

96-Channel Serial to Parallel Converter with Push-Pull Outputs

Features

- 96 High-Voltage Channels
 - Up to 80V Operating Output Voltage
 - 75 mA Peak Output Sink/Source Current
- Six Parallel 16-bit Shift Registers
 - Clockwise and Counter-Clockwise Data Shifting via DIR Pin
- 30 MHz Data Rate

Applications

- Inkjet Printer Driver
- AC Plasma Data Driver
- 3D Printer Driver

Related Devices

- **HV583**: 128-Channel Serial to Parallel Converter with Push-Pull Outputs

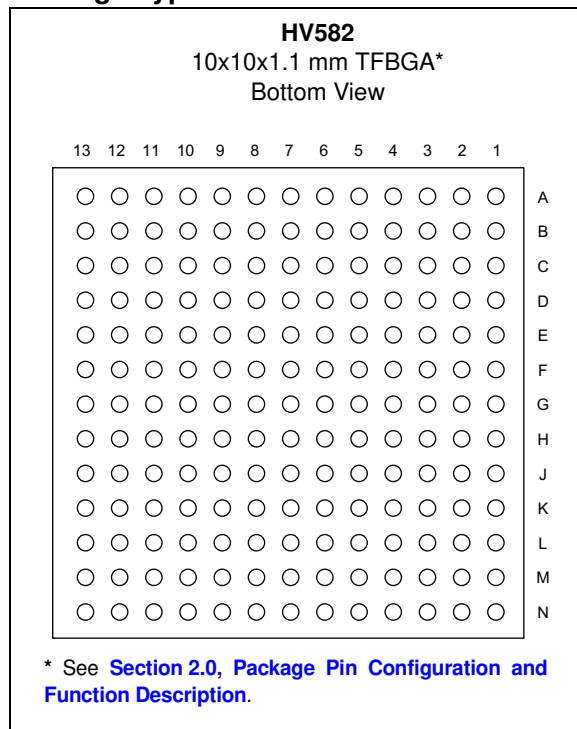

Description

HV582 is a unipolar, 96-channel low-voltage serial to high-voltage parallel converter with push-pull outputs. This device has been designed for applications requiring multiple high-voltage outputs with current sinking and sourcing capabilities, such as plasma displays and Inkjet printers.

The device consists of six parallel 16-bit shift registers, a 96-bit latch and 96 high-voltage outputs. The shift registers operate at 30 MHz, allowing 180 MHz data rates due to the parallel arrangement.

HV582 is offered in a 169-ball 10 x 10 x 1.1 mm TFBGA package.

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Rating†

Supply Voltage V_{DD}	-0.5V to +6.0V
High-Voltage Supply V_{PP}	V_{DD} to +85V
Logic Input Voltages.....	-0.5V to V_{DD} + 0.5V
Operating Junction Temperature.....	-40°C to +125°C
Storage Temperature	-65°C to +150°C

†**Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions, above those indicated in the operational listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. Device is ESD sensitive. Use appropriate ESD precaution.

RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min.	Typ.	Max.	Units	Conditions
Logic Supply Voltage	V_{DD}	4.5	5.0	5.5	V	
High-Voltage Supply	V_{PP}	10	—	80	V	
High-Level Input Voltage	V_{IH}	$V_{DD} - 0.9$	—	V_{DD}	V	
Low-Level Input Voltage	V_{IL}	0	—	0.9	V	

TABLE 1-1: POWER SEQUENCES

Sequence Type	Steps
Power-Up Sequence	<ol style="list-style-type: none"> 1. Connect Ground. 2. Apply V_{DD}. 3. Set All Inputs (Data, CLK, etc.) to a known state. 4. Apply V_{PP}.
Power-Down Sequence	Repeat the Power-Up sequence in reverse order.

DC ELECTRICAL CHARACTERISTICS

Electrical Specification: Unless otherwise specified, $T_A = T_J = +25^\circ\text{C}$, $V_{DD} = 5.0\text{V}$ and $V_{PP} = 80\text{V}$.

2.1 High-Voltage Output Pins (HV_{OUT1} to HV_{OUT96})

These are the high-voltage output channels (Push-Pull).

2.2 High-Voltage Power Supply Pins (V_{PP})

High-voltage power supply pins for the output channels (HV_{OUTn}).

2.3 High-Voltage Ground Pins (HV_{GND})

High-voltage ground pins provide the reference ground level for the high-voltage output channels.

2.4 Logic Power Supply Pins (V_{DD})

Logic power supply pins for the 16-bit shift registers, 96-bit latch and decoders.

2.5 Data Input/Output Pins (D1B, D2B, D3B, D4B, D5B, D6B)

Data Input/Output pins are configurable as inputs or outputs for the shift registers depending on the state of the Direction pin (DIR).

When DIR is High, pins D1B to D6B are configured as inputs to the data shift registers. When DIR is Low, these pins are configured as outputs of the data shift registers.

2.6 Polarity Pin (POL)

The Polarity pin inverts the current state for all the HV_{OUTn} channels (from High to Low or Low to High) when set High.

2.7 Output Enable Pin (OE)

The Output Enable pin controls the functionality of the high-voltage output channels.

When OE is High, all HV_{OUTn} channels are enabled and form a push-pull configuration to operate according to input data or \overline{OL} , \overline{OH} or POL configuration states. When OE is Low, all HV_{OUTn} channels are forced to a high-impedance state, regardless of the data stored in the 96-bit latch or the states of the \overline{OL} , \overline{OH} and POL pins.

2.8 Output Low Pin (\overline{OL})

The Output Low pin sets all high-voltage output channels (HV_{OUT1} to HV_{OUT96}) to a Low level state (HV_{GND}).

When \overline{OL} is set Low and OE is High, all the HV_{OUTn} channels are forced to a Low-level state (HV_{GND}), regardless of the data stored in the 96-bit latch. See [Table 1-2](#) for more information.

2.9 Output High Pin (\overline{OH})

The Output High pin sets all high-voltage output channels (HV_{OUT1} to HV_{OUT96}) to a High-level state (V_{PP}). When \overline{OH} is Low while OE and \overline{OL} are High, all the HV_{OUTn} channels are forced to a High-level state (V_{PP}), regardless of the data stored in the 96-bit latch. See [Table 1-2](#) for more information.

2.10 Direction Pin (DIR)

The DIR pin controls the direction of the input data flow for the input registers, whether it is clockwise (DnA to DnB) or counter-clockwise (DnB to DnA).

When DIR is set High, data flows from DnB to DnA. When DIR is set Low, data flows from DnA to DnB. See [Table 1-3](#) for more information.

2.11 Logic Ground Pins (GND)

Logic ground pins provide a reference ground level for the low-voltage section of the IC, shift registers, latches and decoders.

2.12 Reset Pin (RST)

The RST pin clears shift registers and the 96-bit latch data content when it is set High. See [Table 1-2](#) for more information.

2.13 Latch Enable Pin (LE)

The Latch Enable pin controls the data transfer from the input shift registers to the 96-bit latch and the HV_{OUTn} channels. See [Table 1-2](#) for more information.

2.14 Clock Input Pin (CLK)

This is the clock input pin for the 16-bit input shift registers.

2.15 Data Input/Output Pins (D1A, D2A, D3A, D4A, D5A, D6A)

The Data Input/Output pins are configurable as inputs or outputs for the shift registers depending on the state of the Direction pin (DIR).

When DIR is Low, pins D1A to D6A are configured as inputs to the data shift registers. When DIR is High, pins D1A to D6A are configured as outputs of the data shift registers.

2.16 No Connection Pins (NC)

NC pins do not have any functionality on the IC. These pins should not be connected.

HV582

3.0 FUNCTIONAL DESCRIPTION

The HV582 is a unipolar, 96-channel low-voltage serial to high-voltage parallel converter. The device consists of six parallel 16-bit shift registers, a 96-bit latch and 96 high-voltage outputs.

The six independent shift registers allow data to be updated into the 96-bit latch at six times the speed of a single register (30 MHz), providing a fast update rate for the 96 output channels. The 96-bit latch holds the data for the high-voltage output channels; whether it is a High-level or Low-level state. The flow of the input data can switch direction from clockwise (D1-6A to D1-6B) to counter-clockwise (D1-6B to D1-6A) by controlling the DIR pin. A reset pin (RST) is provided to clear the contents of the latches. All channels can be set at the same time to a high-impedance state (High Z), Low-level state, High-level state, or to alter their polarity through the OE, OL, OH and POL pins, respectively.

The high-output voltages (HV_{OUTn}) can operate from 10V to 80V with a maximum current source and sink capability of 75 mA.

3.1 Application Information

HV582 is designed for applications requiring multiple high-voltage outputs with current sinking and sourcing capabilities in the range of ± 75 mA. Typical applications where the HV582 is utilized are in plasma displays, Inkjet printer drivers and 3D printer drivers.

FIGURE 3-1: Typical Application Block Diagram.

4.0 PACKAGING INFORMATION

4.1 Package Marking Information

169-Ball TFBGA (10 x10 x1.1 mm)

Example

Legend:	XX...X	Product Code or Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or may not include the corporate logo.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
