

## CC025 Dual-Output-Series Power Modules: 18 Vdc to 36 Vdc Input; 25 W

The CC025 Dual-Output-Series Power Modules use advanced, surface-mount technology and deliver high-quality, compact, dc-dc conversion at an economical price.

### Options

- Isolated case pin
- Higher accuracy output voltage clamp set point
- Short pins: 2.79 mm ± 0.25 mm  
(0.110 in. ± 0.010 in.)
- Heat sink available for extended operation
- Negative logic remote on/off

### Description

The CC025 Dual-Output-Series Power Modules are dc-dc converters that operate over an input voltage range of 18 Vdc to 36 Vdc and provide two regulated outputs. These modules offer low noise levels with industry-standard pinouts in a small footprint. Each highly reliable and efficient unit features remote on/off and current limit.

Each output is individually regulated by its own control circuit and has an independent overvoltage clamp. With standard outputs of ±5 V, ±12 V, and ±15 V, the CC025 Dual-Output-Series is flexible enough to provide modified standard units with any combination of output voltages from 2 V to 15 V.

### Features

- Small size: 71.1 mm x 61.0 mm x 12.7 mm  
(2.80 in. x 2.40 in. x 0.50 in.)
- Efficiency greater than 80%
- Wide operating temperature range
- Low output noise
- Industry-standard pinout
- Metal case
- 2:1 input voltage range
- Remote on/off (positive logic)
- *UL*\* Recognized, *CSA*† Certified, and VDE Licensed
- Within FCC and CISPR Class A radiated limits
- Two tightly regulated outputs

### Applications

- Distributed power architectures
- Telecommunications

\* *UL* is a registered trademark of Underwriters Laboratories, Inc.

† *CSA* is a registered trademark of Canadian Standards Association.

## Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operational sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

Parameter	Symbol	Min	Max	Unit
Input Voltage (continuous)	$V_i$	—	50	Vdc
I/O Isolation Voltage:				
dc	—	—	500	V
Transient (1 minute)	—	—	850	V
Operating Case Temperature	$T_c$	-40	100	°C
Storage Temperature	$T_{stg}$	-55	125	°C

## Electrical Specifications

Unless otherwise indicated, specifications apply to all modules over all operating input voltage, resistive load, and temperature conditions.

**Table 1. Input Specifications**

Parameter	Symbol	Min	Typ	Max	Unit
Operating Input Voltage	$V_i$	18	28	36	Vdc
Maximum Input Current ( $V_i = 0$ V to 36 V; $I_o = I_{o,max}$ ; see Figure 1.)	$I_{i,max}$	—	—	3.0	A
Inrush Transient	$i^2t$	—	—	0.8	A <sup>2</sup> s
Input Reflected-ripple Current, Peak-to-peak (5 Hz to 20 MHz, 12 $\mu$ H source impedance; $T_c = 25$ °C; see Figure 11 and Design Considerations section.)	—	—	25	—	mAp-p
Input Ripple Rejection (120 Hz)	—	—	60	—	dB

## Fusing Considerations

**CAUTION: This power module is not internally fused. An input line fuse must always be used.**

This encapsulated power module can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of a sophisticated power architecture. To preserve maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a normal-blow, dc fuse with a maximum rating of 5 A (see Safety Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. Refer to the fuse manufacturer's data for further information.

Test Configurations

Note: Measure input reflected-ripple current with a simulated source impedance ( $L_{\text{TEST}}$ ) of 12  $\mu\text{H}$ . Capacitor  $C_s$  offsets possible battery impedance. Current is measured at the input of the module.

Figure 11. Input Reflected-Ripple Test Setup

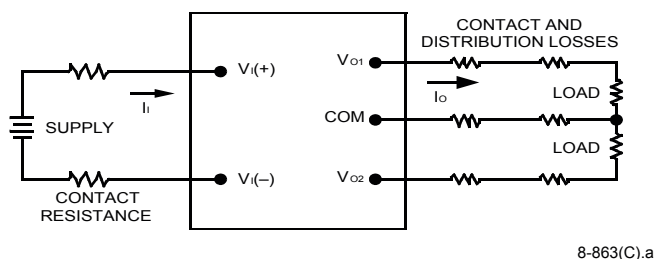

Note: Use a 0.1  $\mu\text{F}$  ceramic capacitor. Scope measurement should be made by using a BNC socket. Position the load between 50 mm and 75 mm (2 in. and 3 in.) from the module.

Figure 12. Output Noise Measurement Test Setup

## Test Configurations (continued)

8-863(C).a

Note: All measurements are taken at the module terminals. When socketing, place Kelvin connections at module terminals to avoid measurement errors due to socket contact resistance. In addition,  $V_I(-)$  is internally connected to the case.

$$\eta = \frac{\sum_{j=1}^2 |[V_{Oj} - COM] I_{Oj}|}{[V_I(+)-V_I(-)] I_i} \times 100$$

Figure 13. Output Voltage and Efficiency Measurement Test Setup

## Design Considerations

### Input Source Impedance

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module. A 33  $\mu$ F electrolytic capacitor (ESR < 0.7  $\%$  at 100 kHz) mounted close to the power module helps ensure stability of the unit.

**Note:**  $V_I(-)$  is internally connected to the case for a standard module.

## Safety Considerations

For safety-agency approval of the system in which the power module is used, the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standard, i.e., *UL-1950*, *CSA 22.2-950*, *EN60950*.

For the converter output to be considered meeting the requirements of safety extra-low voltage (SELV), the input must meet SELV requirements.

The power module has extra-low voltage (ELV) outputs when all inputs are ELV.

The input to these units is to be provided with a maximum 5 A normal blow fuse in the ungrounded lead.

## Input/Output Voltage Reversal

**CAUTION:** Applying a reverse voltage across the module output forward biases an internal diode. Attempting to start the module under this condition can damage the module.

## Feature Descriptions

### Remote On/Off

Two remote on/off options are available. Positive logic remote on/off turns the module on during a logic high voltage on the remote ON/OFF pin, and off during a logic low. Negative logic remote on/off, code suffix "1," turns the module off during a logic high and on during a logic low.

To turn the power module on and off, the user must supply a switch to control the voltage between the on/off terminal and the  $V_{I(-)}$  terminal ( $V_{on/off}$ ). The switch can be an open collector or equivalent (see Figure 14). A logic low is  $V_{on/off} = 0$  V to 1.2 V. The maximum  $I_{on/off}$  during a logic low is 1 mA. The switch should maintain a logic low voltage while sinking 1 mA.

During a logic high, the maximum  $V_{on/off}$  generated by the power module is 10 V. The maximum allowable leakage current of the switch at  $V_{on/off} = 10$  V is 50  $\mu$ A.

Figure 14. Remote On/Off Implementation

### Output Overvoltage Clamp

The output overvoltage clamp consists of control circuitry, independent of the primary regulation loop, that monitors the voltage on the output terminals. The control loop of the clamp has a higher voltage set point than the primary loop (see Feature Specifications table). This provides a redundant voltage control that reduces the risk of output overvoltage.

### Current Limit

To provide protection in a fault (output overload) condition, the unit is equipped with internal current-limiting circuitry and can endure current limiting for an unlimited duration. At the point of current-limit inception, the unit shifts from voltage control to current control. If the output voltage is pulled very low during a severe fault, the current-limit circuit can exhibit either foldback or tailout characteristics (output-current decrease or increase). The unit operates normally once the output current is brought back into its specified range.

### Grounding Considerations

For modules without the isolated case ground pin option, the case is internally connected to the  $V_{I(-)}$  pin. For modules with the isolated case ground pin, option 7, the  $V_{I(-)}$  pin is not connected to the case.

## Thermal Considerations

8-866(C),a

Note: Dimensions are in millimeters and (inches). Drawing is not to scale.

**Figure 15. Thermal Test Setup**

The CC025 Dual-Output-Series Power Modules are designed to operate in a variety of thermal environments. As with any electronic component, sufficient cooling must be provided to help ensure reliable operation of the unit. Heat-dissipating components inside the module are thermally coupled to the case. Heat is removed by conduction, convection, and radiation to the surrounding environment.

The thermal data presented is based on measurements taken in a wind tunnel. The test setup shown in Figure 15 was used to collect data. Actual performance can vary depending on the particular application environment.

## Basic Thermal Performance

The CC025 Dual-Output-Series Power Modules have a separate power stage for each of the outputs. This means that the maximum operating temperature can be predicted quite closely by treating each output individually and then summing the results. Figures 16 through 19 are used to predict the safe operating condition for many different operating and environmental conditions.

The method used to determine the maximum ambient temperature at a given air velocity is a four-step process:

1. Find the power dissipated for output 1 by using the appropriate chart (Figures 16 through 18) for a particular output condition ( $I_{O1}$ ).
2. Repeat step 1 for output 2 using Figures 16 through 18.
3. Find the total power dissipated by summing the power dissipated on each of the outputs:  
 $(P_{Dout1} + P_{Dout2}) = P_{Dtotal}$
4. Use the total power dissipated with Figure 19 to determine the maximum ambient temperature at different air velocities.

## Thermal Considerations (continued)

### Basic Thermal Performance (continued)

For example, the CC025AJ-M power module with a 27 V input and 2.5 A output on  $V_{O1}$  and a 2.0 A output on  $V_{O2}$  will have a power dissipation of 3.65 W (from Figure 16) plus 2.7 W (from Figure 16) for a total of 6.35 W. Using Figure 19, it can be determined that the maximum ambient temperature at natural convection that the CC025AJ-M can operate at is approximately 59 °C.

Keep in mind that these are approximations of the air temperature and velocity required to keep the case temperature below its maximum rating. The maximum case temperature at the point shown in Figure 15 must be kept at 100 °C or less.

### Air Velocity

The air velocity required to maintain a desired maximum case temperature for a given power dissipation and ambient temperature can be calculated by using Figure 19 and the following equation:

$$\theta_{CA} = \frac{T_{C, \max} - T_A}{P_{D\text{total}}}$$

where  $\theta_{CA}$  is the thermal resistance from case-to-ambient air (°C/W),  $T_{C, \max}$  is the desired maximum case temperature (°C),  $T_A$  is the ambient inlet temperature (°C), and  $P_{D\text{total}}$  is the total power dissipated from the module (W).

For example, to maintain a maximum case temperature of 85 °C with an ambient inlet temperature of 55 °C and a power dissipation of 6.7 W, the thermal resistance is:

$$\theta_{CA} \leq \frac{85^\circ\text{C} - 55^\circ\text{C}}{6.7\text{W}} = 4.5^\circ\text{C/W}$$

This corresponds to an air velocity greater than 0.46  $\text{ms}^{-1}$  (90 fpm) in Figure 19.

Use of Heat Sinks and Cold Plates

The CC025 Dual-Output-Series case includes through-threaded M3 x 0.5 mounting holes allowing attachment of heat sinks or cold plates from either side of the module. The mounting torque must not exceed 0.56 N/m (5 in.-lb.).

The following thermal model can be used to determine the required thermal resistance of the sink to provide the necessary cooling:

where Pd is the power dissipated by the module, θcs represents the interfacial contact resistance between the module and the sink, and θsa is the sink-to-ambient thermal impedance (°C/W). For thermal greases or foils, a value of θcs = 0.1 °C/W to 0.3 °C/W is typical.

The required θsa is calculated from the following equation:

$$\theta_{SA} = \frac{T_C - T_A}{P_{Dtotal}} - \theta_{CS}$$

Note that this equation assumes that all dissipated power must be shed by the sink. Depending on the user-defined application environment, a more accurate model including heat transfer from the sides and bottom of the module can be used. This equation provides a conservative estimate in such instances.

For further information, refer to the *Thermal Energy Management CC-, CW-, DC-Series 25 W to 30 W Board-Mounted Power Modules* Technical Note.

## Outline Diagram

Dimensions are in millimeters and (inches).

Copper paths must not be routed beneath the power module standoffs.

Tolerances:  $x.x \pm 0.5$  mm (0.02 in.),  $x.xx \pm 0.25$  mm (0.010 in.).

**Note:** For standard modules,  $V_I(-)$  is internally connected to the case and the CASE GROUND pin is not present. If the CASE GROUND pin is chosen, device code suffix 7, then  $V_I(-)$  is not connected to the case and the CASE GROUND pin is floating.

## Ordering Information

**Table 4. Ordering Information Table**

Input Voltage	Output Voltage	Output Power	Remote On/Off Logic	Device Code	Comcode
18 V—36 V	±5 V	25 W	positive	CC025AJ-M	107586885
18 V—36 V	±12 V	25 W	positive	CC025BK-M	107586893
18 V—36 V	±15 V	25 W	positive	CC025CL-M	107586901

Optional features may be ordered using the device code suffixes shown below. To order more than one option, list suffixes in numerically descending order followed by the -M suffix, indicating metric (M3 x 0.5 heat sink hardware). The heat sinks designed for this package have an M prefix, i.e., MHSTxxx45 and MHSLxxx45 (see *Thermal Energy Management CC-, CW-, DC-, and DW-Series 25 W to 30 W Board-Mounted Power Modules Technical Note*).

**Table 5. Options Table**

Option	Device Code Suffix
Short pins: 2.79 mm ± 0.25 mm (0.110 in. ± 0.010 in.)	8
Isolated case ground pin	7
Negative logic remote on/off	1
