

74ABT373

Octal Transparent Latch with 3-STATE Outputs

The ABT373 consists of eight latches with 3-STATE outputs for bus organized system applications. The flip-flops appear transparent to the data when Latch Enable (LE) is HIGH. When LE is LOW, the data that meets the setup times is latched. Data appears on the bus when the Output Enable (\overline{OE}) is LOW. When \overline{OE} is HIGH the bus output is in the high impedance state.

Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All re-creations are done with the approval of the Original Component Manufacturer (OCM).

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

Quality Overview

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-35835
 - Class Q Military
 - Class V Space Level
- Qualified Suppliers List of Distributors (QSLD)
 - Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OCM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

FOR REFERENCE ONLY

74ABT373 Octal Transparent Latch with 3-STATE Outputs

Features

- 3-STATE outputs for bus interfacing
- Output sink capability of 64mA, source capability of 32mA
- Guaranteed output skew
- Guaranteed multiple output switching specifications
- Output switching specified for both 50pF and 250pF loads
- Guaranteed simultaneous switching, noise level and dynamic threshold performance
- Guaranteed latchup protection
- High-impedance, glitch-free bus loading during entire power up and power down
- Nondestructive, hot-insertion capability

General Description

The ABT373 consists of eight latches with 3-STATE outputs for bus organized system applications. The flip-flops appear transparent to the data when Latch Enable (LE) is HIGH. When LE is LOW, the data that meets the setup times is latched. Data appears on the bus when the Output Enable (\overline{OE}) is LOW. When \overline{OE} is HIGH the bus output is in the high impedance state.

Ordering Information

Order Number	Package Number	Package Description
74ABT373CSC	M20B	20-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-013, 0.300" Wide
74ABT373CSJ	M20D	20-Lead Small Outline Package (SOP), EIAJ TYPE II, 5.3mm Wide
74ABT373CMSA	MSA20	20-Lead Shrink Small Outline Package (SSOP), JEDEC MO-150, 5.3mm Wide
74ABT373CMTC	MTC20	20-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 4.4mm Wide

Device also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering number.
Pb-Free package per JEDEC J-STD-020B.

Connection Diagram

Pin Descriptions

Pin Names	Description
D ₀ -D ₇	Data Inputs
LE	Latch Enable Input (Active HIGH)
\overline{OE}	Output Enable Input (Active LOW)
O ₀ -O ₇	3-STATE Latch Outputs

Functional Description

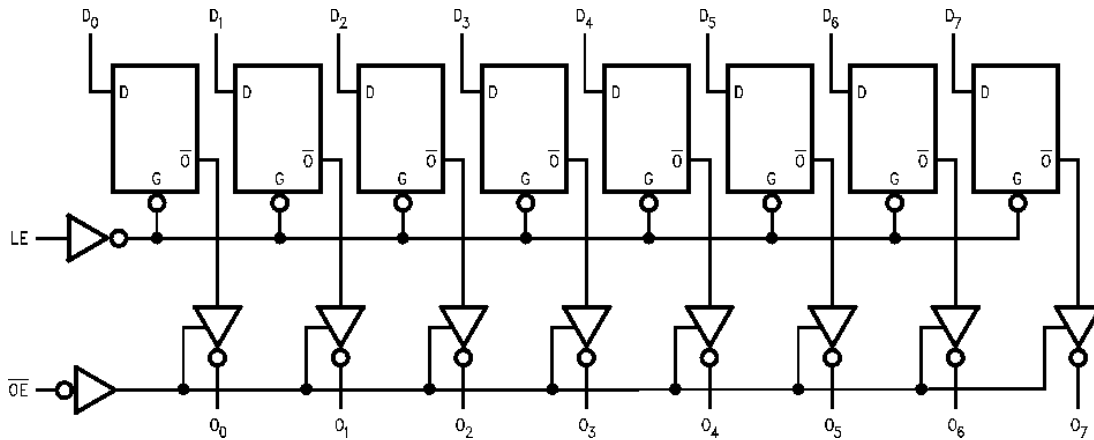

The ABT373 contains eight D-type latches with 3-STATE output buffers. When the Latch Enable (LE) input is HIGH, data on the D_n inputs enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time its D input changes. When LE is LOW, the latches store the information that was present on the D inputs at setup time preceding the HIGH-to-LOW transition of LE. The 3-STATE buffers are controlled by the Output Enable (\overline{OE}) input. When \overline{OE} is LOW, the buffers are in the bi-state mode. When \overline{OE} is HIGH the buffers are in the high impedance mode but this does not interfere with entering new data into the latches.

Truth Table

Inputs			Output
LE	\overline{OE}	D_n	O_n
H	L	H	H
H	L	L	L
L	L	X	O_n (no change)
X	H	X	Z

H = HIGH Voltage Level
 L = LOW Voltage Level
 X = Immaterial
 Z = HIGH Impedance State

Logic Diagram

Please note that this diagram is provided only for the understanding of logic operations and should not be used to estimate propagation delays.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter	Rating
T_{STG}	Storage Temperature	-65°C to +150°C
T_A	Ambient Temperature Under Bias	-55°C to +125°C
T_J	Junction Temperature Under Bias	-55°C to +150°C
V_{CC}	V_{CC} Pin Potential to Ground Pin	-0.5V to +7.0V
V_{IN}	Input Voltage ⁽¹⁾	-0.5V to +7.0V
I_{IN}	Input Current ⁽¹⁾	-30mA to +5.0mA
V_O	Voltage Applied to Any Output Disabled or Power-Off State HIGH State	-0.5V to +5.5V -0.5V to V_{CC}
	Current Applied to Output in LOW State (Max.)	twice the rated I_{OL} (mA)
	DC Latchup Source Current Across Common Operating Range \overline{OE} Pin Other Pins	-150mA -500mA
	Over Voltage Latchup (I/O)	10V

Note:

1. Either voltage limit or current limit is sufficient to protect inputs.

Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to absolute maximum ratings.

Symbol	Parameter	Rating
T_A	Free Air Ambient Temperature	-40°C to +85°C
V_{CC}	Supply Voltage	+4.5V to +5.5V
$\Delta V / \Delta t$	Minimum Input Edge Rate Data Input Enable Input	50mV/ns 20mV/ns

DC Electrical Characteristics

t_{PHZ}	Output Disable Time	1.0	5.5	(10)		(10)		ns
t_{PZL}		1.0	5.5					

Notes:

- This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.).
- This specification is guaranteed but not tested. The limits represent propagation delay with 250pF load capacitors in place of the 50pF load capacitors in the standard AC load. This specification pertains to single output switching only.
- This specification is guaranteed but not tested. The limits represent propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.) with 250pF load capacitors in place of the 50pF load capacitors in the standard AC load.
- The 3-STATE delay times are dominated by the RC network (500Ω, 250pF) on the output and has been excluded from the datasheet.

Skew

SOIC package.

Symbol	Parameter	$T_A = -40^\circ\text{C to } +85^\circ\text{C},$ $V_{CC} = 4.5\text{V} - 5.5\text{V},$ $C_L = 50\text{pF},$ 8 Outputs Switching ⁽¹¹⁾	$T_A = -40^\circ\text{C to } +85^\circ\text{C},$ $V_{CC} = 4.5\text{V} - 5.5\text{V},$ $C_L = 250\text{pF},$ 8 Outputs Switching ⁽¹²⁾	Units
		Max.	Max.	
$t_{OSHL}^{(13)}$	Pin to Pin Skew, HL Transitions	1.0	1.5	ns
$t_{OSLH}^{(13)}$	Pin to Pin Skew, LH Transitions	1.0	1.5	ns
$t_{PS}^{(15)}$	Duty Cycle, LH–HL Skew	1.4	3.5	ns
$t_{OST}^{(13)}$	Pin to Pin Skew, LH/HL Transitions	1.5	3.9	ns
$t_{PV}^{(14)}$	Device to Device Skew, LH/HL Transitions	2.0	4.0	ns

Notes:

- This specification is guaranteed but not tested. The limits represent propagation delays with 250 pF load capacitors in place of the 50pF load capacitors in the standard AC load.
- This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.).
- Skew is defined as the absolute value of the difference between the actual propagation delays for any two separate outputs of the same device. The specification applies to any outputs switching HIGH-to-LOW (t_{OSHL}), LOW-to-HIGH (t_{OSLH}), or any combination switching LOW-to-HIGH and/or HIGH-to-LOW (t_{OST}). This specification is guaranteed but not tested.
- Propagation delay variation is for a given set of conditions (i.e., temperature and V_{CC}) from device to device. This specification is guaranteed but not tested.
- This describes the difference between the delay of the LOW-to-HIGH and the HIGH-to-LOW transition on the same pin. It is measured across all the outputs (drivers) on the same chip, the worst (largest delta) number is the guaranteed specification. This specification is guaranteed but not tested.

Capacitance

Symbol	Parameter	Conditions $T_A = 25^\circ\text{C}$	Typ.	Units
C_{IN}	Input Capacitance	$V_{CC} = 0\text{V}$	5	pF
$C_{OUT}^{(16)}$	Output Capacitance	$V_{CC} = 5.0\text{V}$	9	pF

Note:

- C_{OUT} is measured at frequency $f = 1\text{MHz}$, per MIL-STD-883, Method 3012.
