(Data to Output)

The RCA CD54/74HC/HCT533/563 are high-speed Octal Transparent Latches manufactured with silicon gate CMOS technology. They possess the low power consumption of standard CMOS integrated circuits, as well as the ability to drive 15 LSTTL devices.

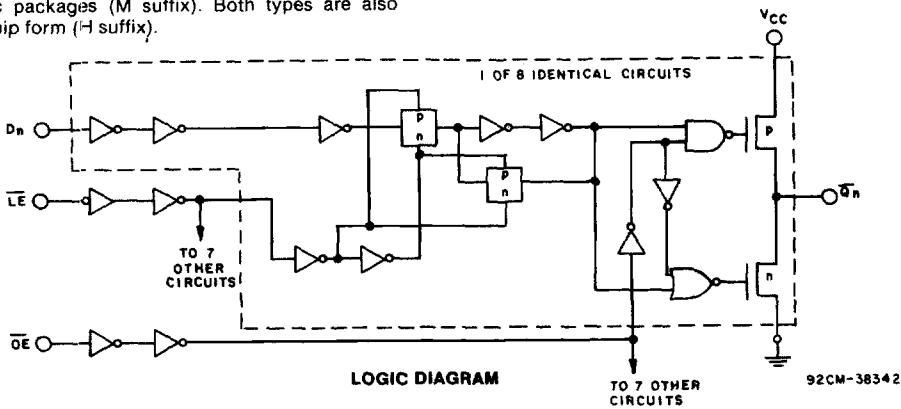

The outputs are transparent to the inputs when the latch enable (\overline{LE}) is high. When the latch enable (\overline{LE}) goes low the data is latched. The output enable (\overline{OE}) controls the 3-state outputs. When the output enable (\overline{OE}) is high the outputs will be in the high impedance state. The latch operation is independent of the state of the output enable.

The CD54/74HC533 and CD54/74HCT533 are identical in function to the CD54/74HC563 and CD54/74HCT563 but have different pinouts. The CD54/74HC533 and CD54/74HCT533 are similar to the CD54/74HC373 and CD54/74HCT373; the latter are non-inverting types.

The CD54HC/HCT533/563 are supplied in 20-lead hermetic dual-in-line ceramic packages (F suffix). The CD74HC/HCT533/563 are supplied in 20-lead dual-in-line plastic packages (E suffix) and in 20-lead dual-in-line surface mount plastic packages (M suffix). Both types are also available in chip form (H suffix).

f_o = output frequency
