethernet-Half duplex mode and collision detection which are not supported</p> <p>Section 4.1 Pin assignment: Added alternative location of RXDV for P5_27 for all packages</p> <p>Section 4.1 Pin Assignment: Removed CRS and COL from all packages because half duplex mode and collision detection are not supported</p> <p>Section 2.2.1 Basic Option: Added revision N for RXDV-pinning improvement</p> <p>Section 4.1. Pin Assignment: added table listing the pin functions which are only available at certain revisions (only RXDV at pin 34 included till now)</p> <p>Section 2.2.1 removed revH from Figure 2-1</p> <p>Section 2.2.2 removed ID-tables for revH</p> <p>All: removed all occurrences of revision H, because this silicon is not provided anymore</p> <p>Section 10 added latest ordering information, removed S6J32EELTHSC20000 because not available</p> <p>Section 8.1: footnote *A: added note that simulation with IBIS model should be done to confirm that clamp current is not exceeded)</p> <p>Section 4.1 Pin assignment: changed AVSS to AVSS/AVRL5 because AVSS and AVRL5 are shared, but it was not explained</p> <p>Section 6: Port description: added AVRL5 to AVSS row because AVSS and AVRL5 are shared</p> <p>Section 8.2: allowed additional two power sequences. Same as in S6J3200-Datasheet</p> <p>Section 5.1 I/O Circuit type: Type E (3V IO) corrected pull-up/down from 50kOhm to 33 kOhm</p>
*H	5991338	12/12/2017	<p>Section 1.2 Related Documents: Updated table with links and Spec numbers.</p> <p>Section 10 Ordering information: Corrected the following part numbers: S6J32GEKSMSC2000A -> S6J32GEKSMSE2000A and S6J32GEKSNSC20000 -> S6J32GEKSNSE20000. Corrected package code for TEQFP-208 from LEQ208 to LET208.</p> <p>Entire document: Fixed spaces in tables, added missing links to Cypress web pages</p>

Revision	ECN	Submission Date	Description of Change
*I	6197700	06/05/2018	<p>Section 2.2.1 'Basic Options': Added revision N in Figure 2-1.</p> <p>Section 2.2.1 'Basic Options': Added option table for revision N.</p> <p>Section 2.2.1 'ID': Added revision N and new option H.</p> <p>Section 4.1.2 TEQFP-216: Added function M_CK_0 to pin 65 (no spec check, pin was already listed in section 6.1 'Port description list' but not shown in the drawing).</p> <p>Section 6.1. Port Description: Changed description of M_SSEL0/1 and G_SSEL0/1.</p> <p>Section 8.2 Operation Assurance Condition: Added the % in note 4 for temperature ("35% or more").</p> <p>Section 8.3.2.2 PSS Timer Mode Shutdown (PD6=OFF): Added values for Timer mode with external clock (w/o Crystal).</p> <p>Section 8.3.2.4 PSS Stop mode Shutdown: Added ICCH5 values for revisions except rev M/P from latest measurement results.</p> <p>Section 8.4.3 Internal clock timing: Changed description of unused clocks to reflect FL00028 and Platform TRM chapter 6 RUNCKEN1/2/3 (disabling of clocks not supported).</p> <p>Section 10 Ordering information: Added newly available devices. Marked revM as 'not for new designs'.</p> <p>All sections: Removed package M (256-pin package). Added revision P as successor of revision M for fixed Flash Interface issue-PEN.</p>
*J	6294104	08/29/2018	Added Section 11. Errata with one item: 1. MCAN wrong message transmission
*K	6316744	09/21/2018	<p>Updated Document Title to read as "S6J32E/S6J32F/S6J32G/S6J32H Series 32-Bit Microcontroller TRAVEO™ T1G Datasheet".</p> <p>Added S6J32H part related information in all instances across the document.</p> <p>Added remark in Table 2-1 and Chapter 6.1 that RMI1 is not supported on S6J32H.</p> <p>Updated Ordering Information:</p> <p>Updated part numbers.</p>
*L	6577298	05/20/2019	Updated to new template.
*M	6901664	06/19/2020	<p>Section 8.1: Added permitted power for Ta=125C and footnote to use only with S6J32JEKSNS20000, S6J32JELNSNC20000</p> <p>Section 8.3.2.1: Added Run mode current conditions for Ta=125C (footnote *4) with S6J32JEKSNS20000, S6J32JELNSNC20000</p> <p>Section 10: added S6J32JEKSNS20000, S6J32JELNSNC20000</p>
*N	7074745	01/25/2021	<p>Updated Ordering Information:</p> <p>Updated part numbers.</p>

Revision	ECN	Submission Date	Description of Change
			Updated Errata: Updated part numbers. Updated Errata Summary: Updated part numbers. Completing Sunset Review.
*O	7100575	03/17/2021	Updated 10. Ordering Information Updated 11. Errata Added 13. Major Changes For details, see 13. Major Changes.
*P	7118986	04/08/2021	Updated Function List: Updated Optional Function: Updated Basic Option: Updated Figure 2-1.
*Q	7402560	10/27/2021	Updated 11. Errata For details, see 13. Major Changes.
