

Intel[®] 975X Express Chipset

Datasheet

For the Intel[®] 82975X Memory Controller Hub (MCH)

November 2005

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH INTEL® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER, AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT. Intel products are not intended for use in medical, life saving, or life sustaining applications.

Intel may make changes to specifications and product descriptions at any time, without notice.

Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined." Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them.

The Intel® 82975X Memory Controller Hub (MCH) may contain design defects or errors known as errata, which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Contact your local Intel sales office or your distributor to obtain the latest specifications and before placing your product order.

¹Hyper-Threading Technology requires a computer system with an Intel® Pentium® 4 processor supporting HT Technology and a Hyper-Threading Technology enabled chipset, BIOS and operating system. Performance will vary depending on the specific hardware and software you use. See <http://www.intel.com/info/hyperthreading/> for more information including details on which processors support HT Technology.

Intel and Pentium are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.

| 4.1 | Configuration Register Details (D1:F0)..... | 53 |
| 4.1.1 | VID—Vendor Identification (D0:F0)..... | 53 |

| | | |
|--------|---|----|
| 4.1.2 | DID—Device Identification (D0:F0) | 53 |
| 4.1.3 | PCICMD—PCI Command (D0:F0) | 54 |
| 4.1.4 | PCISTS—PCI Status (D0:F0) | 55 |
| 4.1.5 | RID—Revision Identification (D0:F0) | 56 |
| 4.1.6 | CC—Class Code (D0:F0) | 56 |
| 4.1.7 | MLT—Master Latency Timer (D0:F0) | 57 |
| 4.1.8 | HDR—Header Type (D0:F0) | 57 |
| 4.1.9 | SVID—Subsystem Vendor Identification (D0:F0) | 57 |
| 4.1.10 | SID—Subsystem Identification (D0:F0) | 58 |
| 4.1.11 | CAPPTR—Capabilities Pointer (D0:F0) | 58 |
| 4.1.12 | EPBAR—Egress Port Base Address (D0:F0) | 59 |
| 4.1.13 | MCHBAR—MCH Memory Mapped Register Range Base Address (D0:F0) | 60 |
| 4.1.14 | PCIEBAR—PCI Express* Register Range Base Address (D0:F0) .. | 61 |
| 4.1.15 | DMIBAR—Root Complex Register Range Base Address (D0:F0) | 62 |
| 4.1.16 | DEVEN—Device Enable (D0:F0) | 63 |
| 4.1.17 | DEAP—DRAM Error Address Pointer (D0:F0) | 64 |
| 4.1.18 | DERRSYN— DRAM Error Syndrome (D0:F0) | 64 |
| 4.1.19 | DERRDST—DRAM Error Destination (D0:F0) | 65 |
| 4.1.20 | PAM0—Programmable Attribute Map 0 (D0:F0) | 66 |
| 4.1.21 | PAM1—Programmable Attribute Map 1 (D0:F0) | 67 |
| 4.1.22 | PAM2—Programmable Attribute Map 2 (D0:F0) | 68 |
| 4.1.23 | PAM3—Programmable Attribute Map 3 (D0:F0) | 69 |
| 4.1.24 | PAM4—Programmable Attribute Map 4 (D0:F0) | 70 |
| 4.1.25 | PAM5—Programmable Attribute Map 5 (D0:F0) | 71 |
| 4.1.26 | PAM6—Programmable Attribute Map 6 (D0:F0) | 72 |
| 4.1.27 | LAC—Legacy Access Control (D0:F0) | 72 |
| 4.1.28 | REMAPBASE—Remap Base Address (D0:F0) | 74 |
| 4.1.29 | REMAPLIMIT—Remap Limit Address (D0:F0) | 74 |
| 4.1.30 | TOLUD—Top of Low Usable DRAM (D0:F0) | 75 |
| 4.1.31 | SMRAM—System Management RAM Control (D0:F0) | 76 |
| 4.1.32 | ESMRAMC—Extended System Management RAM Control (D0:F0) .. | 77 |
| 4.1.33 | TOM—Top of Memory (D0:F0) | 78 |
| 4.1.34 | ERRSTS—Error Status (D0:F0) | 78 |
| 4.1.35 | ERRCMD—Error Command (D0:F0) | 80 |
| 4.1.36 | SMICMD—SMI Command (D0:F0) | 81 |
| 4.1.37 | SCICMD—SCI Command (D0:F0) | 82 |
| 4.1.38 | SKPD—Scratchpad Data (D0:F0) | 82 |
| 4.1.39 | CAPID0—Capability Identifier (D0:F0) | 83 |
| 4.1.40 | EDEAP—Extended DRAM Error Address Pointer (D0:F0) | 83 |
| 4.2 | MCHBAR Register | 84 |
| 4.2.1 | C0DRB0—Channel A DRAM Rank Boundary Address 0 | 85 |
| 4.2.2 | C0DRB1—Channel A DRAM Rank Boundary Address 1 | 86 |
| 4.2.3 | C0DRB2—Channel A DRAM Rank Boundary Address 2 | 86 |
| 4.2.4 | C0DRB3—Channel A DRAM Rank Boundary Address 3 | 87 |
| 4.2.5 | C0DRA0—Channel A DRAM Rank 0,1 Attribute | 87 |
| 4.2.6 | C0DRA2—Channel A DRAM Rank 2, 3 Attribute | 88 |
| 4.2.7 | C0DCLKDIS—Channel A DRAM Clock Disable | 88 |
| 4.2.8 | C0BNKARC—Channel A DRAM Bank Architecture | 89 |
| 4.2.9 | C0DRT1—Channel 0 DRAM Timing Register | 90 |
| 4.2.10 | C0DRC0—Channel 0 DRAM Controller Mode 0 | 91 |
| 4.2.11 | C0DRC1—Channel 0 DRAM Controller Mode 1 | 93 |
| 4.2.12 | C1DRB0—Channel B DRAM Rank Boundary Address 0 | 93 |

| | | |
|--------|---|-----|
| 4.2.13 | C1DRB1—Channel B DRAM Rank Boundary Address 1 | 93 |
| 4.2.14 | C1DRB2—Channel B DRAM Rank Boundary Address 2 | 93 |
| 4.2.15 | C1DRB3—Channel B DRAM Rank Boundary Address 3 | 94 |
| 4.2.16 | C1DRA0—Channel B DRAM Rank 0,1 Attribute | 94 |
| 4.2.17 | C1DRA2—Channel B DRAM Rank 2,3 Attribute | 94 |
| 4.2.18 | C1DCLKDIS—Channel B DRAM Clock Disable | 94 |
| 4.2.19 | C1BNKARC—Channel B Bank Architecture | 94 |
| 4.2.20 | C1DRT1—Channel 1 DRAM Timing Register 1 | 95 |
| 4.2.21 | C1DRC0—Channel 1 DRAM Controller Mode 0 | 95 |
| 4.2.22 | C1DRC1—Channel 1 DRAM Controller Mode 1 | 95 |
| 4.2.23 | PMCFG—Power Management Configuration | 95 |
| 4.2.24 | PMSTS—Power Management Status | 96 |
| 4.3 | EPBAR Registers—Egress Port Register Summary | 97 |
| 4.3.1 | EPESD—EP Element Self Description | 98 |
| 4.3.2 | EPL1D—EP Link Entry 1 Description | 99 |
| 4.3.3 | EPL1A—EP Link Entry 1 Address | 99 |
| 4.3.4 | EPL2D—EP Link Entry 2 Description | 100 |
| 4.3.5 | EPL2A—EP Link Entry 2 Address | 101 |
| 4.3.6 | EPL3D—EP Link Entry 3 Description | 102 |
| 4.3.7 | EPL3A—EP Link Entry 3 Address | 103 |
| 5 | Host-Primary PCI Express* Bridge Registers (D1:F0) | 105 |
| 5.1 | Configuration Register Details (D1:F0) | 109 |
| 5.1.1 | VID1—Vendor Identification (D1:F0) | 109 |
| 5.1.2 | DID1—Device Identification (D1:F0) | 109 |
| 5.1.3 | PCICMD1—PCI Command (D1:F0) | 110 |
| 5.1.4 | PCISTS1—PCI Status (D1:F0) | 112 |
| 5.1.5 | RID1—Revision Identification (D1:F0) | 113 |
| 5.1.6 | CC1—Class Code (D1:F0) | 113 |
| 5.1.7 | CL1—Cache Line Size (D1:F0) | 114 |
| 5.1.8 | HDR1—Header Type (D1:F0) | 114 |
| 5.1.9 | PBUSN1—Primary Bus Number (D1:F0) | 114 |
| 5.1.10 | SBUSN1—Secondary Bus Number (D1:F0) | 115 |
| 5.1.11 | SUBUSN1—Subordinate Bus Number (D1:F0) | 115 |
| 5.1.12 | IOBASE1—I/O Base Address (D1:F0) | 116 |
| 5.1.13 | IOLIMIT1—I/O Limit Address (D1:F0) | 116 |
| 5.1.14 | SSTS1—Secondary Status (D1:F0) | 117 |
| 5.1.15 | MBASE1—Memory Base Address (D1:F0) | 118 |
| 5.1.16 | MLIMIT1—Memory Limit Address (D1:F0) | 119 |
| 5.1.17 | PMBASE1—Prefetchable Memory Base Address (D1:F0) | 120 |
| 5.1.18 | PMLIMIT1—Prefetchable Memory Limit Address (D1:F0) | 121 |
| 5.1.19 | PMBASEU1—Prefetchable Memory Base Address | 122 |
| 5.1.20 | PMLIMITU1—Prefetchable Memory Limit Address | 123 |
| 5.1.21 | CAPPTR1—Capabilities Pointer (D1:F0) | 123 |
| 5.1.22 | INTRLINE1—Interrupt Line (D1:F0) | 124 |
| 5.1.23 | INTRPIN1—Interrupt Pin (D1:F0) | 124 |
| 5.1.24 | BCTRL1—Bridge Control (D1:F0) | 125 |
| 5.1.25 | PM_CAPID1—Power Management Capabilities (D1:F0) | 127 |
| 5.1.26 | PM_CS1—Power Management Control/Status (D1:F0) | 128 |
| 5.1.27 | SS_CAPID—Subsystem ID and Vendor ID Capabilities (D1:F0) | 129 |
| 5.1.28 | SS—Subsystem ID and Subsystem Vendor ID (D1:F0) | 129 |
| 5.1.29 | MSI_CAPID—Message Signaled Interrupts Capability ID (D1:F0) | 130 |
| 5.1.30 | MC—Message Control (D1:F0) | 131 |

| | | |
|--------|---|-----|
| 5.1.31 | MA—Message Address (D1:F0)..... | 132 |
| 5.1.32 | MD—Message Data (D1:F0)..... | 132 |
| 5.1.33 | PEGCAPL—PCI Express* Capability List (D1:F0)..... | 133 |
| 5.1.34 | PCI_EXPRESS_CAP—PCI Express* Capabilities (D1:F0)..... | 133 |
| 5.1.35 | DCAP—Device Capabilities (D1:F0)..... | 134 |
| 5.1.36 | DCTL—Device Control (D1:F0)..... | 135 |
| 5.1.37 | DSTS—Device Status (D1:F0)..... | 136 |
| 5.1.38 | LCAP—Link Capabilities (D1:F0)..... | 137 |
| 5.1.39 | LCTL—Link Control (D1:F0)..... | 138 |
| 5.1.40 | LSTS—Link Status (D1:F0)..... | 139 |
| 5.1.41 | SLOTCAP—Slot Capabilities (D1:F0)..... | 140 |
| 5.1.42 | SLOTCTL—Slot Control (D1:F0)..... | 141 |
| 5.1.43 | SLOTSTS—Slot Status (D1:F0)..... | 142 |
| 5.1.44 | RCTL—Root Control (D1:F0)..... | 143 |
| 5.1.45 | RSTS—Root Status (D1:F0)..... | 144 |
| 5.1.46 | PEGLC—PCI Express* Legacy Control (D1:F0)..... | 145 |
| 5.1.47 | VCECH—Virtual Channel Enhanced Capability Header (D1:F0)..... | 146 |
| 5.1.48 | PVCCAP1—Port VC Capability Register 1 (D1:F0)..... | 147 |
| 5.1.49 | PVCCAP2—Port VC Capability Register 2 (D1:F0)..... | 147 |
| 5.1.50 | PVCCTL—Port VC Control (D1:F0)..... | 148 |
| 5.1.51 | VC0RCAP—VC0 Resource Capability (D1:F0)..... | 148 |
| 5.1.52 | VC0RCTL—VC0 Resource Control (D1:F0)..... | 149 |
| 5.1.53 | VC0RSTS—VC0 Resource Status (D1:F0)..... | 150 |
| 5.1.54 | VC1RCAP—VC1 Resource Capability (D1:F0)..... | 150 |
| 5.1.55 | VC1RCTL—VC1 Resource Control (D1:F0)..... | 151 |
| 5.1.56 | VC1RSTS—VC1 Resource Status (D1:F0)..... | 152 |
| 5.1.57 | RCLDECH—Root Complex Link Declaration Enhanced Capability Header (D1:F0)..... | 152 |
| 5.1.58 | ESD—Element Self Description (D1:F0)..... | 153 |
| 5.1.59 | LE1D—Link Entry 1 Description (D1:F0)..... | 154 |
| 5.1.60 | LE1A—Link Entry 1 Address (D1:F0)..... | 154 |
| 5.1.61 | LE2D—Link Entry 2 Description (D1:F0)..... | 155 |
| 5.1.62 | LE2A—Link Entry 2 Address..... | 156 |
| 5.1.63 | UESTS—Uncorrectable Error Status (D1:F0)..... | 156 |
| 5.1.64 | UEMSK—Uncorrectable Error Mask (D1:F0)..... | 158 |
| 5.1.65 | CESTS—Correctable Error Status (D1:F0)..... | 159 |
| 5.1.66 | CEMSK—Correctable Error Mask (D1:F0)..... | 160 |
| 5.1.67 | PEGSSTS—PCI Express* Sequence Status (D1:F0)..... | 161 |
| 6 | Host-Secondary PCI Express* Bridge Registers (D3:F0)..... | 163 |

Intel® 82975X MCH Features

- Processor Interface
 - One Intel® Pentium® 4 processor in the 90 nm process in the LGA775 Land Grid Array package, Intel® Pentium® D processor, or Intel® Pentium processor Extreme Edition (supports 775-Land package)
 - Supports Pentium 4 processor FSB interrupt delivery
 - 800/1066 MT/s (200/266 MHz) FSB
 - Supports Hyper-Threading Technology¹ (HT Technology)
 - FSB Dynamic Bus Inversion (DBI)
 - 36-bit host bus addressing for access to 8 GB of memory space
 - 12-deep In-Order Queue
 - 1-deep Defer Queue
 - GTL+ bus driver with integrated GTL termination resistors
 - Supports a Cache Line Size of 64 bytes
- DMI Interface
 - A chip-to-chip connection interface to Intel® ICH7
 - 2 GB/s point-to-point DMI to ICH7 (1 GB/s each direction)
 - 100 MHz reference clock (shared with PCI Express* Graphics Attach).
 - 32-bit downstream addressing
 - Messaging and Error Handling
- Bifurcated PCI Express* Graphics Interface
 - Bifurcated PCI Express* Graphics x8 supported.
 - Single PCI Express* Graphics x16 supported.
 - Peer-to-Peer Writes
 - Compatible with the *PCI Express Base Specification, Revision 1.0a*
 - Raw bit rate on data pins of 2.5 Gb/s resulting in a real bandwidth per pair of 250 MB/s
- System Memory
 - 8GB maximum memory
 - One or two 64-bit wide DDR2 SDRAM data channels
 - DDR2 memory DIMM frequencies of 533 MHz and 667 MHz
 - Bandwidth up to 10.7 GB/s (DDR2 667) in dual-channel Interleaved mode
 - ECC and Non-ECC memory
 - 256-Mb, 512-Mb and 1-Gb DDR2 technologies
 - Only x8, x16, DDR2 devices with four banks and also supports eight bank, 1-Gbit DDR2 devices.
 - Unbuffered DIMMs only
 - Page sizes of 4 KB, 8 KB, and 16 KB
 - Opportunistic refresh
 - Up to 64 simultaneously open pages (four ranks of eight bank devices* 2 channels)
 - SPD (Serial Presence Detect) scheme for DIMM detection support
 - Supports partial writes to memory, only when not using ECC
 - Suspend-to-RAM support using CKE
 - Supports configurations defined in the JEDEC DDR2 DIMM specification only
- Package
 - 34 mm × 34 mm., 1202 balls, non-grid pattern

§

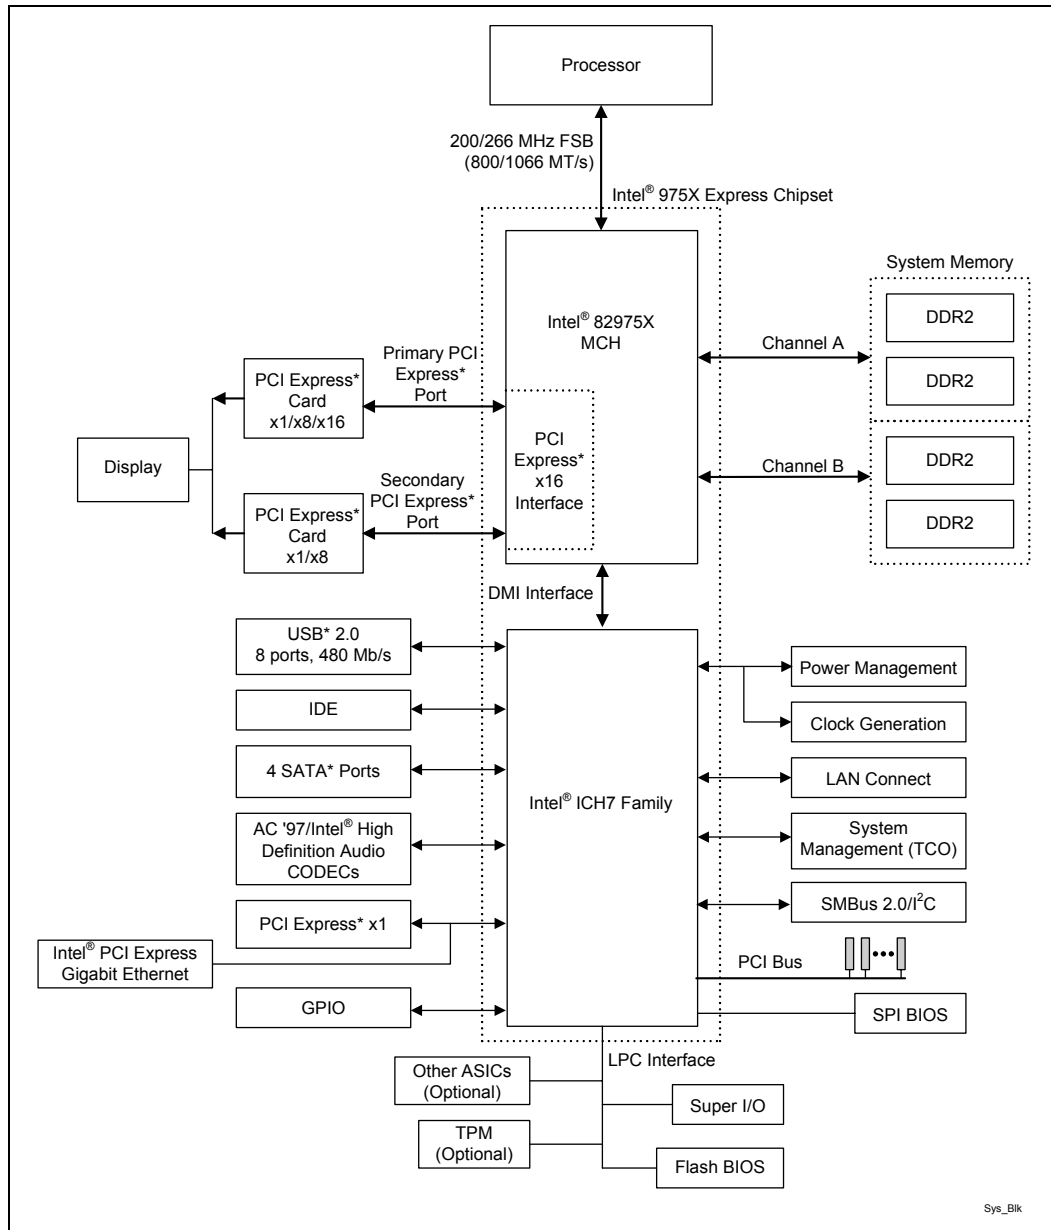

1 Introduction

The Intel® 975X Express chipset is designed for use with Intel® Pentium® 4 processor in the 90 nm process in the LGA775 Land Grid Array package, Intel® Pentium® D processor, and Intel® Pentium® processor Extreme Edition processor-based platforms. The chipset contains two components: Intel® 82975X Memory Controller Hub (MCH) for the host bridge and I/O Controller Hub 7 (ICH7) for the I/O subsystem. The MCH provides the interface to the processor, main memory, PCI Express*, and the ICH7. The ICH7 is the seventh generation I/O Controller Hub and provides a multitude of I/O related functions. Figure 1-1 shows an example system block diagram for the Intel® 975X Express chipset.

This document is the datasheet for the Intel® 82975X MCH. Topics covered include; signal description, system memory map, register descriptions, a description of the MCH interfaces and major functional units, electrical characteristics, ballout definitions, and package characteristics.

Note: Unless otherwise specified, ICH7 refers to the Intel® 82801GB ICH7 and 82801GR ICH7R I/O Controller Hub components.

Figure 1-1. Intel® 975X Express Chipset System Block Diagram Example

1.1 Terminology

| Term | Description |
|---------------------------------|--|
| Accelerated Graphics Port (AGP) | Refers to the AGP/PCI interface that was previously in the MCH components. This port is not on the 82975X MCH; It has been replaced by PCI Express*. |
| Core | The internal base logic in the MCH |
| CRT | Cathode Ray Tube |
| DED | Double-bit Error Detect |
| DBI | Dynamic Bus Inversion |
| DDR | Double Data Rate SDRAM memory technology |
| DDR2 | A second generation Double Data Rate SDRAM memory technology |
| DMI | Direct Media Interface. This is the interface between the MCH and ICH7. |
| ECC | Error Correcting Code |
| FSB | Front Side Bus. This term is synonymous with Host bus or processor bus |
| Full Reset | Full reset is when PWROK is de-asserted. Warm reset is when both RSTIN# and PWROK are asserted. |
| Host | This term is used synonymously with processor. |
| INTx | An interrupt request signal where X stands for interrupts A,B,C, and D |
| Intel® ICH7 | Seventh generation I/O Controller Hub component that contains additional functionality compared to previous ICH components. The I/O Controller Hub component that contains the primary PCI interface, LPC interface, USB2, ATA-100, and other I/O functions. It communicates with the MCH over a proprietary interconnect called DMI. |
| MCH | Intel® 82975X Memory Controller Hub component that contains the processor interface, DRAM controller, and x16 PCI Express port (typically the external graphics interface). It communicates with the I/O controller hub (Intel® ICH7*) and other I/O controller hubs over the DMI interconnect. |
| MSI | Message Signaled Interrupt. A transaction initiated outside the host, conveying interrupt information to the receiving agent through the same path that normally carries read and write commands. |
| PCI Express* | Third generation input/output graphics attach called PCI Express Graphics. It is a high-speed serial interface whose configuration is software compatible with the existing PCI specifications. The specific PCI Express implementation intended for connecting the MCH to an external graphics controller is a x16 link and replaces AGP. |
| Primary PCI | The physical PCI bus that is driven directly by the ICH7 component. Communication between Primary PCI and the MCH occurs over DMI. Note that the Primary PCI bus is not PCI Bus 0 from a configuration standpoint. |
| Processor | Refers to the Intel® Pentium® 4 processor in the 90 nm process in the LGA775 Land Grid Array package, Intel® Pentium D processor, and Intel® Pentium® processor Extreme Edition. |
| SCI | System Control Interrupt. Used in ACPI protocol. |

| Term | Description |
|------|---|
| SEC | Single-bit Error Correct |
| SERR | System Error. An indication that an unrecoverable error has occurred on an I/O bus. |
| SMI | System Management Interrupt. SMI is used to indicate any of several system conditions such as thermal sensor events, throttling activated, access to System Management RAM, chassis open, or other system state related activity. |
| Rank | A unit of DRAM corresponding to eight x8 SDRAM devices in parallel or four x16 SDRAM devices in parallel, ignoring ECC. These devices are usually, but not always, mounted on a single side of a DIMM. |
| TOLM | Top Of Low Memory. The highest address below 4 GB for which a processor-initiated memory read or write transaction will create a corresponding cycle to DRAM on the memory interface. |
| VCO | Voltage Controlled Oscillator |

1.3 MCH Overview

The MCH connects to the processor as shown in Figure 1-1. A major role of the MCH in a system is to manage the flow of information between its four interfaces: the processor interface (FSB), the System Memory interface (DRAM controller), the Dual External Graphics interface (PCI Express*), and the I/O Controller through DMI interface. This includes arbitrating between the four interfaces when each initiates transactions. The processor interface supports the Pentium 4 processor subset of the Extended Mode of the Scalable Bus Protocol.

The MCH supports one or two channels of DDR2 SDRAM. It also supports PCI Express based external graphics attach. To increase system performance, the MCH incorporates several queues and a write cache. The MCH also contains advanced power management logic.

1.3.1 Host Interface

The MCH is optimized for the Pentium® 4 processor in the 90 nm process in the LGA775 Land Grid Array package, Pentium® D processor, and Pentium® processor Extreme Edition in a LGA775 socket. The MCH supports FSB frequencies of 200 MHz (800 MT/s) and 266 MHz (1066 MT/s) using a scalable FSB Vcc_CPU. The MCH supports the Pentium 4 processor subset of the Extended Mode Scalable Bus Protocol. The primary enhancements over the Compatible Mode P6 bus protocol are source synchronous double-pumped (2x) address and source synchronous quad-pumped (4x) data. Other MCH supported features of the host interface include: Hyper-Threading Technology (HT Technology), Pentium 4 processor FSB interrupt delivery, FSB Dynamic Bus Inversion (DBI), 12-deep in-order queue, and a 1-deep defer queue.

The MCH supports 36-bit host addressing, decoding up to 8 GB of the processor's usable memory address space. Host-initiated I/O cycles are decoded to PCI Express, DMI, or the MCH configuration space. Host-initiated memory cycles are decoded to PCI Express, DMI or main memory. PCI Express device accesses to non-cacheable system memory are not snooped on the host bus. Memory accesses initiated from PCI Express* using PCI semantics and from DMI to system SDRAM will be snooped on the host bus.

1.3.2 System Memory Interface

The MCH integrates a system memory DDR2 controller with two, 64-bit wide interfaces. Only Double Data Rate (DDR2) memory is supported; consequently, the buffers support only SSTL_1.8 V signal interfaces. The memory controller interface is fully configurable through a set of control registers. Features of the MCH memory controller include:

- Maximum memory size is 8 GB.
- Directly supports one or two channels of memory (each channel consisting of 64 data lines)
 - The memory channels are asymmetric: "Stacked" channels are assigned addresses serially. Channel B addresses are assigned after all Channel A addresses.
 - The memory channels are interleaved: Addresses are ping-ponged between the channels after each cache line (64-B boundary).
- Available bandwidth up to 5.3 GB/s (DDR2 667) for single-channel mode or dual-channel asymmetric mode and 10.7 GB/s (DDR2 667) in dual-channel Interleaved mode.
- Supports standard ECC (Error Correcting Code) x8 only or Non-ECC x8 and x16 DIMMs.
- Supports DDR2 memory DIMM frequencies of 533 and 667 MHz. The speed used in all channels is the speed of the slowest DIMM in the system.
- Supports 256-Mb, 512-Mb and 1-Gb DDR2 technologies for x8 and x16 devices.
- Supports four banks for all DDR2 devices up to 512-Mbit density. Supports eight banks for 1-Gbit DDR2 devices.
- DDR2-667 4-4-4 is NOT supported
- Supports only unbuffered DIMMs.
- Supports opportunistic refresh.
- In dual channel mode the MCH supports 32 simultaneously open pages.
- SPD (Serial Presence Detect) scheme for DIMM detection support.
- Suspend-to-RAM support using CKE.
- Supports configurations defined in the JEDEC DDR2 DIMM specification only.
- Directly supports two channels of ECC or non-ECC DDR2 DIMMs.
- Supports Partial Writes to memory using Data Mask (DM) signals, only when not using ECC.
- Supports a burst length of 8 for single-channel and dual-channel interleaved and asymmetric operating modes.
- Supports Enhanced Memory Interleave.

1.3.3 PCI Express* Graphics Interface

The PCI Express interface supports 16 bi-directional lanes used for next generation graphics attach. Each PCI Express graphic lane supports a bi-directional transfer rate of 2.5 Gb/s for a theoretical bandwidth of 8 GBs when in x16 mode. Features of the PCI Express interface include:

- One 16-lane PCI Express port intended for graphics attach, compatible to the *PCI Express* Base Specification, Revision 1.0a*.
- A base PCI Express frequency of 2.5 Gb/s only.
- Raw bit-rate on the data pins of 2.5 Gb/s, resulting in a real bandwidth per pair of 250 MB/s given the 8b/10b encoding used to transmit data across this interface.
- Maximum theoretical realized bandwidth on the interface of 4 GB/s in each direction simultaneously, for an aggregate of 8 GB/s when x16.
- PCI Express extended configuration space. The first 256 bytes of configuration space alias directly to the PCI compatibility configuration space. The remaining portion of the fixed 4-KB block of memory-mapped space above that (starting at 100h) is known as extended configuration space.
- PCI Express enhanced addressing mechanism. Accessing the device configuration space in a flat memory mapped fashion.
- Automatic discovery, negotiation, and training of link out of reset.
- Supports traditional PCI style traffic (asynchronous snooped, PCI ordering).
- Supports traditional AGP style traffic (asynchronous non-snooped, PCI Express-relaxed ordering).
- Hierarchical PCI-compliant configuration mechanism for downstream devices (i.e., normal PCI 2.3 configuration space as a PCI-to-PCI bridge).
- Supports “static” lane numbering reversal. This method of lane reversal is controlled by a Hardware Reset strap, and reverses both the receivers and transmitters for all lanes (e.g., TX15->TX0, RX15->RX0). This method is transparent to all external devices and is different than lane reversal as defined in the PCI Express specification. In particular, link initialization is not affected by static lane reversal.

1.3.4 Bifurcated PCI Express* Graphics Supported Features

- Bifurcated PCI Express* Graphics x8 supported.
- Single PCI Express* Graphics x16 supported.
- Peer-to-Peer Writes.

1.3.5 Direct Media Interface (DMI)

Direct Media Interface (DMI) is the chip-to-chip connection between the MCH and ICH7. This high-speed interface integrates advanced priority-based servicing allowing for concurrent traffic and true isochronous transfer capabilities. Base functionality is completely software transparent permitting current and legacy software to operate normally.

To provide for true isochronous transfers and configurable Quality of Service (QoS) transactions, the ICH7 supports two virtual channels on DMI: VC0 and VC1. These two channels provide a fixed arbitration scheme where VC1 is always the highest priority. VC0 is the default conduit of traffic for DMI and is always enabled. VC1 must be specifically enabled and configured at both ends of the DMI link (i.e., the Intel ICH7 and MCH). Configuration registers for DMI, virtual channel support, and DMI active state power management (ASPM) are in the RCRB space in the MCH Register Description. Features of the DMI include:

- A chip-to-chip connection interface to Intel ICH7.
- 2 GB/s point-to-point DMI to ICH7 (1 GB/s each direction).
- 100 MHz reference clock (shared with PCI Express graphics attach).
- 32-bit downstream addressing.
- APIC and MSI interrupt messaging support. MCH will send Intel-defined “End Of Interrupt” broadcast message when initiated by the processor.
- Message Signaled Interrupt (MSI) messages.
- SMI, SCI, and SERR error indication.
- Legacy support for ISA regime protocol (PHOLD/PHOLDA) required for parallel port DMA, floppy drive, and LPC bus masters.

1.3.6 System Interrupts

- Supports both 8259 and Pentium 4 processor FSB interrupt delivery mechanisms.
- Supports interrupts signaled as upstream memory writes from PCI Express and DMI.
 - MSIs routed directly to FSB.
 - From I/OxAPICs.
- Provides redirection for IPI (Inter-Processor Interrupts) and upstream interrupts to the FSB.

1.3.7 MCH Clocking

The Differential FSB clock of 200/266 MHz (HCLKP/HCLKN) supports transfer rates of 800/1066 MT/s. The Host PLL generates 2X, 4X, and 8X versions of the host clock for internal optimizations. The MCH core clock is synchronized to the host clock.

The internal and external memory clocks of 266 MHz and 333 MHz are generated from one of two MCH PLLs that use the Host clock as a reference. Also included are 2x and 4x clocks for internal optimizations.

The PCI Express* core clock of 250 MHz is generated from a separate PCI Express PLL. This clock uses the fixed 100 MHz serial reference clock (GCLKP/GCLKN) for reference.

All of the above mentioned clocks are capable of tolerating Spread Spectrum clocking as defined in the Clock Generator specification. Host, Memory, and PCI Express PLLs, and all associated internal clocks are disabled until PWROK is asserted.

1.3.8 Power Management

The MCH power management support includes:

- PC99 suspend to DRAM support (“STR”, mapped to ACPI state S3)
- SMRAM space remapping to A0000h (128 KB)
- Supports extended SMRAM space above 256 MB, additional 1-MB TSEG from the Top of Low Usable DRAM (TOLUD), and cacheable (cacheability controlled by the processor)
- ACPI Revision 1.0 compatible power management
- Supports processor states: C0 and C1
- Supports system states: S0, S1D, S3, S4, and S5
- Supports processor Thermal Management 2 (TM2)
- Microsoft Windows NT* Hardware Design Guide v1.0 compliant

§

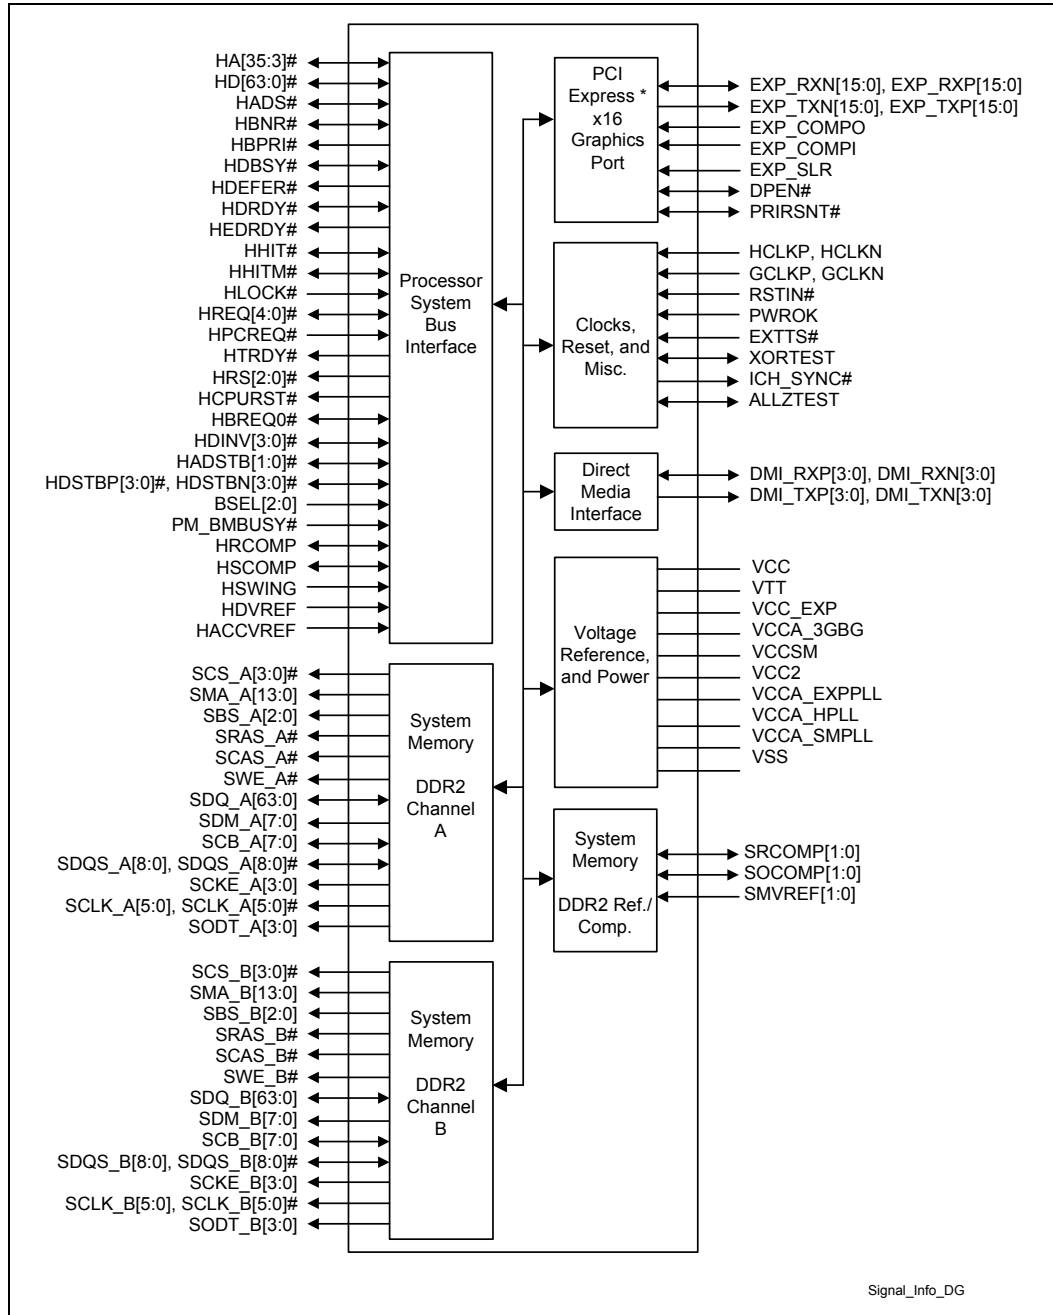

2 Signal Description

This chapter provides a detailed description of MCH signals. The signals are arranged in functional groups according to their associated interface.

The following notations are used to describe the signal type:

| | |
|----------|--|
| PCIE | PCI Express* interface signals. These signals are compatible with PCI Express 1.0 Signaling Environment AC Specifications and are AC coupled. The buffers are not 3.3 V tolerant. Differential voltage spec = $(D+ - D-) * 2 = 1.2 V_{max}$. Single-ended maximum = 1.5 V. Single-ended minimum = 0 V. |
| DMI | Direct Media Interface signals. These signals are compatible with PCI Express 1.0 Signaling Environment AC Specifications, but are DC coupled. The buffers are not 3.3 V tolerant. Differential voltage spec = $(D+ - D-) * 2 = 1.2 V_{max}$. Single-ended maximum = 1.5 V. Single-ended minimum = 0 V. |
| CMOS | CMOS buffers. 1.5 V tolerant. |
| COD | CMOS Open Drain buffers. 2.5 V tolerant. |
| HCSL | Host Clock Signal Level buffers. Current mode differential pair. Differential typical swing = $(D+ - D-) * 2 = 1.4 V$. Single ended input tolerant from -0.35 V to 1.2 V. Typical crossing voltage 0.35 V. |
| HVCMOS | High Voltage CMOS buffers. 2.5 V tolerant. |
| HVIN | High Voltage CMOS input-only buffers. 3.3 V tolerant. |
| SSTL-1.8 | Stub Series Termination Logic. These are 1.8 V output capable buffers. 1.8 V tolerant. |
| A | Analog reference or output. These signals may be used as a threshold voltage or for buffer compensation. |

Figure 2-1. Signal Information Diagram

2.1 Host Interface Signals

Note: Unless otherwise noted, the voltage level for all signals in this interface is tied to the termination voltage of the Host Bus (V_{TT}).

| Signal Name | Type | Description | | | | | | | | | | |
|-------------|-------------|--|-----------|-----------|---------|-----------|---------|-----------|---------|-----------|---------|----------|
| HADS# | I/O GTL+ | Address Strobe: The processor bus owner asserts HADS# to indicate the first of two cycles of a request phase. The MCH can assert this signal for snoop cycles and interrupt messages. | | | | | | | | | | |
| HBNR# | I/O GTL+ | Block Next Request: This signal is used to block the current request bus owner from issuing new requests. This signal is used to dynamically control the processor bus pipeline depth. | | | | | | | | | | |
| HBPRI# | O GTL+ | Priority Agent Bus Request: The MCH is the only Priority Agent on the processor bus. It asserts this signal to obtain the ownership of the address bus. This signal has priority over symmetric bus requests and will cause the current symmetric owner to stop issuing new transactions unless the HLOCK# signal was asserted. | | | | | | | | | | |
| HBREQ0# | I/O GTL+ | Bus Request 0: The MCH pulls the processor's bus HBREQ0# signal low during HCPURST#. The processor samples this signal on the active-to-inactive transition of HCPURST#. The minimum setup time for this signal is 4 HCLKs. The minimum hold time is 2 HCLKs and the maximum hold time is 20 HCLKs. HBREQ0# should be tri-stated after the hold time requirement has been satisfied. | | | | | | | | | | |
| HCPURST# | O GTL+ | CPU Reset: The HCPURST# pin is an output from the MCH. The MCH asserts HCPURST# while RSTIN# is asserted and for approximately 1 ms after RSTIN# is de-asserted. The HCPURST# allows the processors to begin execution in a known state. Note that the Intel [®] ICH7 must provide processor frequency select strap setup and hold times around HCPURST#. This requires strict synchronization between MCH HCPURST# de-assertion and the ICH7 driving the straps. | | | | | | | | | | |
| HDBSY# | I/O GTL+ | Data Bus Busy: This signal is used by the data bus owner to hold the data bus for transfers requiring more than one cycle. | | | | | | | | | | |
| HDEFER# | O GTL+ | Defer: HDEFER# signals that the MCH will terminate the transaction currently being snooped with either a deferred response or with a retry response. | | | | | | | | | | |
| HDINV[3:0]# | I/O GTL+ | Dynamic Bus Inversion: HDINV[3:0]# are driven along with the HD[63:0] signals. They indicate if the associated signals are inverted or not. HDINV[3:0]# are asserted such that the number of data bits driven electrically low (low voltage) within the corresponding 16 bit group never exceeds 8. <table border="0" style="width: 100%;"> <thead> <tr> <th style="text-align: left;">HDINV[x]#</th> <th style="text-align: left;">Data Bits</th> </tr> </thead> <tbody> <tr> <td>HDINV3#</td> <td>HD[63:48]</td> </tr> <tr> <td>HDINV2#</td> <td>HD[47:32]</td> </tr> <tr> <td>HDINV1#</td> <td>HD[31:16]</td> </tr> <tr> <td>HDINV0#</td> <td>HD[15:0]</td> </tr> </tbody> </table> | HDINV[x]# | Data Bits | HDINV3# | HD[63:48] | HDINV2# | HD[47:32] | HDINV1# | HD[31:16] | HDINV0# | HD[15:0] |
| HDINV[x]# | Data Bits | | | | | | | | | | | |
| HDINV3# | HD[63:48] | | | | | | | | | | | |
| HDINV2# | HD[47:32] | | | | | | | | | | | |
| HDINV1# | HD[31:16] | | | | | | | | | | | |
| HDINV0# | HD[15:0] | | | | | | | | | | | |

| Signal Name | Type | Description | | | | | | | | | | | | | | | |
|------------------------------|-------------|--|---------|------|------|--------------------|-----------|-----------|--------------------|-----------|-----------|--------------------|-----------|-----------|--------------------|----------|-----------|
| HDRDY# | I/O GTL+ | Data Ready: This signal is asserted for each cycle that data is transferred. | | | | | | | | | | | | | | | |
| HEDRDY# | O GTL+ | Early Data Ready: This signal indicates that the data phase of a read transaction will start on the bus exactly one common clock after assertion. | | | | | | | | | | | | | | | |
| HA[35:3]# | I/O GTL+ | Host Address Bus: HA[35:3]# connect to the processor address bus. During processor cycles, HA[35:3]# are inputs. The MCH drives HA[35:3]# during snoop cycles on behalf of DMI and PCI Express* initiators. HA[35:3]# are transferred at 2x rate. | | | | | | | | | | | | | | | |
| HADSTB[1:0]# | I/O GTL+ | Host Address Strobe: These signals are the source synchronous strobes used to transfer HA[31:3]# and HREQ[4:0] at the 2x transfer rate. | | | | | | | | | | | | | | | |
| HD[63:0]# | I/O GTL+ | Host Data: These signals are connected to the processor data bus. Data on HD[63:0]# is transferred at 4x rate. Note that the data signals may be inverted on the processor bus, depending on the HDINV[3:0]# signals. | | | | | | | | | | | | | | | |
| HDSTBP[3:0]# HDSTBN[3:0]# | I/O GTL+ | <p>Differential Host Data Strobes: The differential source synchronous strobes used to transfer HD[63:0]# and HDINV[3:0]# at 4x transfer rate.</p> <p>These signals are named this way because they are not level sensitive. Data is captured on the falling edge of both strobes. Hence, they are pseudo-differential, and not true differential.</p> <table border="1"> <thead> <tr> <th>Strobes</th> <th>Data</th> <th>Bits</th> </tr> </thead> <tbody> <tr> <td>HDSTBP3#, HDSTBN3#</td> <td>HD[63:48]</td> <td>HDINV[3]#</td> </tr> <tr> <td>HDSTBP2#, HDSTBN2#</td> <td>HD[47:32]</td> <td>HDINV[2]#</td> </tr> <tr> <td>HDSTBP1#, HDSTBN1#</td> <td>HD[31:16]</td> <td>HDINV[1]#</td> </tr> <tr> <td>HDSTBP0#, HDSTBN0#</td> <td>HD[15:0]</td> <td>HDINV[0]#</td> </tr> </tbody> </table> | Strobes | Data | Bits | HDSTBP3#, HDSTBN3# | HD[63:48] | HDINV[3]# | HDSTBP2#, HDSTBN2# | HD[47:32] | HDINV[2]# | HDSTBP1#, HDSTBN1# | HD[31:16] | HDINV[1]# | HDSTBP0#, HDSTBN0# | HD[15:0] | HDINV[0]# |
| Strobes | Data | Bits | | | | | | | | | | | | | | | |
| HDSTBP3#, HDSTBN3# | HD[63:48] | HDINV[3]# | | | | | | | | | | | | | | | |
| HDSTBP2#, HDSTBN2# | HD[47:32] | HDINV[2]# | | | | | | | | | | | | | | | |
| HDSTBP1#, HDSTBN1# | HD[31:16] | HDINV[1]# | | | | | | | | | | | | | | | |
| HDSTBP0#, HDSTBN0# | HD[15:0] | HDINV[0]# | | | | | | | | | | | | | | | |
| HHIT# | I/O GTL+ | Hit: This signal indicates that a caching agent holds an unmodified version of the requested line. This signal is also driven in conjunction with HHITM# by the target to extend the snoop window. | | | | | | | | | | | | | | | |
| HHITM# | I/O GTL+ | Hit Modified: This signal indicates that a caching agent holds a modified version of the requested line and that this agent assumes responsibility for providing the line. This signal is also driven in conjunction with HHIT# to extend the snoop window. | | | | | | | | | | | | | | | |
| HLOCK# | I GTL+ | Host Lock: All processor bus cycles sampled with the assertion of HLOCK# and HADS#, until the negation of HLOCK# must be atomic (i.e., no DMI or PCI Express accesses to DRAM are allowed when HLOCK# is asserted by the processor). | | | | | | | | | | | | | | | |

| Signal Name | Type | Description |
|-------------|-------------------|---|
| HPCREQ# | I GTL+ 2x | Precharge Request: The processor provides a “hint” to the MCH that it is OK to close the DRAM page of the memory read request with which the hint is associated. The MCH uses this information to schedule the read request to memory using the special “AutoPrecharge” attribute. This causes the DRAM to immediately close (Precharge) the page after the read data has been returned. This allows subsequent processor requests to more quickly access information on other DRAM pages, since it will no longer be necessary to close an open page prior to opening the proper page. HPCREQ# is asserted by the requesting agent during both halves of Request Phase. The same information is provided in both halves of the request phase. |
| HREQ[4:0]# | I/O GTL+ 2x | Host Request Command: These signals define the attributes of the request. HREQ[4:0]# are transferred at 2x rate. They are asserted by the requesting agent during both halves of Request Phase. In the first half the signals define the transaction type to a level of detail that is sufficient to begin a snoop request. In the second half the signals carry additional information to define the complete transaction type. |
| HTRDY# | O GTL+ | Host Target Ready: This signal indicates that the target of the processor transaction is able to enter the data transfer phase. |
| HRS[2:0]# | O GTL+ | Response Signals: These signals indicate the type of response: 000 = Idle state 001 = Retry response 010 = Deferred response 011 = Reserved (not driven by MCH) 100 = Hard Failure (not driven by MCH) 101 = No data response 110 = Implicit Writeback 111 = Normal data response |
| BSEL[2:0] | I CMOS | Bus Speed Select: At the de-assertion of RSTIN#, the value sampled on these pins determines the expected frequency of the bus. |
| PM_BMBUSY# | I HVC MOS | Slew Rate Compensation Select: 1 = Normal Operation – use Lookup table for slew compensation value. 0 = Use SCOMP circuit for slew compensation value. |
| HRCOMP | I/O CMOS | Host RCOMP: This signal is used to calibrate the Host GTL+ I/O buffers. This signal is powered by the Host Interface termination rail (V_{TT}). |
| HSCOMP | I/O CMOS | Slew Rate Compensation: This signal provides compensation for the Host Interface. |
| HSWING | I A | Host Voltage Swing: This signal provides the reference voltage used by FSB RCOMP circuits. HSWING is used for the signals handled by HRCOMP. |
| HDVREF | I A | Host Reference Voltage: This signal is the voltage input for the data, address, and common clock signals of the Host GTL interface. |
| HACCVREF | I A | Host Reference Voltage. This signal is the reference voltage input for the address and common clock signals of the Host GTL interface. |

2.2 DDR2 DRAM Channel A Interface

| Signal Name | Type | Description |
|--------------|-----------------------|---|
| SCB_A[7:0] | I/O SSTL-1.8 2x | ECC Check Byte: These signals are used for ECC. |
| SCLK_A[5:0] | O SSTL-1.8 | SDRAM Differential Clock: (3 per DIMM). SCLK_Ax and its complement SCLK_Ax# signal make a differential clock pair output. The crossing of the positive edge of SCLK_Ax and the negative edge of its complement SCLK_Ax# are used to sample the command and control signals on the SDRAM. |
| SCLK_A[5:0]# | O SSTL-1.8 | SDRAM Complementary Differential Clock: (3 per DIMM). These are the complementary differential DDR2 clock signals. |
| SCS_A[3:0]# | O SSTL-1.8 | Chip Select: (1 per Rank). These signals select particular SDRAM components during the active state. There is one chip select for each SDRAM rank. |
| SMA_A[13:0] | O SSTL-1.8 | Memory Address: These signals are used to provide the multiplexed row and column address to the SDRAM. |
| SBS_A[2:0] | O SSTL-1.8 | Bank Select: These signals define which banks are selected within each SDRAM rank. DDR2: 1-Gb technology is 8 banks. |
| SRAS_A# | O SSTL-1.8 | Row Address Strobe: This signal is used with SCAS_A# and SWE_A# (along with SCS_A#) to define the SDRAM commands. |
| SCAS_A# | O SSTL-1.8 | Column Address Strobe: This signal is used with SRAS_A# and SWE_A# (along with SCS_A#) to define the SDRAM commands. |
| SWE_A# | O SSTL-1.8 | Write Enable: This signal is used with SCAS_A# and SRAS_A# (along with SCS_A#) to define the SDRAM commands. |
| SDQ_A[63:0] | I/O SSTL-1.8 2x | Data Lines: SDQ_Ax signals interface to the SDRAM data bus. |
| SDM_A[7:0] | O SSTL-1.8 2X | Data Mask: When activated during writes, the corresponding data groups in the SDRAM are masked. There is one SDM_Ax signal for every data byte lane. |
| SDQS_A[8:0] | I/O SSTL-1.8 2x | Data Strobes: For DDR2, SDQS_Ax and its complement SDQS_Ax# signal make up a differential strobe pair. The data is captured at the crossing point of SDQS_Ax and its complement SDQS_Ax# during read and write transactions. |
| SDQS_A[8:0]# | I/O SSTL-1.8 2x | Data Strobe Complements: These are the complementary DDR2 strobe signals. |
| SCKE_A[3:0] | O SSTL-1.8 | Clock Enable: (1 per Rank). SCKE_A is used to initialize the SDRAMs during power-up, to power-down SDRAM ranks, and to place all SDRAM ranks into and out of self-refresh during Suspend-to-RAM. |
| SODT_A[3:0] | O SSTL-1.8 | On Die Termination: These signals are Active On-die termination control signals for DDR2 devices. |

2.3 DDR2 DRAM Channel B Interface

| Signal Name | Type | Description |
|--------------|-----------------------|---|
| SCB_B[7:0] | I/O SSTL-1.8 2x | ECC Check Byte: These signals are used for ECC. |
| SCLK_B[5:0] | O SSTL-1.8 | SDRAM Differential Clock: (3 per DIMM). SCLK_Bx and its complement SCLK_Bx# signal make a differential clock pair output. The crossing of the positive edge of SCLK_Bx and the negative edge of its complement SCLK_Bx# are used to sample the command and control signals on the SDRAM. |
| SCLK_B[5:0]# | O SSTL-1.8 | SDRAM Complementary Differential Clock: (3 per DIMM). These are the complementary Differential DDR2 Clock signals. |
| SCS_B[3:0]# | O SSTL-1.8 | Chip Select: (1 per Rank). These signals select particular SDRAM components during the active state. There is one chip select for each SDRAM rank |
| SMA_B[13:0] | O SSTL-1.8 | Memory Address: These signals are used to provide the multiplexed row and column address to the SDRAM. |
| SBS_B[2:0] | O SSTL-1.8 | Bank Select: These signals define which banks are selected within each SDRAM rank. DDR2: 1-Gb technology is 8 banks. |
| SRAS_B# | O SSTL-1.8 | Row Address Strobe: This signal is used with SCAS_B# and SWE_B# (along with SCS_B#) to define the SDRAM commands |
| SCAS_B# | O SSTL-1.8 | Column Address Strobe: This signal is used with SRAS_B# and SWE_B# (along with SCS_B#) to define the SDRAM commands. |
| SWE_B# | O SSTL-1.8 | Write Enable: This signal is used with SCAS_B# and SRAS_B# (along with SCS_B#) to define the SDRAM commands. |
| SDQ_B[63:0] | I/O SSTL-1.8 2x | Data Lines: SDQ_Bx signals interface to the SDRAM data bus. |
| SDM_B[7:0] | O SSTL-1.8 2x | Data Mask: When activated during writes, the corresponding data groups in the SDRAM are masked. There is one SBDM for every data byte lane. |
| SDQS_B[8:0] | I/O SSTL-1.8 2x | Data Strobes: For DDR2, SDQS_Bx and its complement SDQS_Bx# make up a differential strobe pair. The data is captured at the crossing point of SDQS_Bx and its complement SDQS_Bx# during read and write transactions. |
| SDQS_B[8:0]# | I/O SSTL-1.8 2x | Data Strobe Complements: These are the complementary DDR2 strobe signals. |
| SCKE_B[3:0] | O SSTL-1.8 | Clock Enable: (1 per Rank). SCKE_B is used to initialize the SDRAMs during power-up, to power-down SDRAM ranks, and to place all SDRAM ranks into and out of self-refresh during Suspend-to-RAM. |
| SODT_B[3:0] | O SSTL-1.8 | On Die Termination: These signals are Active On-die termination control signals for DDR2 devices. |

2.4 DDR2 DRAM Reference and Compensation

| Signal Name | Type | Description |
|-------------|----------|--|
| SRCOMP[1:0] | I/O | System Memory RCOMP |
| SOCOMP[1:0] | I/O A | DDR2 On-Die DRAM Over Current Detection (OCD) driver compensation |
| SMVREF[1:0] | I A | SDRAM Reference Voltage: Reference voltage inputs for each DQ, DM, DQS, and DQS# input signals. |

2.5 PCI Express* Interface Signals

Unless otherwise specified, PCI Express signals are AC coupled, so the only voltage specified is a maximum 1.2 V differential swing.

| Signal Name | Type | Description |
|--------------------------------|-------------|---|
| EXP_RXN[15:0] EXP_RXP[15:0] | I/O PCIE | PCI Express* Receive Differential Pair |
| EXP_TXN[15:0] EXP_TXP[15:0] | O PCIE | PCI Express Transmit Differential Pair |
| EXP_COMPO | I A | PCI Express Output Current Compensation |
| EXP_COMPI | I A | PCI Express Input Current Compensation |
| EXP_SLR | I CMOS | PCI Express* Static Lane Reversal: MCH's PCI Express lane numbers are reversed. 0 = MCH's PCI Express lane numbers are reversed 1 = Normal operation |
| PRIPRSNT# | I/O GTL+ | Primary Slot x16 Present Strap: PCI Express* Card Present in Primary slot) 0 = Primary PCI Express* Card Present 1 = Primary PCI Express* Card Not Present NOTE: Output Only when in XORTEST mode. |
| DPEN# | I/O GTL+ | Secondary Slot x16 Present Strap: Secondary PCI Express* Card Present in Secondary slot) 0 = Secondary PCI Express* Card Present 1 = Secondary PCI Express* Card Not Present. NOTE: Output Only when in XORTEST mode. |

2.6 Clocks, Reset, and Miscellaneous

| Signal Name | Type | Description |
|----------------|--------------|---|
| HCLKP HCLKN | I HCSL | Differential Host Clock In: These pins receive a differential host clock from the external clock synthesizer. This clock is used by all of the MCH logic that is in the Host clock domain. Memory domain clocks are also derived from this source. |
| GCLKP GCLKN | I HCSL | Differential PCI Express* Clock In: These pins receive a differential 100 MHz serial reference clock from the external clock synthesizer. This clock is used to generate the clocks necessary for the support of PCI Express. |
| RSTIN# | I HVIN | Reset In: When asserted, this signal will asynchronously reset the MCH logic. This signal is connected to the PCIRST# output of the Intel® ICH7. All PCI Express graphics attach output signals will also tri-state compliant to <i>PCI Express* Base Specification, Revision 1.0a</i> . This input should have a Schmitt trigger to avoid spurious resets. This signal is required to be 3.3 V tolerant. |
| PWROK | I HVIN | Power OK: When asserted, PWROK is an indication to the MCH that core power has been stable for at least 10 us. |
| EXTTS# | I HVC MOS | External Thermal Sensor Input: This signal may connect to a precision thermal sensor located on or near the DIMMs. If the system temperature reaches a sufficiently high value, then this signal can be used to trigger the start of system thermal management. This signal is activated when an increase in temperature causes a voltage to cross some threshold in the sensor. |
| ICH_SYNC# | O HVC MOS | ICH Sync: This signal is connected to the MCH_SYNC# signal on the ICH7. |
| XORTEST | I/O GTL+ | XOR Test: This signal is used for Bed of Nails testing by OEMs to execute XOR Chain test. |
| ALLZTEST | I/O GTL+ | All Z Test: As an input this signal is used for Bed of Nails testing by OEMs to execute XOR Chain test. It is used as an output for XOR chain testing. |

2.7 Direct Media Interface (DMI)

| EDS Signal Name | Type | Description |
|------------------------------|------------|--|
| DMI_RXP[3:0] DMI_RXN[3:0] | I/O DMI | Direct Media Interface: Receive differential pair (Rx) |
| DMI_TXP[3:0] DMI_TXN[3:0] | O DMI | Direct Media Interface: Transmit differential pair (Tx) |

2.8 Power, Ground

| Name | Voltage | Description |
|-------------|---------|------------------------------------|
| VCC | 1.5 V | Core Power |
| VTT | 1.2 V | Processor System Bus Power |
| VCC_EXP | 1.5 V | PCI Express* and DMI Power |
| VCCA_3GBG | 2.5 V | PCI Express and DMI Analog Bandgap |
| VCCSM | 1.8 V | System Memory Power |
| VCC2 | 2.5 V | 2.5 V CMOS Power |
| VCCA_EXPPLL | 1.5 V | PCI Express PLL Analog Power |
| VCCA_HPLL | 1.5 V | Host PLL Analog Power |
| VCCA_SMPPLL | 1.5 V | System Memory PLL Analog Power |
| VSS | 0 V | Ground |

2.9 Reset States and Pull-up/Pull-down Values

This section describes the expected states of the MCH I/O buffers during and immediately after the assertion of RSTIN#. This table only refers to the contributions on the interface from the MCH and does NOT reflect any external influence (such as external pull-up/pull-down resistors or external drivers).

Legend:

| | |
|--------|---|
| DRIVE: | Strong drive (to normal value supplied by core logic if not otherwise stated) . |
| TERM: | Normal termination devices are turned on. |
| LV: | Low voltage. |
| HV: | High voltage. |
| IN: | Input buffer enabled. |
| TRI: | Tri-state. |
| PU: | Weak internal pull-up: 7.2 K Ω – 11.1 K Ω , unless otherwise specified. |
| PD: | Weak internal pull-down: 600 Ω – 880 Ω unless otherwise specified. |
| CMCT: | Common Mode Center Tapped. Differential signals are weakly driven to the common mode central voltage. |
| STRAP: | Strap input sampled on the asserting edge of PWROK. |

| Interface | Signal Name | I/O | State During RSTIN# Assertion | State After RSTIN# De-assertion | Pull-up/ Pull-down |
|-----------|--------------|-----|-------------------------------|---------------------------------|-----------------------|
| Host I/F | HCPURST# | O | DRIVE LV | TERM HV after approximately 1ms | |
| | HADSTB[1:0]# | I/O | TERM HV | TERM HV | |
| | HA[35:3]# | I/O | TERM HV STRAP | POC | |
| | HD[63:0] | I/O | TERM HV | TERM HV | |
| | HDSTBP[3:0]# | I/O | TERM HV | TERM HV | |
| | HDSTBN[3:0]# | I/O | TERM HV | TERM HV | |
| | HDINV[3:0]# | I/O | TERM HV | TERM HV | |
| | HADS# | I/O | TERM HV | TERM HV | |
| | HBNR# | I/O | TERM HV | TERM HV | |
| | HBPRI# | O | TERM HV | TERM HV | |
| | HDBSY# | I/O | TERM HV | TERM HV | |
| | HDEFER# | O | TERM HV | TERM HV | |
| | HDRDY# | I/O | TERM HV | TERM HV | |
| | HEDRDY# | O | TERM HV | TERM HV | |
| | HHIT# | I/O | TERM HV | TERM HV | |
| | HHITM# | I/O | TERM HV | TERM HV | |

§

3 MCH Register Description

The MCH contains two sets of software accessible registers, accessed via the Host processor I/O address space: Control registers and internal configuration registers.

- Control registers are I/O mapped into the processor I/O space that control access to PCI and PCI Express configuration space (see Section 3.5).
- Internal configuration registers residing within the MCH are partitioned into two logical device register sets (“logical” since they reside within a single physical device). The first register set is dedicated to Host Bridge functionality (i.e., DRAM configuration, other chipset operating parameters, and optional features). The second register block is dedicated to Host-to-PCI Express Bridge functions (controls PCI Express interface configurations and operating parameters).

The MCH internal registers (I/O Mapped, Configuration and PCI Express extended configuration registers) are accessible by the processor. The registers that reside within the lower 256 bytes of each device can be accessed as Byte, Word (16-bit), or DWord (32-bit) quantities, with the exception of CONFIG_ADDRESS that can only be accessed as a DWord. All multi-byte numeric fields use “little-endian” ordering (i.e., lower addresses contain the least significant parts of the field). Registers that reside in bytes 256 through 4095 of each device may only be accessed using memory-mapped transactions in DWord (32-bit) quantities.

Some of the MCH registers described in this section contain reserved bits. These bits are labeled “Reserved”. Software must deal correctly with fields that are reserved. On reads, software must use appropriate masks to extract the defined bits and not rely on reserved bits being any particular value. On writes, software must ensure that the values of reserved bit positions are preserved. That is, the values of reserved bit positions must first be read, merged with the new values for other bit positions and then written back. Note the software does not need to perform read, merge, and write operation for the configuration address register.

In addition to reserved bits within a register, the MCH contains address locations in the configuration space of the Host Bridge entity that are marked either “Reserved” or “Intel Reserved”. The MCH responds to accesses to “Reserved” address locations by completing the host cycle. When a “Reserved” register location is read, a zero value is returned. (“Reserved” registers can be 8-, 16-, or 32-bits in size). Writes to “Reserved” registers have no effect on the MCH. Registers that are marked as “Intel Reserved” must not be modified by system software. Writes to “Intel Reserved” registers may cause system failure. Reads from “Intel Reserved” registers may return a non-zero value.

Upon a Full Reset, the MCH sets its entire set of internal configuration registers to predetermined default states. Some register values at reset are determined by external strapping options. The default state represents the minimum functionality feature set required to successfully bringing up the system. Hence, it does not represent the optimal system configuration. It is the responsibility of the system initialization software (usually BIOS) to properly determine the DRAM configurations, operating parameters and optional system features that are applicable, and to program the MCH registers accordingly.

3.1 Register Terminology

The following table shows the register-related terminology that is used.

| Item | Description |
|---------|--|
| RO | Read Only bit(s). Writes to these bits have no effect. |
| RO/S | Read Only / Sticky. Writes to these bits have no effect. These are status bits only. Bits are not returned to their default values by "warm" reset, but will be reset with a cold/complete reset (for PCI Express related bits, a cold reset is "Power Good Reset" as defined in the PCI Express specification). |
| RS/WC | Read Set / Write Clear bit(s). These bits are set to 1 when read and then will continue to remain set until written. A write of 1 clears (sets to 0) the corresponding bit(s) and a write of 0 has no effect. |
| R/W | Read / Write bit(s). These bits can be read and written. |
| R/WC | Read / Write Clear bit(s). These bits can be read. Internal events may set this bit. A write of 1 clears (sets to 0) the corresponding bit(s) and a write of 0 has no effect. |
| R/WC/S | Read / Write Clear / Sticky bit(s). These bits can be read. Internal events may set this bit. A write of 1 clears (sets to 0) the corresponding bit(s) and a write of 0 has no effect. Bits are not cleared by "warm" reset, but will be reset with a cold/complete reset (for PCI Express* related bits a cold reset is "Power Good Reset" as defined in the <i>PCI Express* Specification</i>). |
| R/W/L | Read / Write / Lockable bit(s). These bits can be read and written. Additionally, there is a bit (which may or may not be a bit marked R/W/L) that, when set, prohibits this bit field from being writeable (bit field becomes Read Only). |
| R/W/S | Read / Write / Sticky bit(s). These bits can be read and written. Bits are not cleared by "warm" reset, but will be reset with a cold/complete reset (for PCI Express related bits a cold reset is "Power Good Reset" as defined in the <i>PCI Express* Specification</i>). |
| R/WSC | Read / Write Self Clear bit(s). These bits can be read and written. When the bit is 1, hardware may clear the bit to 0 based upon internal events, possibly sooner than any subsequent read could retrieve a 1. |
| R/WSC/L | Read / Write Self Clear / Lockable bit(s). These bits can be read and written. When the bit is 1, hardware may clear the bit to 0 based upon internal events, possibly sooner than any subsequent read could retrieve a 1. Additionally there is a bit (which may or may not be a bit marked R/W/L) that, when set, prohibits this bit field from being writeable (bit field becomes Read Only). |
| R/WO | Write Once bit(s). Once written, bits with this attribute become Read Only. These bits can only be cleared by a Reset. |
| W | Write Only. Whose bits may be written, but will always-return zeros when read. They are used for write side effects. Any data written to these registers cannot be retrieved. |

3.2 Platform Configuration

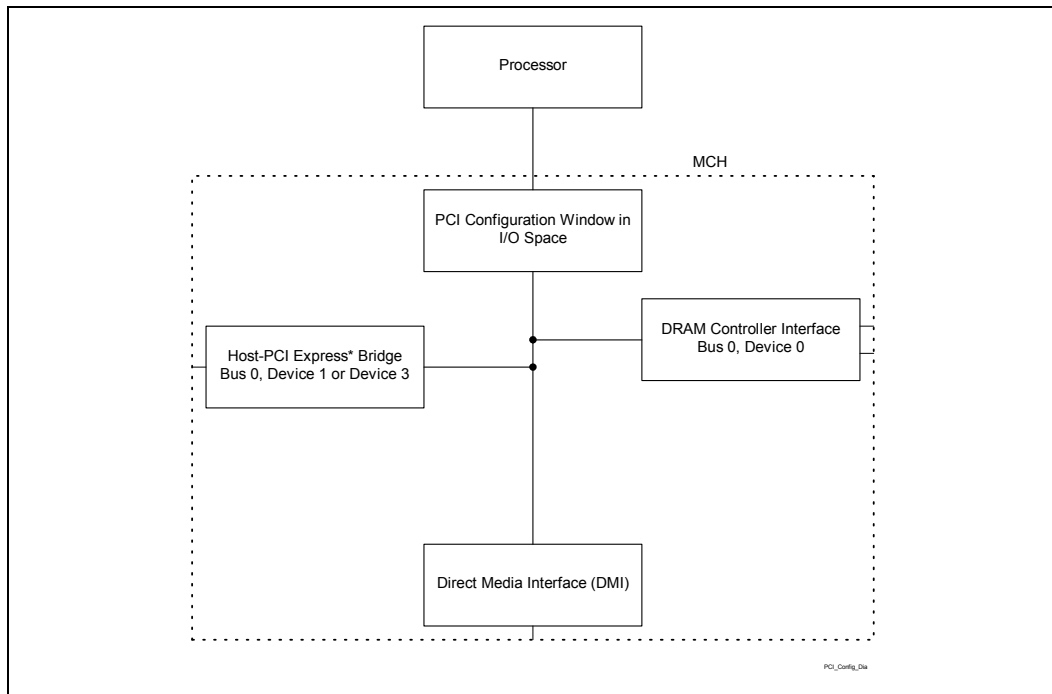

In platforms that support DMI (such as this MCH) the configuration structure is significantly different from previous hub architectures. The DMI physically connects the MCH and the ICH7; so, from a configuration standpoint, the DMI is logically PCI bus 0. As a result, all devices internal to the MCH and the ICH7 appear to be on PCI bus 0.

Note: The ICH7 internal LAN controller does not appear on bus 0; it appears on the external PCI bus and this number is configurable.

The system's primary PCI expansion bus is physically attached to the ICH7 and, from a configuration perspective, appears to be a hierarchical PCI bus behind a PCI-to-PCI bridge; therefore, it has a programmable PCI Bus number. The PCI Express graphics attach appears to system software to be a real PCI bus behind a PCI-to-PCI bridge that is a device resident on PCI bus 0.

Note: A physical PCI bus 0 does not exist; DMI and the internal devices in the MCH and ICH7 logically constitute PCI Bus 0 to configuration software (see Figure 3-1).

Figure 3-1. Conceptual Intel® 975X Express Chipset Platform PCI Configuration Diagram

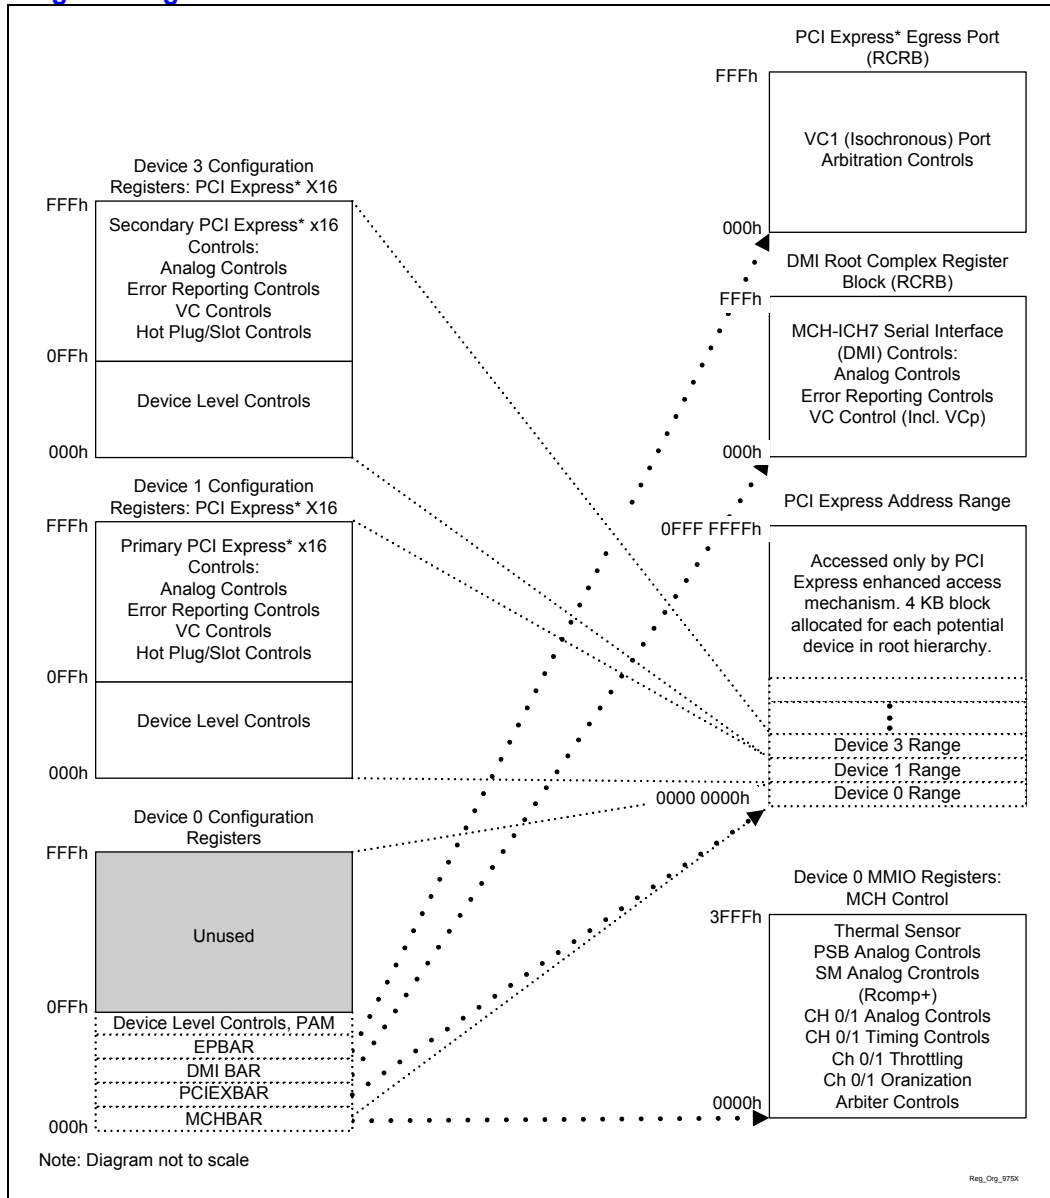

The MCH contains two PCI devices within a single physical component. The configuration registers for the two devices are mapped as devices residing on PCI bus 0.

- **Device 0: Host Bridge/DRAM Controller.** Logically this appears as a PCI device residing on PCI bus 0. Device 0 contains the standard PCI header registers, PCI Express base address register, DRAM control (including thermal/throttling control), and configuration for the DMI and other MCH specific registers.

- Devices 1 and 3: Host-PCI Express Bridge.** Logically this appears as a “virtual” PCI-to-PCI bridge residing on PCI bus 0 and is compliant with *PCI Express* Specification, Revision 1.0a*. Devices 1 and 3 contains the standard PCI-to-PCI bridge registers and the standard PCI Express/PCI configuration registers (including the PCI Express memory address mapping). It also contains Isochronous and Virtual Channel controls in the PCI Express extended configuration space.

Figure 3-2. Register Organization

NOTES:

- Very high level representation. Many details omitted.
- Only Devices 1 and 3 use PCI Express extended configuration space.
- Device 0 uses only standard PCI configuration space.
- Hex numbers represent address range size and not actual locations.

3.3 Configuration Mechanisms

The processor is the originator of configuration cycles so the FSB is the only interface in the platform where these mechanisms are used. The MCH translates transactions received through both configuration mechanisms to the same format.

3.3.1 Standard PCI Configuration Mechanism

The following is the mechanism for translating processor I/O bus cycles to configuration cycles.

The *PCI Local Bus Specification* defines a slot based "configuration space" that allows each device to contain up to 8 functions with each function containing up to 256 8-bit configuration registers. The PCI specification defines two bus cycles to access the PCI configuration space: Configuration Read and Configuration Write. Memory and I/O spaces are supported directly by the processor. Configuration space is supported by a mapping mechanism implemented within the MCH.

The configuration access mechanism makes use of the CONFIG_ADDRESS Register (at I/O address 0CF8h through 0CFBh) and the CONFIG_DATA Register (at I/O address 0CFCh through 0CFFh). To reference a configuration register a DWord I/O write cycle is used to place a value into CONFIG_ADDRESS that specifies the PCI bus, the device on that bus, the function within the device, and a specific configuration register of the device function being accessed. CONFIG_ADDRESS[31] must be 1 to enable a configuration cycle. CONFIG_DATA then becomes a window into the four bytes of configuration space specified by the contents of CONFIG_ADDRESS. Any read or write to CONFIG_DATA will result in the MCH translating the CONFIG_ADDRESS into the appropriate configuration cycle.

The MCH is responsible for translating and routing the processor's I/O accesses to the CONFIG_ADDRESS and CONFIG_DATA registers to internal MCH configuration registers, DMI or PCI Express.

3.3.2 PCI Express* Enhanced Configuration Mechanism

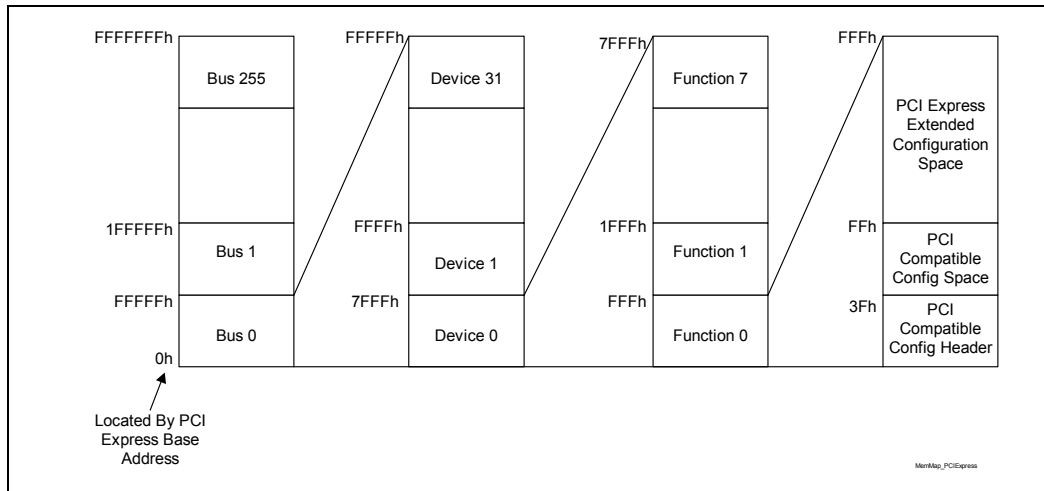

PCI Express extends the configuration space to 4096 bytes per device/function as compared to 256 bytes allowed by *PCI Local Bus Specification, Revision 2.3*. PCI Express configuration space is divided into a PCI 2.3 compatible region that consists of the first 256B of a logical device's configuration space and a PCI Express extended region that consists of the remaining configuration space.

The PCI compatible region can be accessed using either the Standard PCI Configuration Mechanism or using the PCI Express enhanced configuration mechanism described in this section. The extended configuration registers may only be accessed using the PCI Express enhanced configuration mechanism. To maintain compatibility with PCI configuration addressing mechanisms, system software must access the extended configuration space using 32-bit operations (32-bit aligned) only. These 32-bit operations include byte enables allowing only appropriate bytes within the DWord to be accessed. Locked transactions to the PCI Express memory mapped configuration address space are not supported. All changes made using either access mechanism are equivalent.

The PCI Express enhanced configuration mechanism uses a flat memory-mapped address space to access device configuration registers. This address space is reported by the system firmware to the operating system. The PCIEXBAR Register defines the base address for the 256 MB block of addresses below the top of addressable memory (currently 8 GB) for the configuration space associated with all busses, devices, and functions that are potentially a part of the PCI Express root complex hierarchy. The PCIEXBAR Register has controls to limit the size of this reserved memory mapped space; 256 MB is the amount of address space required to reserve space for every bus, device, and function that could possibly exist. Options for 128 MB and 64 MB exist to free up those addresses for other uses. In these cases, the number of busses and all of their associated devices and functions are limited to 128 or 64 busses respectively.

The PCI Express configuration transaction header includes an additional 4 bits (ExtendedRegisterAddress[3:0]) between the Function Number and Register Address fields to provide indexing into the 4 KB of configuration space allocated to each potential device. For PCI Compatible Configuration Requests, the Extended Register Address field must be all zeros.

Figure 3-3. Memory Map to PCI Express* Device Configuration Space

As with PCI devices, each device is selected based on decoded address information that is provided as a part of the address portion of Configuration Request packets. A PCI Express device will decode all address information fields (bus, device, function, and extended address numbers) to provide access to the correct register.

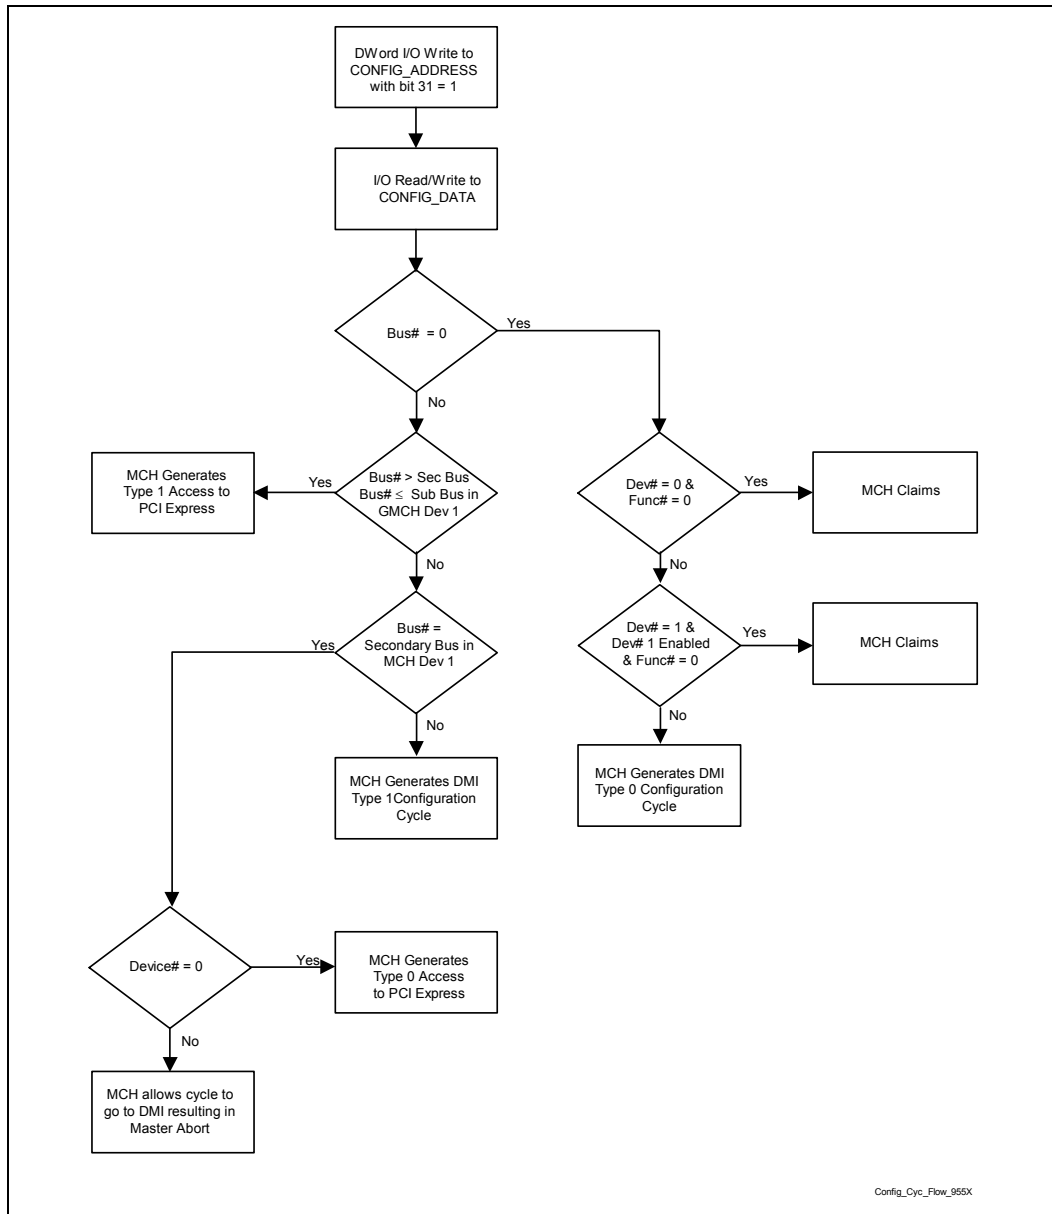

To access this space (steps 1, 2, and 3 are completed only once by BIOS),

1. use the PCI compatible configuration mechanism to enable the PCI Express enhanced configuration mechanism by writing 1 to bit 0 of the PCIEXBAR register.
2. use the PCI compatible configuration mechanism to write an appropriate PCI Express base address into the PCIEXBAR register
3. calculate the host address of the register you wish to set using (PCI Express base + (bus number * 1 MB) + (device number * 32KB) + (function number * 4 KB) + (1 B * offset within the function) = host address)
4. use a memory write or memory read cycle to the calculated host address to write or read that register.

3.4 Routing Configuration Accesses

The MCH supports two PCI related interfaces: DMI and PCI Express. The MCH is responsible for routing PCI and PCI Express configuration cycles to the appropriate device that is an integrated part of the MCH or to one of these two interfaces. Configuration cycles to the ICH7 internal devices and Primary PCI (including downstream devices) are routed to the ICH7 via DMI. Configuration cycles to both the PCI Express graphics PCI compatibility configuration space, and the PCI Express graphics extended configuration space are routed to the PCI Express graphics port device or associated link.

Figure 3-4. MCH Configuration Cycle Flow Chart

3.4.1 Internal Device Configuration Accesses

The MCH decodes the Bus Number (bits 23:16) and the Device Number fields of the CONFIG_ADDRESS register. If the Bus Number field of CONFIG_ADDRESS is 0, the configuration cycle is targeting a PCI Bus #0 device. If the targeted PCI Bus #0 device exists in the MCH and is not disabled, the configuration cycle is claimed by the appropriate device.

3.4.2 Bridge Related Configuration Accesses

Configuration accesses on PCI Express or DMI are PCI Express configuration TLPs (Transaction Layer Packets):

- Bus Number [7:0] is Header Byte 8 [7:0]
- Device Number [4:0] is Header Byte 9 [7:3]
- Function Number [2:0] is Header Byte 9 [2:0]

And special fields for this type of TLP:

- Extended Register Number [3:0] is Header Byte 10 [3:0]
- Register Number [5:0] is Header Byte 11 [7:2]

See the PCI Express specification for more information on both the PCI 2.3 compatible and PCI Express enhanced configuration mechanism and transaction rules.

3.4.2.1 PCI Express* Configuration Accesses

When the Bus Number of a type 1 Standard PCI Configuration cycle or PCI Express enhanced configuration access matches the Device #1 Secondary Bus Number, a PCI Express Type 0 configuration TLP is generated on the PCI Express link targeting the device directly on the opposite side of the link. This should be Device #0 on the bus number assigned to the PCI Express link (likely Bus #1).

The device on other side of link must be Device #0. The MCH will Master Abort any Type 0 configuration access to a non-zero Device number. If there is to be more than one device on that side of the link, there must be a bridge implemented in the downstream device.

When the Bus Number of a type 1 Standard PCI Configuration cycle or PCI Express enhanced configuration access is within the claimed range (between the upper bound of the bridge device's Subordinate Bus Number register and the lower bound of the bridge device's Secondary Bus Number register) but does not match the Device #1 Secondary Bus Number, a PCI Express Type 1 configuration TLP is generated on the secondary side of the PCI Express link.

PCI Express Configuration Writes:

- Internally, the host interface unit translates writes to PCI Express extended configuration space to configuration writes on the backbone.
- Writes to extended space are posted on the FSB, but non-posted on the PCI Express or DMI (i.e., translated to configuration writes).

3.4.2.2 DMI Configuration Accesses

Accesses to disabled MCH internal devices, bus numbers not claimed by the Host-PCI Express bridge, or PCI Bus #0 devices not part of the MCH (#2 through #31) will subtractively decode to the ICH7 and, consequently, be forwarded over the DMI via a PCI Express configuration TLP.

If the Bus Number is zero, the MCH will generate a Type 0 configuration cycle TLP on DMI. If the Bus Number is non-zero, and falls outside the range claimed by the Host-PCI Express bridge, the MCH will generate a Type 1 configuration cycle TLP on DMI.

The ICH7 routes configuration accesses in a manner similar to the MCH. The ICH7 decodes the configuration TLP and generates a corresponding configuration access. Accesses targeting a device on PCI Bus #0 may be claimed by an internal device. The ICH7 compares the non-zero Bus Number with the Secondary Bus Number and Subordinate Bus Number registers of its PCI-to-PCI bridges to determine if the configuration access is meant for Primary PCI, one of the ICH7's devices, the DMI, or some other downstream PCI bus or PCI Express link.

Configuration accesses that are forwarded to the ICH7, but remain unclaimed by any device or bridge will result in a master abort.

3.5 I/O Mapped Registers

The MCH contains two registers that reside in the processor I/O address space: the Configuration Address (CONFIG_ADDRESS) Register and the Configuration Data (CONFIG_DATA) Register. The Configuration Address Register enables/disables the configuration space and determines what portion of configuration space is visible through the Configuration Data window.

3.5.1 CONFIG_ADDRESS—Configuration Address Register

I/O Address: 0CF8–0CFBh Accessed as a DW
 Default Value: 00000000h
 Access: R/W
 Size: 32 bits

CONFIG_ADDRESS is a 32-bit register that can be accessed only as a DWord. A Byte or Word reference will "pass through" the Configuration Address Register and DMI onto the Primary PCI bus as an I/O cycle. The CONFIG_ADDRESS register contains the Bus Number, Device Number, Function Number, and Register Number for which a subsequent configuration access is intended.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 31 | R/W 0b | Configuration Enable (CFGE): 1 = Enable. Accesses to PCI configuration space are enabled. 0 = Disable. |
| 30:24 | | Reserved |

| Bit | Access & Default | Description |
|-------|------------------|---|
| 23:16 | R/W 00h | <p>Bus Number: If the Bus Number is programmed to 00h, the target of the configuration cycle is a PCI Bus #0 agent. If this is the case and the MCH is not the target (i.e., the device number is =2 or >=4), then a DMI Type 0 configuration cycle is generated.</p> <p>If the Bus Number is non-zero, and does not fall within the ranges enumerated by device 1 or 3's Secondary Bus Number or Subordinate Bus Number Register, then a DMI Type 1 configuration cycle is generated.</p> <p>If the Bus Number is non-zero and matches the value programmed into the Secondary Bus Number Register of device 1 or 3, a Type 0 PCI configuration cycle will be generated on PCI Express.</p> <p>If the Bus Number is non-zero, greater than the value in the Secondary Bus Number register of device 1 or 3 and less than or equal to the value programmed into the Subordinate Bus Number Register of device 1 or 3, a Type 1 PCI configuration cycle will be generated on PCI Express.</p> <p>This field is mapped to byte 8 [7:0] of the request header format during PCI Express configuration cycles and A[23:16] during the DMI Type 1 configuration cycles.</p> |
| 15:11 | R/W 00h | <p>Device Number: This field selects one agent on the PCI bus selected by the Bus Number. When the Bus Number field is "00", the MCH decodes the Device Number field. The MCH is always Device Number 0 for the Host bridge entity, Device Number 1 for the Host-PCI Express entity. Therefore, when the Bus Number =0 and the Device Number equals 0, 1 or 3, the internal MCH devices are selected.</p> <p>This field is mapped to byte 6 [7:3] of the request header format during PCI Express configuration cycles and A[15:11] during the DMI configuration cycles.</p> |
| 10:8 | R/W 000b | <p>Function Number: This field allows the configuration registers of a particular function in a multi-function device to be accessed. The MCH ignores configuration cycles to its internal devices if the function number is not equal to 0.</p> <p>This field is mapped to byte 6 [2:0] of the request header format during PCI Express configuration cycles and A[10:8] during the DMI configuration cycles.</p> |
| 7:2 | R/W 00h | <p>Register Number: This field selects one register within a particular Bus, Device, and Function as specified by the other fields in the Configuration Address Register.</p> <p>This field is mapped to byte 7 [7:2] of the request header format during PCI Express configuration cycles and A[7:2] during the DMI configuration cycles.</p> |
| 1:0 | | Reserved |

3.5.2 CONFIG_DATA—Configuration Data Register

I/O Address: 0CFCh–0CFF
 Default Value: 00000000h
 Access: R/W
 Size: 32 bits

CONFIG_DATA is a 32-bit read/write window into configuration space. The portion of configuration space that is referenced by CONFIG_DATA is determined by the contents of CONFIG_ADDRESS.

| Bit | Access & Default | Description |
|------|-------------------|---|
| 31:0 | R/W 0000 0000h | Configuration Data Window (CDW): If bit 31 of CONFIG_ADDRESS is 1, any I/O access to the CONFIG_DATA register will produce a configuration transaction using the contents of CONFIG_ADDRESS to determine the bus, device, function, and offset of the register to be accessed. |

§

4 Host Bridge Registers (D0:F0)

This chapter contains the host bridge registers that are in Device 0 (D0), Function 0 (F0). The DRAM Controller registers are in D0:F0. Table 4-1 is an address map for D0:F0; registers are listed by address offset in ascending order. Section 4.1 provides detailed bit descriptions of the registers listed in Table 4-1. All registers that are defined in the PCI 2.3 specification, but are not necessary or implemented in this component are not included in this document.

Warning: Address locations that are not listed are considered Intel Reserved register locations. Reads to Reserved address locations may return non-zero values. Writes to reserved locations may cause system failures.

Table 4-1. Host Bridge Register Address Map (D0:F0)

| Address Offset | Symbol | Register Name | Default Value | Access |
|----------------|----------|---|--------------------------|-----------|
| 00–01h | VID | Vendor Identification | 8086h | RO |

4.1 Configuration Register Details (D1:F0)

4.1.1 VID—Vendor Identification (D0:F0)

| | |
|-----------------|---------|
| PCI Device: | 0 |
| Address Offset: | 00–01h |
| Default Value: | 8086h |
| Access: | RO |
| Size: | 16 bits |

This register combined, with the Device Identification register, uniquely identifies any PCI device.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:0 | RO 8086h | Vendor Identification Number (VID): PCI standard identification for Intel. |

4.1.2 DID—Device Identification (D0:F0)

| | |
|-----------------|---------|
| PCI Device: | 0 |
| Address Offset: | 02–03h |
| Default Value: | 2774h |
| Access: | RO |
| Size: | 16 bits |

This register, combined with the Vendor Identification register, uniquely identifies any PCI device.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:0 | RO 277Ch | Device Identification Number (DID): Identifier assigned to the MCH core/primary PCI device. |

4.1.3 PCICMD—PCI Command (D0:F0)

| | |
|-----------------|---------|
| PCI Device: | 0 |
| Address Offset: | 04–05h |
| Default Value: | 0006h |
| Access: | RO, R/W |
| Size: | 16 bits |

Since MCH Device 0 does not physically reside on Primary PCI bus, many of the bits are not implemented.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 15:10 | | Reserved |
| 9 | RO 0b | Fast Back-to-Back Enable (FB2B): Not implemented. Hardwired to 0. This bit controls whether or not the master can do fast back-to-back write. Since device 0 is strictly a target, this bit is not implemented. |
| 8 | R/W 0b | SERR Enable (SERRE): This bit is a global enable bit for Device 0 SERR messaging. The MCH does not have a SERR signal. The MCH communicates the SERR condition by sending a SERR message over DMI to the Intel® ICH7. 0 = Disable. SERR message is not generated by the MCH for Device 0 1 = The MCH is enabled to generate SERR messages over DMI for specific Device 0 error conditions that are individually enabled in the ERRCMD Register. The error status is reported in the ERRSTS, and PCISTS Registers. NOTE: This bit only controls SERR messaging for the Device 0. Devices 1 and 3 have their own SERRE bits to control error reporting for error conditions occurring in that device. The control bits are used in a logical OR manner to enable the SERR DMI message mechanism. |
| 7 | RO 0b | Address/Data Stepping Enable (ADSTEP): Not implemented. Hardwired to 0. Address/data stepping is not implemented in the MCH. |
| 6 | RO 0b | Parity Error Enable (PERRE): Not implemented. Hardwired to 0. PERR# is not implemented by the MCH. |
| 5 | RO 0b | VGA Palette Snoop Enable (VGASNOOP): Not implemented. Hardwired to 0. |
| 4 | RO 0b | Memory Write and Invalidate Enable (MWIE): Not implemented. Hardwired to 0. The MCH will never issue memory write and invalidate commands. |
| 3 | | Reserved |
| 2 | RO 1b | Bus Master Enable (BME): Hardwired to 1. The MCH is always enabled as a master. |
| 1 | RO 1b | Memory Access Enable (MAE): Hardwired to 1. The MCH always allows access to main memory. |
| 0 | RO 0b | I/O Access Enable (IOAE): Not implemented. Hardwired to 0. |

4.1.4 PCISTS—PCI Status (D0:F0)

| | |
|-----------------|-----------|
| PCI Device: | 0 |
| Address Offset: | 06–07h |
| Default Value: | 0090h |
| Access: | RO, R/W/C |
| Size: | 16 bits |

This status register reports the occurrence of error events on Device 0's PCI interface. Since the MCH Device 0 does not physically reside on Primary PCI, many of the bits are not implemented.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15 | RO 0b | Detected Parity Error (DPE): Not implemented. Hardwired to 0. |
| 14 | R/WC 0b | Signaled System Error (SSE): Software clears this bit by writing a 1 to it. 0 = MCH Device 0 did Not generate a SERR message over DMI 1 = MCH Device 0 generated a SERR message over DMI for any enabled Device 0 error condition. Device 0 error conditions are enabled in the PCICMD, and ERRCMD registers. Device 0 error flags are read/reset from the PCISTS, or ERRSTS registers. |
| 13 | R/WC 0b | Received Master Abort Status (RMAS): Software clears this bit by writing a 1 to it. 0 = MCH did Not generate a DMI request that received an Unsupported Request completion packet. 1 = MCH generated a DMI request that received an Unsupported Request completion packet. |
| 12 | R/WC 0b | Received Target Abort Status (RTAS): Software clears this bit by writing a 1 to it. 0 = MCH did Not generate a DMI request that received a Completer Abort completion packet. 1 = MCH generated a DMI request that receives a Completer Abort completion packet. |
| 11 | RO 0b | Signaled Target Abort Status (STAS): Not implemented. Hardwired to 0. The MCH will not generate a Target Abort DMI completion packet or Special Cycle. |
| 10:9 | RO 00b | DEVSEL Timing (DEVT): These bits are hardwired to "00". Device 0 does not physically connect to Primary PCI. These bits are set to "00" (fast decode) so that optimum DEVSEL timing for Primary PCI is not limited by the MCH. |
| 8 | RO 0b | Master Data Parity Error Detected (DPD): Not implemented. Hardwired to 0. |
| 7 | RO 1b | Fast Back-to-Back (FB2B): Hardwired to 1. Device 0 does not physically connect to the Primary PCI. This bit is set to 1 (indicating fast back-to-back capability) so that the optimum setting for Primary PCI is not limited by the MCH. |
| 6 | | Reserved |
| 5 | RO 0b | 66 MHz Capable: Hardwired to 0. This bit does not apply to PCI Express*. |

| Bit | Access & Default | Description |
|-----|------------------|---|
| 4 | RO 1b | Capability List (CLIST): This bit is hardwired to 1 to indicate to the configuration software that this device/function implements a list of new capabilities. A list of new capabilities is accessed via the CAPPTR register (offset 34h). The CAPPTR Register contains an offset pointing to the start address within configuration space of this device where the Capability standard register resides. |
| 3:0 | | Reserved |

4.1.5 RID—Revision Identification (D0:F0)

| | |
|-----------------|--------------------------|
| PCI Device: | 0 |
| Address Offset: | 08h |
| Default Value: | See register table below |
| Access: | RO |
| Size: | 8 bits |

This register contains the revision number of the MCH Device 0. These bits are read only and writes to this register have no effect.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7:0 | RO | Revision Identification Number (RID): This is an 8-bit value that indicates the revision identification number for the MCH Device 0. Refer to the <i>Intel® 975X Express Chipset Specification Update</i> for the value of the Revision ID Register. |

4.1.6 CC—Class Code (D0:F0)

| | |
|-----------------|---------|
| PCI Device: | 0 |
| Address Offset: | 09–0Bh |
| Default Value: | 060000h |
| Access: | RO |
| Size: | 24 bits |

This register identifies the basic function of the device, a more specific sub-class, and a register-specific programming interface.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 23:16 | RO 06h | Base Class Code (BCC): This is an 8-bit value that indicates the base class code for the MCH. 06h = Bridge device. |
| 15:8 | RO 00h | Sub-Class Code (SUBCC): This is an 8-bit value that indicates the category of Bridge into which the MCH falls. 00h = Host Bridge. |
| 7:0 | RO 00h | Programming Interface (PI): This is an 8-bit value that indicates the programming interface of this device. This value does not specify a particular register set layout and provides no practical use for this device. |

4.1.7 MLT—Master Latency Timer (D0:F0)

| | |
|-----------------|--------|
| PCI Device: | 0 |
| Address Offset: | 0Dh |
| Default Value: | 00h |
| Access: | RO |
| Size: | 8 bits |

Device 0 in the MCH is not a PCI master. Therefore, this register is not implemented.

| Bit | Access & Default | Description |
|-----|------------------|-------------|
| 7:0 | | Reserved |

4.1.8 HDR—Header Type (D0:F0)

| | |
|-----------------|--------|
| PCI Device: | 0 |
| Address Offset: | 0Eh |
| Default Value: | 00h |
| Access: | RO |
| Size: | 8 bits |

This register identifies the header layout of the configuration space. No physical register exists at this location.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:0 | RO 00h | PCI Header (HDR): This field always returns 0 to indicate that the MCH is a single function device with standard header layout. Reads and writes to this location have no effect. |

4.1.9 SVID—Subsystem Vendor Identification (D0:F0)

| | |
|-----------------|---------|
| PCI Device: | 0 |
| Address Offset: | 2C–2Dh |
| Default Value: | 0000h |
| Access: | R/WO |
| Size: | 16 bits |

This register is used to identify the vendor of the subsystem.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:0 | R/WO 0000h | Subsystem Vendor ID (SUBVID): This field should be programmed during boot-up to indicate the vendor of the system board. After it has been written once, it becomes read only. |

4.1.10 SID—Subsystem Identification (D0:F0)

PCI Device: 0
 Address Offset: 2E–2Fh
 Default Value: 0000h
 Access: R/WO
 Size: 16 bits

This register is used to identify a particular subsystem.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:0 | R/WO 0000h | Subsystem ID (SUBID): This field should be programmed during BIOS initialization. After it has been written once, it becomes read only. |

4.1.11 CAPPTR—Capabilities Pointer (D0:F0)

PCI Device: 0
 Address Offset: 34h
 Default Value: E0h
 Access: RO
 Size: 8 bits

The CAPPTR Register provides the offset that is the pointer to the location of the first device capability in the capability list.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7:0 | RO E0h | Pointer to the Offset of the First Capability ID Register Block: In this case the first capability is the product-specific Capability Identifier (CAPID0). |

4.1.12 EPBAR—Egress Port Base Address (D0:F0)

| | |
|-----------------|-----------|
| PCI Device: | 0 |
| Address Offset: | 40–43h |
| Default Value: | 00000000h |
| Access: | RO |
| Size: | 32 bits |

This is the base address for the Egress Port MMIO Configuration space. There is no physical memory within this 4-KB window that can be addressed. The 4 KB space reserved by this register does not alias to any PCI 2.3 compliant memory mapped space.

Note: On reset, this register is disabled and must be enabled by writing a 1 to EPBAREN.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 31:12 | R/W 00000h | <p>Egress Port MMIO Base Address: This field corresponds to bits 31:12 of the base address Egress Port MMIO configuration space.</p> <p>BIOS will program this register resulting in a base address for a 4-KB block of contiguous memory address space. This register ensures that a naturally aligned 4-KB space is allocated within total addressable memory space of 4 GB.</p> <p>System software uses this base address to program the MCH MMIO register set.</p> |
| 11:1 | | Reserved |
| 0 | R/W 0b | <p>EPBAR Enable (EPBAREN):</p> <p>0 = Disable. EPBAR is disabled and does not claim any memory.</p> <p>1 = Enable. EPBAR memory mapped accesses are claimed and decoded appropriately</p> |

4.1.13 MCHBAR—MCH Memory Mapped Register Range Base Address (D0:F0)

| | |
|-----------------|-----------|
| PCI Device: | 0 |
| Address Offset: | 44–47h |
| Default Value: | 00000000h |
| Access: | R/W |
| Size: | 32 bits |

This is the base address for the MCH memory mapped configuration space. There is no physical memory within this 16-KB window that can be addressed. The 16 KB space reserved by this register does not alias to any PCI 2.3 compliant memory mapped space.

Note: On reset, this register is disabled and must be enabled by writing a 1 to MCHBAREN.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:14 | R/W 00000h | <p>MCH Memory Mapped Base Address: This field corresponds to bits 31:14 of the base address MCH Memory Mapped configuration space.</p> <p>BIOS will program this register resulting in a base address for a 16-KB block of contiguous memory address space. This register ensures that a naturally aligned 16-KB space is allocated within total addressable memory space of 4 GB.</p> <p>System software uses this base address to program the MCH Memory Mapped register set.</p> |
| 13:1 | | Reserved |
| 0 | R/W 0b | <p>MCHBAR Enable (MCHBAREN):</p> <p>0 = Disable. MCHBAR is disabled and does not claim any memory</p> <p>1 = Enable. MCHBAR memory mapped accesses are claimed and decoded appropriately</p> |

4.1.14 PCIEXBAR—PCI Express* Register Range Base Address (D0:F0)

| | |
|-----------------|-----------|
| PCI Device: | 0 |
| Address Offset: | 48–4Bh |
| Default Value: | E0000000h |
| Access: | R/W |
| Size: | 32 bits |

This is the base address for the PCI Express configuration space. This window of addresses contains the 4 KB of configuration space for each PCI Express device that can potentially be part of the PCI Express hierarchy associated with the MCH. There is not actual physical memory within this window of up to 256-MBs that can be addressed. The actual length is determined by a field in this register. Each PCI Express hierarchy requires a PCI Express BASE register. The MCH supports one PCI Express hierarchy.

The region reserved by this register does not alias to any PCI 2.3 compliant memory mapped space. For example, MCHBAR reserves a 16-KB space outside of PCIEXBAR space. It cannot be overlaid on the space reserved by PCIEXBAR for device 0.

On reset, this register is disabled and must be enabled by writing a 1 to the enable field in this register. This base address shall be assigned on a boundary consistent with the number of buses (defined by the Length field in this register) above TOLUD and still within total 32 bit addressable memory space.

All other bits not decoded are read only 0. The PCI Express Base Address cannot be less than the maximum address written to the Top of physical memory register (TOLUD). Software must ensure that these ranges do not overlap with known ranges located above TOLUD.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:28 | R/W Eh | <p>PCI Express* Base Address: This field corresponds to bits 31:28 of the base address for PCI Express enhanced configuration space. BIOS will program this register resulting in a base address for a contiguous memory address space; size is defined by bits 2:1 of this register.</p> <p>This base address shall be assigned on a boundary consistent with the number of buses (defined by the Length field in this register) above TOLUD and still within total 32-bit addressable memory space. The address bits decoded depend on the length of the region defined by this register.</p> <p>The address used to access the PCI Express configuration space for a specific device can be determined as follows:</p> <p>PCI Express Base Address + Bus Number * 1MB + Device Number * 32KB + Function Number * 4KB</p> <p>The address used to access the PCI Express configuration space for Device 1 or 3 in this component would be PCI Express Base Address + 0 * 1MB + 1 * 32KB + 0 * 4KB = PCI Express Base Address + 32KB. Remember that this address is the beginning of the 4 KB space that contains both the PCI compatible configuration space and the PCI Express extended configuration space.</p> |

| Bit | Access & Default | Description |
|------|------------------|--|
| 27 | R/W 0b | 128 MB Base Address Mask (128ADMSK): This bit is either part of the PCI Express Base Address (R/W) or part of the address mask (RO, read 0b), depending on the value of bits 2:1 in this register. |
| 26 | R/W 0b | 64MB Base Address Mask (64ADMSK): This bit is either part of the PCI Express Base Address (R/W) or part of the address mask (RO, read 0b), depending on the value of bits 2:1 in this register |
| 25:3 | | Reserved |
| 2:1 | R/W 00b | Length (LENGTH): This Field describes the length of this region: Enhanced Configuration Space Region/Buses Decoded. 00 = 256 MB (buses 0–255). Bits 31:28 are decoded in the PCI Express Base Address Field 01 = 128 MB (Buses 0–127). Bits 31:27 are decoded in the PCI Express Base Address Field. 10 = 64 MB (Buses 0–63). Bits 31:26 are decoded in the PCI Express Base Address Field. 11 = Reserved |
| 0 | R/W 0h | PCIEXBAR Enable (PCIEXBAREN): 0 = PCIEXBAR Register is disabled. Memory read and write transactions proceed as if there were no PCIEXBAR Register. PCIEXBAR bits 31:26 are R/W with no functionality behind them. 1 = PCIEXBAR Register is enabled. Memory read and write transactions whose address bits 31:26 match PCIEXBAR will be translated to configuration reads and writes within the MCH. |

4.1.15 DMIBAR—Root Complex Register Range Base Address (D0:F0)

| | |
|-----------------|-----------|
| PCI Device: | 0 |
| Address Offset: | 4C–4Fh |
| Default Value: | 00000000h |
| Access: | R/W |
| Size: | 32 bits |

This is the base address for the Root Complex configuration space. This window of addresses contains the Root Complex Register set for the PCI Express hierarchy associated with the MCH. There is no physical memory within this 4-KB window that can be addressed. The 4 KB reserved by this register does not alias to any PCI 2.3 compliant memory mapped space.

On reset, this register is disabled and must be enabled by writing a 1 to the DMIBAREN in this register.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:12 | R/W 00000h | <p>DMI Base Address: This field corresponds to bits 31:12 of the base address DMI configuration space.</p> <p>BIOS will program this register resulting in a base address for a 4-KB block of contiguous memory address space. This register ensures that a naturally aligned 4-KB space is allocated within total addressable memory space of 4 GB.</p> <p>System Software uses this base address to program the DMI register set.</p> |
| 11:1 | | Reserved |
| 0 | R/W 0b | <p>DMIBAR Enable (DMIBAREN):</p> <p>0 = Disable. DMIBAR is disabled and does not claim any memory</p> <p>1 = Enable. DMIBAR memory mapped accesses are claimed and decoded appropriately</p> |

4.1.16 DEVEN—Device Enable (D0:F0)

| | |
|-----------------|-----------|
| PCI Device: | 0 |
| Address Offset: | 54–57h |
| Default Value: | 00000003h |
| Access: | R/W |
| Size: | 32 bits |

This register allows for enabling/disabling of PCI devices and functions that are within the MCH.

| Bit | Access & Default | Description |
|------|------------------|--|
| 31:3 | | Reserved |
| 2 | R/W 1b | <p>PCI Express* Port (D3EN):</p> <p>0 = Disable. Bus 0, Device 3, Function 0 is disabled and hidden.</p> <p>1 = Enable. Bus 0, Device 3, Function 0 is enabled and visible.</p> <p>BIOS Requirement: The link must be disabled (see Dev 3 B0h[4]) prior to the device being disabled</p> |
| 1 | R/W 1b | <p>PCI Express* Port (D1EN):</p> <p>0 = Disable. Bus 0, Device 1, Function 0 is disabled and hidden.</p> <p>1 = Enable. Bus 0, Device 1, Function 0 is enabled and visible.</p> <p>Device 1 must not be disabled when Device 3 is enabled.</p> <p>BIOS Requirement: The link must be disabled (see Dev 1 B0h[4]) prior to the device being disabled.</p> |
| 0 | RO 1b | <p>Host Bridge: Hardwired to 1. Bus 0, Device 0, Function 0 may not be disabled.</p> |

4.1.17 DEAP—DRAM Error Address Pointer (D0:F0)

| | |
|-----------------|-----------|
| PCI Device: | 0 |
| Address Offset: | 58–5Bh |
| Default Value: | 00000000h |
| Access: | RO/S |
| Size: | 32 bits |

This register contains the address of detected DRAM ECC error(s).

| Bit | Access & Default | Description |
|------|------------------|--|
| 31:7 | RO/S 0000000h | <p>Error Address Pointer (EAP): This field is used to store the 128B (Two Cache Line) address of main memory for which an error (single bit or multi-bit error) has occurred. The address is captured after any address remapping through REMAPBASE/ REMAPLIMIT is applied, such that all physical system memory appears as a contiguous logical address block. It is valid to compare this address against C0DRB* and C1DRB* registers to determine which rank of memory failed.</p> <p>Note that the value of this bit field represents the address of the first single or the first multiple bit error occurrence after the error flag bits in the ERRSTS Register have been cleared by software. A multiple bit error will overwrite a single bit error. Once the error flag bits are set as a result of an error, this bit field is locked and doesn't change as a result of a new error. These bits are reset on PWROK.</p> |
| 6:1 | | Reserved |
| 0 | RO/S 0b | <p>Channel Indicator (CHI): This bit indicates which memory channel had the error.</p> <p>0 = Channel 0 1 = Channel 1</p> |

4.1.18 DERRSYN— DRAM Error Syndrome (D0:F0)

| | |
|-----------------|--------|
| PCI Device: | 0 |
| Address Offset: | 5Ch |
| Default Value: | 00h |
| Access: | RO/S |
| Size: | 8 bits |

This register is used to report the ECC syndromes for each quadword of a 32B-aligned data quantity read from the DRAM array.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:0 | RO/S 00h | <p>DRAM ECC Syndrome (DECCSYN): After a DRAM ECC error on any QWord of the data chunk resulting from a read command, hardware loads this field with a syndrome that describes the set of bits associated with the first QWord containing an error. Note that this field is locked from the time that it is loaded up to the time when the error flag is cleared by software. If the first error was a single bit, correctable error, then a subsequent multiple bit error on any of the QWords in this read transaction or any subsequent read transaction will cause the field to be re-recorded. When a multiple bit error is recorded, then the field is locked until the error flag is cleared by software. In all other cases, an error, which occurs after the first error, and before the error flag, has been cleared by software, will escape recording.</p> <p>These bits are reset on PWROK.</p> |

4.1.19 DERRDST—DRAM Error Destination (D0:F0)

| | |
|-----------------|--------|
| PCI Device: | 0 |
| Address Offset: | 5Dh |
| Default Value: | 00h |
| Access: | RO/S |
| Size: | 8 bits |

This register is used to report the destination of the data containing an ECC error whose address is recorded in DEAP.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7:6 | | Reserved |
| 5:0 | RO/S 00 0000b | <p>ECC Error Source Code (EESC): This field is updated concurrently with DERRSYN.</p> <p>00h = Processor to memory reads 01h – 07h = Reserved 08h – 09h = DMI VC0 initiated and targeting cycles/data 0Ah – 0Bh = DMI VC1 initiated and targeting cycles/data 0Ch – DMI = VCp initiated and targeting cycle/data 0Dh – 0Fh = Reserved 10h = Primary PCI Express initiated and targeting cycles/data 11h = Reserved 12h = Primary PCI Express initiated and targeting cycles/data 13h = Reserved 14h – 15h = Primary PCI Express initiated and targeting cycles/data 16h – 1Fh = Reserved 20h = Secondary PCI Express initiated and targeting cycles/data 21h = Reserved 22h = Secondary PCI Express initiated and targeting cycles/data 23h = Reserved 24h – 15h = Secondary PCI Express initiated and targeting cycles/data 26h – 27h = Reserved</p> |

4.1.20 PAM0—Programmable Attribute Map 0 (D0:F0)

| | |
|-----------------|--------|
| PCI Device: | 0 |
| Address Offset: | 90h |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

This register controls the read, write, and shadowing attributes of the BIOS area from 0F0000h to 0FFFFFFh

The MCH allows programmable memory attributes on 13 Legacy memory segments of various sizes in the 768-KB to 1-MB address range. Seven Programmable Attribute Map (PAM) registers support these features. Cache ability of these areas is controlled via the MTRR registers in the P6 processor. Two bits are used to specify memory attributes for each memory segment. These bits apply to both host accesses and PCI initiator accesses to the PAM areas. These attributes are:

- RE (Read Enable). When RE = 1, the processor read accesses to the corresponding memory segment are claimed by the MCH and directed to main memory. Conversely, when RE = 0, the host read accesses are directed to PRIMARY PCI.
- WE (Write Enable). When WE = 1, the host write accesses to the corresponding memory segment are claimed by the MCH and directed to main memory. Conversely, when WE = 0, the host write accesses are directed to PRIMARY PCI.

The RE and WE attributes permit a memory segment to be read only, write only, read/write, or disabled. For example, if a memory segment has RE = 1 and WE = 0, the segment is read only.

Each PAM Register controls two regions, typically 16 KB in size.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:6 | | Reserved |
| 5:4 | R/W 00b | 0F0000–0FFFFFFh Attribute (HIENABLE): This field controls the steering of read and write cycles that addresses the BIOS area from 0F0000h to 0FFFFFFh. 00 = DRAM Disabled: All accesses are directed to the DMI. 01 = Read Only: All reads are sent to DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |
| 3:0 | | Reserved |

Warning: The MCH may hang if a PCI Express graphics attach or DMI originated access to Read Disabled or Write Disabled PAM segments occur (due to a possible IWB to non-DRAM). For these reasons, the following critical restriction is placed on the programming of the PAM regions:

At the time that a DMI or PCI Express graphics attach accesses to the PAM region may occur, the targeted PAM segment must be programmed to be both readable and writeable.

4.1.21 PAM1—Programmable Attribute Map 1 (D0:F0)

PCI Device: 0
 Address Offset: 91h
 Default Value: 00h
 Access: R/W
 Size: 8 bits

This register controls the read, write, and shadowing attributes of the BIOS areas from 0C0000h–0C7FFFh.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:6 | | Reserved |
| 5:4 | R/W 00b | 0C4000–0C7FFFh Attribute (HIENABLE): This field controls the steering of read and write cycles that address the BIOS area from 0C4000h to 0C7FFFh. 00 = DRAM Disabled: Accesses are directed to the DMI. 01 = Read Only: All reads are serviced by DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |
| 3:2 | | Reserved |
| 1:0 | R/W 00b | 0C0000–0C3FFFh Attribute (LOENABLE): This field controls the steering of read and write cycles that address the BIOS area from 0C0000h to 0C3FFFh. 00 = DRAM Disabled: Accesses are directed to the DMI. 01 = Read Only: All reads are serviced by DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |

4.1.22 PAM2—Programmable Attribute Map 2 (D0:F0)

PCI Device: 0
 Address Offset: 92h
 Default Value: 00h
 Access: R/W
 Size: 8 bits

This register controls the read, write, and shadowing attributes of the BIOS areas from 0C8000h–0CFFFFh.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:6 | | Reserved |
| 5:4 | R/W 00b | 0CC000–0CFFFFh Attribute (HIENABLE): 00 = DRAM Disabled: Accesses are directed to the DMI. 01 = Read Only: All reads are serviced by DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |
| 3:2 | | Reserved |
| 1:0 | R/W 00b | 0C8000–0CBFFFh Attribute (LOENABLE): This field controls the steering of read and write cycles that address the BIOS area from 0C8000h to 0CBFFFh. 00 = DRAM Disabled: Accesses are directed to the DMI. 01 = Read Only: All reads are serviced by DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |

4.1.23 PAM3—Programmable Attribute Map 3 (D0:F0)

PCI Device: 0
 Address Offset: 93h
 Default Value: 00h
 Access: R/W
 Size: 8 bits

This register controls the read, write, and shadowing attributes of the BIOS areas from 0D0000h–0D7FFFh.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:6 | | Reserved |
| 5:4 | R/W 00 b | 0D4000–0D7FFFh Attribute (HIENABLE): This field controls the steering of read and write cycles that address the BIOS area from 0D4000h to 0D7FFFh. 00 = DRAM Disabled: Accesses are directed to the DMI. 01 = Read Only: All reads are serviced by DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |
| 3:2 | | Reserved |
| 1:0 | R/W 00 b | 0D0000–0D3FFFh Attribute (LOENABLE): This field controls the steering of read and write cycles that address the BIOS area from 0D0000h to 0D3FFFh. 00 = DRAM Disabled: Accesses are directed to the DMI. 01 = Read Only: All reads are serviced by DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |

4.1.24 PAM4—Programmable Attribute Map 4 (D0:F0)

PCI Device: 0
 Address Offset: 94h
 Default Value: 00h
 Access: R/W
 Size: 8 bits

This register controls the read, write, and shadowing attributes of the BIOS areas from 0D8000h–0DFFFFh.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:6 | | Reserved |
| 5:4 | R/W 00b | 0DC000–0DFFFFh Attribute (HIENABLE): This field controls the steering of read and write cycles that address the BIOS area from 0DC000h to 0DFFFFh. 00 = DRAM Disabled: Accesses are directed to the DMI. 01 = Read Only: All reads are serviced by DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |
| 3:2 | | Reserved |
| 1:0 | R/W 00b | 0D8000–0DBFFFh Attribute (LOENABLE): This field controls the steering of read and write cycles that address the BIOS area from 0D8000h to 0DBFFFh. 00 = DRAM Disabled: Accesses are directed to the DMI. 01 = Read Only: All reads are serviced by DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |

4.1.25 PAM5—Programmable Attribute Map 5 (D0:F0)

PCI Device: 0
 Address Offset: 95h
 Default Value: 00h
 Access: R/W
 Size: 8 bits

This register controls the read, write, and shadowing attributes of the BIOS areas from 0E0000h–0E7FFFh.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:6 | | Reserved |
| 5:4 | R/W 00b | 0E4000–0E7FFFh Attribute (HIENABLE): This field controls the steering of read and write cycles that address the BIOS area from 0E4000h to 0E7FFFh. 00 = DRAM Disabled: Accesses are directed to the DMI. 01 = Read Only: All reads are serviced by DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |
| 3:2 | | Reserved |
| 1:0 | R/W 00b | 0E0000–0E3FFFh Attribute (LOENABLE): This field controls the steering of read and write cycles that address the BIOS area from 0E0000h to 0E3FFFh. 00 = DRAM Disabled: Accesses are directed to the DMI. 01 = Read Only: All reads are serviced by DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |

4.1.26 PAM6—Programmable Attribute Map 6 (D0:F0)

PCI Device: 0
 Address Offset: 96h
 Default Value: 00h
 Access: R/W
 Size: 8 bits

This register controls the read, write, and shadowing attributes of the BIOS areas from 0E8000h–0EFFFFh.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7:6 | | Reserved |
| 5:4 | R/W 00b | 0EC000h–0EFFFFh Attribute (HIENABLE): This field controls the steering of read and write cycles that address the BIOS area from 0E4000h to 0E7FFFh. 00 = DRAM Disabled: Accesses are directed to the DMI. 01 = Read Only: All reads are serviced by DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |
| 3:2 | | Reserved |
| 1:0 | R/W 00b | 0E8000–0EBFFFh Attribute (LOENABLE): This field controls the steering of read and write cycles that address the BIOS area from 0E0000h to 0E3FFFh. 00 = DRAM Disabled: Accesses are directed to the DMI. 01 = Read Only: All reads are serviced by DRAM. All writes are forwarded to the DMI. 10 = Write Only: All writes are sent to DRAM. Reads are serviced by DMI. 11 = Normal DRAM Operation: All reads and writes are serviced by DRAM. |

4.1.27 LAC—Legacy Access Control (D0:F0)

PCI Device: 0
 Address Offset: 97h
 Default Value: 00h
 Access: R/W
 Size: 8 bits

This 8-bit register controls a fixed DRAM hole from 15–16 MB.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7 | R/W 0b | Hole Enable (HEN): This field enables a memory hole in DRAM space. The DRAM that lies "behind" this space is not remapped. 0 = No memory hole. 1 = Memory hole from 15 MB to 16 MB. |
| 6:1 | | Reserved |

| Bit | Access & Default | Description | | | | | | | | | | | | | | | |
|-------|------------------|--|-------|------|-------------|---|---|---|---|---|---------------------|---|---|---|---|---|---|
| 0 | R/W 0b | <p>MDA Present (MDAP): This bit works with the VGA Enable bits in the BCTRL Register of Device 1 to control the routing of processor-initiated transactions targeting MDA compatible I/O and memory address ranges. This bit should not be set if device 1's VGA Enable bit is not set. Software must ensure the setting of the VGA Enable bits in device 1 and device 3 are mutually exclusive.</p> <p>If device 1's VGA enable bit is not set, then accesses to I/O address range x3BCh–x3BFh are forwarded to the DMI.</p> <p>If the VGA enable bit is set and MDA is not present, then accesses to I/O address range x3BCh–x3BFh are forwarded to the PEG corresponding to this control bit if the address is within the corresponding IOBASE and IOLIMIT; otherwise, they are forwarded to the DMI.</p> <p>MDA resources are defined as the following:</p> <p>Memory: 0B0000h – 0B7FFFh</p> <p>I/O: 3B4h, 3B5h, 3B8h, 3B9h, 3BAh, 3BFh, (Including ISA address aliases, A [15:10] are not used in decode)</p> <p>Any I/O reference that includes the I/O locations listed above, or their aliases, will be forwarded to the DMI even if the reference includes I/O locations not listed above.</p> <p>The following table shows the behavior for all combinations of MDA and VGA:</p> <table border="1"> <thead> <tr> <th>VGAEN</th> <th>MDAP</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>All References to MDA and VGA space are routed to the DMI</td> </tr> <tr> <td>0</td> <td>1</td> <td>Invalid combination</td> </tr> <tr> <td>1</td> <td>0</td> <td>All VGA and MDA references are routed to the PEG corresponding to this control bit.</td> </tr> <tr> <td>1</td> <td>1</td> <td>All VGA references are routed to the PEG corresponding to this control bit MDA references are routed to the DMI</td> </tr> </tbody> </table> <p>VGA and MDA memory cycles can only be routed across PCI Express when MAE (PCICMD1[1]) is set.</p> <p>VGA and MDA I/O cycles can only be routed across the PCI Express if IOAE (PCICMD1[0]) is set.</p> | VGAEN | MDAP | Description | 0 | 0 | All References to MDA and VGA space are routed to the DMI | 0 | 1 | Invalid combination | 1 | 0 | All VGA and MDA references are routed to the PEG corresponding to this control bit. | 1 | 1 | All VGA references are routed to the PEG corresponding to this control bit MDA references are routed to the DMI |
| VGAEN | MDAP | Description | | | | | | | | | | | | | | | |
| 0 | 0 | All References to MDA and VGA space are routed to the DMI | | | | | | | | | | | | | | | |
| 0 | 1 | Invalid combination | | | | | | | | | | | | | | | |
| 1 | 0 | All VGA and MDA references are routed to the PEG corresponding to this control bit. | | | | | | | | | | | | | | | |
| 1 | 1 | All VGA references are routed to the PEG corresponding to this control bit MDA references are routed to the DMI | | | | | | | | | | | | | | | |

4.1.28 REMAPBASE—Remap Base Address (D0:F0)

PCI Device: 0
 Address Offset: 98–99h
 Default Value: 03FFh
 Access: R/W
 Size: 16 bits

| Bit | Access & Default | Description |
|-------|------------------|--|
| 15:10 | | Reserved |
| 9:0 | R/W 3FFh | <p>Remap Base Address [35:26] (REMAPBASE): The value in this register defines the lower boundary of the Remap window. The Remap window is inclusive of this address. In the decoder A[25:0] of the Remap Base Address are assumed to be 0s. Thus, the bottom of the defined memory range will be aligned to a 64 MB boundary.</p> <p>When the value in this register is greater than the value programmed into the Remap Limit register, the Remap window is disabled.</p> <p>NOTE: Bit 0 (Address Bit 26) must be a 0</p> |

4.1.29 REMAPLIMIT—Remap Limit Address (D0:F0)

PCI Device: 0
 Address Offset: 9A–9Bh
 Default Value: 0000h
 Access: R/W
 Size: 16 bits

| Bit | Access & Default | Description |
|-------|------------------|--|
| 15:10 | | Reserved |
| 9:0 | R/W 00h | <p>Remap Limit Address [35:26] (REMAPLMT): The value in this register defines the upper boundary of the Remap window. The Remap window is inclusive of this address. In the decoder A[25:0] of the remap limit address are assumed to be 1s. Thus the top of the defined range will be one less than a 64 MB boundary.</p> <p>When the value in this register is less than the value programmed into the Remap Base register, the Remap window is disabled.</p> <p>NOTE: Bit 0 (address bit 26) must be a 0.</p> |

4.1.30 TOLUD—Top of Low Usable DRAM (D0:F0)

| | |
|-----------------|--------|
| PCI Device: | 0 |
| Address Offset: | 9Ch |
| Default Value: | 08h |
| Access: | R/W |
| Size: | 8 bits |

This 8-bit register defines the Top of Low Usable DRAM. TSEG Memory are within the DRAM space defined. From the top, MCH optionally claims 1, 2, or 8 MB of DRAM for TSEG if enabled.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:3 | R/W 01 h | <p>Top of Low Usable DRAM (TOLUD): This register contains bits 31:27 of an address one byte above the maximum DRAM memory that is usable by the operating system. Address bits 31:27 programmed to 01h implies a minimum memory size of 128 MB.</p> <p>Configuration software must set this value to the smaller of the following 2 choices. Maximum amount memory in the system plus one byte or the minimum address allocated for PCI memory.</p> <p>Address bits 26:0 are assumed to be 000_0000h for the purposes of address comparison. The Host interface positively decodes an address towards DRAM if the incoming address is less than the value programmed in this register.</p> <p>If this register is set to 0000 0 b it implies 128 MB of system memory.</p> <p>Note: That the Top of Low Usable DRAM is the lowest address above TSEG.</p> |
| 2:0 | | Reserved |

4.1.31 SMRAM—System Management RAM Control (D0:F0)

| | |
|-----------------|----------------|
| PCI Device: | 0 |
| Address Offset: | 9Dh |
| Default Value: | 02h |
| Access: | R/W/L, R/W, RO |
| Size: | 8 bits |

The SMRAMC Register controls how accesses to Compatible and Extended SMRAM spaces are treated. The Open, Close, and Lock bits function only when the G_SMROME bit is set to a 1. Also, the OPEN bit must be reset before the LOCK bit is set.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7 | | Reserved |
| 6 | R/W/L 0b | SMM Space Open (D_OPEN): When D_OPEN=1 and D_LCK=0, the SMM space DRAM is made visible even when SMM decode is not active. This is intended to help BIOS initialize SMM space. Software should ensure that D_OPEN=1 and D_CLS=1 are not set at the same time. |
| 5 | R/W 0b | SMM Space Closed (D_CLS): When D_CLS = 1, SMM space DRAM is not accessible to data references, even if SMM decode is active. Code references may still access SMM space DRAM. This will allow SMM software to reference through SMM space to update the display even when SMM is mapped over the VGA range. Software should ensure that D_OPEN=1 and D_CLS=1 are not set at the same time. Note that the D_CLS bit only applies to Compatible SMM space. |
| 4 | R/W/L 0b | SMM Space Locked (D_LCK): When D_LCK is set to 1, then D_OPEN is reset to 0 and D_LCK, D_OPEN, C_BASE_SEG, H_SMROME_EN, TSEG_SZ and TSEG_EN become read only. D_LCK can be set to 1 via a normal configuration space write but can only be cleared by a Full Reset. The combination of D_LCK and D_OPEN provide convenience with security. The BIOS can use the D_OPEN function to initialize SMM space and then use D_LCK to "lock down" SMM space in the future so that no application software (or BIOS itself) can violate the integrity of SMM space, even if the program has knowledge of the D_OPEN function. |
| 3 | R/W/L 0b | Global SMRAM Enable (G_SMROME): If set to a 1, then Compatible SMRAM functions are enabled, providing 128 KB of DRAM accessible at the A0000h address while in SMM (ADSB with SMM decode). To enable Extended SMRAM function this bit has be set to 1. Refer to the section on SMM for more details. Once D_LCK is set, this bit becomes read only. |
| 2:0 | RO 010b | Compatible SMM Space Base Segment (C_BASE_SEG): This field indicates the location of SMM space. SMM DRAM is not remapped. It is simply made visible if the conditions are right to access SMM space; otherwise, the access is forwarded to DMI. Since the MCH supports only the SMM space between A0000h and BFFFFh, this field is hardwired to 010. |

4.1.32 ESMRAMC—Extended System Management RAM Control (D0:F0)

| | |
|-----------------|-----------|
| PCI Device: | 0 |
| Address Offset: | 9Eh |
| Default Value: | 38h |
| Access: | R/W/L, RO |
| Size: | 8 bits |

The Extended SMRAM register controls the configuration of Extended SMRAM space. The Extended SMRAM (E_SMRAM) memory provides a write-back cacheable SMRAM memory space that is above 1 MB.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7 | R/W/L 0b | Enable High SMRAM (H_SMFRAME): This bit controls the SMM memory space location (i.e., above 1 MB or below 1 MB). When G_SMFRAME = 1 and H_SMFRAME = 1, the high SMRAM memory space is enabled. SMRAM accesses within the range 0FEDA0000h to 0FEDBFFFFh are remapped to DRAM addresses within the range 000A0000h to 000BFFFFh. Once D_LCK has been set, this bit becomes read only. |
| 6 | R/W/C 0b | Invalid SMRAM Access (E_SMERR): This bit is set when processor has accessed the defined memory ranges in Extended SMRAM (High Memory and T-segment) while not in SMM space and with D-OPEN = 0. It is software's function to clear this bit. Software must write a 1 to this bit to clear it. |
| 5 | RO 1b | SMRAM Cacheable (SM_CACHE): This bit is forced to 1 by the MCH. |
| 4 | RO 1b | L1 Cache Enable for SMRAM (SM_L1): This bit is forced to 1 by the MCH. |
| 3 | RO 1b | L2 Cache Enable for SMRAM (SM_L2): This bit is forced to 1 by the MCH. |
| 2:1 | R/W/L 00b | TSEG Size (TSEG_SZ): This field selects the size of the TSEG memory block if enabled. Memory from the top of DRAM space is partitioned away so that it may only be accessed by the processor interface and only then when the SMM bit is set in the request packet. Non-SMM accesses to this memory region are sent to the DMI when the TSEG memory block is enabled. 00 = 1-MB TSEG (TOLUD – 1M) to (TOLUD). 01 = 2-MB TSEG (TOLUD – 2M) to (TOLUD). 10 = 8-MB TSEG (TOLUD – 8M) to (TOLUD). 11 = Reserved. Once D_LCK has been set, these bits become read only. |
| 0 | R/W/L 0b | TSEG Enable (T_EN): This bit is for enabling of SMRAM memory for Extended SMRAM space only. When G_SMFRAME = 1 and TSEG_EN = 1, TSEG is enabled to appear in the appropriate physical address space. Note that once D_LCK is set, this bit becomes read only. |

4.1.33 TOM—Top of Memory (D0:F0)

| | |
|-----------------|---------|
| PCI Device: | 0 |
| Address Offset: | A0–A1h |
| Default Value: | 0001h |
| Access: | RO, R/W |
| Size: | 16 bits |

This register contains the size of physical memory. BIOS determines the memory size reported to the OS using this register.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:9 | | Reserved |
| 8:0 | R/W 01h | <p>Top of Memory (TOM): This register reflects the total amount of populated physical memory. This is also the amount of addressable physical memory when remapping is used appropriate to ensure that no physical memory is wasted. This is NOT necessarily the highest main memory address (holes may exist in main memory address map due to addresses allocated for memory mapped IO).</p> <p>These bits correspond to address bits 35:27 (128 MB granularity). Bits 26:0 are assumed to be 0.</p> |

4.1.34 ERRSTS—Error Status (D0:F0)

| | |
|-----------------|------------|
| PCI Device: | 0 |
| Address Offset: | C8–C9h |
| Default Value: | 0000h |
| Access: | R/WC/S, RO |
| Size: | 16 bits |

This register is used to report various error conditions via the SERR DMI messaging mechanism. A SERR DMI message is generated on a 0-to-1 transition of any of these flags (if enabled by the ERRCMD and PCICMD Registers). These bits are set regardless of whether or not the SERR is enabled and generated. After the error processing is complete, the error logging mechanism can be unlocked by clearing the appropriate status bit by software writing a 1 to it.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 15:12 | | Reserved |
| 11 | R/WC/S 0b | <p>MCH Thermal Sensor Event for SMI/SCI/SERR:</p> <p>0 = MCH Thermal Sensor Event for SMI/SCI/SERR has Not occurred.</p> <p>1 = A MCH Thermal Sensor trip has occurred and a SMI, SCI, or SERR has been generated. The status bit is set only if a message is sent based on Thermal event enables in Error Command, SMI Command, and SCI Command Registers. A trip point can generate one of SMI, SCI, or SERR interrupts (two or more per event is invalid). Multiple trip points can generate the same interrupt, if software chooses this mode, subsequent trips may be lost. If this bit is already set, then an interrupt message will not be sent on a new thermal sensor event.</p> |

| Bit | Access & Default | Description |
|-----|------------------|---|
| 10 | | Reserved |
| 9 | R/WC/S 0b | LOCK to Non-DRAM Memory Flag (LCKF): 0 = LOCK to Non-DRAM Memory Flag Not detected 1 = The MCH has detected a lock operation to memory space that did not map into DRAM. |
| 8 | R/WC/S 0b | Received Refresh Timeout Flag (RRTOF): 0 = No Received Refresh Timeout 1 = 1024 memory core refreshes are enqueued. |
| 7:2 | | Reserved |
| 1 | R/WC/S 0b | Multiple-bit DRAM ECC Error Flag (DMERR): 0 = No Multiple-bit DRAM ECC Error. 1 = A memory read data transfer had an uncorrectable multiple-bit error. When this bit is set the address, channel number, and device number that caused the error are logged in the DEAP register. Once this bit is set the DEAP, DERRSYN, and DERRDST fields are locked until the processor clears this bit by writing a 1. Software uses bits [1:0] to detect whether the logged error address is for Single or Multiple-bit error. This bit is reset on PWROK. |
| 0 | R/WC/S 0b | Single-bit DRAM ECC Error Flag (DSERR): 0 = No Single-bit DRAM ECC Error 1 = A memory read data transfer had a single-bit correctable error and the corrected data was sent for the access. When this bit is set, the address and device number that caused the error are logged in the DEAP Register. Once this bit is set, the DEAP, DERRSYN, and DERRDST fields are locked to further single bit error updates until the processor clears this bit by writing a 1. A multiple bit error that occurs after this bit is set will overwrite the DEAP and DERRSYN fields with the multiple-bit error signature and the DMERR bit will also be set. A single bit error that occurs after a multi-bit error will set this bit but will not overwrite the other fields. This bit is reset on PWROK. |

4.1.35 ERRCMD—Error Command (D0:F0)

| | |
|-----------------|---------|
| PCI Device: | 0 |
| Address Offset: | CA–CBh |
| Default Value: | 0000h |
| Access: | R/W |
| Size: | 16 bits |

This register controls the MCH responses to various system errors. Since the MCH does not have an SERRB signal, SERR messages are passed from the MCH to the ICH7 over DMI. When a bit in this register is set, a SERR message will be generated on DMI when the corresponding flag is set in the ERRSTS register. The actual generation of the SERR message is globally enabled for Device 0 via the PCI Command Register.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 15:12 | | Reserved |
| 11 | R/W 0b | SERR on MCH Thermal Sensor Event (TSESERR): 0 = Disable. Reporting of this condition via SERR messaging is disabled. 1 = The MCH generates a DMI SERR special cycle when bit 11 of the ERRSTS is set. The SERR must not be enabled at the same time as the SMI for the same thermal sensor event. |
| 10 | | Reserved |
| 9 | R/W 0b | SERR on LOCK to non-DRAM Memory (LCKERR): 0 = Disable. Reporting of this condition via SERR messaging is disabled. 1 = The MCH will generate a DMI SERR special cycle whenever a processor lock cycle is detected that does not hit DRAM. |
| 8 | R/W 0b | SERR on DRAM Refresh Timeout (DRTOERR): 0 = Disable. Reporting of this condition via SERR messaging is disabled. 1 = The MCH generates a DMI SERR special cycle when a DRAM Refresh timeout occurs. |
| 7:2 | | Reserved |
| 1 | R/W 0b | SERR Multiple-Bit DRAM ECC Error (DMERR): 0 = Disable. Reporting of this condition via SERR messaging is disabled. For systems not supporting ECC, this bit must be disabled. 1 = The MCH generates an SERR message over DMI when it detects a multiple-bit error reported by the DRAM controller. |
| 0 | R/W 0b | SERR on Single-bit ECC Error (DSERR): 0 = Disable. Reporting of this condition via SERR messaging is disabled. 1 = The MCH generates an SERR special cycle over DMI when the DRAM controller detects a single bit error. |

4.1.36 SMICMD—SMI Command (D0:F0)

PCI Device: 0
 Address Offset: CC–CDh
 Default Value: 0000h
 Access: RO, R/W
 Size: 16 bits

This register enables various errors to generate an SMI DMI special cycle. When an error flag is set in the ERRSTS register, it can generate an SERR, SMI, or SCI DMI special cycle when enabled in the ERRCMD, SMICMD, or SCICMD registers, respectively. Note that one and only one message type can be enabled.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:2 | RO 000h | Reserved |
| 1 | R/W 0b | SMI on Multiple-Bit DRAM ECC Error (DMESMI): 0 = Disable. Reporting of this condition via SMI messaging is disabled. For systems not supporting ECC, this bit must be disabled. 1 = The MCH generates an SMI DMI message when it detects a multiple-bit error reported by the DRAM controller. |
| 0 | R/W 0b | SMI on Single-bit ECC Error (DSESMI): 0 = Disable. Reporting of this condition via SMI messaging is disabled. For systems that do not support ECC, this bit must be disabled. 1 = The MCH generates an SMI DMI special cycle when the DRAM controller detects a single bit error. |

4.1.37 SCICMD—SCI Command (D0:F0)

| | |
|-----------------|---------|
| PCI Device: | 0 |
| Address Offset: | CE–CFh |
| Default Value: | 0000h |
| Access: | RO, R/W |
| Size: | 16 bits |

This register enables various errors to generate an SMI DMI special cycle. When an error flag is set in the ERRSTS Register, it can generate an SERR, SMI, or SCI DMI special cycle when enabled in the ERRCMD, SMICMD, or SCICMD registers, respectively. Note that one and only one message type can be enabled.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:2 | RO 000h | Reserved |
| 1 | R/W 0b | SCI on Multiple-bit DRAM ECC Error (DMESCI): 0 =Disable. Reporting of this condition via SCI messaging is disabled. For systems not supporting ECC, this bit must be disabled. 1 =The MCH generates an SCI DMI message when it detects a multiple-bit error reported by the DRAM controller. |
| 0 | R/W 0b | SCI on Single-bit ECC Error (DSESCI): 0 =Disable. Reporting of this condition via SCI messaging is disabled. For systems that do not support ECC, this bit must be disabled. 1 =The MCH generates an SCI DMI special cycle when the DRAM controller detects a single bit error. |

4.1.38 SKPD—Scratchpad Data (D0:F0)

| | |
|-----------------|-----------|
| PCI Device: | 0 |
| Address Offset: | DC–DFh |
| Default Value: | 00000000h |
| Access: | R/W |
| Size: | 32 bits |

This register holds 32 writable bits with no functionality. It is for the convenience of BIOS and graphics drivers.

| Bit | Access & Default | Description |
|------|------------------|--|
| 31:0 | R/W 00000000h | Scratchpad Data: 1 DWord of data storage. |

4.1.39 CAPID0—Capability Identifier (D0:F0)

PCI Device: 0
 Address Offset: E0–E8h
 Default Value: 06089BA102510900099h
 Access: RO
 Size: 72 bits

| Bit | Access & Default | Description |
|-------|------------------|--|
| 71:28 | | Reserved |
| 27:24 | RO 1h | CAPID Version: This field has the value 0001b to identify the first revision of the CAPID register definition. |
| 23:16 | RO 09h | CAPID Length: This field has the value 09h to indicate the structure length (9 bytes). |
| 15:8 | RO 00h | Next Capability Pointer: This field is hardwired to 00h indicating the end of the capabilities linked list. |
| 7:0 | RO 09h | CAP_ID: This field has the value 1001b to identify the CAP_ID assigned by the PCI SIG for vendor dependent capability pointers. |

4.1.40 EDEAP—Extended DRAM Error Address Pointer (D0:F0)

PCI Device: 0
 Address Offset: FCh
 Default Value: 00h
 Access: RO/S
 Size: 8 bits

This register is used with the DEAP register. This EDEAP register contains bit 32 of the address of detected DRAM ECC error(s).

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:1 | | Reserved |
| 0 | RO/S 0b | Extended Error Address Pointer (EEAP): This bit provides bit 32 of the error address after any remapping when an ECC error occurs. This bit is concatenated with bits 31:7 of the DEAP register to get bits 32:7 of the address in which an error occurred. This bit is reset on PWROK. |

4.2 MCHBAR Register

The MCHBAR registers are offset from the MCHBAR base address. Table 4-2 provides an address map of the registers listed by address offset in ascending order. Detailed bit descriptions of the registers follow the table.

Table 4-2. MCHBAR Register Address Map

| Address Offset | Register Symbol | Register Name | Default Value | Access |
|----------------|-----------------|--|----------------|----------------|
| 100h | C0DRB0 | Channel 0 DRAM Rank Boundary Address 0 | 00h | R/W |
| 101h | C0DRB1 | Channel 0 DRAM Rank Boundary Address 1 | 00h | R/W |
| 102h | C0DRB2 | Channel 0 DRAM Rank Boundary Address 2 | 00h | R/W |
| 103h | C0DRB3 | Channel 0 DRAM Rank Boundary Address 3 | 00h | R/W |
| 108h | C0DRA0 | Channel 0 DRAM Rank 0,1 Attribute | 00h | R/W |
| 109h | C0DRA2 | Channel 0 DRAM Rank 2,3 Attribute | 00h | R/W |
| 10Ch | C0DCLKDIS | Channel 0 DRAM Clock Disable | 00h | R/W |
| 10E–10Fh | C0BNKARC | Channel 0 DRAM Bank Architecture | 0000h | R/W |
| 114–117h | C0DRT1 | Channel 0 DRAM Timing Register 1 | 02483D22h | R/W |
| 120–123h | C0DRC0 | Channel 0 DRAM Controller Mode 0 | 4000280_00ss_h | R/W |
| 124–127h | C0DRC1 | Channel 0 DRAM Controller Mode 1 | 00000000h | R/W |
| 180h | C1DRB0 | Channel 1 DRAM Rank Boundary Address 0 | 00h | R/W |
| 181h | C1DRB1 | Channel 1 DRAM Rank Boundary Address 1 | 00h | R/W |
| 182h | C1DRB2 | Channel 1 DRAM Rank Boundary Address 2 | 00h | R/W |
| 183h | C1DRB3 | Channel 1 DRAM Rank Boundary Address 3 | 00h | R/W |
| 188h | C1DRA0 | Channel 1 DRAM Rank 0,1 Attribute | 00h | RO, R/W |
| 189h | C1DRA2 | Channel 1 DRAM Rank 2,3 Attribute | 00h | RO, R/W |
| 18Ch | C1DCLKDIS | Channel 1 DRAM Clock Disable | 00h | RO, R/W/L |
| 18E–18Fh | C1BNKARC | Channel 1 Bank Architecture | 0000h | RO, R/W |
| 194–197h | C1DRT1 | Channel 1 DRAM Timing Register 1 | 02903D22h | RO |
| 1A0–1A3h | C1DRC0 | Channel 1 DRAM Controller Mode 0 | 00000000h | R/W |
| 1A4–1A7h | C1DRC1 | Channel 1 DRAM Controller Mode 1 | 00000000h | R/W, RO, R/W/L |
| F10–F13h | PMCFG | Power Management Configuration | 00000000h | R/W, RO |

| Address Offset | Register Symbol | Register Name | Default Value | Access |
|----------------|-----------------|-------------------------|---------------|---------|
| F14–F17h | PMSTS | Power Management Status | 00000000h | R/W/C/S |

4.2.1 C0DRB0—Channel A DRAM Rank Boundary Address 0

| | |
|-----------------|--------|
| MMIO Range: | MCHBAR |
| Address Offset: | 100h |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

The **DRAM Rank Boundary Register** defines the upper boundary address of each DRAM rank with a granularity of 32 MB. Each rank has its own single-byte **DRB** register. These registers are used to determine which chip select will be active for a given address.

Channel and rank map:

| | |
|-------------------|------|
| Channel A Rank 0: | 100h |
| Channel A Rank 1: | 101h |
| Channel A Rank 2: | 102h |
| Channel A Rank 3: | 103h |
| Channel B Rank 0: | 180h |
| Channel B Rank 1: | 181h |
| Channel B Rank 2: | 182h |
| Channel B Rank 3: | 183h |

Single Channel or Asymmetric Channels Example

If the channels are independent, addresses in Channel 1 should begin where addresses in Channel 0 left off, and the address of the first rank of Channel 0 can be calculated from the technology (256 Mbit, 512 Mbit, or 1 Gbit) and the x8 or x16 configuration. With independent channels a value of 01h in **C0DRB0** indicates that 32 MB of DRAM has been populated in the first rank, and the top address in that rank is 32 MB.

Programming guide:

If Channel A is empty, all of the C0DRBs are programmed with 00h.

$C0DRB0 = \text{Total memory in ChA rank0 (in 32-MB increments)}$

$C0DRB1 = \text{Total memory in ChA rank0 + ChA rank1 (in 32-MB increments)}$

—

$C1DRB0 = \text{Total memory in ChA rank0 + ChA rank1 + ChA rank2 + ChA rank3 + ChB rank0 (in 32-MB increments)}$

If Channel B is empty, all of the C1DRBs are programmed with the same value as C0DRB3.

Interleaved Channels Example

If channels are interleaved, corresponding ranks in opposing channels will contain the same value, and the value programmed takes into account the fact that twice as many addresses are spanned by this rank compared to the single channel case. With interleaved channels, a value of 01h in **C0DRB0** and a value of 01h in **C1DRB0** indicate that 32 MB of DRAM has been populated in the first rank of each channel and the top address in that rank of either channel is 64 MB.

Programming guide:

C0DRB0 = C1DRB0 = Total memory in ChA rank0 (in 32-MB increments)

C0DRB1 = C1DRB1 = Total memory in ChA rank0 + ChA rank1 (in 32-MB increments)

C0DRB3 = C1DRB3 = Total memory in ChA rank0 + ChA rank1+ ChA rank2 + ChA rank3
(in 32-MB increments)

In all modes, if a DIMM is single sided, it appears as a populated rank and an empty rank. A DRB must be programmed appropriately for each.

Each Rank is represented by a byte. Each byte has the following format.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7:0 | R/W 00h | Channel A DRAM Rank Boundary Address: This 8 bit value defines the upper and lower addresses for each DRAM rank. Bits 6:2 are compared against Address 31:27 to determine the upper address limit of a particular rank. Bits 1:0 must be 0s. Bit 7 may be programmed to a 1 in the highest DRB (DRB3) if 4 GBs of memory is present. |

4.2.2 C0DRB1—Channel A DRAM Rank Boundary Address 1

MMIO Range: MCHBAR
Address Offset: 101h
Default Value: 00h
Access: R/W
Size: 8 bits

The operation of this register is detailed in the description for the C0DRB0 Register.

4.2.3 C0DRB2—Channel A DRAM Rank Boundary Address 2

MMIO Range: MCHBAR
Address Offset: 102h
Default Value: 00h
Access: R/W
Size: 8 bits

The operation of this register is detailed in the description for the C0DRB0 Register.

4.2.4 C0DRB3—Channel A DRAM Rank Boundary Address 3

| | |
|-----------------|--------|
| MMIO Range: | MCHBAR |
| Address Offset: | 103h |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

The operation of this register is detailed in the description for the C0DRB0 Register.

4.2.5 C0DRA0—Channel A DRAM Rank 0,1 Attribute

| | |
|-----------------|--------|
| MMIO Range: | MCHBAR |
| Address Offset: | 108h |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

The **DRAM Rank Attribute Registers** define the page sizes to be used when accessing different ranks. These registers should be left with their default value (all zeros) for any rank that is unpopulated, as determined by the corresponding CxDRB Registers. Each byte of information in the CxDRA Registers describes the page size of a pair of ranks.

Channel and rank map:

| | |
|----------------------|------|
| Channel A Rank 0, 1: | 108h |
| Channel A Rank 2, 3: | 109h |
| Channel B Rank 0, 1: | 188h |
| Channel B Rank 2, 3: | 189h |

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7 | | Reserved |
| 6:4 | R/W 000b | Channel A DRAM odd Rank Attribute: This 3 bit field defines the page size of the corresponding rank. 000 = Unpopulated 001 = Reserved 010 = 4 KB 011 = 8 KB 100 = 16 KB Others = Reserved |
| 3 | | Reserved |
| 2:0 | R/W 000b | Channel A DRAM even Rank Attribute: This 3 bit field defines the page size of the corresponding rank. 000 = Unpopulated 001 = Reserved 010 = 4 KB 011 = 8 KB 100 = 16 KB Others = Reserved |

4.2.6 C0DRA2—Channel A DRAM Rank 2, 3 Attribute

| | |
|-----------------|--------|
| MMIO Range: | MCHBAR |
| Address Offset: | 109h |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

The operation of this register is detailed in the description for the C0DRA0 Register.

4.2.7 C0DCLKDIS—Channel A DRAM Clock Disable

| | |
|-----------------|--------|
| MMIO Range: | MCHBAR |
| Address Offset: | 10Ch |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

This register can be used to disable the system memory clock signals to each DIMM slot, which can significantly reduce EMI and Power concerns for clocks that go to unpopulated DIMMs. Clocks should be enabled based on whether a slot is populated, and what kind of DIMM is present.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:6 | | Reserved |
| 5 | R/W 0b | DIMM Clock Gate Enable Pair 5: 0 = Tri-state the corresponding clock pair. 1 = Enable the corresponding clock pair. |
| 4 | R/W 0b | DIMM Clock Gate Enable Pair 4: 0 = Tri-state the corresponding clock pair. 1 = Enable the corresponding clock pair. |
| 3 | R/W 0b | DIMM Clock Gate Enable Pair 3: 0 = Tri-state the corresponding clock pair. 1 = Enable the corresponding clock pair. |
| 2 | R/W 0b | DIMM Clock Gate Enable Pair 2: 0 = Tri-state the corresponding clock pair. 1 = Enable the corresponding clock pair. |
| 1 | R/W 0b | DIMM Clock Gate Enable Pair 1: 0 = Tri-state the corresponding clock pair. 1 = Enable the corresponding clock pair. |
| 0 | R/W 0b | DIMM Clock Gate Enable Pair 0: 0 = Tri-state the corresponding clock pair. 1 = Enable the corresponding clock pair. |

Note: Since there are multiple clock signals assigned to each Rank of a DIMM, it is important to clarify exactly which Rank width field affects which clock signal:

| Channel | Rank | Clocks Affected |
|---------|--------|---------------------------|
| 0 | 0 or 1 | SCLK_A[2:0]/ SCLK_A[2:0]# |
| 0 | 2 or 3 | SCLK_A[5:3]/ SCLK_A[5:3]# |
| 1 | 0 or 1 | SCLK_B[2:0]/ SCLK_B[2:0]# |
| 1 | 2 or 3 | SCLK_B[5:3]/ SCLK_B[5:3]# |

4.2.8 C0BNKARC—Channel A DRAM Bank Architecture

PCI Device: MCHBAR
 Function: 0
 Address Offset: 10E–10Fh
 Default: 0000h
 Access: R/W
 Size: 16 bits

This register is used to program the bank architecture for each Rank.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:8 | | Reserved |
| 7:6 | R/W 00b | Rank 3 Bank Architecture: 00 = 4 Bank 01 = 8 Bank 1X = Reserved |
| 5:4 | R/W 00b | Rank 2 Bank Architecture: 00 = 4 Bank 01 = 8 Bank 1X = Reserved |
| 3:2 | R/W 00b | Rank 1 Bank Architecture: 00 = 4 Bank 01 = 8 Bank 1X = Reserved |
| 1:0 | R/W 00b | Rank 0 Bank Architecture: 00 = 4 Bank 01 = 8 Bank 1X = Reserved |

4.2.9 C0DRT1—Channel 0 DRAM Timing Register

MMIO Range: MCHBAR
 Address Offset: 114–117h
 Default: 02483D22h
 Access: R/W
 Size: 32 bits

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:23 | | Reserved |
| 22:19 | R/W 9h | Activate to Precharge delay (t_{RAS}): This bit controls the number of DRAM clocks for t_{RAS} . The minimum recommendations are beside their corresponding encodings. 0h – 3h = Reserved 4h – Fh = Four to fifteen clocks respectively. |
| 18:10 | | Reserved |
| 9:8 | R/W 01b | CAS# Latency (t_{CL}): This value is programmable on DDR2 DIMMs. The value programmed here must match the CAS Latency of every DDR2 DIMM in the system. 00 = 5 01 = 4 10 = 3 11 = 6 |
| 7 | | Reserved |
| 6:4 | R/W 010b | DRAM RAS to CAS Delay (t_{RCB}): This bit controls the number of clocks inserted between a row activate command and a read or write command to that row. 000 = 2 DRAM clocks 001 = 3 DRAM clocks 010 = 4 DRAM clocks 011 = 5 DRAM clocks 100 = 6 DRAM clocks 101–111 = Reserved |
| 3 | | Reserved |
| 2:0 | R/W 010b | DRAM RAS Precharge (t_{RP}): This bit controls the number of clocks that are inserted between a row precharge command and an activate command to the same rank. 000 = 2 DRAM clocks 001 = 3 DRAM clocks 010 = 4 DRAM clocks 011 = 5 DRAM clocks 100 = 6 DRAM clocks 101–111 = Reserved |

4.2.10 C0DRC0—Channel 0 DRAM Controller Mode 0

MMIO Range: MCHBAR
 Address Offset: 120–123h
 Default: 4000280_00ss_h
 Access: RO, R/W
 Size: 32 bits

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:30 | | Reserved |
| 29 | R/W 0b | Initialization Complete (IC): This bit is used for communication of software state between the memory controller and the BIOS. BIOS sets this bit to 1 after initialization of the DRAM memory array is complete. |
| 28:11 | | Reserved |
| 10:8 | R/W 000b | Refresh Mode Select (RMS): This field determines whether refresh is enabled and, if so, at what rate refreshes will be executed. 000 = Refresh disabled 001 = Refresh enabled. Refresh interval 15.6 μ sec 010 = Refresh enabled. Refresh interval 7.8 μ sec 011 = Refresh enabled. Refresh interval 3.9 μ sec 100 = Refresh enabled. Refresh interval 1.95 μ sec 111 = Refresh enabled. Refresh interval 64 clocks (fast refresh mode) Other = Reserved |
| 7 | RO 0b | Reserved |

| Bit | Access & Default | Description |
|-----|------------------|--|
| 6:4 | R/W 000b | <p>Mode Select (SMS): These bits select the special operational mode of the DRAM interface. The special modes are intended for initialization at power up.</p> <p>000 = Post Reset state – When the MCH exits reset (power-up or otherwise), the mode select field is cleared to "000". During any reset sequence, while power is applied and reset is active, the MCH de-asserts all CKE signals. After internal reset is de-asserted, CKE signals remain de-asserted until this field is written to a value different than "000". On this event, all CKE signals are asserted. During suspend, MCH internal signal triggers DRAM controller to flush pending commands and enter all ranks into Self-Refresh mode. As part of resume sequence, MCH will be reset, which will clear this bit field to "000" and maintain CKE signals de-asserted. After internal reset is de-asserted, CKE signals remain de-asserted until this field is written to a value different than "000". On this event, all CKE signals are asserted. During entry to other low power states (C3, S1), MCH internal signal triggers DRAM controller to flush pending commands and enter all ranks into Self-Refresh mode. During exit to normal mode, MCH signal triggers DRAM controller to exit Self-Refresh and resume normal operation without S/W involvement.</p> <p>001 = NOP Command Enable – All processor cycles to DRAM result in a NOP command on the DRAM interface.</p> <p>010 = All Banks Pre-charge Enable – All processor cycles to DRAM result in an "all banks precharge" command on the DRAM interface.</p> <p>011 = Mode Register Set Enable – All processor cycles to DRAM result in a "mode register" set command on the DRAM interface. Host address lines are mapped to DRAM address lines in order to specify the command sent, as shown in Volume 1, System Memory Controller section, memory Detection and Initialization. Refer to JEDEC Standard 79-2A Section 2.2.2 "Programming the Mode and Extended Mode Registers".</p> <p>100 = Extended Mode Register Set Enable – All processor cycles to DRAM result in an "extended mode register set" command on the DRAM interface. Host address lines are mapped to DRAM address lines in order to specify the command sent, as shown in Volume 1, System Memory Controller section, memory Detection and Initialization. Refer to JEDEC Standard 79-2A Section 2.2.2 "Programming the Mode and Extended Mode Registers".</p> <p>110 = CBR Refresh Enable – In this mode all processor cycles to DRAM result in a CBR cycle on the DRAM interface.</p> <p>111 = Normal operation</p> |
| 3:2 | | Reserved |
| 1:0 | RO | <p>DRAM Type (DT): This field is used to select between supported SDRAM types.</p> <p>00 = Reserved</p> <p>01 = Reserved</p> <p>10 = Second Revision Dual Data Rate (DDR2) SDRAM</p> <p>11 = Reserved</p> |

4.2.11 C0DRC1—Channel 0 DRAM Controller Mode 1

B/D/F/Type: 0/0/0/MCHBAR
 Address Offset: 124–127h
 Default Value: 00000000h
 Access: R/W
 Size: 32 bits

| Bit | Access & Default | Description |
|------|------------------|--|
| 31 | R/W 0b | Enhanced Addressing Enable (ENHADE): 0 =Disabled. DRAM address map follows the standard address map. 1 =Enabled. DRAM address map follows the enhanced address map. |
| 30:0 | | Intel Reserved |

4.2.12 C1DRB0—Channel B DRAM Rank Boundary Address 0

MMIO Range: MCHBAR
 Address Offset: 180h
 Default: 00h
 Access: R/W
 Size: 8 bits

The operation of this register is detailed in the description for the C0DRB0 Register.

4.2.13 C1DRB1—Channel B DRAM Rank Boundary Address 1

MMIO Range: MCHBAR
 Address Offset: 181h
 Default: 00h
 Access: R/W
 Size: 8 bits

The operation of this register is detailed in the description for the C0DRB0 Register.

4.2.14 C1DRB2—Channel B DRAM Rank Boundary Address 2

MMIO Range: MCHBAR
 Address Offset: 182h
 Default: 00h
 Access: R/W
 Size: 8 bits

The operation of this register is detailed in the description for the C0DRB0 Register.

4.2.15 **C1DRB3—Channel B DRAM Rank Boundary Address 3**

| | |
|-----------------|--------|
| MMIO Range: | MCHBAR |
| Address Offset: | 183h |
| Default: | 00h |
| Access: | R/W |
| Size: | 8 bits |

The operation of this register is detailed in the description for the C0DRB0 Register.

4.2.16 **C1DRA0—Channel B DRAM Rank 0,1 Attribute**

| | |
|-----------------|--------|
| MMIO Range: | MCHBAR |
| Address Offset: | 188h |
| Default: | 00h |
| Access: | R/W |
| Size: | 8 bits |

The operation of this register is detailed in the description for the C0DRA0 Register.

4.2.17 **C1DRA2—Channel B DRAM Rank 2,3 Attribute**

| | |
|-----------------|--------|
| MMIO Range: | MCHBAR |
| Address Offset: | 189h |
| Default: | 00h |
| Access: | R/W |
| Size: | 8 bits |

The operation of this register is detailed in the description for the C0DRA0 Register.

4.2.18 **C1DCLKDIS—Channel B DRAM Clock Disable**

| | |
|-----------------|--------|
| MMIO Range: | MCHBAR |
| Address Offset: | 18Ch |
| Default: | 00h |
| Access: | R/W/L |
| Size: | 8 bits |

The operation of this register is detailed in the description for the C0DCLKDIS Register.

4.2.19 **C1BNKARC—Channel B Bank Architecture**

| | |
|-----------------|----------|
| MMIO Range: | MCHBAR |
| Address Offset: | 18E–18Fh |
| Default: | 0000h |
| Access: | R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for the C0BNKARC Register.

4.2.20 C1DRT1—Channel 1 DRAM Timing Register 1

| | |
|-----------------|-----------|
| MMIO Range: | MCHBAR |
| Address Offset: | 194–197h |
| Default: | 02483D22h |
| Access: | R/W |
| Size: | 32 bits |

The operation of this register is detailed in the description for the C0DRT1 Register.

4.2.21 C1DRC0—Channel 1 DRAM Controller Mode 0

| | |
|-----------------|---------------|
| MMIO Range: | MCHBAR |
| Address Offset: | 1A0–1A3h |
| Default: | 4000280_00??h |
| Access: | R/W |
| Size: | 32 bits |

The operation of this register is detailed in the description for the C0DRC0 Register.

4.2.22 C1DRC1—Channel 1 DRAM Controller Mode 1

| | |
|-----------------|----------------|
| MMIO Range: | MCHBAR |
| Address Offset: | 1A4–1A7h |
| Default: | 00000000h |
| Access: | RO, R/W, R/W/L |
| Size: | 32 bits |

The operation of this register is detailed in the description for the C0DRC1 Register.

4.2.23 PMCFG—Power Management Configuration

| | |
|-----------------|-----------|
| PCI Device: | MCHBAR |
| Address Offset: | F10–F13h |
| Default: | 00000000h |
| Access: | R/W |
| Size: | 32 bits |

| Bit | Access & Default | Description |
|------|------------------|--|
| 31:5 | | Reserved |
| 4 | R/W 0b | Enhanced Power Management Features Enable: 0 = Legacy power management mode 1 = Reserved. |
| 3:0 | | Reserved |

4.2.24 PMSTS—Power Management Status

PCI Device: MCHBAR
 Address Offset: F14–F17h
 Default: 00000000h
 Access: R/W/C/S
 Size: 32 bits

This register is reset by PWROK only.

| Bit | Access & Default | Description |
|------|------------------|--|
| 31:2 | | Reserved |
| 1 | R/W/C/S 0 b | <p>Channel B in Self-Refresh: Set by power management hardware after Channel B is placed in self-refresh as a result of a Power State or a Reset Warn sequence.</p> <p>Cleared by Power management hardware before starting Channel B self-refresh exit sequence initiated by a power management exit.</p> <p>Cleared by the BIOS in a warm reset (Reset# asserted while PWROK is asserted) exit sequence.</p> <p>0 = Channel B not ensured to be in self-refresh. 1 = Channel B in Self-Refresh.</p> |
| 0 | R/W/C/S 0 b | <p>Channel A in Self-Refresh: Set by power management hardware after Channel A is placed in self refresh as a result of a Power State or a Reset Warn sequence,</p> <p>Cleared by Power management hardware before starting Channel A self refresh exit sequence initiated by a power management exit.</p> <p>Cleared by the BIOS in a warm reset (Reset# asserted while PWROK is asserted) exit sequence.</p> <p>0 = Channel A not ensured to be in self-refresh. 1 = Channel A in Self-Refresh.</p> |

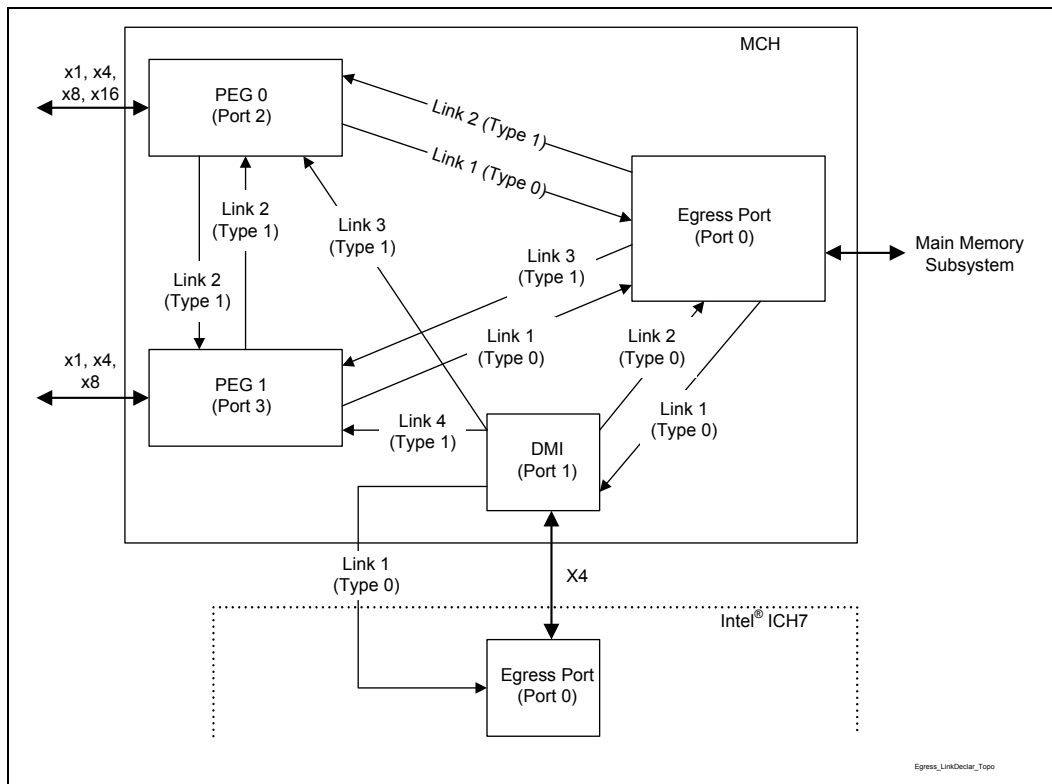

4.3 EPBAR Registers—Egress Port Register Summary

The MCHBAR registers are offset from the EPBAR base address. Table 4-3 provides an address map of the registers listed by address offset in ascending order. Detailed bit descriptions of the registers follow the table. Link Declaration Topology is shown in Figure 4-1.

Table 4-3. Egress Port Register Address Map

| Address Offset | Symbol | Register Name | Default Value | Access |
|----------------|--------|-----------------------------|----------------------|----------|
| 044h–047h | EPESD | EP Element Self Description | 00000301h | R/WO, RO |
| 050h–053h | EPL1D | EP Link Entry 1 Description | 01000000h | R/WO, RO |
| 058h–05Fh | EPL1A | EP Link Entry 1 Address | 00000000 0000000h | R/WO |
| 060h–063h | EPL2D | EP Link Entry 2 Description | 02000002h | R/WO, RO |
| 068h–06Fh | EPL2A | EP Link Entry 2 Address | 00000000 0008000h | RO |
| 070h–073h | EPL3D | EP Link Entry 3 Description | 03000002h | R/WO, RO |
| 078h–07Fh | EPL3A | EP Link Entry 3 Address | 00000000 0018000h | RO |

Figure 4-1. Link Declaration Topology

4.3.1 EPESD—EP Element Self Description

| | |
|-----------------|-----------|
| MMIO Range: | EPBAR |
| Address Offset: | 044–047h |
| Default Value: | 00000301h |
| Access: | RO, R/WO |
| Size: | 32 bits |

This register provides information about the root complex element containing this Link Declaration Capability.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:24 | RO 00h | Port Number: This field specifies the port number associated with this element with respect to the component that contains this element. Value of 00 h indicates to configuration software that this is the default egress port. |
| 23:16 | R/WO 00h | Component ID: This field identifies the physical component that contains this Root Complex Element. Component IDs start at 1. This value is a mirror of the value in the Component ID field of all elements in this component. The value only needs to be written in one of the mirrored fields and it will be reflected everywhere that it is mirrored. |
| 15:8 | RO 03h | Number of Link Entries: This field indicates the number of link entries following the Element Self Description. This field reports 3 (one each for PEG0, PEG1, and DMI). |
| 7:4 | | Reserved |
| 3:0 | RO 01h | Element Type: This field indicates the type of the Root Complex Element. Value of 1h represents a port to system memory |

4.3.2 EPLE1D—EP Link Entry 1 Description

| | |
|-----------------|-----------|
| MMIO Range: | EPBAR |
| Address Offset: | 050–053h |
| Default Value: | 01000000h |
| Access: | RO, R/WO |
| Size: | 32 bits |

This register provides the first part of a Link Entry that declares an internal link to another Root Complex Element.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:24 | RO 01h | Target Port Number: This field specifies the port number associated with the element targeted by this link entry (DMI). The target port number is with respect to the component that contains this element as specified by the target component ID. |
| 23:16 | R/WO 00h | Target Component ID: This field identifies the physical or logical component that is targeted by this link entry. A value of 0 is reserved; Component IDs start at 1. This value is a mirror of the value in the Component ID field of all elements in this component. The value only needs to be written in one of the mirrored fields and it will be reflected everywhere that it is mirrored. |
| 15:2 | | Reserved |
| 1 | RO 0b | Link Type: This field indicates that the link points to memory-mapped space (for RCRB). The link address specifies the 64-bit base address of the target RCRB. |
| 0 | R/WO 0b | Link Valid: 0 = Link Entry is not valid and will be ignored. 1 = Link Entry specifies a valid link. |

4.3.3 EPLE1A—EP Link Entry 1 Address

| | |
|-----------------|--------------------|
| MMIO Range: | EPBAR |
| Address Offset: | 058–05Fh |
| Default Value: | 00000000_00000000h |
| Access: | R/WO |
| Size: | 64 bits |

This register provides the second part of a Link Entry that declares an internal link to another Root Complex Element.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 63:32 | | Reserved |
| 31:12 | R/WO 0 0000 h | Link Address: This field provides the memory mapped base address of the RCRB that is the target element (DMI) for this link entry. |
| 11:0 | | Reserved |

4.3.4 EPLE2D—EP Link Entry 2 Description

| | |
|-----------------|-----------|
| MMIO Range: | EPBAR |
| Address Offset: | 060–063h |
| Default Value: | 00000000h |
| Access: | RO, R/WO |
| Size: | 32 bits |

This register provides the first part of a Link Entry that declares an internal link to another Root Complex Element.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 31:24 | RO 02h | Target Port Number: This field specifies the port number associated with the element targeted by this link entry (PCI Express). The target port number is with respect to the component that contains this element as specified by the target component ID. |
| 23:16 | R/WO 00h | Target Component ID: This field identifies the physical or logical component that is targeted by this link entry. A value of 0 is reserved; Component IDs start at 1. This value is a mirror of the value in the Component ID field of all elements in this component. The value only needs to be written in one of the mirrored fields and it will be reflected everywhere that it is mirrored. |
| 15:2 | | Reserved |
| 1 | RO 1b | Link Type: This field indicates that the link points to configuration space of the integrated device that controls the x16 root port. The link address specifies the configuration address (segment, bus, device, function) of the target root port. |
| 0 | R/WO 0b | Link Valid: 0 = Link Entry is not valid and will be ignored. 1 = Link Entry specifies a valid link. |

4.3.5 EPLE2A—EP Link Entry 2 Address

MMIO Range: EPBAR
Address Offset: 068–06Fh
Default Value: 00000000_0000000h
Access: RO, R/WO
Size: 64 bits

This register provides the second part of a Link Entry that declares an internal link to another Root Complex Element.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 63:28 | | Reserved |
| 27:20 | RO 00h | Bus Number: |
| 19:15 | RO 0 0001b | Device Number: Target for this link is PCI Express* x16 port (Device 1). |
| 14:12 | RO 000b | Function Number: |
| 11:0 | | Reserved |

4.3.6 EPLE3D—EP Link Entry 3 Description

| | |
|-----------------|-----------|
| MMIO Range: | EPBAR |
| Address Offset: | 070–073h |
| Default Value: | 03000002h |
| Access: | RO, R/WO |
| Size: | 32 bits |

This register provides the first part of a Link Entry that declares an internal link to another Root Complex Element.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:24 | RO 03h | Target Port Number: This field specifies the port number associated with the element targeted by this link entry (PEG1). The target port number is with respect to the component that contains this element as specified by the target component ID. |
| 23:16 | R/WO 00h | Target Component ID: This field identifies the physical or logical component that is targeted by this link entry. A value of 0 is reserved; Component IDs start at 1. This value is a mirror of the value in the Component ID field of all elements in this component. The value only needs to be written in one of the mirrored fields and it will be reflected everywhere that it is mirrored. |
| 15:2 | | Reserved |
| 1 | RO 1b | Link Type (LTYP): Hardwired to 1 to indicate that the link points to configuration space of an integrated device. The link address specifies the configuration address (segment, bus, device, function) of the target root port. |
| 0 | R/WO 0b | Link Valid: 0 = Link Entry is Not valid and will be ignored. 1 = Link Entry specifies a valid link. |

4.3.7 EPLE2A—EP Link Entry 3 Address

MMIO Range: EPBAR
Address Offset: 078–07Fh
Default Value: 00000000_00018000h
Access: RO
Size: 64 bits

This register provides the second part of a Link Entry that declares an internal link to another Root Complex Element.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 63:20 | | Reserved |
| 19:15 | RO 0 0011b | Device Number: Target for this link is PEG1 (Device 3). |
| 14:0 | | Reserved |

§

5 Host-Primary PCI Express* Bridge Registers (D1:F0)

Device 1 contains the controls associated with the PCI Express x16 root port that is the intended attach point for external graphics. In addition, it also functions as the virtual PCI-to-PCI bridge. Table 5-1 provides an address map of the D1:F0 registers listed by address offset in ascending order. Section 5.1 provides a detailed bit description of the registers.

Warning: When reading the PCI Express "conceptual" registers such as this, you may not get a valid value unless the register value is stable.

The *PCI Express* Specification* defines two types of reserved bits: Reserved and Preserved.

- Reserved for future RW implementations; software must preserve value read for writes to bits.
- Reserved and Zero: Reserved for future R/WC/S implementations; software must use 0 for writes to bits.

Unless explicitly documented as Reserved and Zero, all bits marked as reserved are part of the Reserved and Preserved type, which have historically been the typical definition for Reserved.

Note: Most (if not all) control bits in this device cannot be modified unless the link is down. Software is required to first Disable the link, then program the registers, and then re-enable the link (which will cause a full-retrain with the new settings).

Table 5-1. Host-PCI Express* Graphics Bridge Register Address Map (D1:F0)

| Address Offset | Symbol | Register Name | Default Value | Access |
|----------------|---------|-------------------------|--------------------------|-----------|
| 00–01h | VID1 | Vendor Identification | 8086h | RO |
| 02–03h | DID1 | Device Identification | 277Dh | RO |
| 04–05h | PCICMD1 | PCI Command | 0000h | RO, R/W |
| 06–07h | PCISTS1 | PCI Status | 0010h | RO, R/W/C |
| 08h | RID1 | Revision Identification | See register description | RO |
| 09–0Bh | CC1 | Class Code | 060400h | RO |
| 0Ch | CL1 | Cache Line Size | 00h | R/W |
| 0Dh | — | <i>Reserved</i> | — | — |
| 0Eh | HDR1 | Header Type | 01h | RO |
| 0F–17h | — | <i>Reserved</i> | — | — |
| 18h | PBUSN1 | Primary Bus Number | 00h | RO |

| Address Offset | Symbol | Register Name | Default Value | Access |
|----------------|-----------------|---|---------------|----------------|
| 19h | SBUSN1 | Secondary Bus Number | 00h | RO |

5.1 Configuration Register Details (D1:F0)

5.1.1 VID1—Vendor Identification (D1:F0)

| | |
|-----------------|---------|
| PCI Device: | 1 |
| Address Offset: | 00–01h |
| Default Value: | 8086h |
| Access: | RO |
| Size: | 16 bits |

This register combined with the Device Identification register uniquely identifies any PCI device.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:0 | RO 8086h | Vendor Identification (VID1): PCI standard identification for Intel. |

5.1.2 DID1—Device Identification (D1:F0)

| | |
|-----------------|---------|
| PCI Device: | 1 |
| Address Offset: | 02–03h |
| Default Value: | 277Dh |
| Access: | RO |
| Size: | 16 bits |

This register combined with the Vendor Identification register uniquely identifies any PCI device.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:0 | RO 277Dh | Device Identification Number (DID1): This field identifier is assigned to the MCH device 1 (virtual PCI-to-PCI bridge, PCI Express* Graphics port). |

5.1.3 PCICMD1—PCI Command (D1:F0)

PCI Device: 1
 Address Offset: 04–05h
 Default Value: 0000h
 Access: RO, R/W
 Size: 16 bits

| Bit | Access & Default | Description |
|-------|------------------|---|
| 15:11 | | Reserved |
| 10 | R/W 0b | <p>INTA Assertion Disable:</p> <p>0 = This device is permitted to generate INTA interrupt messages.</p> <p>1 = This device is prevented from generating interrupt messages.</p> <p>Any INTA emulation interrupts already asserted must be de-asserted when this bit is set.</p> <p>This bit only affects interrupts generated by the device (PCI INTA from a PME or Hot Plug event) controlled by this command register. It does not affect upstream MSIs, upstream PCI INTA-INTD asserts and de-assert messages.</p> |
| 9 | RO 0b | Fast Back-to-Back Enable (FB2B): Not Applicable or Implemented. Hardwired to 0. |
| 8 | R/W 0b | <p>SERR Message Enable (SERRE1): This bit is an enable bit for Device 1 SERR messaging. The MCH communicates the SERR# condition by sending a SERR message to the Intel® ICH7. This bit, when set, enables reporting of non-fatal and fatal errors to the Root Complex. Note that errors are reported if enabled either through this bit or through the PCI Express* specific bits in the Device Control Register.</p> <p>0 = The SERR message is generated by the MCH for Device 1 only under conditions enabled individually through the Device Control Register.</p> <p>1 = The MCH is enabled to generate SERR messages that will be sent to the ICH7 for specific Device 1 error conditions generated/detected on the primary side of the virtual PCI to PCI Express bridge (not those received by the secondary side). The error status is reported in the PCISTS1 register.</p> |
| 7 | | Reserved |
| 6 | R/WO 0b | <p>Parity Error Enable (PERRE): This bit controls whether or not the Master Data Parity Error bit in the PCI Status Register can be set.</p> <p>0 = Master Data Parity Error bit in PCI Status register can Not be set.</p> <p>1 = Master Data Parity Error bit in PCI Status register can be set.</p> |
| 5 | RO 0b | VGA Palette Snoop: Not Implemented. Hardwired to 0. |
| 4 | RO 0b | Memory Write and Invalidate Enable (MWIE): Not Implemented. Hardwired to 0. |
| 3 | RO 0b | Special Cycle Enable (SCE): Not Implemented. Hardwired to 0. |

| Bit | Access & Default | Description |
|-----|------------------|---|
| 2 | R/W 0b | <p>Bus Master Enable (BME): This bit controls the ability of the PCI Express port to forward memory and I/O read/write requests in the upstream direction.</p> <p>0 = This device is prevented from making memory or I/O requests to its primary bus. Note that according to <i>PCI Local Bus Specification</i>, as MSI interrupt messages are in-band memory writes, disabling the bus master enable bit prevents this device from generating MSI interrupt messages or passing them from its secondary bus to its primary bus. Upstream memory writes/reads, I/O writes/reads, peer writes/reads, and MSIs will all be treated as invalid cycles. Writes are forwarded to memory address 0 with byte enables de-asserted. Reads will be forwarded to memory address 0 and will return Unsupported Request status (or Master abort) in its completion packet.</p> <p>1 = This device is allowed to issue requests to its primary bus. Completions for previously issued memory read requests on the primary bus will be issued when the data is available.</p> <p>This bit does not affect forwarding of Completions from the primary interface to the secondary interface.</p> |
| 1 | R/W 0b | <p>Memory Access Enable (MAE):</p> <p>0 = All of device 1's memory space is disabled.</p> <p>1 = Enable the Memory and Pre-fetchable memory address ranges defined in the MBASE1, MLIMIT1, PMBASE1, and PMLIMIT1 registers.</p> |
| 0 | R/W 0b | <p>IO Access Enable (IOAE):</p> <p>0 = All of device 1's I/O space is disabled.</p> <p>1 = Enable the I/O address range defined in the IOBASE1, and IOLIMIT1 registers.</p> |

5.1.4 PCISTS1—PCI Status (D1:F0)

| | |
|-----------------|-----------|
| PCI Device: | 1 |
| Address Offset: | 06–07h |
| Default Value: | 0010h |
| Access: | RO, R/W/C |
| Size: | 16 bits |

This register reports the occurrence of error conditions associated with primary side of the “virtual” Host-PCI Express bridge embedded within the MCH.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15 | RO 0b | Detected Parity Error (DPE): Not Implemented. Hardwired to 0. Parity (generating poisoned TLPs) is not supported on the primary side of this device (The MCH does Not do error forwarding). |
| 14 | R/WC 0b | Signaled System Error (SSE): 1 = This Device sent a SERR due to detecting an ERR_FATAL or ERR_NONFATAL condition and the SERR Enable bit in the Command Register is 1. Both received (if enabled by BCTRL1[1]) and internally detected error messages do not affect this field. |
| 13 | RO 0b | Received Master Abort Status (RMAS): Not Implemented. Hardwired to 0. The concept of a master abort does not exist on primary side of this device. |
| 12 | RO 0b | Received Target Abort Status (RTAS): Not Implemented. Hardwired to 0. The concept of a target abort does not exist on primary side of this device. |
| 11 | RO 0b | Signaled Target Abort Status (STAS): Not Implemented. Hardwired to 0. The concept of a target abort does not exist on primary side of this device. |
| 10:9 | RO 00b | DEVSELB Timing (DEVT): This device is not the subtractive decoded device on bus 0. This bit field is therefore hardwired to 00 to indicate that the device uses the fastest possible decode. |
| 8 | RO 0b | Master Data Parity Error (PMDPE): Because the primary side of the PCI Express’s virtual PCI-to-PCI bridge is integrated with the MCH functionality, there is no scenario where this bit will get set. Because hardware will never set this bit, software does not have an opportunity to clear this bit or otherwise test that it is implemented. The PCI specification defines it as a R/WC, but for this implementation a RO definition behaves the same way and will meet Microsoft testing requirements. |
| 7 | RO 0b | Fast Back-to-Back (FB2B): Not Implemented. Hardwired to 0. |
| 6 | | Reserved |
| 5 | RO 0b | 66/60MHz capability (CAP66): Not Implemented. Hardwired to 0. |
| 4 | RO 1b | Capabilities List: This bit indicates that a capabilities list is present. Hardwired to 1. |
| 3 | RO 0b | INTA Status: This bit indicates that an interrupt message is pending internally to the device. Only PME and Hot Plug sources feed into this status bit (not PCI INTA-INTD assert and de-assert messages). The INTA Assertion Disable bit, PCICMD1[10], has no effect on this bit. |
| 2:0 | | Reserved |

5.1.5 RID1—Revision Identification (D1:F0)

| | |
|-----------------|--------------------------|
| PCI Device: | 1 |
| Address Offset: | 08h |
| Default Value: | See register table below |
| Access: | RO |
| Size: | 8 bits |

This register contains the revision number of the MCH device 1. These bits are read only and writes to this register have no effect.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7:0 | RO | Revision Identification Number (RID1): This is an 8-bit value that indicates the revision identification number for the MCH. Refer to the <i>Intel® 975X Express Chipset Specification Update</i> for the value of the Revision ID Register. |

5.1.6 CC1—Class Code (D1:F0)

| | |
|-----------------|---------|
| PCI Device: | 1 |
| Address Offset: | 09–0Bh |
| Default Value: | 060400h |
| Access: | RO |
| Size: | 24 bits |

This register identifies the basic function of the device, a more specific sub-class, and a register-specific programming interface.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 23:16 | RO 06h | Base Class Code (BCC): This field indicates the base class code for this device. 06h = Bridge device. |
| 15:8 | RO 04h | Sub-Class Code (SUBCC): This field indicates the sub-class code for this device. 04h = PCI-to-PCI Bridge. |
| 7:0 | RO 00h | Programming Interface (PI): This field indicates the programming interface of this device. This value does not specify a particular register set layout and provides no practical use for this device. |

5.1.7 CL1—Cache Line Size (D1:F0)

| | |
|-----------------|--------|
| PCI Device: | 1 |
| Address Offset: | 0Ch |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:0 | R/W 00h | Cache Line Size (Scratch pad): Implemented by PCI Express* devices as a read-write field for legacy compatibility purposes but has no impact on any PCI Express device functionality. |

5.1.8 HDR1—Header Type (D1:F0)

| | |
|-----------------|--------|
| PCI Device: | 1 |
| Address Offset: | 0Eh |
| Default Value: | 01h |
| Access: | RO |
| Size: | 8 bits |

This register identifies the header layout of the configuration space. No physical register exists at this location.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7:0 | RO 01h | Header Type Register (HDR): This field returns 01 to indicate that this is a single function device with bridge header layout. |

5.1.9 PBUSN1—Primary Bus Number (D1:F0)

| | |
|-----------------|--------|
| PCI Device: | 1 |
| Address Offset: | 18h |
| Default Value: | 00h |
| Access: | RO |
| Size: | 8 bits |

This register identifies that this “virtual” Host-PCI Express bridge is connected to PCI bus 0.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7:0 | RO 00h | Primary Bus Number (BUSN): Configuration software typically programs this field with the number of the bus on the primary side of the bridge. Since device 1 is an internal device and its primary bus is always 0, these bits are read only and are hardwired to 0. |

5.1.10 SBUSN1—Secondary Bus Number (D1:F0)

| | |
|-----------------|--------|
| PCI Device: | 1 |
| Address Offset: | 19h |
| Default Value: | 00h |
| Access: | RO |
| Size: | 8 bits |

This register identifies the bus number assigned to the second bus side of the “virtual” bridge (i.e., to PCI Express). This number is programmed by the PCI configuration software to allow mapping of configuration cycles to PCI Express.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:0 | R/W 00h | Secondary Bus Number (BUSN): This field is programmed by configuration software with the bus number assigned to PCI Express*. |

5.1.11 SUBUSN1—Subordinate Bus Number (D1:F0)

| | |
|-----------------|--------|
| PCI Device: | 1 |
| Address Offset: | 1Ah |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

This register identifies the subordinate bus (if any) that resides at the level below PCI Express. This number is programmed by the PCI configuration software to allow mapping of configuration cycles to PCI Express.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7:0 | R/W 00h | Subordinate Bus Number (BUSN): This register is programmed by configuration software with the number of the highest subordinate bus behind the device 1 bridge. When only a single PCI device resides on the PCI Express* segment, this register will contain the same value as the SBUSN1 register. |

5.1.12 IOBASE1—I/O Base Address (D1:F0)

| | |
|-----------------|--------|
| PCI Device: | 1 |
| Address Offset: | 1Ch |
| Default Value: | F0h |
| Access: | RO |
| Size: | 8 bits |

This register controls the processor-to-PCI Express I/O access routing based on the following formula:

$$\text{IO_BASE} \leq \text{address} \leq \text{IO_LIMIT}$$

Only the upper 4 bits of this register are programmable. For the purpose of address decode, address bits A [11:0] are treated as 0. Thus, the bottom of the defined I/O address range will be aligned to a 4-KB boundary.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:4 | R/W Fh | I/O Address Base (IOBASE): This field corresponds to A [15:12] of the I/O addresses passed by bridge 1 to PCI Express*. BIOS must not set this register to 00h; otherwise, 0CF8h/0CFCh accesses will be forwarded to the PCI Express hierarchy associated with this device. |
| 3:0 | | Reserved |

5.1.13 IOLIMIT1—I/O Limit Address (D1:F0)

| | |
|-----------------|--------|
| PCI Device: | 1 |
| Address Offset: | 1Dh |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

This register controls the processor-to-PCI Express I/O access routing based on the following formula:

$$\text{IO_BASE} \leq \text{address} \leq \text{IO_LIMIT}$$

Only upper 4 bits of this register are programmable. For the purposes of address decode, address bits A [11:0] are assumed to be FFFh. Thus, the top of the defined I/O address range will be at the top of a 4-KB aligned address block.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7:4 | R/W 0h | I/O Address Limit (IOLIMIT): This field corresponds to A[15:12] of the I/O address limit of device 1. Devices between this upper limit and IOBASE1 will be passed to the PCI Express* hierarchy associated with this device. |
| 3:0 | | Reserved |

5.1.14 SSTS1—Secondary Status (D1:F0)

PCI Device: 1
 Address Offset: 1E–1Fh
 Default Value: 00h
 Access: RO, R/W/C
 Size: 16 bits

SSTS1 is a 16-bit status register that reports the occurrence of error conditions associated with secondary side (i.e., PCI Express side) of the “virtual” PCI-to-PCI Bridge in the MCH.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15 | R/WC 0b | Detected Parity Error (DPE): 0 = Parity error Not detected. 1 = MCH received across the link (upstream) a Posted Write Data Poisoned TLP (EP=1) |
| 14 | R/WC 0b | Received System Error (RSE): 0 = System error Not received. 1 = Secondary side sends an ERR_FATAL or ERR_NONFATAL message due to an error detected by the secondary side, and the SERR Enable bit in the Bridge Control register is '1'. |
| 13 | R/WC 0b | Received Master Abort (RMA): 0 = Master abort Not received. 1 = Secondary Side for Type 1 Configuration Space Header Device (for requests initiated by the Type 1 Header Device itself) receives a Completion with Unsupported Request Completion Status. |
| 12 | R/WC 0b | Received Target Abort (RTA): 0 = Target abort Not received. 1 = Secondary Side for Type 1 Configuration Space Header Device (for requests initiated by the Type 1 Header Device itself) receives a Completion with Completer Abort Completion Status. |
| 11 | RO 0b | Signaled Target Abort (STA): Not Implemented. Hardwired to 0. The MCH does not generate Target Aborts (the MCH will never complete a request using the Completer Abort Completion status). |
| 10:9 | RO 00b | DEVSELB Timing (DEVT): Not Implemented. Hardwired to 0. |
| 8 | | Reserved |
| 7 | RO 0b | Fast Back-to-Back (FB2B): Not Implemented. Hardwired to 0. |
| 6 | | Reserved |
| 5 | RO 0b | 66/60 MHz capability (CAP66): Not Implemented. Hardwired to 0. |
| 4:0 | | Reserved |

5.1.15 MBASE1—Memory Base Address (D1:F0)

| | |
|-----------------|---------|
| PCI Device: | 1 |
| Address Offset: | 20–21h |
| Default Value: | FFF0h |
| Access: | R/W |
| Size: | 16 bits |

This register controls the processor-to-PCI Express non-prefetchable memory access routing based on the following formula:

$$\text{MEMORY_BASE} \leq \text{address} \leq \text{MEMORY_LIMIT}$$

The upper 12 bits of the register are read/write and correspond to the upper 12 address bits A[31:20] of the 32-bit address. The bottom 4 bits of this register are read-only and return zeroes when read. The configuration software must initialize this register. For the purpose of address decode, address bits A[19:0] are assumed to be 0. Thus, the bottom of the defined memory address range will be aligned to a 1-MB boundary.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:4 | R/W FFFh | Memory Address Base (MBASE): This field corresponds to A[31:20] of the lower limit of the memory range that will be passed to PCI Express*. |
| 3:0 | | Reserved |

5.1.16 MLIMIT1—Memory Limit Address (D1:F0)

| | |
|-----------------|---------|
| PCI Device: | 1 |
| Address Offset: | 22–23h |
| Default Value: | 0000h |
| Access: | R/W |
| Size: | 16 bits |

This register controls the processor-to-PCI Express non-prefetchable memory access routing based on the following formula:

$$\text{MEMORY_BASE} \leq \text{address} \leq \text{MEMORY_LIMIT}$$

The upper 12 bits of the register are read/write and correspond to the upper 12 address bits A[31:20] of the 32-bit address. The bottom 4 bits of this register are read-only and return zeroes when read. The configuration software must initialize this register. For the purpose of address decode, address bits A[19:0] are assumed to be FFFFh. Thus, the top of the defined memory address range will be at the top of a 1-MB aligned memory block.

Note: Memory range covered by MBASE and MLIMIT Registers are used to map non-prefetchable PCI Express address ranges (typically, where control/status memory-mapped I/O data structures of the Graphics Controller will reside) and PMBASE and PMLIMIT are used to map prefetchable address ranges (typically, graphics local memory).

This segregation allows application of USWC space attribute to be performed in a true plug-and-play manner to the prefetchable address range for improved processor -to-PCI Express memory access performance.

Note: Configuration software is responsible for programming all address range registers (prefetchable, non-prefetchable) with the values that provide exclusive address ranges (i.e., prevent overlap with each other and/or with the ranges covered with the main memory). There is no provision in the MCH hardware to enforce prevention of overlap and operations of the system in the case of overlap are not ensured.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:4 | R/W 000h | Memory Address Limit (MLIMIT): This field corresponds to A[31:20] of the upper limit of the address range passed to PCI Express*. |
| 3:0 | | Reserved |

5.1.17 PMBASE1—Prefetchable Memory Base Address (D1:F0)

| | |
|-----------------|---------|
| PCI Device: | 1 |
| Address Offset: | 24–25h |
| Default Value: | FFF1h |
| Access: | RO, R/W |
| Size: | 16 bits |

This register, in conjunction with the corresponding Upper Base Address register, controls the processor-to-PCI Express prefetchable memory access routing based on the following formula:

$$\text{PREFETCHABLE_MEMORY_BASE} \leq \text{address} \leq \text{PREFETCHABLE_MEMORY_LIMIT}$$

The upper 12 bits of this register are read/write and correspond to address bits A[31:20] of the 40-bit address. The lower 8 bits of the Upper Base Address register are read/write and correspond to address bits A[39:32] of the 40-bit address. The configuration software must initialize this register. For the purpose of address decode, address bits A[19:0] are assumed to be 0. Thus, the bottom of the defined memory address range will be aligned to a 1-MB boundary.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:4 | R/W FFFh | Prefetchable Memory Base Address (MBASE): This field corresponds to A[31:20] of the lower limit of the memory range that will be passed to PCI Express*. |
| 3:0 | RO 1h | 64-bit Address Support: This field indicates that the upper 32-bits of the prefetchable memory region limit address are contained in the Prefetchable Memory Base Limit Address Register (offset 2Ch). |

5.1.18 PMLIMIT1—Prefetchable Memory Limit Address (D1:F0)

| | |
|-----------------|---------|
| PCI Device: | 1 |
| Address Offset: | 26–27h |
| Default Value: | 0000h |
| Access: | RO, R/W |
| Size: | 16 bits |

This register, in conjunction with the corresponding Upper Limit Address register, controls the processor-to-PCI Express prefetchable memory access routing based on the following formula:

$$\text{PREFETCHABLE_MEMORY_BASE} \leq \text{address} \leq \text{PREFETCHABLE_MEMORY_LIMIT}$$

The upper 12 bits of this register are read/write and correspond to address bits A[31:20] of the 40-bit address. The lower 8 bits of the Upper Limit Address register are read/write and correspond to address bits A[39:32] of the 40-bit address. The configuration software must initialize this register. For the purpose of address decode, address bits A[19:0] are assumed to be FFFFh.

Thus, the top of the defined memory address range will be at the top of a 1-MB aligned memory block. Note that prefetchable memory range is supported to allow segregation by the configuration software between the memory ranges that must be defined as UC and the ones that can be designated as a USWC (i.e., prefetchable) from the processor perspective.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:4 | R/W 000h | Prefetchable Memory Address Limit (PMLIMIT): This field corresponds to A[31:20] of the upper limit of the address range passed to PCI Express*. |
| 3:0 | RO 0h | 64-bit Address Support: This field indicates that the bridge has 32-bit address support only. |

5.1.19 PMBASEU1—Prefetchable Memory Base Address

| | |
|-----------------|-----------|
| PCI Device: | 1 |
| Address Offset: | 28–2Bh |
| Default Value: | 0000000Fh |
| Access: | R/W |
| Size: | 32 bits |

This register, in conjunction with the corresponding Upper Base Address register, controls the processor-to-PCI Express prefetchable memory access routing based on the following formula:

$$\text{PREFETCHABLE_MEMORY_BASE} \leq \text{address} \leq \text{PREFETCHABLE_MEMORY_LIMIT}$$

The upper 12 bits of this register are read/write and correspond to address bits A[31:20] of the 40-bit address. The lower 8 bits of the Upper Base Address register are read/write and correspond to address bits A[39:32] of the 40-bit address. This register must be initialized by the configuration software. For the purpose of address decode, address bits A[19:0] are assumed to be 0. Thus, the bottom of the defined memory address range will be aligned to a 1-MB boundary.

| Bit | Access & Default | Description |
|------|------------------|--|
| 31:4 | R/W 0000000h | Reserved |
| 3:0 | R/W Fh | Prefetchable Memory Base Address (MBaseU): This field corresponds to A[35:32] of the lower limit of the prefetchable memory range that will be passed to PCI Express. |

5.1.20 PMLIMITU1— Prefetchable Memory Limit Address

| | |
|-----------------|-----------|
| PCI Device: | 1 |
| Address Offset: | 2C–2Fh |
| Default Value: | 00000000h |
| Access: | R/W |
| Size: | 32 bits |

This register, in conjunction with the corresponding Upper Limit Address register, controls the processor-to-PCI Express prefetchable memory access routing based on the following formula:

$$\text{PREFETCHABLE_MEMORY_BASE} \leq \text{address} \leq \text{PREFETCHABLE_MEMORY_LIMIT}$$

The upper 12 bits of this register are read/write and correspond to address bits A[31:20] of the 40-bit address. The lower 8 bits of the Upper Limit Address register are read/write and correspond to address bits A[39:32] of the 40-bit address. This register must be initialized by the configuration software. For the purpose of address decode, address bits A[19:0] are assumed to be FFFFh. Thus, the top of the defined memory address range will be at the top of a 1 MB aligned memory block.

Note: Prefetchable memory range is supported to allow segregation by the configuration software between the memory ranges that must be defined as UC and the ones that can be designated as a USWC (i.e., prefetchable) from the processor perspective.

| Bit | Access & Default | Description |
|------|------------------|--|
| 31:4 | R/W 0000000h | Reserved |
| 3:0 | R/W 0h | Prefetchable Memory Address Limit (MLIMITU): This field corresponds to A[35:32] of the upper limit of the prefetchable Memory range that will be passed to PCI Express. |

5.1.21 CAPPTR1—Capabilities Pointer (D1:F0)

| | |
|-----------------|--------|
| PCI Device: | 1 |
| Address Offset: | 34h |
| Default Value: | 88h |
| Access: | RO |
| Size: | 8 bits |

The capabilities pointer provides the address offset to the location of the first entry in this device's linked list of capabilities.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7:0 | RO 88h | First Capability (CAPPTR1): The first capability in the list is the Subsystem ID and Subsystem Vendor ID Capability. |

5.1.22 INTRLINE1—Interrupt Line (D1:F0)

| | |
|-----------------|--------|
| PCI Device: | 1 |
| Address Offset: | 3Ch |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

This register contains interrupt line routing information. The device itself does not use this value; rather, device drivers and operating systems use it to determine priority and vector information.

| Bit | Access & Default | Description |
|-----|------------------|--|
| 7:0 | R/W 00h | Interrupt Connection. This field communicates interrupt line routing information. POST software writes the routing information into this register as it initializes and configures the system. The value in this register indicates which input of the system interrupt controller is connected to this device's interrupt pin. |

5.1.23 INTRPIN1—Interrupt Pin (D1:F0)

| | |
|-----------------|--------|
| PCI Device: | 1 |
| Address Offset: | 3Dh |
| Default Value: | 01h |
| Access: | RO |
| Size: | 8 bits |

This register specifies which interrupt pin this device uses.

| Bit | Access & Default | Description |
|-----|------------------|---|
| 7:0 | RO 01h | Interrupt Pin. As a single function device, the PCI Express* device specifies INTA as its interrupt pin. 01h=INTA. |

5.1.24 BCTRL1—Bridge Control (D1:F0)

| | |
|-----------------|---------|
| PCI Device: | 1 |
| Address Offset: | 3Eh |
| Default Value: | 0000h |
| Access: | RO, R/W |
| Size: | 16 bits |

This register provides extensions to the PCICMD1 Register that are specific to PCI-to-PCI bridges. The BCTRL provides additional control for the secondary interface (i.e., PCI Express) as well as some bits that affect the overall behavior of the “virtual” Host-PCI Express bridge in the MCH (e.g., VGA compatible address ranges mapping).

| Bit | Access & Default | Description |
|-------|------------------|---|
| 15:12 | | Reserved |
| 11 | RO 0b | Discard Timer SERR Enable: Not Implemented. Hardwired to 0. |
| 10 | RO 0b | Discard Timer Status: Not Implemented. Hardwired to 0. |
| 9 | RO 0b | Secondary Discard Timer: Not Implemented. Hardwired to 0. |
| 8 | RO 0b | Primary Discard Timer: Not Implemented. Hardwired to 0. |
| 7 | RO 0b | Fast Back-to-Back Enable (FB2BEN): Not Implemented. Hardwired to 0. |
| 6 | R/W 0b | Secondary Bus Reset (SRESET): Setting this bit triggers a hot reset on the corresponding PCI Express* Port. |
| 5 | RO 0b | Master Abort Mode (MAMODE): When acting as a master, unclaimed reads that experience a master abort returns all 1s and any writes that experience a master abort completes normally and the data is discarded. Hardwired to 0. |
| 4 | R/W 0b | VGA 16-bit Decode: This bit enables the PCI-to-PCI bridge to provide 16-bit decoding of VGA I/O address precluding the decoding of alias addresses every 1 KB. This bit only has meaning if bit 3 (VGA Enable) of this register is also 1, enabling VGA I/O decoding and forwarding by the bridge. 0 = Execute 10-bit address decodes on VGA I/O accesses. 1 = Execute 16-bit address decodes on VGA I/O accesses. |
| 3 | R/W 0b | VGA Enable (VGAEN): This bit controls the routing of processor-initiated transactions targeting VGA compatible I/O and memory address ranges. See the VGAEN/MDAP table in Device 0, offset 97h[0]. See the VGAEN/MDAP table in the LAC Register[0] (Device 0, offset 97h). |

| Bit | Access & Default | Description |
|-----|------------------|--|
| 2 | R/W 0b | <p>ISA Enable (ISAEN): This bit is needed to exclude legacy resource decode to route ISA resources to legacy decode path. This bit modifies the response by the MCH to an I/O access issued by the processor that target ISA I/O addresses. This applies only to I/O addresses that are enabled by the IOBASE and IOLIMIT registers.</p> <p>0 = All addresses defined by the IOBASE and IOLIMIT for processor I/O transactions will be mapped to PCI Express.</p> <p>1 = MCH will not forward to PCI Express any I/O transactions addressing the last 768 bytes in each 1-KB block even if the addresses are within the range defined by the IOBASE and IOLIMIT registers. Instead of going to PCI Express these cycles will be forwarded to DMI where they can be subtractively or positively claimed by the ISA bridge.</p> |
| 1 | R/W 0b | <p>SERR Enable (SERREN)</p> <p>0 = Disable. No forwarding of error messages from secondary side to primary side that could result in a SERR.</p> <p>1 = Enable. RR_COR, ERR_NONFATAL, and ERR_FATAL messages result in SERR message when individually enabled by the Root Control register.</p> |
| 0 | RO 0b | <p>Parity Error Response Enable (PEREN): This bit controls whether or not the Master Data Parity Error bit in the Secondary Status register is set when the MCH receives across the link (upstream) a Read Data Completion Poisoned TLP.</p> <p>0 = Disable. Master Data Parity Error bit in Secondary Status register cannot be set.</p> <p>1 = Enable. Master Data Parity Error bit in Secondary Status register can be set.</p> |

5.1.25 PM_CAPID1—Power Management Capabilities (D1:F0)

PCI Device: 1
Address Offset: 80–83h
Default Value: C8029001h
Access: RO
Size: 32 bits

| Bit | Access & Default | Description |
|-------|------------------|---|
| 31:27 | RO 19h | PME Support: This field indicates the power states in which this device may indicate PME wake via PCI Express messaging. D0, D3hot, and D3cold. This device is not required to do anything to support D3hot and D3cold; it simply must report that those states are supported. Refer to the <i>PCI Power Management Interface Specification, Revision 1.1</i> for encoding explanation and other power management details. |
| 26 | RO 0b | D2: Hardwired to 0 to indicate that the D2 power management state is NOT supported. |
| 25 | RO 0b | D1: Hardwired to 0 to indicate that the D1 power management state is NOT supported. |
| 24:22 | RO 000b | Auxiliary Current: Hardwired to 0 to indicate that there are no 3.3 V _{aux} auxiliary current requirements. |
| 21 | RO 0b | Device Specific Initialization (DSI): Hardwired to 0 to indicate that special initialization of this device is NOT required before generic class device driver is to use it. |
| 20 | RO 0b | Auxiliary Power Source (APS): Hardwired to 0. |
| 19 | RO 0b | PME Clock: Hardwired to 0 to indicate this device does NOT support PME# generation. |
| 18:16 | RO 010b | PCI PM CAP Version: Hardwired to 02h to indicate there are 4 bytes of power management registers implemented and that this device complies with revision 1.1 of the <i>PCI Power Management Interface Specification</i> . |
| 15:8 | RO 90h / A0h | Pointer to Next Capability: This contains a pointer to the next item in the capabilities list. If MSICH (CAPL[0] @ 7Fh) is 0, then the next item in the capabilities list is the Message Signaled Interrupts (MSI) capability at 90h. If MSICH (CAPL[0] @ 7Fh) is 1, then the next item in the capabilities list is the PCI Express* capability at A0h. |
| 7:0 | RO 01h | Capability ID: The value of 01h identifies this linked list item (capability structure) as being for PCI Power Management registers. |

5.1.26 PM_CS1—Power Management Control/Status (D1:F0)

PCI Device: 1
 Address Offset: 84h
 Default Value: 00000000h
 Access: RO, R/W, R/W/S
 Size: 32 bits

| Bit | Access & Default | Description |
|-------|------------------|---|
| 31:16 | | Reserved |
| 15 | RO 0b | PME Status: This bit indicates that this device does not support PME# generation from D3 _{cold} . |
| 14:13 | RO 00b | Data Scale: This field indicates that this device does not support the power management data register. |
| 12:9 | RO 0h | Data Select: This field indicates that this device does not support the power management data register. |
| 8 | R/W/S 0b | <p>PME Enable: This bit indicates that this device does not generate PME# assertion from any D-state.</p> <p>0 = PME# generation not possible from any D State</p> <p>1 = PME# generation enabled from any D State</p> <p>The setting of this bit has no effect on hardware. See PM_CAP[15:11]</p> |
| 7:2 | | Reserved |
| 1:0 | R/W 00b | <p>Power State: This field indicates the current power state of this device and can be used to set the device into a new power state. If software attempts to write an unsupported state to this field, write operation must complete normally on the bus, but the data is discarded and no state change occurs.</p> <p>00 = D0</p> <p>01 = D1 (Not supported in this device.)</p> <p>10 = D2 (Not supported in this device.)</p> <p>11 = D3</p> <p>Support of D3_{cold} does not require any special action.</p> <p>While in the D3_{hot} state, this device can only act as the target of PCI configuration transactions (for power management control). This device also cannot generate interrupts or respond to MMR cycles in the D3 state. The device must return to the D0 state in order to be fully functional.</p> <p>There is no hardware functionality required to support these Power States.</p> |

5.1.27 SS_CAPID—Subsystem ID and Vendor ID Capabilities (D1:F0)

| | |
|-----------------|-----------|
| PCI Device: | 1 |
| Address Offset: | 88h |
| Default Value: | 0000800Dh |
| Access: | RO |
| Size: | 32 bits |

This capability is used to uniquely identify the subsystem where the PCI device resides. Because this device is an integrated part of the system and not an add-in device, it is anticipated that this capability will never be used. However, it is necessary because Microsoft will test for its presence.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:16 | | Reserved |
| 15:8 | RO 80h | Pointer to Next Capability: This contains a pointer to the next item in the capabilities list which is the PCI Power Management capability. |
| 7:0 | RO 0Dh | Capability ID: The value of 0Dh identifies this linked list item (capability structure) as being for SSID/SSVID registers in a PCI-to-PCI Bridge. |

5.1.28 SS—Subsystem ID and Subsystem Vendor ID (D1:F0)

| | |
|-----------------|-----------|
| PCI Device: | 1 |
| Address Offset: | 8Ch |
| Default Value: | 00008086h |
| Access: | RO |
| Size: | 32 bits |

System BIOS can be used as the mechanism for loading the SSID/SVID values. These values must be preserved through power management transitions and hardware reset.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:16 | R/WO 0000h | Subsystem ID (SSID): This field identifies the particular subsystem and is assigned by the vendor. |
| 15:0 | R/WO 8086h | Subsystem Vendor ID (SSVID): This field identifies the manufacturer of the subsystem and is the same as the vendor ID that is assigned by the PCI Special Interest Group. |

5.1.29 MSI_CAPID—Message Signaled Interrupts Capability ID (D1:F0)

| | |
|-----------------|---------|
| PCI Device: | 1 |
| Address Offset: | 90h |
| Default Value: | A005h |
| Access: | RO |
| Size: | 16 bits |

When a device supports MSI, it can generate an interrupt request to the processor by writing a predefined data item (a message) to a predefined memory address.

The reporting of the existence of this capability can be disabled by setting MSICH (CAPL[0] @ 7Fh). In that case walking this linked list will skip this capability and instead go directly from the PCI PM capability to the PCI Express capability.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:8 | RO A0h | Pointer to Next Capability: This field contains a pointer to the next item in the capabilities list which is the PCI Express* capability. |
| 7:0 | RO 05h | Capability ID: The value of 05h identifies this linked list item (capability structure) as being for MSI registers. |

5.1.30 MC—Message Control (D1:F0)

| | |
|-----------------|---------|
| PCI Device: | 1 |
| Address Offset: | 92h |
| Default Value: | 0000h |
| Access: | RO, R/W |
| Size: | 16 bits |

System software can modify bits in this register, but the device is prohibited from doing so.

If the device writes the same message multiple times, only one of those messages will be serviced. If all of them must be serviced, the device must not generate the same message again until the driver services the earlier one.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:8 | | Reserved |
| 7 | RO 0b | 64-bit Address Capable: Hardwired to 0 to indicate that the function does not implement the upper 32 bits of the Message Address register and is incapable of generating a 64-bit memory address. |
| 6:4 | R/W 000b | Multiple Message Enable (MME): System software programs this field to indicate the actual number of messages allocated to this device. This number will be equal to or less than the number actually requested. The encoding is the same as for the MMC field below. |
| 3:1 | RO 000b | Multiple Message Capable (MMC): System software reads this field to determine the number of messages being requested by this device. 000 = 1 001–111 = Reserved |
| 0 | R/W 0b | MSI Enable (MSIEN) This bit controls the ability of this device to generate MSIs. 0 = MSI will not be generated. 1 = MSI will be generated when the MCH receive PME or Hot Plug messages. INTA will not be generated and INTA Status (PCISTS1[3]) will not be set. |

5.1.31 MA—Message Address (D1:F0)

PCI Device: 1
 Address Offset: 94h
 Default Value: 00000000h
 Access: RO, R/W
 Size: 32 bits

| Bit | Access & Default | Description |
|------|------------------|---|
| 31:2 | R/W 00000000h | Message Address: This field is used by system software to assign a MSI address to the device. The device handles an MSI by writing the padded contents of the MD register to this address. |
| 1:0 | RO 00b | Force DWord Align: Hardwired to 0 so that addresses assigned by system software are always aligned on a DWord address boundary. |

5.1.32 MD—Message Data (D1:F0)

PCI Device: 1
 Address Offset: 98h
 Default Value: 0000h
 Access: R/W
 Size: 16 bits

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:0 | R/W 0000h | <p>Message Data: Base message data pattern assigned by system software and used to handle an MSI from the device.</p> <p>When the device must generate an interrupt request, it writes a 32-bit value to the memory address specified in the MA Register. The upper 16 bits are always set to 0. This register supplies the lower 16 bits.</p> |

5.1.33 PEGCAPL—PCI Express* Capability List (D1:F0)

| | |
|-----------------|---------|
| PCI Device: | 1 |
| Address Offset: | A0–A1h |
| Default Value: | 0010h |
| Access: | RO |
| Size: | 16 bits |

This register enumerates the PCI Express capability structure.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:8 | RO 00h | Pointer to Next Capability: This value terminates the capabilities list. The Virtual Channel capability and any other PCI Express* specific capabilities that are reported via this mechanism are in a separate capabilities list located entirely within PCI Express extended configuration space. |
| 7:0 | RO 10h | Capability ID: This field identifies this linked list item (capability structure) as being for PCI Express registers. |

5.1.34 PCI_EXPRESS_CAP—PCI Express* Capabilities (D1:F0)

| | |
|-----------------|----------|
| PCI Device: | 1 |
| Address Offset: | A2–A3h |
| Default Value: | 0141h |
| Access: | RO, R/WO |
| Size: | 16 bits |

This register indicates PCI Express device capabilities.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 15:14 | | Reserved |
| 13:9 | RO 00h | Interrupt Message Number: Not Implemented. Hardwired to 0. |
| 8 | R/WO 1b | Slot Implemented: 0 = The PCI Express* Link associated with this port is connected to an integrated component or is disabled. 1 = The PCI Express Link associated with this port is connected to a slot. BIOS must initialize this field appropriately if a slot connection is not implemented. |
| 7:4 | RO 4h | Device/Port Type: Hardwired to 0100b to indicate root port of PCI Express Root Complex. |
| 3:0 | RO 1h | PCI Express Capability Version: Hardwired to 1 as it is the first version. |

5.1.35 DCAP—Device Capabilities (D1:F0)

PCI Device: 1
 Address Offset: A4–A7h
 Default Value: 00000000h
 Access: RO
 Size: 32 bits

This register indicates PCI Express link capabilities.

| Bit | Access & Default | Description |
|------|------------------|--|
| 31:6 | | Reserved |
| 5 | RO 0b | Extended Tag Field Supported: Hardwired to indicate support for 5-bit Tags as a requestor. |
| 4:3 | RO 00b | Phantom Functions Supported: Not Implemented. Hardwired to 0. |
| 2:0 | RO 000b | Max Payload Size: Hardwired to indicate 128B maximum supported payload for Transaction Layer Packets (TLP). |

5.1.36 DCTL—Device Control (D1:F0)

| | |
|-----------------|---------|
| PCI Device: | 1 |
| Address Offset: | A8–A9h |
| Default Value: | 0000h |
| Access: | R/W |
| Size: | 16 bits |

This register provides control for PCI Express device specific capabilities.

Note: The error reporting enable bits are in reference to errors detected by this device, not error messages received across the link. The reporting of error messages (ERR_CORR, ERR_NONFATAL, ERR_FATAL) received by the Root Port is controlled exclusively by the Root Port Command Register.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:8 | | Reserved |
| 7:5 | R/W 000b | Max Payload Size: 000 = 128B maximum supported payload for Transaction Layer Packets (TLP). As a receiver, the Device must handle TLPs as large as the set value; as transmitter, the Device must not generate TLPs exceeding the set value. 001–111 = Reserved. |
| 4 | | Reserved |
| 3 | R/W 0b | Unsupported Request Reporting Enable: 0 = Disable 1 = Enable. Unsupported Requests will be reported. Note that reporting of error messages received by Root Port is controlled exclusively by Root Control register. |
| 2 | R/W 0b | Fatal Error Reporting Enable: 0 = Disable 1 = Enable. Fatal errors will be reported. For a Root Port, the reporting of fatal errors is internal to the root. No external ERR_FATAL message is generated. |
| 1 | R/W 0b | Non-Fatal Error Reporting Enable: 0 = Disable 1 = Enable. Non-fatal errors will be reported. For a Root Port, the reporting of non-fatal errors is internal to the root. No external ERR_NONFATAL message is generated. Uncorrectable errors can result in degraded performance. |
| 0 | R/W 0b | Correctable Error Reporting Enable: 0 = Disable 1 = Enable. Correctable errors will be reported. For a Root Port, the reporting of correctable errors is internal to the root. No external ERR_CORR message is generated. |

5.1.37 DSTS—Device Status (D1:F0)

PCI Device: 1
 Address Offset: AA–ABh
 Default Value: 0000h
 Access: RO
 Size: 16 bits

This register reflects status corresponding to controls in the Device Control register.

Note: The error reporting bits are in reference to errors detected by this device, not error messages received across the link.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:6 | | Reserved |
| 5 | RO 0b | Transactions Pending: 0 = All pending transactions (including completions for any outstanding non-posted requests on any used virtual channel) have been completed. 1 = Indicates that the device has transaction(s) pending (including completions for any outstanding non-posted requests for all used Traffic Classes). |
| 4 | | Reserved |
| 3 | R/WC 0b | Unsupported Request Detected: 0 = Unsupported Request Not detected. 1 = Indicates that the Device received an Unsupported Request. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control Register. |
| 2 | R/WC 0b | Fatal Error Detected: When Advanced Error Handling is enabled, errors are logged in this register regardless of the settings of the Correctable Error Mask Register. 0 = Fatal Error Not detected. 1 = Indicates that fatal error(s) were detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control Register. |
| 1 | R/WC 0b | Non-Fatal Error Detected: When Advanced Error Handling is enabled, errors are logged in this register regardless of the settings of the Correctable Error Mask Register. 0 = Non-fatal error Not detected. 1 = Indicates that non-fatal error(s) were detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control Register. |
| 0 | R/WC 0b | Correctable Error Detected: When Advanced Error Handling is enabled, errors are logged in this register regardless of the settings of the Correctable Error Mask Register. 0 = Correctable error Not detected. 1 = Indicates that correctable error(s) were detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control Register. |

5.1.38 LCAP—Link Capabilities (D1:F0)

PCI Device: 1
 Address Offset: AC–AFh
 Default Value: 02012D01h
 Access: R/WO
 Size: 16 bits

This register indicates PCI Express device specific capabilities.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:24 | RO 02h | Port Number: This field indicates the PCI Express* port number for the given PCI Express link. The field matches the value in Element Self Description [31:24]. |
| 23:18 | | Reserved |
| 17:15 | R/WO 010b | L1 Exit Latency: This field indicates the length of time this Port requires to complete the transition from L1 to L0. The value 010 b indicates the range of 2 μ s to less than 4 μ s. If this field is required to be any value other than the default, BIOS must initialize it accordingly. Both bytes of this register that contain a portion of this field must be written simultaneously to prevent an intermediate (and undesired) value from ever existing. |
| 14:12 | R/WO 010b | L0s Exit Latency: This field indicates the length of time this Port requires to complete the transition from L0s to L0. The value 010 b indicates the range of 128 ns to less than 256 ns. If this field is required to be any value other than the default, BIOS must initialize it accordingly. |
| 11:10 | RO 11b | Active State Link PM Support: L0s & L1 entry supported. |
| 9:4 | RO 10h | Max Link Width: Hardwired to indicate X16. When Force X1 mode is enabled on this PCI Express device, this field reflects X1 (01h). |
| 3:0 | RO 1h | Max Link Speed: Hardwired to indicate 2.5 Gb/s. |

5.1.39 LCTL—Link Control (D1:F0)

PCI Device: 1
 Address Offset: B0–B1h
 Default Value: 0000h
 Access: RO, R/W
 Size: 16 bits

This field allows control of PCI Express link.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:7 | | Reserved |
| 6 | R/W 0b | <p>Common Clock Configuration:</p> <p>0 = Indicates that this component and the component at the opposite end of this Link are operating with asynchronous reference clock.</p> <p>1 = Indicates that this component and the component at the opposite end of this Link are operating with a distributed common reference clock.</p> <p>Components use this common clock configuration information to report the correct L0s and L1 Exit Latencies.</p> |
| 5 | R/W 0b | <p>Retrain Link: This bit always returns 0 when read. This bit is cleared automatically (no need to write a 0).</p> <p>0 = Normal operation</p> <p>1 = Full Link retraining is initiated by directing the Physical Layer LTSSM from L0, L0s, or L1 states to the Recovery state.</p> |
| 4 | R/W 0b | <p>Link Disable: Link retraining happens automatically on 0 to 0 transition, just like when coming out of reset. Writes to this bit are immediately reflected in the value read from the bit, regardless of actual Link state.</p> <p>0 = Normal operation</p> <p>1 = Link is disabled. Forces the LTSSM to transition to the Disabled state (via Recovery) from L0, L0s, or L1 states.</p> |
| 3 | RO 0b | Read Completion Boundary (RCB): Hardwired to 0 to indicate 64 byte. |
| 2 | | Reserved |
| 1:0 | R/W 00b | <p>Active State PM: This field controls the level of active state power management supported on the given link.</p> <p>00 = Disabled</p> <p>01 = L0s Entry Supported</p> <p>10 = Reserved</p> <p>11 = L0s and L1 Entry Supported</p> |

5.1.40 LSTS—Link Status (D1:F0)

PCI Device: 1
Address Offset: B2–B3h
Default Value: 1001h
Access: RO
Size: 16 bits

This register indicates PCI Express link status.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 15:13 | | Reserved |
| 12 | RO 1b | Slot Clock Configuration: 0 = The device uses an independent clock irrespective of the presence of a reference on the connector. 1 = The device uses the same physical reference clock that the platform provides on the connector. |
| 11 | RO 0b | Link Training: This bit indicates that Link training is in progress. Hardware clears this bit once Link training is complete. |
| 10 | RO 0b | Training Error: This bit is set by hardware upon detection of unsuccessful training of the Link to the L0 Link state. |
| 9:4 | RO 00h | Negotiated Width: This field indicates negotiated link width. 00h = Reserved 01h = X1 04h = X4 08h = X8 10h = X16 All other encodings are reserved. |
| 3:0 | RO 1h | Negotiated Speed: This field indicates negotiated link speed. 1h = 2.5 Gb/s All other encodings are reserved. |

5.1.41 SLOTCAP—Slot Capabilities (D1:F0)

| | |
|-----------------|-----------|
| PCI Device: | 1 |
| Address Offset: | B4–B7h |
| Default Value: | 00000000h |
| Access: | R/WO |
| Size: | 32 bits |

PCI Express slot-related registers allow for the support of Hot-Plug.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:19 | R/WO 0000h | Physical Slot Number: This field indicates the physical slot number attached to this Port. This field must be initialized by BIOS to a value that assigns a slot number that is globally unique within the chassis. |
| 18:17 | | Reserved |
| 16:15 | R/WO 00b | Slot Power Limit Scale: This field specifies the scale used for the Slot Power Limit Value. If this field is written, the link sends a Set_Slot_Power_Limit message. 00 = 1.0x 01 = 0.1x 10 = 0.01x 11 = 0.001x |
| 14:7 | R/WO 00h | Slot Power Limit Value: This field, in combination with the Slot Power Limit Scale value, specifies the upper limit on power supplied by slot. Power limit (in Watts) is calculated by multiplying the value in this field by the value in the Slot Power Limit Scale field. If this field is written, the link sends a Set_Slot_Power_Limit message. |
| 6 | R/WO 0b | Hot-plug Capable: This bit indicates that this slot is capable of supporting Hot-plug operations. 0 = Not capable 1 = Capable |
| 5 | R/WO 0b | Hot-plug Surprise: This bit indicates that a device present in this slot might be removed from the system without any prior notification. 0 = No Hot-plug Surprise 1 = Hot plug Surprise capable. |
| 4 | R/WO 0b | Power Indicator Present: This bit indicates that a Power Indicator is implemented on the chassis for this slot. 0 = Not Present 1 = Present |
| 3 | R/WO 0b | Attention Indicator Present: This bit indicates that an Attention Indicator is implemented on the chassis for this slot. 0 = Not Present 1 = Present |
| 2:1 | | Reserved |
| 0 | R/WO 0b | Attention Button Present: This bit indicates that an Attention Button is implemented on the chassis for this slot. The Attention Button allows the user to request hot-plug operations. 0 = Not Present 1 = Present |

5.1.42 SLOTCTL—Slot Control (D1:F0)

PCI Device: 1
 Address Offset: B8–B9h
 Default Value: 01C0h
 Access: R/W
 Size: 16 bits

PCI Express slot related registers allow for the support of Hot-Plug.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 15:10 | | Reserved |
| 9:8 | R/W 01b | Power Indicator Control: Reads to this register return the current state of the Power Indicator. Writes to this register set the Power Indicator and cause the Port to send the appropriate POWER_INDICATOR_* messages. 00 = Reserved 01 = On 10 = Blink 11 = Off |
| 7:6 | R/W 11b | Attention Indicator Control: Reads to this register return the current state of the Attention Indicator. Writes to this register set the Attention Indicator and cause the Port to send the appropriate ATTENTION_INDICATOR_* messages. 00 = Reserved 01 = On 10 = Blink 11 = Off |
| 5 | R/W 0b | Hot plug Interrupt Enable: 0 = Disable 1 = Enables generation of hot plug interrupt on enabled hot plug events. |
| 4 | R/W 0b | Command Completed Interrupt Enable: 0 = Disable 1 = Enables the generation of hot plug interrupt when the Hot plug controller completes a command. |
| 3 | R/W 0b | Presence Detect Changed Enable: 0 = Disable 1 = Enables the generation of hot plug interrupt or wake message on a presence detect changed event. |
| 2:1 | | Reserved |
| 0 | R/W 0b | Attention Button Pressed Enable: 0 = Disable 1 = Enables the generation of hot plug interrupt or wake message on an attention button pressed event. |

5.1.43 SLOTSTS—Slot Status (D1:F0)

PCI Device: 1
 Address Offset: BA–BBh
 Default Value: 0000h
 Access: RO, R/W/C
 Size: 16 bits

PCI Express slot-related registers allow for the support of Hot-Plug.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:7 | | Reserved |
| 6 | RO Xb | Presence Detect State: This bit indicates the presence of a card in the slot. 0 = Slot Empty 1 = Card Present in slot. |
| 5 | | Reserved |
| 4 | R/WC 0b | Command Completed: 0 = Command Not completed. 1 = Hot plug controller completes an issued command. |
| 3 | R/WC 0b | Presence Detect Changed: 0 = No Presence Detect change. 1 = Presence Detect change is detected. This corresponds to an edge on the signal that corresponds to bit 6 of this register (Presence Detect State). |
| 2:1 | | Reserved |
| 0 | R/WC 0b | Attention Button Pressed: 0 = Attention button Not pressed. 1 = Attention Button is pressed. |

5.1.44 RCTL—Root Control (D1:F0)

PCI Device: 1
 Address Offset: BC–BDh
 Default Value: 0000h
 Access: R/W
 Size: 16 bits

This register allows control of PCI Express Root Complex specific parameters. The system error control bits in this register determine if corresponding SERRs are generated when the device detects an error (reported in this device's Device Status register) or when an error message is received across the link. Reporting of SERR as controlled by these bits takes precedence over the SERR Enable in the PCI Command Register.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:4 | | Reserved |
| 3 | R/W 0b | PME Interrupt Enable: 0 = Disable. No interrupts are generated as a result of receiving PME messages. 1 = Enables interrupt generation upon receipt of a PME message as reflected in the PME Status bit of the Root Status Register. A PME interrupt is also generated if the PME Status bit of the Root Status Register is set when this bit is set from a cleared state. |
| 2 | R/W 0b | System Error on Fatal Error Enable: This bit controls the Root Complex's response to fatal errors. 0 = Disable. No SERR generated on receipt of fatal error. 1 = Indicates that an SERR should be generated if a fatal error is reported by any of the devices in the hierarchy associated with this Root Port, or by the Root Port itself. |
| 1 | R/W 0b | System Error on Non-Fatal Uncorrectable Error Enable: This bit controls the Root Complex's response to non-fatal errors. 0 = Disable. No SERR generated on receipt of non-fatal error. 1 = Indicates that an SERR should be generated if a non-fatal error is reported by any of the devices in the hierarchy associated with this Root Port, or by the Root Port itself. |
| 0 | R/W 0b | System Error on Correctable Error Enable: This bit controls the Root Complex's response to correctable errors. 0 = Disable. No SERR generated on receipt of correctable error. 1 = Indicates that an SERR should be generated if a correctable error is reported by any of the devices in the hierarchy associated with this Root Port, or by the Root Port itself. |

5.1.45 RSTS—Root Status (D1:F0)

PCI Device: 1
 Address Offset: C0–C3h
 Default Value: 00000000h
 Access: RO, R/W/C
 Size: 32 bits

This register provides information about PCI Express Root Complex specific parameters.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:18 | | Reserved |
| 17 | RO 0b | PME Pending: 0 = PME Not pending. 1 = Another PME is pending when the PME Status bit is set. When the PME Status bit is cleared by software; the PME is delivered by hardware by setting the PME Status bit again and updating the Requestor ID appropriately. The PME pending bit is cleared by hardware if no more PMEs are pending. |
| 16 | R/W/C 0b | PME Status: 0 = Requestor ID did Not assert PME. 1 = Requestor ID indicated in the PME Requestor ID field asserted PME. Subsequent PMEs are kept pending until the status register is cleared by writing a 1 to this field. |
| 15:0 | RO 0000h | PME Requestor ID: This field indicates the PCI requestor ID of the last PME requestor. |

5.1.46 PEGLC—PCI Express* Legacy Control (D1:F0)

PCI Device: 1
Address Offset: EC–EFh
Default: 00000000h
Access: RO, R/W
Size: 32 bits

This field controls functionality that is needed by Legacy (non-PCI Express aware) operating systems during run time.

| Bit | Access & Default | Description |
|------|---------------------|--|
| 31:3 | RO 0000 0000h | Reserved |
| 2 | R/W 0b | PME GPE Enable (PMEGPE): 0 = Disable. Do Not generate GPE PME message when PME is received. 1 = Generate a GPE PME message when PME is received (Assert_PMEGPE and Deassert_PMEGPE messages on DMI). This enables the MCH to support PMEs on the PCI Express port under legacy operating systems. |
| 1 | R/W 0b | Hot-Plug GPE Enable (HPGPE): 0 = Disable. Do Not generate GPE Hot-Plug message when Hot-Plug event is received. 1 = Generate a GPE Hot-Plug message when Hot-Plug Event is received (Assert_HPGPE and Deassert_HPGPE messages on DMI). This enables the MCH to support Hot-Plug on the PCI Express port under legacy operating systems. |
| 0 | R/W 0b | General Message GPE Enable (GENGPE): 0 = Disable. Do Not forward received GPE assert/de-assert messages. 1 = Forward received GPE assert/de-assert messages. These general GPE message can be received via the PCI Express port from an external Intel device and will be subsequently forwarded to the Intel® ICH7 (via Assert_GPE and Deassert_GPE messages on DMI). |

5.1.47 VCECH—Virtual Channel Enhanced Capability Header (D1:F0)

| | |
|-----------------|-----------|
| PCI Device: | 1 |
| Address Offset: | 100–103h |
| Default Value: | 14010002h |
| Access: | RO |
| Size: | 32 bits |

This register indicates PCI Express device Virtual Channel capabilities.

Note: Extended capability structures for PCI Express devices are located in PCI Express extended configuration space and have different field definitions than standard PCI capability structures.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 31:20 | RO 140h | Pointer to Next Capability: The Link Declaration Capability is the next in the PCI Express* extended capabilities list. |
| 19:16 | RO 1h | PCI Express* Virtual Channel Capability Version: Hardwired to 1 to indicate compliances with the <i>PCI Express specification, Revision 1.0a</i> . |
| 15:0 | RO 0002h | Extended Capability ID: Value of 0002h identifies this linked list item (capability structure) as being for PCI Express Virtual Channel registers. |

5.1.48 PVCCAP1—Port VC Capability Register 1 (D1:F0)

PCI Device: 1
 Address Offset: 104–107h
 Default Value: 00000001h
 Access: RO, R/WO
 Size: 32 bits

This register describes the configuration of PCI Express Virtual Channels associated with this port.

| Bit | Access & Default | Description |
|------|------------------|---|
| 31:7 | | Reserved |
| 6:4 | RO 000b | Low Priority Extended VC Count: This field indicates the number of (extended) Virtual Channels in addition to the default VC belonging to the low-priority VC (LPVC) group that has the lowest priority with respect to other VC resources in a strict-priority VC Arbitration. The value of 0 in this field implies strict VC arbitration. |
| 3 | | Reserved |
| 2:0 | R/WO 001b | Extended VC Count: This field indicates the number of (extended) Virtual Channels in addition to the default VC supported by the device. BIOS Requirement: Set this field to 000b for all configurations. |

5.1.49 PVCCAP2—Port VC Capability Register 2 (D1:F0)

PCI Device: 1
 Address Offset: 108–10Bh
 Default Value: 00000001h
 Access: RO
 Size: 32 bits

This register describes the configuration of PCI Express Virtual Channels associated with this port.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 31:24 | RO 00h | VC Arbitration Table Offset: This field indicates the location of the VC Arbitration Table. This field contains the zero-based offset of the table in DQWORDS (16 bytes) from the base address of the Virtual Channel Capability Structure. A value of 0 indicates that the table is not present (due to fixed VC priority). |
| 23:8 | | Reserved |
| 7:0 | RO 01h | VC Arbitration Capability: This field indicates that the only possible VC arbitration scheme is hardware fixed (in the root complex). VC1 is the highest priority, VC0 is the lowest priority. |

5.1.50 PVCCTL—Port VC Control (D1:F0)

PCI Device: 1
 Address Offset: 10C–10Dh
 Default Value: 0000h
 Access: R/W
 Size: 16 bits

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:4 | | Reserved |
| 3:1 | R/W 000b | VC Arbitration Select: This field will be programmed by software to the only possible value as indicated in the VC Arbitration Capability field. The value 001b when written to this field will indicate the VC arbitration scheme is hardware fixed (in the root complex). This field can not be modified when more than one VC in the LPVC group is enabled. |
| 0 | | Reserved |

5.1.51 VC0RCAP—VC0 Resource Capability (D1:F0)

PCI Device: 1
 Address Offset: 110–113h
 Default Value: 00000000h
 Access: RO
 Size: 32 bits

| Bit | Access & Default | Description |
|-------|------------------|---|
| 31:16 | | Reserved |
| 15 | RO 0b | Reject Snoop Transactions 0 = Transactions with or without the No Snoop bit set within the TLP header are allowed on this VC. 1 = Any transaction without the No Snoop bit set within the TLP header will be rejected as an Unsupported Request. |
| 14:0 | | Reserved |

5.1.52 VC0RCTL—VC0 Resource Control (D1:F0)

PCI Device: 1
Address Offset: 114–117h
Default Value: 800000FFh
Access: RO, R/W
Size: 32 bits

Controls the resources associated with PCI Express Virtual Channel 0.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31 | RO 1b | VC0 Enable: For VC0, this is hardwired to 1 and read only as VC0 can never be disabled. |
| 30:27 | | Reserved |
| 26:24 | RO 000b | VC0 ID: This field assigns a VC ID to the VC resource. For VC0, this is hardwired to 0 and read only. |
| 23:8 | | Reserved |
| 7:1 | R/W 7Fh | TC/VC0 Map: This field indicates the TCs (Traffic Classes) that are mapped to the VC resource. Bit locations within this field correspond to TC values. For example, when bit 7 is set in this field, TC7 is mapped to this VC resource. When more than one bit in this field is set, it indicates that multiple TCs are mapped to the VC resource. In order to remove one or more TCs from the TC/VC Map of an enabled VC, software must ensure that no new or outstanding transactions with the TC labels are targeted at the given Link. |
| 0 | RO 1b | TC0/VC0 Map: Traffic Class 0 is always routed to VC0. |

5.1.53 VC0RSTS—VC0 Resource Status (D1:F0)

PCI Device: 1
 Address Offset: 11A–11Bh
 Default Value: 0002h
 Access: RO
 Size: 16 bits

This register reports the Virtual Channel specific status.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:2 | | Reserved |
| 1 | RO 1b | <p>VC0 Negotiation Pending: This bit indicates the status of the process of Flow Control initialization. It is set by default on Reset, as well as when the corresponding Virtual Channel is Disabled or the Link is in the DL_Down state. It is cleared when the link successfully exits the FC_INIT2 state.</p> <p>0 = The VC negotiation is complete.</p> <p>1 = The VC resource is still in the process of negotiation (initialization or disabling).</p> <p>Before using a Virtual Channel, software must check whether the VC Negotiation Pending fields for that Virtual Channel are cleared in both Components on a Link.</p> |
| 0 | | Reserved |

5.1.54 VC1RCAP—VC1 Resource Capability (D1:F0)

PCI Device: 1
 Address Offset: 11C–11Fh
 Default Value: 00008000h
 Access: RO
 Size: 32 bits

| Bit | Access & Default | Description |
|-------|------------------|---|
| 31:16 | | Reserved |
| 15 | RO 1b | <p>Reject Snoop Transactions:</p> <p>0 = Transactions with or without the No Snoop bit set within the TLP header are allowed on this VC.</p> <p>1 = Any transaction without the No Snoop bit set within the TLP header will be rejected as an Unsupported Request.</p> |
| 14:0 | | Reserved |

5.1.55 VC1RCTL—VC1 Resource Control (D1:F0)

| | |
|-----------------|-----------|
| PCI Device: | 1 |
| Address Offset: | 120–123h |
| Default Value: | 01000000h |
| Access: | RO, R/W |
| Size: | 32 bits |

Controls the resources associated with PCI Express Virtual Channel 1.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31 | R/W 0b | <p>VC1 Enable:</p> <p>0 = Virtual Channel is disabled.</p> <p>1 = Virtual Channel is enabled. See exceptions in note below.</p> <p>Software must use the VC Negotiation Pending bit to check whether the VC negotiation is complete. When VC Negotiation Pending bit is cleared, a 1 read from this VC Enable bit indicates that the VC is enabled (Flow Control Initialization is completed for the PCI Express* port); a 0 read from this bit indicates that the Virtual Channel is currently disabled.</p> <p>NOTES:</p> <ol style="list-style-type: none"> To enable a Virtual Channel, the VC Enable bits for that Virtual Channel must be set in both Components on a Link. To disable a Virtual Channel, the VC Enable bits for that Virtual Channel must be cleared in both Components on a Link. Software must ensure that no traffic is using a Virtual Channel at the time it is disabled. Software must fully disable a Virtual Channel in both Components on a Link before re-enabling the Virtual Channel. <p>BIOS Requirement: This field must not be set to 1b. VC1 is not a POR feature.</p> |
| 30:27 | | Reserved |
| 26:24 | R/W 001b | <p>VC1 ID: This field assigns a VC ID to the VC resource. Assigned value must be non-zero.</p> <p>This field cannot be modified when the VC is already enabled.</p> |
| 23:8 | | Reserved |
| 7:1 | R/W 00h | <p>TC/VC1 Map: This field indicates the TCs (Traffic Classes) that are mapped to the VC resource. Bit locations within this field correspond to TC values. For example, when bit 7 is set in this field, TC7 is mapped to this VC resource. When more than one bit in this field is set, it indicates that multiple TCs are mapped to the VC resource. To remove one or more TCs from the TC/VC Map of an enabled VC, software must ensure that no new or outstanding transactions with the TC labels are targeted at the given Link.</p> |
| 0 | RO 0b | <p>TC0/VC1 Map: Traffic Class 0 is always routed to VC0.</p> |

5.1.56 VC1RSTS—VC1 Resource Status (D1:F0)

| | |
|-----------------|----------|
| PCI Device: | 1 |
| Address Offset: | 126–127h |
| Default Value: | 0002h |
| Access: | RO |
| Size: | 16 bits |

This register reports the Virtual Channel specific status.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:2 | | Reserved |
| 1 | RO 1 b | <p>VC1 Negotiation Pending: This bit indicates the status of the process of Flow Control initialization. It is set by default on Reset, as well as when the corresponding Virtual Channel is Disabled or the Link is in the DL_Down state. It is cleared when the link successfully exits the FC_INIT2 state.</p> <p>0 = The VC negotiation is complete.</p> <p>1 = The VC resource is still in the process of negotiation (initialization or disabling).</p> <p>Before using a Virtual Channel, software must check whether the VC Negotiation Pending fields for that Virtual Channel are cleared in both Components on a Link.</p> |
| 0 | | Reserved |

5.1.57 RCLDECH—Root Complex Link Declaration Enhanced Capability Header (D1:F0)

| | |
|-----------------|-----------|
| PCI Device: | 1 |
| Address Offset: | 140–143h |
| Default Value: | 00010005h |
| Access: | RO |
| Size: | 32 bits |

This capability declares links from this element (PCI Express) to other elements of the root complex component to which it belongs. See the PCI Express specification for link/topology declaration requirements.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:20 | RO 000h | Pointer to Next Capability: This is the last capability in the PCI Express* extended capabilities list |
| 19:16 | RO 1h | Link Declaration Capability Version: Hardwired to 1 to indicate compliances with <i>PCI Express Specification, Revision 1.0a</i> . |
| 15:0 | RO 0005h | Extended Capability ID: Value of 0005 h identifies this linked list item (capability structure) as being for PCI Express Link Declaration Capability. |

Note: See corresponding Egress Port Link Declaration Capability registers for diagram of Link Declaration Topology.

5.1.58 ESD—Element Self Description (D1:F0)

| | |
|-----------------|-----------|
| PCI Device: | 1 |
| Address Offset: | 144–147h |
| Default Value: | 02000200h |
| Access: | RO, R/WO |
| Size: | 32 bits |

This register provides information about the root complex element containing this Link Declaration Capability.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:24 | RO 02h | Port Number: This field specifies the port number associated with this element with respect to the component that contains this element. The egress port of the component to provide arbitration to this Root Complex Element uses this port number value. |
| 23:16 | R/WO 00h | Component ID: This field identifies the physical component that contains this Root Complex Element. Component IDs start at 1. This value is a mirror of the value in the Component ID field of all elements in this component. The value only needs to be written in one of the mirrored fields and it will be reflected everywhere that it is mirrored. |
| 15:8 | RO 02h | Number of Link Entries: This field identifies the number of link entries following the Element Self Description. This field reports 2 (to the other PEG port and to Egress port). |
| 7:4 | | Reserved |
| 3:0 | RO 0h | Element Type: This field indicates the type of the Root Complex Element. Value of 0h represents a root port. |

5.1.59 LE1D—Link Entry 1 Description (D1:F0)

| | |
|-----------------|-----------|
| PCI Device: | 1 |
| Address Offset: | 150–153h |
| Default Value: | 00000000h |
| Access: | RO, R/WO |
| Size: | 32 bits |

This register provides the first part of a Link Entry that declares an internal link to another Root Complex Element.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:24 | RO 00h | Target Port Number: This field specifies the port number associated with the element targeted by this link entry (Egress Port). The target port number is with respect to the component that contains this element as specified by the target component ID. |
| 23:16 | R/WO 00h | Target Component ID: This field identifies the physical or logical component that is targeted by this link entry. A value of 0 is reserved; Component IDs start at 1. This value is a mirror of the value in the Component ID field of all elements in this component. The value only needs to be written in one of the mirrored fields and it will be reflected everywhere that it is mirrored. |
| 15:2 | | Reserved |
| 1 | RO 0b | Link Type (TYP): This bit indicates that the link points to memory-mapped space (for RCRB). The link address specifies the 64-bit base address of the target RCRB. |
| 0 | R/WO 0b | Link Valid 0 = Link Entry is not valid and will be ignored. 1 = Link Entry specifies a valid link. |

5.1.60 LE1A—Link Entry 1 Address (D1:F0)

| | |
|-----------------|-------------------|
| PCI Device: | 1 |
| Address Offset: | 158–15Fh |
| Default Value: | 0000000000000000h |
| Access: | R/WO |
| Size: | 64 bits |

This register contains the second part of a Link Entry that declares an internal link to another Root Complex Element.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 63:32 | | Reserved |
| 31:12 | R/WO 0 0000h | Link Address: This field contains the memory mapped base address of the RCRB that is the target element (Egress Port) for this link entry. |
| 11:0 | | Reserved |

5.1.61 LE2D—Link Entry 2 Description (D1:F0)

| | |
|-----------------|-----------|
| PCI Device: | 1 |
| Address Offset: | 160–163h |
| Default Value: | 00000002h |
| Access: | RO, R/WO |
| Size: | 32 bits |

This register provides the first part of a Link Entry that declares an internal link to another Root Complex Element.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:24 | RO 00h | Target Port Number: This field specifies the port number associated with the element targeted by this link entry (PEG1). The target port number is with respect to the component that contains this element as specified by the target component ID. |
| 23:16 | R/WO 00h | Target Component ID: This field identifies the physical or logical component that is targeted by this link entry. A value of 0 is reserved; Component IDs start at 1. This value is a mirror of the value in the Component ID field of all elements in this component. The value only needs to be written in one of the mirrored fields and it will be reflected everywhere that it is mirrored. |
| 15:2 | | Reserved |
| 1 | RO 1b | Link Type (LTYP): This bit indicates that the link points to configuration space of an integrated device. The link address specifies the configuration address (segment, bus, device, function) of the target root port. |
| 0 | R/WO 0b | Link Valid 0 = Link Entry is not valid and will be ignored. 1 = Link Entry specifies a valid link. |

5.1.62 LE2A— Link Entry 2 Address

| | |
|-----------------|-------------------|
| PCI Device: | 1 |
| Address Offset: | 168–16Fh |
| Default Value: | 0000000000018000h |
| Access: | RO |
| Size: | 64 bits |

This register provides the second part of a Link Entry that declares an internal link to another Root Complex Element.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 63:20 | | Reserved |
| 19:15 | RO 0 0011b | Device Number: Target for this link is PEG1(Device 3). |
| 14:0 | | Reserved |

5.1.63 UESTS—Uncorrectable Error Status (D1:F0)

| | |
|-----------------|------------|
| B/D/F/Type: | 0/1/0/MMR |
| Address Offset: | 1C4–1C7h |
| Default Value: | 00000000h |
| Access: | RO, R/WC/S |
| Size: | 32 bits |

This register reports error status of individual error sources on a PCI Express device. An individual error status bit that is set indicates that a particular error occurred. Software clears an error status by writing a 1 to the respective bit.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:21 | RO 000h | Reserved |
| 20 | R/WC/S 0b | Unsupported Request Error Status: 0 = Error did Not occur 1 = Error occurred |
| 19 | RO 0b | Reserved |
| 18 | R/WC/S 0b | Malformed TLP Status: 0 = Error did Not occur 1 = Error occurred |
| 17 | R/WC/S 0b | Receiver Overflow Status: 0 = Error did Not occur 1 = Error occurred |

| Bit | Access & Default | Description |
|------|------------------|--|
| 16 | R/WC/S 0b | Unexpected Completion Status: 0 = Error did Not occur 1 = Error occurred |
| 15 | RO 0b | Reserved |
| 14 | R/WC/S 0b | Completion Timeout Status: 0 = Error did Not occur 1 = Error occurred |
| 13:5 | RO 0b | Reserved |
| 4 | R/WC/S 0b | Data Link Protocol Error Status (DLPEs): The Data Link Layer Protocol Error that causes this bit to be set will also cause the Fatal Error Detected bit in Device Status[2] to be set if not already set. |
| 3:0 | RO 000b | Reserved |

5.1.64 UEMSK—Uncorrectable Error Mask (D1:F0)

| | |
|-----------------|-----------|
| B/D/F/Type: | 0/1/0/MMR |
| Address Offset: | 1C8–1CBh |
| Default Value: | 00000000h |
| Access: | RO, R/W/S |
| Size: | 32 bits |

This register controls reporting of individual errors by the device (or logic associated with this port) to the PCI Express Root Complex. As these errors are not originating on the other side of a PCI Express link, no PCI Express error message is sent, but the unmasked error is reported directly to the root control logic. A masked error (respective bit set to 1 in the mask register) has no action taken. There is a mask bit per error bit of the Uncorrectable Error Status register.

| Bit | Access & Default | Description |
|-----------|------------------|---|
| 31:2 1 | RO 000h | Reserved |
| 20 | R/W/S 0b | Unsupported Request Error Mask: 0 = Not Masked 1 = Masked |
| 19 | RO 0b | Reserved |
| 18 | R/W/S 0b | Malformed TLP Mask: 0 = Not Masked 1 = Masked |
| 17 | R/W/S 0b | Receiver Overflow Mask: 0 = Not Masked 1 = Masked |
| 16 | R/W/S 0b | Unexpected Completion Mask: 0 = Not Masked 1 = Masked |
| 15 | RO 0b | Reserved |
| 14 | R/W/S 0b | Completion Timeout Mask: 0 = Not Masked 1 = Masked |
| 13:5 | RO 0b | Reserved |
| 4 | R/W/S 0b | Data Link Protocol Error Mask: 0 = Not Masked 1 = Masked |
| 3:0 | RO 000b | Reserved |

5.1.65 CESTS—Correctable Error Status (D1:F0)

B/D/F/Type: 0/1/0/MMR
Address Offset: 1D0–1D3h
Default Value: 00000000h
Access: RO, R/WC/S
Size: 32 bits

This register reports error status of individual error sources on a PCI Express device. An individual error status bit that is set indicates that a particular error occurred. Software may clear an error status by writing a 1 to the respective bit.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:13 | RO 00000h | Reserved |
| 12 | R/WC/S 0b | Replay Timer Timeout Status: 0 = Error did Not occur 1 = Error occurred |
| 11:9 | RO 000b | Reserved |
| 8 | R/WC/S 0b | Replay Number Rollover Status: 0 = Error did Not occur 1 = Error occurred |
| 7 | R/WC/S 0b | Bad DLLP Status: 0 = Error did Not occur 1 = Error occurred |
| 6 | R/WC/S 0b | Bad TLP Status: 0 = Error did Not occur 1 = Error occurred |
| 5:1 | RO 00h | Reserved |
| 0 | R/WC/S 0b | Receiver Error Status (RES): Receiver Errors will be indicated due to all of the following: 8b/10b Decode Errors, Framing Errors, Lane Deskew Errors, and Elasticity Buffer Overflow/Underflow. 0 = Error did Not occur 1 = Error occurred |

5.1.66 CEMSK—Correctable Error Mask (D1:F0)

| | |
|-----------------|-----------|
| B/D/F/Type: | 0/1/0/MMR |
| Address Offset: | 1D4–1D7h |
| Default Value: | 00000000h |
| Access: | RO, R/W/S |
| Size: | 32 bits |

This register controls reporting of individual correctable errors by the device (or logic associated with this port) to the PCI Express Root Complex. As these errors are not originating on the other side of a PCI Express link, no PCI Express error message is sent, but the unmasked error is reported directly to the root control logic. A masked error (respective bit set to 1 in the mask register) has no action taken. There is a mask bit per error bit of the Correctable Error Status register.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:13 | RO 00000h | Reserved |
| 12 | R/W/S 0b | Replay Timer Timeout Mask: 0 = Not Masked 1 = Masked |
| 11:9 | RO 000b | Reserved |
| 8 | R/W/S 0b | Replay Number Rollover Mask: 0 = Not Masked 1 = Masked |
| 7 | R/W/S 0b | Bad DLLP Mask: 0 = Not Masked 1 = Masked |
| 6 | R/W/S 0b | Bad TLP Mask: 0 = Not Masked 1 = Masked |
| 5:1 | RO 00h | Reserved |
| 0 | R/W/S 0b | Receiver Error Mask: 0 = Not Masked 1 = Masked |

5.1.67 PEGSSTS—PCI Express* Sequence Status (D1:F0)

PCI Device: 1
Address Offset: 218–21Fh
Default Value: 000000000000FFFh
Access: RO
Size: 64 bits

PCI Express status reporting that is required by the PCI Express specification.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 63:60 | | Reserved |
| 59:48 | RO 000h | Next Transmit Sequence Number: This field contains the value of the NXT_TRANS_SEQ counter. This counter represents the transmit Sequence number to be applied to the next TLP to be transmitted onto the Link for the first time. |
| 47:44 | | Reserved |
| 43:32 | RO 000h | Next Packet Sequence Number: This field contains the packet sequence number to be applied to the next TLP to be transmitted or re-transmitted onto the Link. |
| 31:28 | | Reserved |
| 27:16 | RO 000h | Next Receive Sequence Number: This is the sequence number associated with the TLP that is expected to be received next. |
| 15:12 | | Reserved |
| 11:0 | RO FFFh | Last Acknowledged Sequence Number: This is the sequence number associated with the last acknowledged TLP. |

§

6 Host-Secondary PCI Express* Bridge Registers (D3:F0)

Device 3 contains the controls associated with the Secondary PCI Express x16 root port that is the intended attach point for external graphics. In addition, it also functions as the virtual PCI-to-PCI bridge. Table 5-1 provides an address map of the D3:F0 registers listed by address offset in ascending order. Section 5.1 provides a detailed bit description of the registers.

The *PCI Express* Specification* defines two types of reserved bits: Reserved and Preserved.

- Reserved for future RW implementations; software must preserve value read for writes to bits.
- Reserved and Zero: Reserved for future R/WC/S implementations; software must use 0 for writes to bits.

Unless explicitly documented as Reserved and Zero, all bits marked as reserved are part of the Reserved and Preserved type, which have historically been the typical definition for Reserved.

Note: Most (if not all) control bits in this device cannot be modified unless the link is down. Software is required to first Disable the link, then program the registers, and then re-enable the link (which will cause a full-retrain with the new settings).

Table 6-1. Host-PCI Express* Graphics Bridge Register Address Map (D3:F0)

| Address Offset | Symbol | Register Name | Default Value | Access |
|----------------|---------|-------------------------|--------------------------|-----------|
| 00–01h | VID3 | Vendor Identification | 8086h | RO |
| 02–03h | DID3 | Device Identification | 277Ah | RO |
| 04–05h | PCICMD3 | PCI Command | 0000h | RO, R/W |
| 06–07h | PCISTS3 | PCI Status | 0010h | RO, R/W/C |
| 08h | RID3 | Revision Identification | See register description | RO |
| 09–0Bh | CC3 | Class Code | 060400h | RO |
| 0Ch | CL3 | Cache Line Size | 00h | R/W |
| 0Dh | — | <i>Reserved</i> | — | — |
| 0Eh | HDR3 | Header Type | 01h | RO |
| 0F–17h | — | <i>Reserved</i> | — | — |
| 18h | PBUSN3 | Primary Bus Number | 00h | RO |
| 19h | SBUSN3 | Secondary Bus Number | 00h | RO |
| 1Ah | SUBUSN3 | Subordinate Bus Number | 00h | R/W |

| Address Offset | Symbol | Register Name | Default Value | Access |
|----------------|------------------|---|---------------|----------------|
| 1Bh | — | <i>Reserved</i> | — | — |
| 1Ch | IOBASE3 | I/O Base Address | F0h | RO |
| 1Dh | IOLIMIT3 | I/O Limit Address | 00h | R/W |
| 1Eh–1Fh | SSTS3 | Secondary Status | 00h | RO, R/W/C |
| 20–21h | MBASE3 | Memory Base Address | FFF0h | R/W |
| 22–23h | MLIMIT3 | Memory Limit Address | 0000h | R/W |
| 24–25h | PMBASE3 | Prefetchable Memory Base Address | FFF1h | RO, R/W |
| 26–27h | PMLIMIT3 | Prefetchable Memory Limit Address | 0000h | RO, R/W |
| 28–2Bh | PMBASEU3 | Prefetchable Memory Base Address | 0000000Fh | R/W |
| 2C–2Fh | PMLIMITU3 | Prefetchable Memory Limit Address | 00000000h | R/W |
| 30–33h | — | <i>Reserved</i> | — | — |
| 34h | CAPPTR3 | Capabilities Pointer | 88h | RO |
| 35–3Bh | — | <i>Reserved</i> | — | — |
| 3Ch | INTRLINE3 | Interrupt Line | 00h | R/W |
| 3Dh | INTRPIN3 | Interrupt Pin | 01h | RO |
| 3E–3Fh | BCTRL3 | Bridge Control | 0000h | RO, R/W |
| 40–7Fh | — | <i>Reserved</i> | — | — |
| 80–83h | PM_CAPID3 | Power Management Capabilities | C8029001h | RO |
| 84–87h | PM_CS3 | Power Management Control/Status | 00000000h | RO, R/W, R/W/S |
| 88–8Bh | SS_CAPID3 | Subsystem Identification and Vendor Identification Capabilities | 0000800Dh | RO |
| 8C–8Fh | SS3 | Subsystem ID and Subsystem Vendor ID | 00008086h | RO |
| 90–91h | MSI_CAPID3 | Message Signaled Interrupts Capability Identification | A005h | RO |
| 92–93h | MC3 | Message Control | 0000h | RO, R/W |
| 94–97h | MA3 | Message Address | 00000000h | RO, R/W |
| 98–99h | MD3 | Message Data | 0000h | R/W |
| 9A–9Fh | — | <i>Reserved</i> | — | — |
| A0–A1h | PEGCAPL3 | PCI Express* Capability List | 0010h | RO |

6.1 Configuration Register Details (D3:F0)

6.1.1 VID3—Vendor Identification (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | 00–01h |
| Default Value: | 8086h |
| Access: | RO |
| Size: | 16 bits |

This register combined with the Device Identification register uniquely identifies any PCI device.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:0 | RO 8086h | Vendor Identification (VID3) PCI standard identification for Intel. |

6.1.2 DID3—Device Identification (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | 02–03h |
| Default Value: | 277Ah |
| Access: | RO |
| Size: | 16 bits |

This register combined with the Vendor Identification register uniquely identifies any PCI device.

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:0 | RO 277Ah | Device Identification Number (DID3): Identifier assigned to the MCH Device 3 (virtual PCI-to-PCI bridge, PCI Express* Graphics port). |

6.1.3 PCICMD3—PCI Command (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | 04–05h |
| Default Value: | 0000h |
| Access: | RO, R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PCICMD1 Register.

6.1.4 PCISTS3—PCI Status (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 06–07h |
| Default Value: | 0010h |
| Access: | RO, R/W/C |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PCISTS1 Register.

6.1.5 RID3—Revision Identification (D3:F0)

| | |
|-----------------|------------------------|
| PCI Device: | 3 |
| Address Offset: | 08h |
| Default Value: | see register bit table |
| Access: | RO |
| Size: | 8 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – RID1 Register.

6.1.6 CC3—Class Code (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | 09–0Bh |
| Default Value: | 060400h |
| Access: | RO |
| Size: | 24 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – CC1 Register.

6.1.7 CL3—Cache Line Size (D3:F0)

| | |
|-----------------|--------|
| PCI Device: | 3 |
| Address Offset: | 0Ch |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – CL1 Register.

6.1.8 HDR3—Header Type (D3:F0)

| | |
|-----------------|--------|
| PCI Device: | 3 |
| Address Offset: | 0Eh |
| Default Value: | 01h |
| Access: | RO |
| Size: | 8 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – HDR1 Register.

6.1.9 PBUSN3—Primary Bus Number (D3:F0)

| | |
|-----------------|--------|
| PCI Device: | 3 |
| Address Offset: | 18h |
| Default Value: | 00h |
| Access: | RO |
| Size: | 8 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PBUSN1 Register.

6.1.10 SBUSN3—Secondary Bus Number (D3:F0)

| | |
|-----------------|--------|
| PCI Device: | 3 |
| Address Offset: | 19h |
| Default Value: | 00h |
| Access: | RO |
| Size: | 8 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – SBUSN1 Register.

6.1.11 SUBUSN3—Subordinate Bus Number (D3:F0)

| | |
|-----------------|--------|
| PCI Device: | 3 |
| Address Offset: | 1Ah |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – SUBUSN1 Register.

6.1.12 IOBASE3—I/O Base Address (D3:F0)

| | |
|-----------------|--------|
| PCI Device: | 3 |
| Address Offset: | 1Ch |
| Default Value: | F0h |
| Access: | RO |
| Size: | 8 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – IOBASE1 Register.

6.1.13 IOLIMIT3—I/O Limit Address (D3:F0)

| | |
|-----------------|--------|
| PCI Device: | 3 |
| Address Offset: | 1Dh |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – IOLIMIT1 Register.

6.1.14 SSTS3—Secondary Status (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 1E–1Fh |
| Default Value: | 00h |
| Access: | RO, R/W/C |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – SSTS1 Register.

6.1.15 MBASE3—Memory Base Address (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | 20–21h |
| Default Value: | FFF0h |
| Access: | R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – MBASE1 Register.

6.1.16 MLIMIT3—Memory Limit Address (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | 22–23h |
| Default Value: | 0000h |
| Access: | R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – MLIMIT1 Register.

6.1.17 PMBASE3—Prefetchable Memory Base Address (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | 24–25h |
| Default Value: | FFF1h |
| Access: | RO, R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PMBASE1 Register.

6.1.18 PMLIMIT3—Prefetchable Memory Limit Address (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | 26–27h |
| Default Value: | 0000h |
| Access: | RO, R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PMLIMIT1 Register.

6.1.19 PMBASEU3—Prefetchable Memory Base Address

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 28–2Bh |
| Default Value: | 0000000Fh |
| Access: | R/W |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PMBASEU1 Register.

6.1.20 PMLIMITU3— Prefetchable Memory Limit Address

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 2C–2Fh |
| Default Value: | 00000000h |
| Access: | R/W |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PMLIMITU1 Register.

6.1.21 CAPPTR3—Capabilities Pointer (D3:F0)

| | |
|-----------------|--------|
| PCI Device: | 3 |
| Address Offset: | 34h |
| Default Value: | 88h |
| Access: | RO |
| Size: | 8 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – CAPPTR1 Register.

6.1.22 INTRLINE3—Interrupt Line (D3:F0)

| | |
|-----------------|--------|
| PCI Device: | 3 |
| Address Offset: | 3Ch |
| Default Value: | 00h |
| Access: | R/W |
| Size: | 8 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – INTRLINE1 Register.

6.1.23 INTRPIN3—Interrupt Pin (D3:F0)

| | |
|-----------------|--------|
| PCI Device: | 3 |
| Address Offset: | 3Dh |
| Default Value: | 01h |
| Access: | RO |
| Size: | 8 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – INTRPIN1 Register.

6.1.24 BCTRL3—Bridge Control (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | 3Eh |
| Default Value: | 0000h |
| Access: | RO, R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – BCTRL1 Register.

6.1.25 PM_CAPID3—Power Management Capabilities (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 80–83h |
| Default Value: | C8029001h |
| Access: | RO |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PM_CAPID1 Register.

6.1.26 PM_CS3—Power Management Control/Status (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 84h |
| Default Value: | 00000000h |
| Access: | RO, R/W |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PM_CS1 Register.

6.1.27 SS_CAPID3—Subsystem ID and Vendor ID Capabilities (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 88h |
| Default Value: | 0000800Dh |
| Access: | RO |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – SS_CAPID Register.

6.1.28 **SS3—Subsystem ID and Subsystem Vendor ID (D3:F0)**

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 8Ch |
| Default Value: | 00008086h |
| Access: | RO |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – SS Register.

6.1.29 **MSI_CAPID3—Message Signaled Interrupts Capability ID (D3:F0)**

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | 90h |
| Default Value: | A005h |
| Access: | RO |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – MSI_CAPID Register.

6.1.30 **MC3—Message Control (D3:F0)**

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | 92h |
| Default Value: | 0000h |
| Access: | RO, R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – MC Register.

6.1.31 **MA3—Message Address (D3:F0)**

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 94h |
| Default Value: | 00000000h |
| Access: | RO, R/W |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – MA Register.

6.1.32 MD3—Message Data (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | 98h |
| Default Value: | 0000h |
| Access: | R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – MD Register.

6.1.33 PEGCAPL3—PCI Express* Capability List (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | A0–A1h |
| Default Value: | 0010h |
| Access: | RO |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PEGCAPL Register.

6.1.34 PCI_EXPRESS_CAP3—PCI Express* Capabilities (D3:F0)

| | |
|-----------------|----------|
| PCI Device: | 3 |
| Address Offset: | A2–A3h |
| Default Value: | 0141h |
| Access: | RO, R/WO |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PEGCAP Register.

6.1.35 DCAP3—Device Capabilities (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | A4–A7h |
| Default Value: | 00000000h |
| Access: | RO |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – DCAP Register.

6.1.36 DCTL3—Device Control (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | A8–A9h |
| Default Value: | 0000h |
| Access: | R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – DCTL Register.

6.1.37 DSTS3—Device Status (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | AA–ABh |
| Default Value: | 0000h |
| Access: | RO |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – DSTS Register.

6.1.38 LCAP3—Link Capabilities (D3:F0)

PCI Device: 3
 Address Offset: AC–AFh
 Default Value: 02012081h
 Access: R/WO
 Size: 16 bits

This register indicates PCI Express device specific capabilities.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:24 | RO 02h | Port Number: This field indicates the PCI Express* port number for the given PCI Express link. The field matches the value in Element Self Description [31:24]. |
| 23:18 | | Reserved |
| 17:15 | R/WO 010b | L1 Exit Latency: This field indicates the length of time this Port requires to complete the transition from L1 to L0. The value 010 b indicates the range of 2 μ s to less than 4 μ s. If this field is required to be any value other than the default, BIOS must initialize it accordingly. Both bytes of this register that contain a portion of this field must be written simultaneously to prevent an intermediate (and undesired) value from ever existing. |
| 14:12 | R/WO 010b | L0s Exit Latency: This field indicates the length of time this Port requires to complete the transition from L0s to L0. The value 010 b indicates the range of 128 ns to less than 256 ns. If this field is required to be any value other than the default, BIOS must initialize it accordingly. |
| 11:10 | RO 11b | Active State Link PM Support: L0s and L1 entry supported. |
| 9:4 | RO 08h | Max Link Width: Hardwired to indicate X8. When Force X1 mode is enabled on this PCI Express device, this field reflects X1 (01h). |
| 3:0 | RO 1h | Max Link Speed: Hardwired to indicate 2.5 Gb/s. |

6.1.39 LCTL3—Link Control (D3:F0)

PCI Device: 3
 Address Offset: B0–B1h
 Default Value: 0000h
 Access: RO, R/W
 Size: 16 bits

The operation of this register is detailed in the description for Device 1, Function 0 – LCTL Register.

6.1.40 LSTS3—Link Status (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | B2–B3h |
| Default Value: | 1001h |
| Access: | RO |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – LSTS Register.

6.1.41 SLOTCAP3—Slot Capabilities (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | B4–B7h |
| Default Value: | 00000000h |
| Access: | R/WO |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – SLOTCAP Register.

6.1.42 SLOTCTL3—Slot Control (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | B8–B9h |
| Default Value: | 01C0h |
| Access: | R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – SLOTCTL Register.

6.1.43 SLOTSTS3—Slot Status (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | BA–BBh |
| Default Value: | 0000h |
| Access: | RO, R/W/C |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – SLOTSTS Register.

6.1.44 RCTL3—Root Control (D3:F0)

| | |
|-----------------|---------|
| PCI Device: | 3 |
| Address Offset: | BC–BDh |
| Default Value: | 0000h |
| Access: | R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – RCTL Register.

6.1.45 RSTS3—Root Status (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | C0–C3h |
| Default Value: | 00000000h |
| Access: | RO, R/W/C |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – RSTS Register.

6.1.46 PEGLC3—PCI Express* Legacy Control (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | EC–EFh |
| Default: | 00000000h |
| Access: | RO, R/W |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PEGLC Register.

6.1.47 VCECH3—Virtual Channel Enhanced Capability Header (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 100–103h |
| Default Value: | 14010002h |
| Access: | RO |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – VCECH Register.

6.1.48 PVCCAP31—Port VC Capability Register 1 (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 104–107h |
| Default Value: | 00000001h |
| Access: | RO, R/WO |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PVCCAP1 Register.

6.1.49 PVCCAP32—Port VC Capability Register 2 (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 108–10Bh |
| Default Value: | 00000001h |
| Access: | RO |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PVCCAP2 Register.

6.1.50 PVCCTL3—Port VC Control (D3:F0)

| | |
|-----------------|----------|
| PCI Device: | 3 |
| Address Offset: | 10C–10Dh |
| Default Value: | 0000h |
| Access: | R/W |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PVCCTL Register.

6.1.51 VC0RCAP3—VC0 Resource Capability (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 110–113h |
| Default Value: | 00000000h |
| Access: | RO |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – VC0RCAP Register.

6.1.52 VC0RCTL3—VC0 Resource Control (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 114–117h |
| Default Value: | 800000FFh |
| Access: | RO, R/W |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – VC0RCTL Register.

6.1.53 VC0RSTS3—VC0 Resource Status (D3:F0)

| | |
|-----------------|----------|
| PCI Device: | 3 |
| Address Offset: | 11A–11Bh |
| Default Value: | 0002h |
| Access: | RO |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – VC0RSTS Register.

6.1.54 VC1RCAP3—VC1 Resource Capability (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 11C–11Fh |
| Default Value: | 00008000h |
| Access: | RO |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – VC1RCAP Register.

6.1.55 VC1RCTL3—VC1 Resource Control (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 120–123h |
| Default Value: | 01000000h |
| Access: | RO, R/W |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – VC1RCTL Register.

6.1.56 VC1RSTS3—VC1 Resource Status (D3:F0)

| | |
|-----------------|----------|
| PCI Device: | 3 |
| Address Offset: | 126–127h |
| Default Value: | 0002h |
| Access: | RO |
| Size: | 16 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – VC1RSTS Register.

6.1.57 RCLDECH3—Root Complex Link Declaration Enhanced Capability Header (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 140–143h |
| Default Value: | 00010005h |
| Access: | RO |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – RCLDECH Register.

6.1.58 ESD3—Element Self Description (D3:F0)

PCI Device: 3
 Address Offset: 144–147h
 Default Value: 02000200h
 Access: RO, R/WO
 Size: 32 bits

This register provides information about the root complex element containing this Link Declaration Capability.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:24 | RO 02h | Port Number: This field specifies the port number associated with this element with respect to the component that contains this element. The egress port of the component to provide arbitration to this Root Complex Element uses this port number value. |
| 23:16 | R/WO 00h | Component ID: This field identifies the physical component that contains this Root Complex Element. Component IDs start at 1. This value is a mirror of the value in the Component ID field of all elements in this component. The value only needs to be written in one of the mirrored fields and it will be reflected everywhere that it is mirrored. |
| 15:8 | RO 02h | Number of Link Entries: This field identifies the number of link entries following the Element Self Description. This field reports 2 (to the other PEG port and to Egress port). |
| 7:4 | | Reserved |
| 3:0 | RO 0h | Element Type: This field identifies the type of the Root Complex Element. Value of 0h represents a root port. |

6.1.59 LE1D3—Link Entry 1 Description (D3:F0)

PCI Device: 1
 Address Offset: 150–153h
 Default Value: 00000000h
 Access: RO, R/WO
 Size: 32 bits

The operation of this register is detailed in the description for Device 1, Function 0 – LE1D Register.

6.1.60 LE1A3—Link Entry 1 Address (D3:F0)

PCI Device: 1
 Address Offset: 158–15Fh
 Default Value: 0000000000000000h
 Access: R/WO
 Size: 64 bits

The operation of this register is detailed in the description for Device 1, Function 0 – LE1A Register.

6.1.61 LE2D3—Link Entry 2 Description (D3:F0)

| | |
|-----------------|-----------|
| PCI Device: | 3 |
| Address Offset: | 160–163h |
| Default Value: | 00000002h |
| Access: | RO, R/WO |
| Size: | 32 bits |

This register provides the first part of a Link Entry that declares an internal link to another Root Complex Element.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:24 | RO 00h | Target Port Number: This field specifies the port number associated with the element targeted by this link entry (PEG1). The target port number is with respect to the component that contains this element as specified by the target component ID. |
| 23:16 | R/WO 00h | Target Component ID: This field identifies the physical or logical component that is targeted by this link entry. A value of 0 is reserved; Component IDs start at 1. This value is a mirror of the value in the Component ID field of all elements in this component. The value only needs to be written in one of the mirrored fields and it will be reflected everywhere that it is mirrored. |
| 15:2 | | Reserved |
| 1 | RO 1b | Link Type (LTYP): This bit indicates that the link points to configuration space of an integrated device. The link address specifies the configuration address (segment, bus, device, function) of the target root port. |
| 0 | R/WO 0b | Link Valid 0 = Link Entry is not valid and will be ignored. 1 = Link Entry specifies a valid link. |

6.1.62 LE2A3— Link Entry 2 Address (D3:F0)

| | |
|-----------------|-------------------|
| PCI Device: | 3 |
| Address Offset: | 168–16Fh |
| Default Value: | 0000000000010000h |
| Access: | RO |
| Size: | 64 bits |

This register provides the second part of a Link Entry that declares an internal link to another Root Complex Element.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 63:20 | | Reserved |
| 19:15 | RO 0 0001b | Device Number: Target for this link is PEG0(Device 1). |
| 14:0 | | Reserved |

6.1.63 UESTS3—Uncorrectable Error Status (D3:F0)

| | |
|-----------------|------------|
| B/D/F/Type: | 0/1/0/MMR |
| Address Offset: | 1C4–1C7h |
| Default Value: | 00000000h |
| Access: | RO, R/WC/S |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – UESTS Register.

6.1.64 UEMSK3—Uncorrectable Error Mask (D3:F0)

| | |
|-----------------|-----------|
| B/D/F/Type: | 0/1/0/MMR |
| Address Offset: | 1C8–1CBh |
| Default Value: | 00000000h |
| Access: | RO, R/W/S |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – UEMSK Register.

6.1.65 CESTS3—Correctable Error Status (D3:F0)

| | |
|-----------------|------------|
| B/D/F/Type: | 0/1/0/MMR |
| Address Offset: | 1D0–1D3h |
| Default Value: | 00000000h |
| Access: | RO, R/WC/S |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – CESTS Register

6.1.66 CEMSK3—Correctable Error Mask (D3:F0)

| | |
|-----------------|-----------|
| B/D/F/Type: | 0/1/0/MMR |
| Address Offset: | 1D4–1D7h |
| Default Value: | 00000000h |
| Access: | RO, R/W/S |
| Size: | 32 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – CEMSK Register

6.1.67 PEGSSTS3—PCI Express* Sequence Status (D3:F0)

| | |
|-----------------|-------------------|
| PCI Device: | 1 |
| Address Offset: | 218–21Fh |
| Default Value: | 0000000000000FFFh |
| Access: | RO |
| Size: | 64 bits |

The operation of this register is detailed in the description for Device 1, Function 0 – PEGSSTS Register

§

7 Direct Media Interface (DMI) RCRB

This Root Complex Register Block (RCRB) controls the MCH-ICH7 serial interconnect. The base address of this space is programmed in DMIBAR in D0:F0 configuration space. Table 7-1 provides an address map of the DMI registers listed by address offset in ascending order. Section 7.1 provides a detailed bit description of the registers.

Table 7-1. DMI Register Address Map

| Address Offset | Symbol | Register Name | PCI Dev # | Access |
|----------------|-------------|--|-----------|------------|
| 000–003h | DMIVCECH | DMI Virtual Channel Enhanced Capability Header | DMIBAR | RO |
| 004–007h | DMIPVCCAP1 | DMI Port VC Capability Register 1 | DMIBAR | RO |
| 008–00Bh | DMIPVCCAP2 | DMI Port VC Capability Register 2 | DMIBAR | RO, R/WO |
| 00C–00Dh | DMIPVCCCTL | DMI Port VC Control | DMIBAR | RO |
| 00E–00Fh | — | <i>Reserved</i> | — | — |
| 010–013h | DMIVC0RCAP | DMI VC0 Resource Capability | DMIBAR | RO |
| 014–017h | DMIVC0RCTL0 | DMI VC0 Resource Control | DMIBAR | RO, R/W |
| 018–019h | — | <i>Reserved</i> | — | — |
| 01A–01B h | DMIVC0RSTS | DMI VC0 Resource Status | DMIBAR | RO |
| 01C–01F h | DMIVC1RCAP | DMI VC1 Resource Capability | DMIBAR | RO |
| 020–023h | DMIVC1RCTL1 | DMI VC1 Resource Control | DMIBAR | RO, R/W |
| 024–025h | — | <i>Reserved</i> | — | — |
| 026–027h | DMIVC1RSTS | DMI VC1 Resource Status | DMIBAR | RO |
| 028–083h | — | <i>Reserved</i> | — | — |
| 084–087h | DMILCAP | DMI Link Capabilities | DMIBAR | RO, R/WO |
| 088–089h | DMILCTL | DMI Link Control | DMIBAR | R/W |
| 08A–08Bh | DMILSTS | DMI Link Status | DMIBAR | RO |
| 08C– 1C3h | — | <i>Reserved</i> | — | — |
| 1C4–1C7h | DMIUESTS | DMI Uncorrectable Error Status | DMIBAR | RO, R/WC/S |
| 1C8–1CBh | DMIUEMSK | DIM Uncorrectable Error Mask | DMIBAR | RO, R/W/S |
| 1CC– 1CFh | — | <i>Reserved</i> | — | — |
| 1D0–1D3h | DMICESTS | DMI Correctable Error Status | DMIBAR | RO, R/WC/S |
| 1D4– FFFh | — | <i>Reserved</i> | — | — |

7.1 DMI RCRB Configuration Register Details

7.1.1 DMIVCECH—DMI Virtual Channel Enhanced Capability Header

| | |
|-----------------|-----------|
| MMIO Range: | DMIBAR |
| Address Offset: | 000–003h |
| Default: | 14010002h |
| Access: | RO |
| Size: | 32 bits |

This register indicates DMI Virtual Channel capabilities.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:20 | RO 140h | Pointer to Next Capability: This field indicates the next item in the list. |
| 19:16 | RO 1h | Capability Version: This field indicates support as a version 1 capability structure. |
| 15:0 | RO 0002h | Capability ID: This field indicates this is the Virtual Channel capability item. |

7.1.2 DMIPVCCAP1—DMI Port VC Capability Register 1

| | |
|-----------------|-----------|
| MMIO Range: | DMIBAR |
| Address Offset: | 004–007h |
| Default: | 00000001h |
| Access: | RO, R/WO |
| Size: | 32 bits |

This register describes the configuration of Virtual Channels associated with this port.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:12 | | Reserved |
| 11:10 | RO 00b | Port Arbitration Table Entry Size (PATS): This field indicates the size of the port arbitration table is 4 bits (to allow up to 8 ports). |
| 9:8 | RO 00b | Reference Clock (RC): Fixed at 10 ns. |
| 7 | | Reserved |
| 6:4 | RO 000b | Low Priority Extended VC Count (LPEVC): This field indicates that there are no additional VCs of low priority with extended capabilities. |
| 3 | | Reserved |
| 2:0 | R/WO 001b | Extended VC Count: This field indicates that there is one additional VC (VC1) that exists with extended capabilities. |

7.1.3 DMIPVCCAP2—DMI Port VC Capability Register 2

MMIO Range: DMIBAR
 Address Offset: 008–00Bh
 Default: 00000001h
 Access: RO
 Size: 32 bits

This register describes the configuration of Virtual Channels associated with this port.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:24 | RO 00h | VC Arbitration Table Offset (ATO): This field indicates that no table is present for VC arbitration since it is fixed. |
| 23:8 | | Reserved |
| 7:0 | RO 01h | VC Arbitration Capability: This field indicates that the VC arbitration is fixed in the root complex. VC1 is highest priority and VC0 is lowest priority. |

7.1.4 DMIPVCCTL—DMI Port VC Control

MMIO Range: DMIBAR
 Address Offset: 00C–00Dh
 Default: 0000h
 Access: RO
 Size: 16 bits

| Bit | Access & Default | Description |
|------|------------------|--|
| 15:4 | | Reserved |
| 3:1 | R/W 000b | VC Arbitration Select: This field indicates which VC should be programmed in the VC arbitration table. The root complex takes no action on the setting of this field since there is no arbitration table. |
| 0 | RO 0b | Reserved |

7.1.5 DMIVC0RCAP—DMI VC0 Resource Capability

| | |
|-----------------|-----------|
| MMIO Range: | DMIBAR |
| Address Offset: | 010–013h |
| Default: | 00000001h |
| Access: | RO |
| Size: | 32 bits |

| Bit | Access & Default | Description |
|-------|------------------|---|
| 31:23 | | Reserved |
| 22:16 | RO 00h | Maximum Time Slots (MTS): This VC implements fixed arbitration; therefore, this field is not used. |
| 15 | RO 0b | Reject Snoop Transactions (RTS): This VC must be able to take snoopable transactions. |
| 14:8 | | Reserved |
| 7:0 | RO 01h | Port Arbitration Capability (PAC): This field indicates that this VC uses fixed port arbitration. |

7.1.6 DMIVC0RCTL0—DMI VC0 Resource Control

| | |
|-----------------|----------|
| MMIO Range: | DMIBAR |
| Address Offset: | 014–017h |
| Default: | 80000FEh |
| Access: | RO, R/W |
| Size: | 32 bits |

This register controls the resources associated with PCI Express Virtual Channel 0.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31 | RO 1b | Virtual Channel Enable (EN): 0 = Disable 1 = Enable |
| 30:27 | | Reserved |
| 26:24 | RO 000b | Virtual Channel Identifier (ID): This field indicates the ID to use for this virtual channel. |
| 23:20 | | Reserved |
| 19:17 | R/W 0h | Port Arbitration Select (PAS): This field indicates which port table is being programmed. The root complex takes no action on this setting since the arbitration is fixed and there is no arbitration table. |
| 16:8 | | Reserved |
| 7:1 | R/W 7Fh | Transaction Class / Virtual Channel Map (TVM): This field indicates which transaction classes are mapped to this virtual channel. 0 = Transaction class is Not mapped to the virtual channel. 1 = This transaction class is mapped to the virtual channel. |
| 0 | | Reserved |

7.1.7 DMIVC0RSTS—DMI VC0 Resource Status

MMIO Range: DMIBAR
 Address Offset: 01A–01Bh
 Default: 0002h
 Access: RO
 Size: 16 bits

This register reports the Virtual Channel specific status.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:2 | | Reserved |
| 1 | RO 1b | VC Negotiation Pending (NP): 0 = VC Negotiation complete; Not pending 1 = Virtual channel is still being negotiated with ingress ports. |
| 0 | | Reserved |

7.1.8 DMIVC1RCAP—DMI VC1 Resource Capability

MMIO Range: DMIBAR
 Address Offset: 01C–01Fh
 Default: 0008001h
 Access: RO
 Size: 32 bits

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:16 | | Reserved |
| 15 | RO 1b | Reject Snoop Transactions (RTS): 0 = Do Not reject snoop transactions 1 = All snoopable transactions on VC1 are rejected. This VC is for isochronous transfers only. |
| 14:8 | | Reserved |
| 7:0 | RO 01h | Port Arbitration Capability (PAC): This field indicates the port arbitration capability is time-based WRR of 128 phases. |

7.1.9 DMIVC1RCTL1—DMI VC1 Resource Control

| | |
|-----------------|-----------|
| MMIO Range: | DMIBAR |
| Address Offset: | 020–023h |
| Default: | 01000000h |
| Access: | RO, R/W |
| Size: | 32 bits |

This register controls the resources associated with Virtual Channel 1.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31 | R/W 0b | Virtual Channel Enable (EN): 0 = Disable. 1 = Enable. |
| 30:27 | | Reserved |
| 26:24 | R/W 001b | Virtual Channel Identifier (ID): This field indicates the ID to use for this virtual channel. |
| 23:20 | | Reserved |
| 19:17 | R/W 0h | Port Arbitration Select (PAS): This field indicates which port table is being programmed. The only permissible value of this field is 4h for the time-based WRR entries. |
| 16:8 | | Reserved |
| 7:1 | R/W 00h | Transaction Class / Virtual Channel Map (TVM): This field indicates which transaction classes are mapped to this virtual channel. When a bit is set, this transaction class is mapped to the virtual channel. |
| 0 | | Reserved |

7.1.10 DMIVC1RSTS—DMI VC1 Resource Status

| | |
|-----------------|----------|
| MMIO Range: | DMIBAR |
| Address Offset: | 026–027h |
| Default: | 0000h |
| Access: | RO |
| Size: | 16 bits |

This register reports the Virtual Channel specific status.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:2 | | Reserved |
| 1 | RO 0b | VC Negotiation Pending (NP): 0 = VC negotiation Not pending 1 = Virtual channel is still being negotiated with ingress ports. |
| 0 | | Reserved |

7.1.11 DMILCAP—DMI Link Capabilities

| | |
|-----------------|-----------|
| MMIO Range: | DMIBAR |
| Address Offset: | 084–087h |
| Default: | 00012C41h |
| Access: | RO, R/WO |
| Size: | 32 bits |

This register indicates DMI specific capabilities.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:18 | | Reserved |
| 17:15 | R/WO 010b | L1 Exit Latency (EL1): L1 not supported on DMI. |
| 14:12 | R/WO 010b | L0s Exit Latency (EL0): This field indicates that exit latency is 128 ns to less than 256 ns. |
| 11:10 | RO 11b | Active State Link PM Support (APMS): This field indicates that L0s is supported on DMI. |
| 9:4 | RO 4h | Maximum Link Width (MLW): This field indicates the maximum link width is 4 ports. |
| 3:0 | RO 1h | Maximum Link Speed (MLS): This field indicates the link speed is 2.5 Gb/s. |

7.1.12 DMILCTL—DMI Link Control

| | |
|-----------------|----------|
| MMIO Range: | DMIBAR |
| Address Offset: | 088–089h |
| Default: | 0000h |
| Access: | R/W |
| Size: | 16 bits |

This register allows control of DMI.

| Bit | Access & Default | Description |
|------|------------------|---|
| 15:8 | | Reserved |
| 7 | R/W 0h | Extended Synch (ES): 1 = Forces extended transmission of FTS ordered sets when exiting L0s prior to entering L0 and extra TS1 sequences at exit from L1 prior to entering L0. |
| 6:2 | | Reserved |
| 1:0 | R/W 00b | Active State Link PM Control (APMC): This field indicates whether DMI should enter L0s. 00 = Disabled 01 = L0s entry enabled 10 = Reserved 11 = Reserved |

7.1.13 DMILSTS—DMI Link Status

MMIO Range: DMIBAR
 Address Offset: 08A–08Bh
 Default: 0001h
 Access: RO
 Size: 16 bits

This register indicates DMI status.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 15:10 | | Reserved |
| 9:4 | RO 00h | Negotiated Link Width (NLW): Negotiated link width is x4 (000100b). |
| 3:0 | RO 1h | Link Speed (LS): Link is 2.5 Gb/s. |

7.1.14 DMIUESTS—DMI Uncorrectable Error Status

B/D/F/Type: 0/0/0/DMIBAR
 Address Offset: 1C4–1C7h
 Default Value: 00000000h
 Access: RO, R/WC/S
 Size: 32 bits

This register reports error status of individual uncorrectable error sources on DMI. An individual error status bit that is set indicates that a particular error occurred. Software can clear an error status by writing a 1 to the respective bit.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:21 | RO 000h | Reserved |
| 20 | R/WC/S 0b | Unsupported Request Error Status: 0 = Error did Not occur 1 = Error occurred |
| 19 | RO 0b | Reserved |
| 18 | R/WC/S 0b | Malformed TLP Status: 0 = Error did Not occur 1 = Error occurred |
| 17 | R/WC/S 0b | Receiver Overflow Status: 0 = Error did Not occur 1 = Error occurred |
| 16 | R/WC/S 0b | Unexpected Completion Status: 0 = Error did Not occur 1 = Error occurred |
| 15 | RO 0b | Reserved |
| 14 | R/WC/S 0b | Completion Timeout Status: 0 = Error did Not occur 1 = Error occurred |
| 13:5 | RO 0b | Reserved |
| 4 | R/WC/S 0b | Data Link Protocol Error Status: 0 = Error did Not occur 1 = Error occurred |
| 3:0 | RO 000b | Reserved |

7.1.15 DMIUEMSK—DMI Uncorrectable Error Mask

| | |
|-----------------|--------------|
| B/D/F/Type: | 0/0/0/DMIBAR |
| Address Offset: | 1C8–1CBh |
| Default Value: | 00000000h |
| Access: | RO, R/W/S |
| Size: | 32 bits |

This register controls reporting of individual uncorrectable errors over DMI. A masked error (respective bit set to 1 in the mask register) has no action taken. There is a mask bit per error bit of the DMIUESTS Register.

| Bit | Access & Default | Description |
|-------|------------------|---|
| 31:21 | RO 000h | Reserved |
| 20 | R/W/S 0b | Unsupported Request Error Mask: 0 = Not Masked 1 = Masked |
| 19 | RO 0b | Reserved |
| 18 | R/W/S 0b | Malformed TLP Mask: 0 = Not Masked 1 = Masked |
| 17 | R/W/S 0b | Receiver Overflow Mask: 0 = Not Masked 1 = Masked |
| 16 | R/W/S 0b | Unexpected Completion Mask: 0 = Not Masked 1 = Masked |
| 15 | RO 0b | Reserved |
| 14 | R/W/S 0b | Completion Timeout Mask: 0 = Not Masked 1 = Masked |
| 13:5 | RO 00h | Reserved |
| 4 | R/W/S 0b | Data Link Protocol Error Mask: 0 = Not Masked 1 = Masked |
| 3:0 | RO 000b | Reserved |

7.1.16 DMICESTS— DMI Correctable Error Status

| | |
|-----------------|--------------|
| B/D/F/Type: | 0/0/0/DMIBAR |
| Address Offset: | 1D0–1D3h |
| Default Value: | 00000000h |
| Access: | RO, R/WC/S |
| Size: | 32 bits |

This register reports error status of individual correctable error sources on DMI. An individual error status bit that is set indicates that a particular error occurred. Software can clear an error status by writing a 1 to the respective bit.

| Bit | Access & Default | Description |
|-------|------------------|--|
| 31:13 | RO 00000h | Reserved |
| 12 | R/WC/S 0b | Replay Timer Timeout Status: 0 = Error did Not occur 1 = Error occurred |
| 11:9 | RO 000b | Reserved |
| 8 | R/WC/S 0b | REPLAY_NUM Rollover Status: 0 = Error did Not occur 1 = Error occurred |
| 7 | R/WC/S 0b | Bad DLLP Status: 0 = Error did Not occur 1 = Error occurred |
| 6 | R/WC/S 0b | Bad TLP Status: 0 = Error did Not occur 1 = Error occurred |
| 5:1 | RO 00h | Reserved |
| 0 | R/WC/S 0b | Receiver Error Status (RES): Receiver errors will be indicated due to all of the following: 8b/10b Decode Errors, Framing Errors, Lane Deskew Errors, and Elasticity Buffer Overflow/Underflow. 0 = Error did Not occur 1 = Error occurred |

§

8 System Address Map

The MCH supports 64 GB of addressable memory space (see Figure 8-1) and 64 KB+3 bytes of addressable I/O space. A programmable memory address space under the 1-MB region is divided into regions that can be individually controlled with programmable attributes such as disable, read/write, write only, or read only. This section focuses on how the memory space is partitioned and what the separate memory regions are used for. I/O address space has simpler mapping and is explained near the end of this section.

Addressing of memory ranges larger than 4 GB is supported. The HREQ[4:3] FSB signals are decoded to determine whether the access is above or below 4 GB.

The MCH does support PCI Express* port upper prefetchable base/limit registers. This allows the PCI Express to claim I/O accesses above 32 bit. Addressing of greater than 4 GB is allowed on both the DMI Interface and PCI Express interface. The MCH supports a maximum of 8 GB of DRAM; DRAM memory will Not be accessible above 12 GB. DRAM capacity is limited by the number of address signals available. There is no hardware lock to prevent the situation where more memory than is addressable is inserted.

In the following sections, it is assumed that all of the compatibility memory ranges reside on the DMI. The exception to this rule is VGA ranges that may be mapped to PCI Express or DMI. In the absence of more specific references, cycle descriptions referencing PCI should be interpreted as the DMI/PCI, while cycle descriptions referencing PCI Express are related to the PCI Express bus. The TOLUD Register is set to the appropriate value by BIOS. The remapbase/remaplimit registers remap logical accesses intended for addresses above 4 GB onto physical addresses that fall within DRAM.

The address map includes a number of programmable ranges:

- Device 0:
 - EPBAR – Egress port registers. Necessary for setting up VC1 as an isochronous channel using time based weighted round robin arbitration. (4-KB window)
 - MCHBAR – Memory mapped range for internal MCH registers. For example, memory buffer register controls. (16-KB window)
 - PCIEXBAR – Flat memory-mapped address space to access device configuration registers. This mechanism can be used to access PCI configuration space (0–FFh) and Extended configuration space (100h–FFFh) for PCI Express devices. This enhanced configuration access mechanism is defined in the PCI Express specification. (64 MB, 128 MB, or 256-MB window)
 - DMIBAR – This window is used to access registers associated with the MCH/ ICH7 (DMI) register memory range. (4-KB window)
 - IFPBAR – Any write to this window will trigger a flush of the MCH's Global Write Buffer to let software provide coherency between writes from an isochronous agent and writes from the processor (4-KB window).

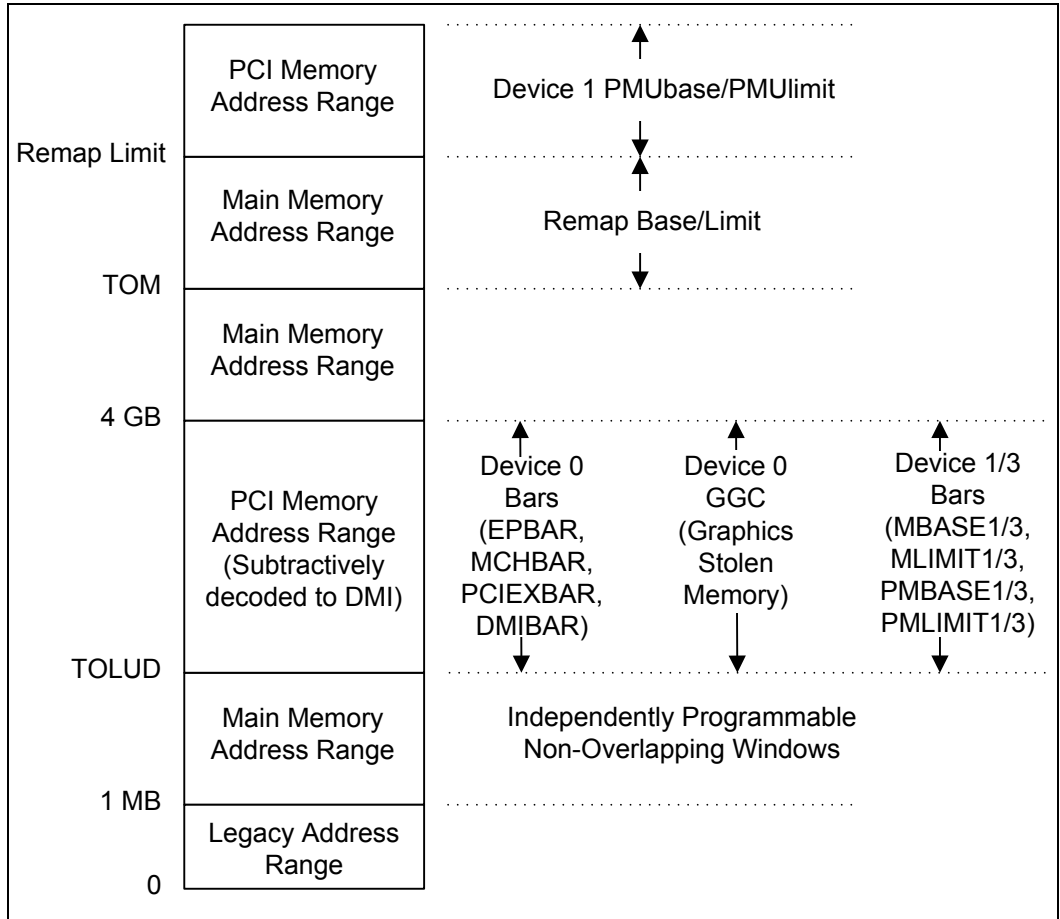

- Device 1, Function 0:
 - MBASE1/MLIMIT1 – Primary PCI Express port non-prefetchable memory access window.
 - PMBASE1/PMLIMIT1 – Primary PCI Express port prefetchable memory access window.
 - IOBASE1/IOLIMIT1 – Primary PCI Express port I/O access window.
- Device 3, Function 0:
 - MBASE3/MLIMIT3 – Secondary PCI Express port non-prefetchable memory access window.
 - PMBASE3/PMLIMIT3 – Secondary PCI Express port prefetchable memory access window.
 - IOBASE3/IOLIMIT3 – Secondary PCI Express port I/O access window.

The rules for the above programmable ranges are:

- All of these ranges **MUST** be unique and **NON-OVERLAPPING**. It is the BIOS or system designer's responsibility to limit memory population so that adequate PCI, PCI Express, High BIOS, PCI Express memory-mapped space, and APIC memory space can be allocated.
- In the case of overlapping ranges with memory, the memory decode will be given priority.
- There are **NO** Hardware Interlocks to prevent problems in the case of overlapping ranges.
- Accesses to overlapped ranges may produce indeterminate results.
- The only peer-to-peer cycles allowed below the top of memory (TOLUD Register) are DMI-to-PCI Express VGA range writes.

Figure 8-1 represents the system memory address map in a simplified form.

Figure 8-1. System Address Ranges

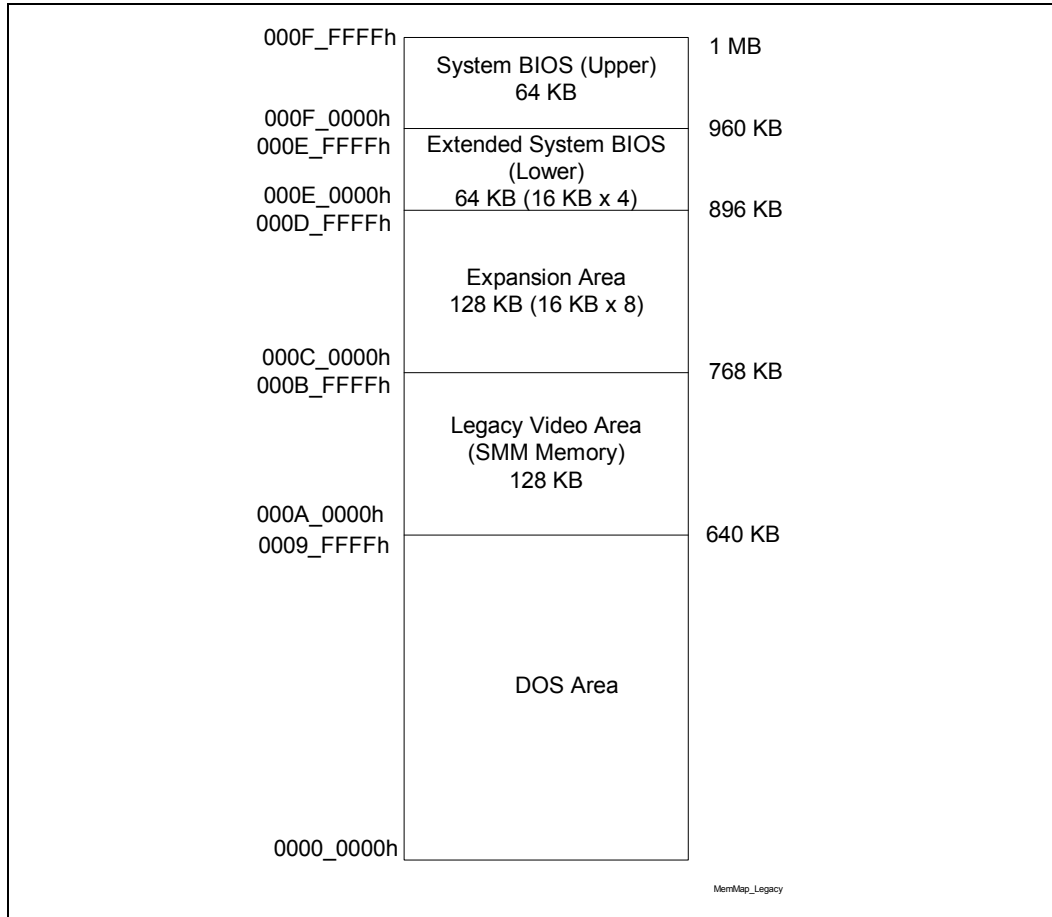

8.1 Legacy Address Range

This area is divided into the following address regions:

- 0 – 640 KB: DOS Area
- 640 – 768 KB: Legacy Video Buffer Area
- 768 – 896 KB in 16-KB sections (total of 8 sections): Expansion Area
- 896 – 960 KB in 16-KB sections (total of 4 sections): Extended System BIOS Area
- 960-KB – 1-MB Memory: System BIOS Area

Figure 8-2. Microsoft MS-DOS* Legacy Address Range

8.1.1 DOS Range (0h–9_FFFFh)

The DOS area is 640 KB (0000_0000h–0009_FFFFh) in size and is always mapped to the main memory controlled by the MCH.

8.1.2 Legacy Video Area (A_0000h–B_FFFFh)

The legacy 128-KB VGA memory range, frame buffer, (000A_0000h–000B_FFFFh) can be mapped to PCI Express* (Device 1 or 3), and/or to the DMI. Software will select one of the two graphics cards as the primary display. The selected graphics device will have its VGA enable register enabled. Either device 1 or device 3 can have the VGA enable set. The VGA enable will never be set for both device 1 and device 3 simultaneously. The appropriate mapping depends on which devices are enabled and the programming of the VGA steering bits. Based on the VGA steering bits, priority for VGA mapping is constant. The MCH always decodes internally mapped devices first; internal to the MCH. The MCH always positively decodes internally mapped devices and PCI Express. Subsequent decoding of regions mapped to PCI Express or the DMI depends on the Legacy VGA configuration bits (VGA Enable and MDAP); see LAC Register (Device 0, offset 97h). This region is also the default for SMM space.

Compatible SMRAM Address Range (A_0000h–B_FFFFh)

When compatible SMM space is enabled, SMM-mode processor accesses to this range are routed to physical system DRAM at 000A_0000h–000B_FFFFh. Non-SMM-mode processor accesses to this range are considered to be to the Video Buffer Area as described above. PCI Express and DMI originated cycles to enabled SMM space are not allowed and are considered to be to the Video Buffer area. PCI Express and DMI initiated cycles are attempted as Peer cycles, and will master abort on PCI if no external VGA device claims them.

Monochrome Adapter (MDA) Range (B_0000h–B_7FFFh)

Legacy support requires the ability to have a second graphics controller (monochrome) in the system. Accesses in the standard VGA range are forwarded to PCI Express, or DMI (depending on configuration bits). Since the monochrome adapter may be mapped to any one of these devices, the MCH must decode cycles in the MDA range (000B_0000h–000B_7FFFh) and forward either to PCI Express, or the DMI. This capability is controlled by VGA steering bits and the legacy configuration bit (MDAP bit). In addition to the memory range B0000h to B7FFFh, the MCH decodes I/O cycles at 3B4h, 3B5h, 3B8h, 3B9h, 3Bah, and 3BFh and forwards them to the either PCI Express, and/or the DMI.

PCI Express* 16-bit VGA Decode

In the *PCI to PCI Bridge Architecture Specification, Revision 1.2*, it is required that 16-bit VGA decode be a feature. The VGA 16-bit decode originally was described in an ECR to the *PCI to PCI Bridge Architecture Specification, Revision 1.1*. This is now listed as a required feature in the updated Revision 1.2 specification.

8.1.3 Expansion Area (C_0000h–D_FFFFh)

This 128-KB ISA Expansion region (000C_0000h–000D_FFFFh) is divided into eight 16-KB segments (see Table 8-1). Each segment can be assigned one of four read/write states: read-only, write-only, read/write, or disabled. Typically, these blocks are mapped through the MCH and are subtractively decoded to ISA space. Memory that is disabled is not remapped.

Non-snooped accesses from PCI Express or DMI to this region are always sent to main memory.

Table 8-1. Expansion Area Memory Segments

| Memory Segments | Attributes | Comments |
|-----------------|------------|-------------|
| 0C0000h–0C3FFFh | WE, RE | Add-on BIOS |
| 0C4000h–0C7FFFh | WE, RE | Add-on BIOS |
| 0C8000h–0CBFFFh | WE, RE | Add-on BIOS |
| 0CC000h–0CFFFFh | WE, RE | Add-on BIOS |
| 0D0000h–0D3FFFh | WE, RE | Add-on BIOS |
| 0D4000h–0D7FFFh | WE, RE | Add-on BIOS |
| 0D8000h–0DBFFFh | WE, RE | Add-on BIOS |
| 0DC000h–0DFFFFh | WE, RE | Add-on BIOS |

8.1.4 Extended System BIOS Area (E_0000h–E_FFFFh)

This 64-KB area (000E_0000h–000E_FFFFh) is divided into four 16-KB segments (see Table 8-2). Each segment can be assigned independent read and write attributes so it can be mapped either to main memory or to DMI. Typically, this area is used for RAM or ROM. Memory segments that are disabled are not remapped elsewhere.

Non-snooped accesses from PCI Express or DMI to this region are always sent to main memory.

Table 8-2. Extended System BIOS Area Memory Segments

| Memory Segments | Attributes | Comments |
|-----------------|------------|----------------|
| 0E0000h–0E3FFFh | WE, RE | BIOS Extension |
| 0E4000h–0E7FFFh | WE, RE | BIOS Extension |
| 0E8000h–0EBFFFh | WE, RE | BIOS Extension |
| 0EC000h–0EFFFFh | WE, RE | BIOS Extension |

8.1.5 System BIOS Area (F_0000h–F_FFFFh)

This area is a single 64-KB segment (000F_0000h–000F_FFFFh). This segment can be assigned read and write attributes. It is by default (after reset) read/write disabled and cycles are forwarded to the DMI. By manipulating the read/write attributes, the MCH can “shadow” BIOS into main memory. When disabled, this segment is not remapped.

Non-snooped accesses from PCI Express or DMI to this region are always sent to DRAM.

Table 8-3. System BIOS Area Memory Segments

| Memory Segments | Attributes | Comments |
|-----------------|------------|-----------|
| 0F0000h–0FFFFFh | WE RE | BIOS Area |

8.1.6 Programmable Attribute Map (PAM) Memory Area Details

The 13 sections from 768 KB to 1 MB comprise what is also known as the PAM memory area.

The MCH does not handle IWB (Implicit Write-Back) cycles targeting DMI. Since all memory residing on DMI should be set as non-cacheable, there will normally not be IWB cycles targeting DMI.

However, DMI becomes the default target for processor and DMI originated accesses to disabled segments of the PAM region. If the MTRRs covering the PAM regions are set to WB or RC it is possible to get IWB cycles targeting DMI. This may occur for DMI-originated cycles to disabled PAM regions.

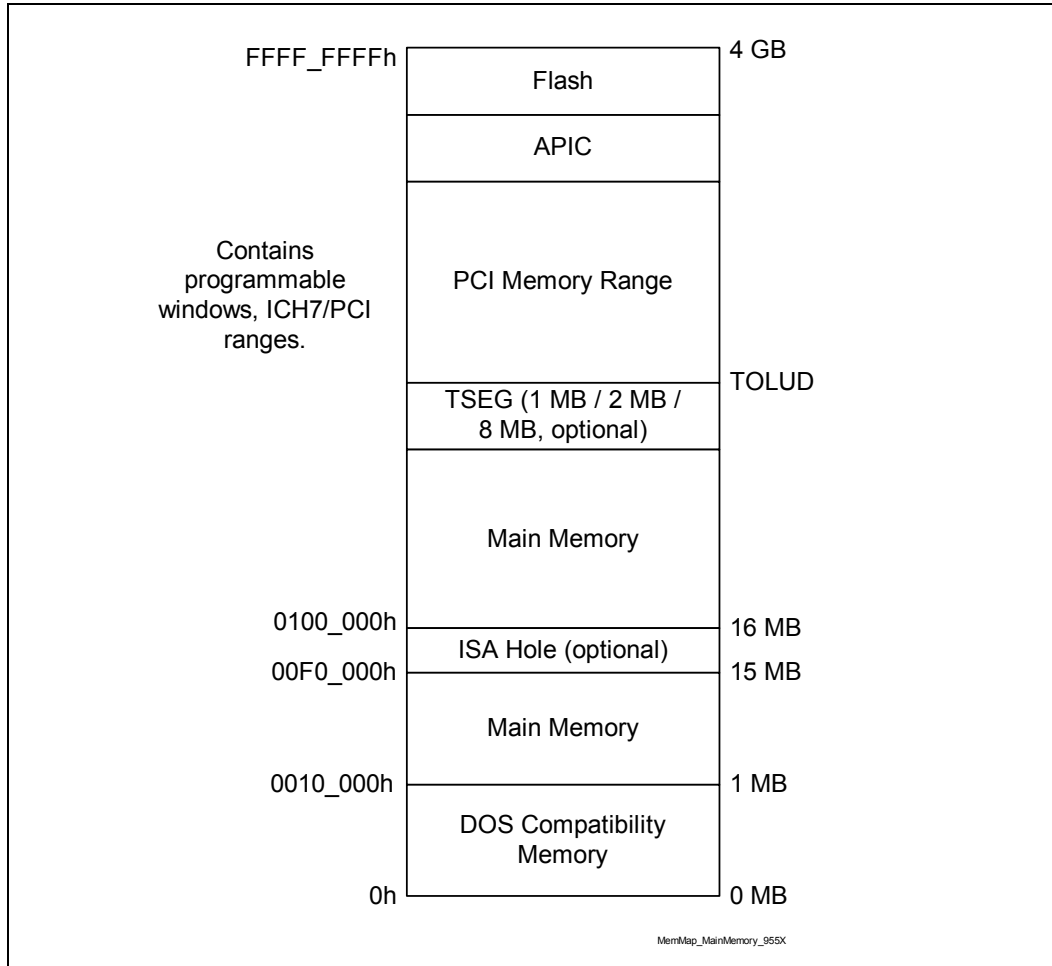

For example, say that a particular PAM region is set for “Read Disabled” and the MTRR associated with this region is set to WB. A DMI master generates a memory read targeting the PAM region. A snoop is generated on the FSB and the result is an IWB. Since the PAM region is “Read Disabled”, the default target for the memory read becomes DMI. The IWB associated with this cycle will cause the MCH to hang.

8.2 Main Memory Address Range (1 MB to TOLUD)

This address range (see Figure 8-3) extends from 1 MB to the top of physical memory that is permitted to be accessible by the MCH (as programmed in the TOLUD Register). All accesses to addresses within this range will be forwarded by the MCH to the main memory unless they fall into the optional TSEG or optional ISA Hole.

The MCH provides a maximum main memory address decode space of 8 GB. The MCH does not remap APIC or PCI Express memory space. This means that as the amount of physical memory populated in the system reaches 4 GB, there will be physical memory that exists yet is non-addressable and, therefore, unusable by the system. The MCH does not limit main memory address space in hardware.

Figure 8-3. Main Memory Address Range

8.2.1 ISA Hole (15 MB–16 MB)

A hole can be created at 15 MB–16 MB as controlled by the fixed hole enable bit in the LAC Register (Device 0, offset 97h). Accesses within this hole are forwarded to the DMI. The range of physical main memory disabled by opening the hole is not remapped to the top of the memory; that physical main memory space is not accessible. This 15 MB–16 MB hole is an optionally enabled ISA hole.

Video accelerators originally used this hole. It is also used by validation and customer SV teams for some of their test cards. That is why it is being supported. There is no inherent BIOS request for the 15–16-MB window.

8.2.2 TSEG

TSEG is optionally 1 MB, 2 MB, or 8 MB in size. SMM-mode processor accesses to enabled TSEG, access the physical DRAM at the same address. Non-processor originated accesses are not allowed to SMM space. PCI Express*, and DMI originated cycles to enabled SMM space are handled as invalid cycle type with reads and writes to location 0 and byte enables turned off for writes. When the extended SMRAM space is enabled, processor accesses to the TSEG range without SMM attribute or without WB attribute are also forwarded to memory as invalid accesses. Non-SMM-mode write-back cycles that target TSEG space are completed to main memory for cache coherency. When SMM is enabled, the maximum amount of memory available to the system is equal to the amount of physical DRAM minus the value in the TSEG register that is fixed at 1 MB, 2 MB, or 8 MB.

8.2.3 Pre-allocated Memory

Voids of physical addresses that are not accessible as general system memory and reside within the system memory address range (< TOLUD) are created for SMM-mode and legacy VGA graphics compatibility. **It is the responsibility of BIOS to properly initialize these regions.** Table 8-4 details the location and attributes of the regions.

Table 8-4. Pre-Allocated Memory Example for 64-MB DRAM, 1-MB VGA and 1-MB TSEG

| Memory Segments | Attributes | Comments |
|-------------------------|---------------------------------|---|
| 0000_0000h – 03DF_FFFFh | R/W | Available System Memory 62 MB |
| 03E0_0000h – 03EF_FFFFh | SMM Mode Only - processor Reads | TSEG Address Range and Pre-allocated Memory |
| 03F0_0000h – 03FF_FFFFh | R/W | Pre-allocated Graphics VGA memory. |

8.3 PCI Memory Address Range (TOLUD–4 GB)

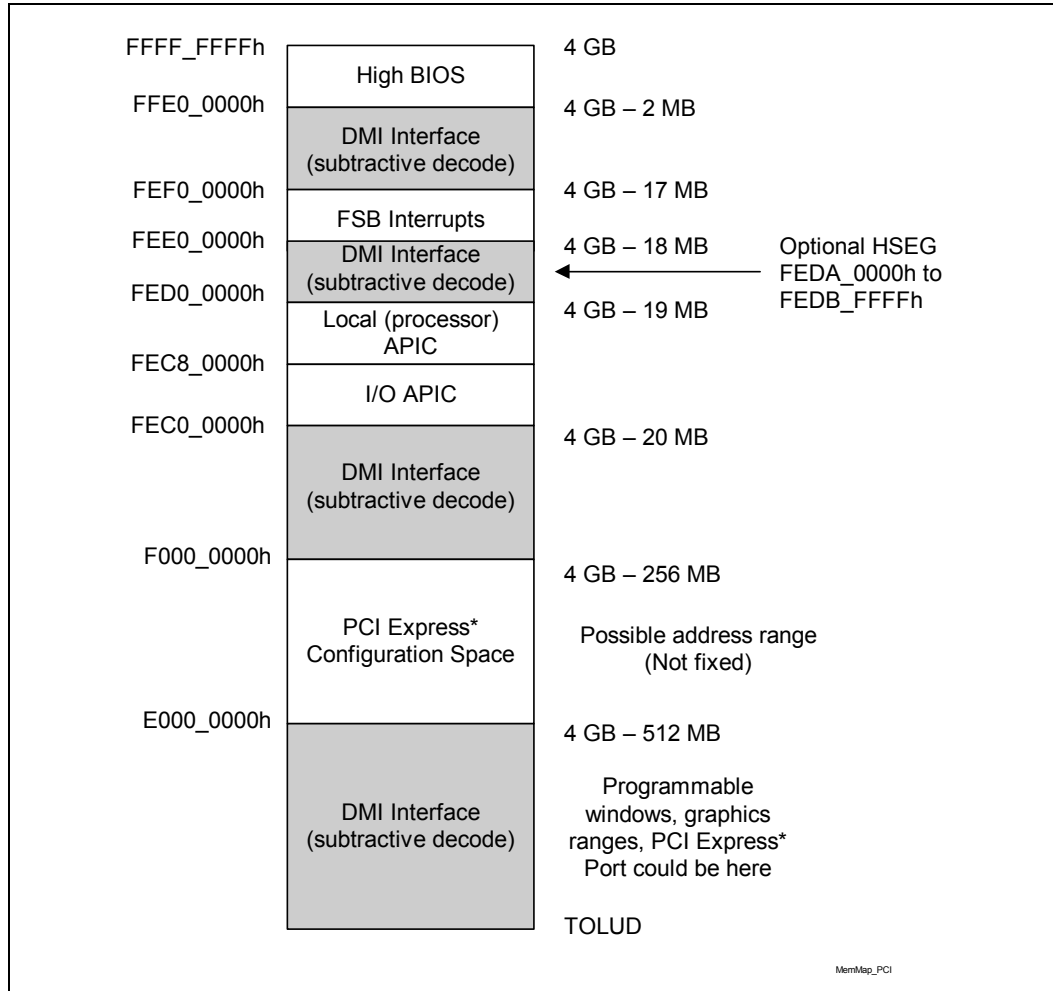

This address range (see Figure 8-4), from the top of physical memory to 4 GB, is normally mapped via the DMI to PCI. Exceptions to this mapping include the BAR memory mapped regions that include:

- EPBAR, MCHBAR, DMIBAR.
- The second exception to the mapping rule deals with the PCI Express port:
 - Addresses decoded to the Primary PCI Express memory window defined by the MBASE1, MLIMIT1, PMBASE1, and PMLIMIT1 Registers are mapped to PCI Express.
 - Addresses decoded to the Secondary PCI Express memory window defined by the MBASE3, MLIMIT3, PMBASE3, and PMLIMIT3 Registers are mapped to PCI Express.
 - Addresses decoded to PCI Express configuration space are mapped based on bus, device, and function number. (PCIEXBAR range).

Note: The AGP Aperture no longer exists with PCI Express.

The exceptions listed above for PCI Express ports **MUST NOT** overlap with APCI configuration, FSB interrupt space, and High BIOS address range.

Figure 8-4. PCI Memory Address Range

8.3.1 APIC Configuration Space (FEC0_0000h–FECF_FFFFh)

This range is reserved for APIC configuration space. The I/O APIC(s) usually reside in the ICH7 portion of the chipset, but can also exist as stand-alone components.

The IOAPIC spaces are used to communicate with IOAPIC interrupt controllers that may be populated in the system. Since it is difficult to relocate an interrupt controller using plug-and-play software, fixed address decode regions have been allocated for them. Processor accesses to the default IOAPIC region (FEC0_0000h to FEC7_FFFFh) are always forwarded to DMI.

8.3.2 HSEG (FEDA_0000h–FEDB_FFFFh)

This optional segment from FEDA_0000h to FEDB_FFFFh provides a remapping window to SMM space. It is sometimes called the High SMM memory space. SMM-mode processor accesses to the optionally enabled HSEG are remapped to 000A_0000h–000B_FFFFh. Non-SMM-mode processor accesses to enabled HSEG are considered invalid and are terminated immediately on the FSB. The exceptions to this rule are Non-SMM-mode write-back cycles that are remapped to SMM space to maintain cache coherency. PCI Express and DMI originated cycles to enabled SMM space are not allowed. Physical main memory behind the HSEG transaction address is not remapped and is not accessible. All cacheline writes with WB attribute or implicit write-backs to the HSEG range are completed to main memory like a SMM cycle.

8.3.3 FSB Interrupt Memory Space (FEE0_0000–FEEF_FFFF)

The FSB Interrupt space is the address used to deliver interrupts to the FSB. Any device on PCI Express or DMI may issue a memory write to 0FEE_x_xxxxh. The MCH forwards this memory write, along with the data, to the FSB as an Interrupt Message Transaction. The MCH terminates the FSB transaction by providing the response and asserting HTRDY#. This memory write cycle does not go to main memory.

8.3.4 High BIOS Area

The top 2 MB (FEE0_0000h–FFFF_FFFFh) of the PCI memory address range is reserved for system BIOS (High BIOS), extended BIOS for PCI devices, and the A20 alias of the system BIOS. The processor begins execution from the High BIOS after reset. This region is mapped to the DMI so that the upper subset of this region aliases to the 16-MB–256-KB range. The actual address space required for the BIOS is less than 2 MB, but the minimum processor MTRR range for this region is 2 MB so that full 2 MB must be considered.

8.4 Main Memory Address Space (4 GB to Remaplimit)

The maximum main memory size supported is 8 GB total main memory. A hole between TOLUD and 4 GB occurs when main memory size approaches 4 GB or larger. As a result, a TOM Register and Remapbase/Remaplimit Registers become relevant.

The new remap configuration registers exist to reclaim lost main memory space.

Upstream write accesses above 36-bit addressing will be treated as peer writes by PCI Express and DMI. Upstream read accesses above 36-bit addressing will be treated as invalid cycles by PCI Express and DMI.

Top of Memory

This “Top of Memory” register reflects the total amount of populated physical memory. This is also the amount of addressable physical memory when remapping is used to ensure that no physical memory is wasted. This is NOT necessarily the highest main memory address (holes may exist in main memory address map due to addresses allocated for memory mapped I/O).

The TOLUD Register is restricted to 4 GB memory (A[31:27]), but the MCH can support up to 8 GB, limited by DRAM pins. For physical memory greater than 4 GB, the TOM Register helps identify the address range in-between the 4 GB boundary and the top of physical memory. This identifies memory that can be directly accessed (no remap address calculation) which is useful for memory access indication, early path indication, and trusted read indication.

C1DRB3 cannot be used directly to determine the effective size of memory as the values programmed in the DRBs depend on the memory mode (stacked, interleaved). The Remap Base/Limit registers also can not be used because remapping can be disabled. The TOM Register is used for early memory channel identification (channel 0 vs. channel 1) in the case of stacked memory.

8.4.1 Memory Re-claim Background

The following are examples of memory mapped I/O devices that are typically located below 4 GB:

- High BIOS
- HSEG
- TSEG
- XAPIC
- Local APIC
- FSB Interrupts
- PCI Express BAR
- MCHBAR
- EPBAR
- DMIBAR
- PMBASE/PMLIMIT, including PMBASEU/PMLIMITU
- MBASE/MLIMIT

In previous generation MCHs, the physical main memory overlapped by the logical address space allocated to these memory mapped I/O devices was unusable. The result is that a large amount of physical memory populated in the system is unusable.

The MCH provides the capability to re-claim the physical memory overlapped by the memory mapped I/O logical address space. The MCH re-maps physical memory from the Top of Low Memory (TOLUD) boundary up to the 4 GB boundary to an equivalent sized logical address range located just above the top of physical memory.

8.4.2 Memory Re-mapping

An incoming address (referred to as a logical address) is checked to see if it falls in the memory re-map window. The bottom of the re-map window is defined by the value in the REMAPBASE Register. The top of the re-map window is defined by the value in the REMAPLIMIT Register. An address that falls within this window is remapped to the physical memory starting at the address defined by the TOLUD Register.

8.4.3 PCI Express* Configuration Address Space

The PCIEXBAR Register (Device 0, offset 48h) defines the base address for the 256-MB block of addresses below the top of addressable memory (currently 4 GB) for the configuration space associated with all devices and functions that are potentially a part of the PCI Express root complex hierarchy. This range will be aligned to a 64 MB, 128 MB or 256-MB boundary. BIOS must assign this address range such that it will not conflict with any other address ranges.

8.4.4 PCI Express* Graphics Attach

The MCH can be programmed to direct memory accesses to the PCI Express interface when addresses are within either of two ranges specified via registers in MCH's Device 1 configuration space.

- The first range is controlled via the Memory Base (MBASE) Register and Memory Limit (MLIMIT) Register.
- The second range is controlled via the Prefetchable Memory Base (PMBASE) Register and Prefetchable Memory Limit (PMLIMIT) Register.

The MCH positively decodes memory accesses to PCI Express memory address space as defined by the following inequalities:

$$\text{Memory_Base_Address} \leq \text{Address} \leq \text{Memory_Limit_Address}$$

$$\text{Prefetchable_Memory_Base_Address} \leq \text{Address} \leq \text{Prefetchable_Memory_Limit_Address}$$

It is essential to support a separate Prefetchable range to apply the USWC attribute (from the processor point of view) to that range. The USWC attribute is used by the processor for write combining.

Note that the MCH Device 1 memory range registers described above are used to allocate memory address space for any PCI Express devices on PCI Express that require such a window.

The PCICMD1 Register can override the routing of memory accesses to PCI Express. In other words, the memory access enable bit must be set in the device 1 PCICMD1 Register to enable the memory base/limit and prefetchable base/limit windows.

8.4.5 AGP DRAM Graphics Aperture

Unlike AGP4x, PCI Express has no concept of aperture for PCI Express devices. As a result, there is no need to translate addresses from PCI Express. Therefore, the MCH has no APBASE and APSIZE Registers.

8.5 System Management Mode (SMM)

System Management Mode uses main memory for System Management RAM (SMM RAM). The MCH supports: Compatible SMRAM (C_SMRAM), High Segment (HSEG), and Top of Memory Segment (TSEG). System Management RAM space provides a memory area that is available for the SMI handlers and code and data storage. This memory resource is normally hidden from the system OS so that the processor has immediate access to this memory space upon entry to SMM. The MCH provides three SMRAM options:

- Below 1-MB option that supports compatible SMI handlers.
- Above 1-MB option that allows new SMI handlers to execute with write-back cacheable SMRAM.
- Optional TSEG area of 1 MB, 2 MB, or 8 MB in size.
- The above 1-MB solutions require changes to compatible SMRAM handlers' code to properly execute above 1 MB.

Note: DMI and PCI Express masters are not allowed to access the SMM space.

8.5.1 SMM Space Definition

SMM space is defined by its **addressed** SMM space and its DRAM SMM space. The addressed SMM space is defined as the range of bus addresses used by the processor to access SMM space. DRAM SMM space is defined as the range of physical main memory locations containing the SMM code. SMM space can be accessed at one of three transaction address ranges: Compatible, High, and TSEG. The Compatible and TSEG SMM space is not remapped; therefore, the addressed and DRAM SMM space is the same address range. Since the High SMM space is remapped, the addressed and DRAM SMM space are different address ranges. Note that the High DRAM space is the same as the Compatible Transaction Address space. The following table describes three unique address ranges:

- Compatible Transaction Address
- High Transaction Address
- TSEG Transaction Address

| SMM Space Enabled | Transaction Address Space | DRAM Space (DRAM) |
|-------------------|---------------------------|--------------------------|
| Compatible (C) | 000A_0000h to 000B_FFFFh | 000A_0000h to 000B_FFFFh |
| High (H) | FEDA_0000h to FEDB_FFFFh | 000A_0000h to 000B_FFFFh |
| TSEG (T) | (TOLUD –TSEG) to TOLUD | (TOLUD–TSEG) to TOLUD |

8.5.2 SMM Space Restrictions

If any of the following conditions are not met, the results of SMM accesses are unpredictable and may cause the system to hang:

1. The Compatible SMM space **must not** be set up as cacheable.
2. High or TSEG SMM transaction address space **must not** overlap address space assigned to system main memory, or to any “PCI” devices (including DMI, PCI Express, and graphics devices). This is a BIOS responsibility.
3. Both D_OPEN and D_CLOSE **must not** be set to 1 at the same time.
4. When TSEG SMM space is enabled, the TSEG space **must not** be reported to the OS as available main memory. This is a BIOS responsibility.

8.5.3 SMM Space Combinations

When High SMM is enabled (G_SMRAME=1 and H_SMRAM_EN=1), the compatible SMM space is effectively disabled. Processor-originated accesses to the compatible SMM space are forwarded to PCI Express if VGAEN=1 (also depends on MDAP); otherwise, they are forwarded to the DMI. PCI Express and DMI originated accesses are **not** allowed to access SMM space.

Table 8-5. SMM Space

| Global Enable G_SMRAME | High Enable H_SMRAM_EN | TSEG Enable TSEG_EN | Compatible (C) Range | High (H) Range | TSEG (T) Range |
|---------------------------|---------------------------|------------------------|-------------------------|-------------------|-------------------|
| 0 | X | X | Disable | Disable | Disable |
| 1 | 0 | 0 | Enable | Disable | Disable |
| 1 | 0 | 1 | Enable | Disable | Enable |
| 1 | 1 | 0 | Disabled | Enable | Disable |
| 1 | 1 | 1 | Disabled | Enable | Enable |

8.5.4 SMM Control Combinations

The G_SMRAME bit provides a global enable for all SMM memory. The D_OPEN bit allows software to write to the SMM ranges without being in SMM mode. BIOS software can use this bit to initialize SMM code at powerup. The D_LCK bit limits the SMM range access to only SMM mode accesses. The D_CLS bit causes SMM data accesses to be forwarded to the DMI or PCI Express*. The SMM software can use this bit to write to video memory while running SMM code out of main memory.

Table 8-6. SMM Control

| G_SMRAME | D_LCK | D_CLS | D_OPEN | Processor in SMM Mode | SMM Code Access | SMM Data Access |
|----------|-------|-------|--------|-----------------------|-----------------|-----------------|
| 0 | x | X | x | x | Disable | Disable |
| 1 | 0 | X | 0 | 0 | Disable | Disable |
| 1 | 0 | 0 | 0 | 1 | Enable | Enable |
| 1 | 0 | 0 | 1 | x | Enable | Enable |
| 1 | 0 | 1 | 0 | 1 | Enable | Disable |
| 1 | 0 | 1 | 1 | x | Invalid | Invalid |
| 1 | 1 | X | x | 0 | Disable | Disable |
| 1 | 1 | 0 | x | 1 | Enable | Enable |
| 1 | 1 | 1 | x | 1 | Enable | Disable |

8.5.5 SMM Space Decode and Transaction Handling

Only the processor is allowed to access SMM space. PCI Express and DMI originated transactions are not allowed to SMM space.

8.5.6 Processor WB Transaction to an Enabled SMM Address Space

Processor writeback transactions (HREQ[1]# = 0) to enabled SMM address space must be written to the associated SMM main memory even though D_OPEN=0 and the transaction is not performed in SMM mode. This ensures SMM space cache coherency when cacheable extended SMM space is used.

8.5.7 Memory Shadowing

Any block of memory that can be designated as read-only or write-only can be “shadowed” into MCH main memory. Typically, this is done to allow ROM code to execute more rapidly out of main memory. ROM is used as read-only during the copy process while main memory at the same time is designated write-only. After copying, the main memory is designated read-only so that ROM is shadowed. Processor bus transactions are routed accordingly.

8.5.8 I/O Address Space

The MCH does not support the existence of any other I/O devices beside itself on the processor bus. The MCH generates either DMI or PCI Express bus cycles for all processor I/O accesses that it does not claim. Within the host bridge, the MCH contains two internal registers in the processor I/O space: Configuration Address (CONFIG_ADDRESS) Register and Configuration Data (CONFIG_DATA) Register. These locations are used to implement a configuration space access mechanism.

The processor allows 64 K+3 bytes to be addressed within the I/O space. The MCH propagates the processor I/O address without any translation on to the destination bus and, therefore, provides addressability for 64 K+3 byte locations. Note that the upper 3 locations can be accessed only during I/O address wrap-around when the processor bus HA16# address signal is asserted. HA16# is asserted on the processor bus whenever an I/O access is made to 4 bytes from address 0FFFDh, 0FFFEh, or 0FFFFh. HA16# is also asserted when an I/O access is made to 2 bytes from address 0FFFFh.

The I/O accesses (other than ones used for configuration space access) are forwarded normally to the DMI bus unless they fall within the PCI Express I/O address range as defined by the mechanisms explained below. I/O writes are **not** posted. Memory writes to ICH7 or PCI Express are posted. The PCICMD1 Register can disable the routing of I/O cycles to PCI Express.

The MCH responds to I/O cycles initiated on PCI Express or DMI with a UR status. Upstream I/O cycles and configuration cycles should never occur. If one does occur, the request will route as a read to memory address 0h so a completion is naturally generated (whether the original request was a read or write). The transaction will complete with a UR completion status.

For Pentium processors, I/O reads that lie within 8-byte boundaries but cross 4-byte boundaries are issued from the processor as 1 transaction. The MCH breaks this into 2 separate transactions. I/O writes that lie within 8-byte boundaries but cross 4-byte boundaries are assumed to be split into 2 transactions by the processor.

8.5.9 PCI Express* I/O Address Mapping

The MCH can be programmed to direct non-memory (I/O) accesses to the PCI Express bus interface when processor-initiated I/O cycle addresses are within the PCI Express I/O address range. This range is controlled via the I/O Base Address (IOBASE) and I/O Limit Address (IOLIMIT) Registers in MCH Device 1 configuration space.

8.5.10 MCH Decode Rules and Cross-Bridge Address Mapping

The following are MCH decode rules and cross-bridge address mapping used in this chipset:

- VGAA = 000A_0000 – 000A_FFFF
- MDA = 000B_0000 – 000B_7FFF
- VGAB = 000B_8000 – 000B_FFFF
- MAINMEM = 0100_0000 to TOLUD

8.5.11 Legacy VGA and I/O Range Decode Rules

The legacy 128-KB VGA memory range 000A_0000h–000B_FFFFh can be mapped to PCI Express (Device 1), and/or to the DMI depending on the programming of the VGA steering bits. Priority for VGA mapping is constant in that the MCH always decodes internally mapped devices first. The MCH always positively decodes internally mapped devices, namely PCI Express. Subsequent decoding of regions mapped to PCI Express or the DMI depends on the Legacy VGA configurations bits (VGA Enable and MDAP) in the LAC Register (Device 0).

§

9 Functional Description

This chapter describes the MCH interfaces and major functional units.

9.1 Host Interface

The MCH supports the Pentium 4 processor subset of the Enhanced Mode Scalable Bus. The cache line size is 64 bytes. Source synchronous transfer is used for the address and data signals. The address signals are double pumped and a new address can be generated every other bus clock. At 200/267 MHz bus clock the address signals run at 400/533 MT/s. The data is quad pumped and an entire 64 Byte cache line can be transferred in two bus clocks. At 200/267 MHz bus clock the data signals run at 800/1066 MT/s for a maximum bandwidth of 10.7 GB/s.

9.1.1 FSB IOQ Depth

The Scalable Bus supports up to 12 simultaneous outstanding transactions.

9.1.2 FSB OOQ Depth

The MCH supports only one outstanding deferred transaction on the FSB.

9.1.3 FSB GTL+ Termination

The MCH integrates GTL+ termination resistors on die. Also, approximately 2.8pf (fast) – 3.3pf (slow) per pad of on die capacitance will be implemented to provide better FSB electrical performance.

9.1.4 FSB Dynamic Bus Inversion

The MCH supports Dynamic Bus Inversion (DBI) when driving and when receiving data from the processor. DBI limits the number of data signals that are driven to a low voltage on each quad pumped data phase. This decreases the worst-case power consumption of the MCH. HDINV[3:0]# indicate if the corresponding 16 bits of data are inverted on the bus for each quad pumped data phase:

| HDINV[3:0]# | Data Bits |
|-------------|------------|
| HDINV0# | HD[15:0]# |
| HDINV1# | HD[31:16]# |
| HDINV2# | HD[47:32]# |
| HDINV3# | HD[63:48]# |

When the processor or the MCH drives data, each 16-bit segment is analyzed. If more than 8 of the 16 signals would normally be driven low on the bus, the corresponding HDINV# signal will be asserted and the data will be inverted prior to being driven on the bus. When the processor or the MCH receives data, it monitors HDINV[3:0]# to determine if the corresponding data segment should be inverted.

9.1.4.1 APIC Cluster Mode Support

This is required for backwards compatibility with existing software, including various operating systems. As an example, beginning with Microsoft Windows* 2000, there is a mode (boot.ini) that allows an end user to enable the use of cluster addressing support of the APIC.

The MCH supports three types of interrupt re-direction:

- Physical
- Flat-Logical
- Clustered-Logical

9.2 System Memory Controller

The system memory controller supports two styles of memory organization (Interleaved and Asymmetric). Rules for populating DIMM slots are included in this section. Sample memory organizations are provided in Table 9-1 and Table 9-2.

Table 9-1. Sample System Memory Organization with Interleaved Channels

| | Channel A population | Cumulative Top Address in Channel A | Channel B Population | Cumulative Top Address in Channel B |
|--------|----------------------|-------------------------------------|----------------------|-------------------------------------|
| Rank 3 | 0 MB | 2560 MB | 0 MB | 2560 MB |
| Rank 2 | 256 MB | 2560 MB | 256 MB | 2560 MB |
| Rank 1 | 512 MB | 2048 MB | 512 MB | 2048 MB |
| Rank 0 | 512 MB | 1024 MB | 512 MB | 1024 MB |

Table 9-2. Sample System Memory Organization with Asymmetric Channels

| | Channel A population | Cumulative Top Address in Channel A | Channel B Population | Cumulative Top Address in Channel B |
|--------|----------------------|-------------------------------------|----------------------|-------------------------------------|
| Rank 3 | 0 MB | 1280 MB | 0 MB | 2560 MB |
| Rank 2 | 256 MB | 1280 MB | 256 MB | 2560 MB |
| Rank 1 | 512 MB | 1024 MB | 512 MB | 2304 MB |
| Rank 0 | 512 MB | 512 MB | 512 MB | 1792 MB |

Interleaved Mode

This mode provides maximum performance on real applications. Addresses are ping-ponged between the channels, and the switch happens after each cache line (64 byte boundary). If two consecutive cache lines are requested, both may be retrieved simultaneously, since they are on opposite channels. The drawbacks of Interleaved Mode are that the system designer must populate both channels of memory such that they have equal capacity; however, the technology and device width may vary from one channel to the other.

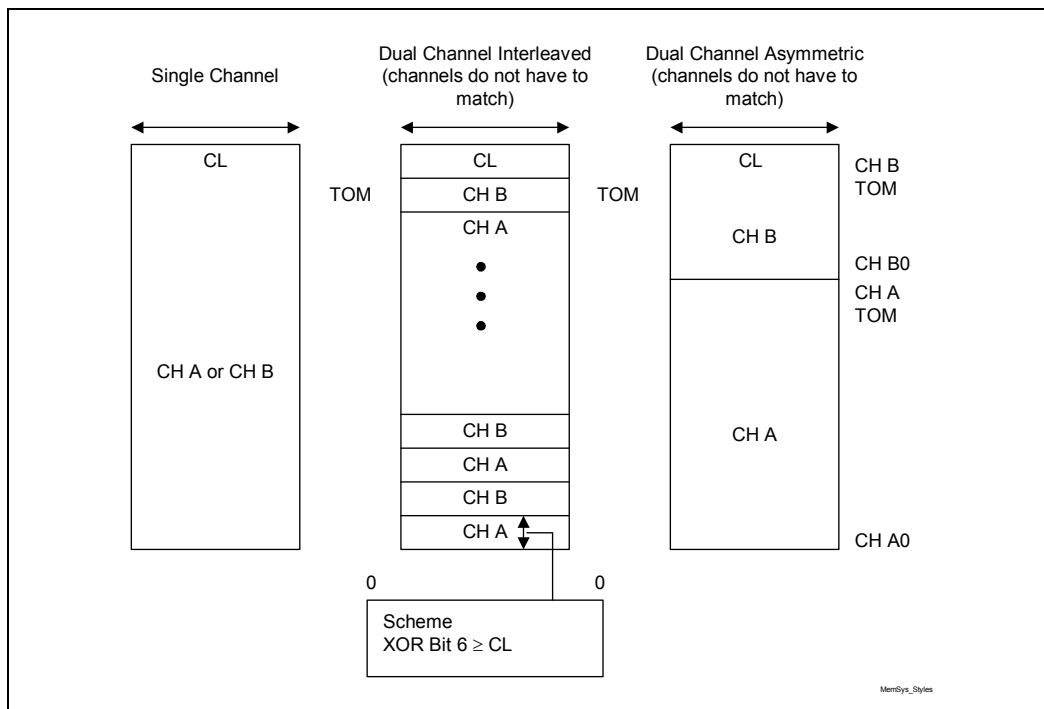

Enhanced Channel Interleaving

Transactions are issued to both channels simultaneously.

Asymmetric Mode

This mode trades performance for system design flexibility. Unlike the previous mode, addresses start in channel A and stay there until the end of the highest rank in channel A; then addresses continue from the bottom of channel B to the top. Real world applications are unlikely to make requests that alternate between addresses that sit on opposite channels with this memory organization. Thus, in most cases, bandwidth will be limited to that of a single channel. The system designer is free to populate or not to populate any rank on either channel, including either degenerate single channel case.

Figure 9-1. System Memory Styles

9.2.1 System Memory Configuration Registers Overview

The configuration registers located in the PCI configuration space of the MCH control the system memory operation. Following is a brief description of configuration registers.

DRAM Rank Boundary (CxDRBy): The x represents a channel, either A or B. They represent a rank, 0 through 3. DRB Registers define the upper addresses for a rank of DRAM devices in a channel. When the MCH is configured in asymmetric mode, each register represents a single rank. When the MCH is configured in a dual interleaved mode, each register represents a pair of corresponding ranks in opposing channels. There are 4 DRB Registers for each channel.

DRAM Rank Architecture (CxDRAy): The x represents a channel, either A or B. They represent a rank, 0 through 3. DRA Registers specify the architecture features of each rank of devices in a channel. The only architecture feature specified is page size. When the MCH is configured in asymmetric mode, each DRA represents a single rank in a single channel. When the MCH is configured in a dual-channel lock-step or interleaved mode, each DRA represents a pair of corresponding ranks in opposing channels. There are 4 DRA Registers per channel. Each requires only 3 bits, so there are two DRAs packed into a byte.

DRAM Timing (CxDRt1): The x represents a channel, A or B represented by 0 and 1 respectively. The DRT Register defines the timing parameters for all devices in a channel. The BIOS programs this register with “least common denominator” values after reading the SPD Registers of each DIMM in the channel.

DRAM Control (CxDRc0): The x represents a channel, A or B represented by 0 and 1 respectively. DRAM refresh mode, rate, and other controls are selected here.

9.2.2 DRAM Technologies and Organization

"Single sided" below is a logical term referring to the number of chip selects attached to the DIMM. A real DIMM may put the components on both sides of the substrate, but be logically indistinguishable from single-sided DIMM, if all components on the DIMM are attached to the same chip select signal.

- x8 means that each component has 8 data lines.
- x16 means that each component has 16 data lines

All standard 256-Mb, 512-Mb, and 1-Gb technologies and addressing are supported for x16 and x8 devices.

For DDR2

533 (PC 4300)

ECC

Version A = Single sided x8

Version B = Double sided x8

667 (PC 5300)

ECC

Version F = Single sided x8

Version G = Double sided x8

There is No support for DIMMs with different technologies or capacities on opposite sides of the same DIMM. If one side of a DIMM is populated, the other side is either identical or empty.

The DRAM sub-system supports single or dual channels, 64b or 72b wide per channel. There can be a maximum of 4 ranks populated (2 Double Sided DIMMs) per channel. Mixed mode DDR DS-DIMMs (x8 and x16 on the same DIMM) are not supported.

By using 1Gb technology, the largest memory capacity is: $8\text{Gb} (16\text{K rows} * 1\text{K columns} * 1 \text{ cell}/(\text{row} * \text{column}) * 8 \text{ b/cell} * 8 \text{ banks/device} * 8 \text{ devices/rank} * 4 \text{ ranks/channel} * 2 \text{ channel} * 1\text{M}/(\text{K} * \text{K}) * 1\text{G}/1024\text{M} * 1\text{B}/8\text{b} = 8 \text{ Gb})$. Using 8 Gb of memory is only possible in Interleaved mode with all ranks populated at maximum capacity. By using 256 Mb technology, the smallest memory capacity is: $128 \text{ Mb} (8\text{K rows} * 512 \text{ columns} * 1 \text{ cell}/(\text{row} * \text{column}) * 16\text{b/cell} * 4 \text{ banks/device} * 4 \text{ devices/rank} * 1 \text{ rank} * 1\text{M}/1024\text{K} * 1\text{B}/8\text{b} = 128 \text{ Mb})$.

9.2.2.1 Rules for Populating DIMM Slots

- In all modes, the frequency of system memory will be the lowest frequency of all DIMMs in the system, as determined through the SPD Registers on the DIMMs.
- In the Single Channel mode, any DIMM slot within the channel may be populated in any order. Either channel may be used. To save power, do not populate the unused channel.
- In Dual Channel Asymmetric mode, any DIMM slot may be populated in any order.
- In Dual Channel Interleaved mode, any DIMM slot may be populated in any order, but the total memory in each channel must be the same.

9.2.2.2 System Memory Supported Configurations

The MCH supports 256Mbit, 512Mbit, and 1Gbit technology based DIMMs from Table 9-3.

Table 9-3. DDR2 DIMM Supported Configurations

| Technology | Configuration | # of Row Address Bits | # of Column Address Bits | # of Bank Address Bits | Page Size | Rank Size |
|------------|---------------|-----------------------|--------------------------|------------------------|-----------|-----------|
| 256 Mbit | 16M X 16 | 13 | 9 | 2 | 4K | 128 MB |
| 256 Mbit | 32M X 8 | 13 | 10 | 2 | 8K | 256 MB |
| 512 Mbit | 32M X 16 | 13 | 10 | 2 | 8K | 256 MB |
| 512 Mbit | 64M X 8 | 14 | 10 | 2 | 8K | 512 MB |
| 1 Gbit | 64M X 16 | 13 | 10 | 3 | 8K | 512 MB |
| 1 Gbit | 128M X 8 | 14 | 10 | 3 | 8K | 1 GB |

9.2.2.3 Main Memory DRAM Address Translation and Decoding

Table 9-4 and Table 9-5 specify the host interface to memory interface address multiplex for the MCH. Refer to the details of the various DIMM configurations as described in Table 9-3. The address lines specified in the column header refer to the host (processor) address lines.

Table 9-4. DRAM Address Translation (Single Channel/Dual Asymmetric Mode)

| Tech | Banks | Page Size | Rank Size | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 |

9.2.2.4 ECC Support

The MCH supports ECC (Error Checking and Correction) and uses an ECC algorithm to protect against soft errors, when enabled. The algorithm works on a QWord (64-bit) basis. It corrects any single-bit error and detects any two-bits of error. An odd number of errors greater than 1, will either be detected correctly or will be misinterpreted as a single-bit error, and cannot be corrected. An error in an even number of bits greater than two will either be detected as a multi-bit error or it may not be detected at all.

9.2.3 DRAM Clock Generation

The MCH generates three differential clock pairs for every supported DIMM. There are total of 6 clock pairs driven directly by the MCH to 2 DIMMs per channel.

9.2.4 Suspend To RAM and Resume

When entering the Suspend to RAM (STR) state, the SDRAM controller will flush pending cycles and then enter all SDRAM rows into self refresh. In STR, the CKE signals remain low so the SDRAM devices will perform self-refresh.

9.2.5 DDR2 On Die Termination

On die termination (ODT) is a feature that allows a DRAM to turn on/off internal termination resistance for each DQx, DMx, DQSx, and DQSx# signal for x8 and x16 configurations via the ODT control signals. The ODT feature is designed to improve signal integrity of the memory channel by allowing the termination resistance for the DQx, DMx, DQSx, and DQSx# signals to be located inside the DRAM devices themselves instead of on the motherboard. The MCH drives out the required ODT signals, based on memory configuration and which rank is being written to or read from, to the DRAM devices on a targeted DIMM rank to enable or disable their termination resistance.

9.3 PCI Express*

See Chapter 1 for a list of PCI Express features and the PCI Express specification for further details.

This MCH is part of a PCI Express root complex. This means it connects a host processor / memory subsystem to a PCI Express hierarchy. The control registers for this functionality are located in device 1 configuration space and two Root Complex Register Blocks (RCRBs). The DMI RCRB contains registers for control of the ICH7 attach ports.

9.3.1 PCI Express* Architecture

The PCI Express architecture is specified in layers. Compatibility with the PCI addressing model (a load-store architecture with a flat address space) is maintained to ensure that all existing applications and drivers operate unchanged. The PCI Express configuration uses standard mechanisms as defined in the PCI Plug-and-Play specification. The initial speed of 1.25 GHz (250 MHz internally) results in 2.5 Gb/s/direction that provides a 250 MB/s communications channel in each direction (500 MB/s total); this is close to twice the data rate of classic PCI per lane.

9.3.1.1 Transaction Layer

The upper layer of the PCI Express architecture is the Transaction Layer. The Transaction Layer's primary responsibility is the assembly and disassembly of Transaction Layer Packets (TLPs). TLPs are used to communicate transactions (such as, read and write) as well as certain types of events. The Transaction Layer also manages flow control of TLPs.

9.3.1.2 Data Link Layer

The middle layer in the PCI Express stack, the Data Link Layer, serves as an intermediate stage between the Transaction Layer and the Physical Layer. Responsibilities of Data Link Layer include link management, error detection, and error correction.

9.3.1.3 Physical Layer

The Physical Layer includes all circuitry for interface operation, including driver and input buffers, parallel-to-serial and serial-to-parallel conversion, PLL(s), and impedance matching circuitry.

9.4 Bifurcated PCI Express* Graphics

9.4.1 Configurations

These PCI Express* ports will be referred to as the PEG0 and PEG1. Device 1 contains the control registers for PEG0. Device 3 contains the control registers for PEG1.

The PCI Express* links are mapped through separate PCI-to-PCI bridge structures.

Figure 9-2. PCI Express* Related Register Structures in MCH

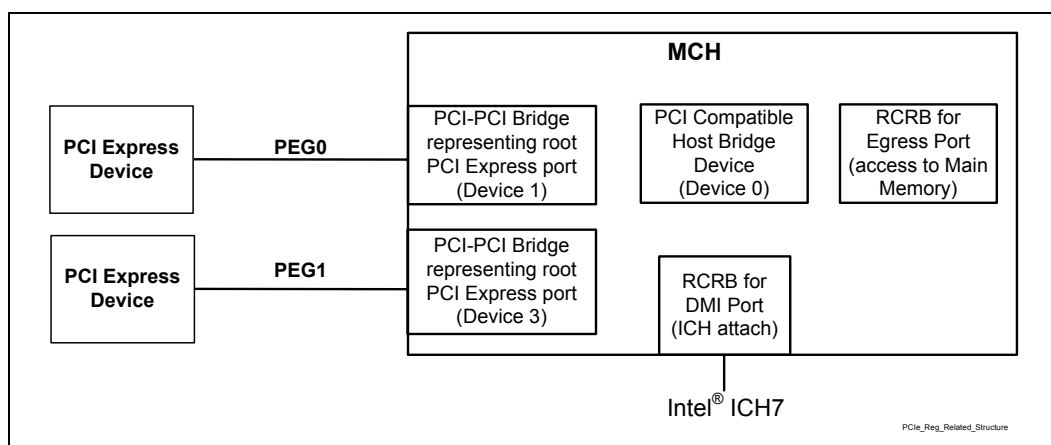

Table 9-6. Lane Mapping Configurations for PCI Express* Graphics

| Config Name | Primary Slot (PEG0) | Secondary Slot (PEG1) | Example Figures |
|--------------------------------------|---------------------|-----------------------|---|
| Single Primary | x1, x16 | None | <p>Diagram illustrating the lane mapping for a Single Primary configuration. The Secondary (PEG1) slot is empty, and the Primary (PEG0) slot is populated with an x16 device. The Secondary (PEG1) slot has PRSNT1# and PRSNT2# pins. The Primary (PEG0) slot has PRSNT1# and PRSNT2# pins. Lane 15 is connected to Dev 1, lanes 8-7 to MCH, and lane 0 to Dev 1. DPEN# and PRIPRSNT# are also shown.</p> <p style="text-align: right;"><small>PCIe_LaneMapConfig_1</small></p> |
| Single Secondary ² (Swap) | None ³ | x1, x8 | <p>Diagram illustrating the lane mapping for a Single Secondary (Swap) configuration. The Secondary (PEG1) slot is populated with an x8 device, and the Primary (PEG0) slot is empty. The Secondary (PEG1) slot has PRSNT1# and PRSNT2# pins. The Primary (PEG0) slot has PRSNT1# and PRSNT2# pins. Lane 15 is connected to Dev 3, lanes 8-7 to MCH, and lane 0 to Dev 1. DPEN# and PRIPRSNT# are also shown.</p> <p style="text-align: right;"><small>PCIe_LaneMapConfig_2</small></p> |
| Bifurcated PCI Express* | x1, x8 | x1, x8 | <p>Diagram illustrating the lane mapping for a Bifurcated PCI Express* configuration. Both the Secondary (PEG1) and Primary (PEG0) slots are populated with x8 devices. Both slots have PRSNT1# and PRSNT2# pins. Lane 15 is connected to Dev 3, lanes 8-7 to MCH, and lane 0 to Dev 1. DPEN# and PRIPRSNT# are also shown.</p> <p style="text-align: right;"><small>PCIe_LaneMapConfig_3</small></p> |

| Config Name | Primary Slot (PEG0) | Secondary Slot (PEG1) | Example Figures |
|------------------------------|---------------------|-----------------------|-----------------|
| No PCI Express* ¹ | None | None | |

NOTES:

1. Graphics device attached to ICH7.
2. It is an unsupported configuration to have a PCI Express* graphics card present in the secondary slot and nothing in the primary slot. System will boot and BIOS should display user warning to switch which slot the card is plugged into.
3. BIOS must not disable Device 1 so that the Device 1 clock is active.

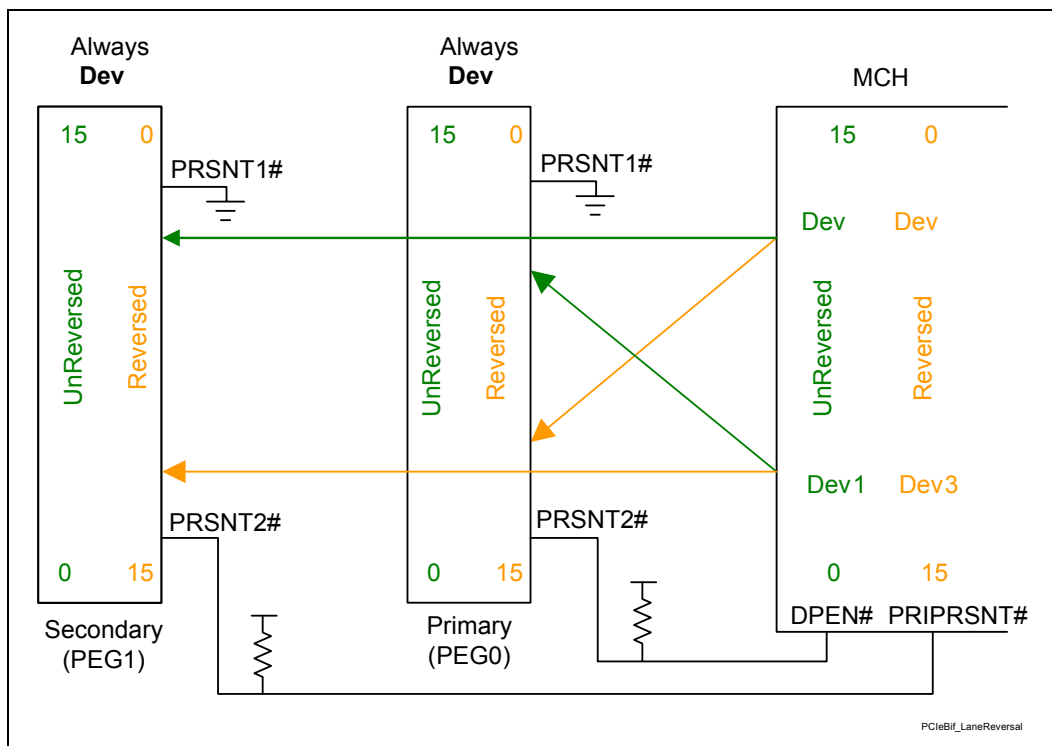

Device 1 must be enabled any time any PCI Express* device is present (regardless of slot).
 Device 3 has a separate clock tree from Device 1 that will be gated based on the Device 3 enable configuration bit (PEG1 disabled=gated PEG1 clock).

9.4.2 Lane Reversal

Device 1 registers are always associated with the control of the primary slot (PEG0). Device 3 registers are always associated with the control of the secondary slot (PEG1).

When lane reversal is indicated to the MCH (same static/strap mechanism as in Intel® 945G/945P Express chipset family), all 16 lanes are reversed end-to-end. What was lane 0 now maps to lane 15 and vice versa. As shown in the following figure, the device controls associated with the lanes also changes such that the same logical lanes are always controlled by the same device.

Figure 9-3. Lane Reversal (Bifurcated PCI Express* Configuration Example)

9.4.3 PCI Express* Straps

There is no dynamic detection so straps are required to indicate the desired configuration to the MCH. Two straps are redefined in order to support Bifurcated PCI Express* functionality. Each will connect to the PRSNT2# pin of a PCI Express* connector and will indicate whether a PCI Express* card is present in the corresponding slot. Polarity needs to match as the PCI Express specification defines how the Present Detect signals work (PRSNT2# asserted low to indicate presence).

DPEN# is the low asserted motherboard signal indicating Bifurcated PCI Express* Enable. PRIPRSNT# is the low asserted motherboard signal indicating a PCI Express* card is present in the primary slot.

Table 9-7. Strap Combinations

| Topic | DPEN# = 0 (Secondary Slot) | DPEN# = 1 (Secondary Slot) |
|---------------------------------|--|--------------------------------|
| PRIPRSNT# = 0 (Primary Slot) | 2x8 (Devices 1 and 3 Enabled) | 1x16 (Device 1 Enabled) |
| PRIPRSNT# = 1 (Primary Slot) | 1x8 in Secondary (Device 3 Enabled. Device 1 training blocked.) | No PCI Express* cards in slots |

The PRSNT2# connector signals (and corresponding straps) are pulled low when a PCI Express* card is present in the slot. When the slot is empty, the signal is pulled high.

9.4.3.1 Bifurcated PCI Express* Indication

Secondary Slot (PEG1) PRSNT2# is connected to DPEN# to indicate whether a PCI Express* card is present in the secondary slot and, therefore, Bifurcated PCI Express* operation is desired. DPEN#=0 means PCI Express* card is present in secondary slot.

When the DPEN# strap is pulled low by a PCI Express* card in the secondary slot, the Device 3 Enable configuration bit = 1 (enabled) out of reset. When the DPEN# (DPEN#) strap is not pulled low, the Device 3 Enable configuration bit = 0 (disabled) out of reset.

When the Device 3 enable = 0 (disabled), the clock to the 2nd PCI Express* port will be gated.

9.4.3.2 Primary Slot Device Present Indication

Primary Slot (PEG0) PRSNT2# is connected to PRIPRSNT# to indicate whether a PCI Express* card is present in the primary slot. PRIPRSNT#=0 means PCI Express* card is present in primary slot. In the case where Bifurcated PCI Express* is indicated by the DPEN# strap and the PRIPRSNT# strap indicates there is NOT a card present, it signals the MCH that this is the undesirable “Single Secondary” configuration. Device 3 is connected to only the upper 8 lanes of the only PCI Express* graphics card present, which is an undesirable configuration for graphics.

9.4.4 Bifurcated PCI Express* Decode Rules

Summary of decode rules

1. At most one device may set its VGAEN (Video Graphics Array Enable) bit.
2. If a device has set its VGAEN bit and has not also set its VGA16D (VGA 16-bit Decode) bit, then all other 16-bit I/O devices must set their ISAEN (Industry Standard Architecture I/O bus present in the system) bits to avoid decoding 16-bit aliases of 10-bit VGA addresses.
3. The MDAP bit (MDA Present) corresponding to a device may only be set if the VGAEN bit for that device is set.
4. The VGA16D bit in a device may only be set if the VGAEN bit for that device is set.
5. The I/O decode ranges for separate devices must not be programmed to overlap by the time I/O decode is enabled for the device. This also restricts programming an I/O range in one device to match any part of the VGA or MDA ranges when a different device has set both VGAEN and VGA16D.

Once all the above rules are met, **decode** is as follows with the earlier statements taking priority over later statements:

1. If MDAP and VGA16D are set for a device, and I/O decode is enabled for that device, then the following addresses go to DMI because no MCH device will claim them:
03B4h, 03B5h, 03B8h, 03B9h, 03BAh, 03BFh
2. If MDAP is set for a device, and I/O decode is enabled for that device, then the following addresses go to DMI because no MCH device will claim them:
xyB4h, xyB5h, xyB8h, xyB9h, xyBAh, xyBFh; where x is any hex value 0 to F, and y is 3, 7, B, or F.
3. If VGA16D is set for a device, and I/O decode is enabled for that device, then that device will claim the following addresses:
03B0h to 03BBh, 03C0h to 03CFh, 03D0h to 03DFh
4. If VGAEN is set for a device, and I/O decode is enabled for that device, then that device will claim the following addresses:
xyB0h to xyBBh, xyC0h to xyCFh, xyD0h to xyDFh; where x is any hex value 0 to F, and y is 3, 7, B, or F.
5. If ISAEN is set, and I/O decode is enabled for the device, then the following addresses go to DMI because no MCH device will claim them:
xy00h to xyFFh; where x, is any hex value 0 to F, and y is 1,2,3,5,6,7,9,A,B,D,E,or F.
6. If an I/O address falls within the IOBASE to IOLIMIT range of a device, and I/O decode is enabled for the device, that device claims the cycle.
7. The cycle goes to DMI.

9.4.5 Platform Firmware Considerations

There are special requirements due to the ability to have two display cards in their respective PCI Express* slots and a monitor plugged into only one of the display cards. Even in the case of a monitor being plugged into each display card, these rules need to be followed during system initialization. For proper display during initialization with one monitor, the card that is connected to the monitor should be configured/enabled by BIOS as a VGA display adapter for system boot, while the other card will be configured but left disabled, until the driver gets loaded for that display card. This disabled card will not respond/claim any VGA cycles.

It is anticipated that the two display cards are identical with both having BaseClass code 03h (display class) and SubClass code 00h (VGA subclass); however, whether or not this is a hard requirement is dependent on the driver(s).

System BIOS Requirements

1. System BIOS enables VGA by setting the VGAEN (and VGA16D as appropriate) bit on PEG0 and configures the display card behind it, then passes control to VBIOS init entry point of that card.
2. Video BIOS on the card attempts to detect the presence of an attached monitor and passes the results to system BIOS on return of the video BIOS init function during POST. One way this can be accomplished is to have VBIOS unload itself by writing a 0 to offset 2 of the VBIOS image at C000 segment if it determines that there is no monitor attached to the card.
3. System BIOS must check the info returned by VBIOS (as stated above). If it sees that no monitor is attached to the card, it should disable the card, clear the VGAEN bit of the port, and proceed to the next port (PEG1) and repeat steps 1 and 2 on the next port.
4. At the time when system BIOS pass control to OS, one of the two cards will be enabled with VGAEN bit set for that port. The other card will have been configured (IO/memory/IRQ resource allocation) but left disabled (PCI Command register at offset 04h=0h)

The OS will attempt to load drivers for both cards. The PCI Express graphics driver must understand that the disabled card has VGAEN bit disabled and, therefore, will not respond to any VGA cycles. The driver will enable this card and operate the card in a way that no VGA resources are needed by this card.

9.4.6 Peer-to-Peer

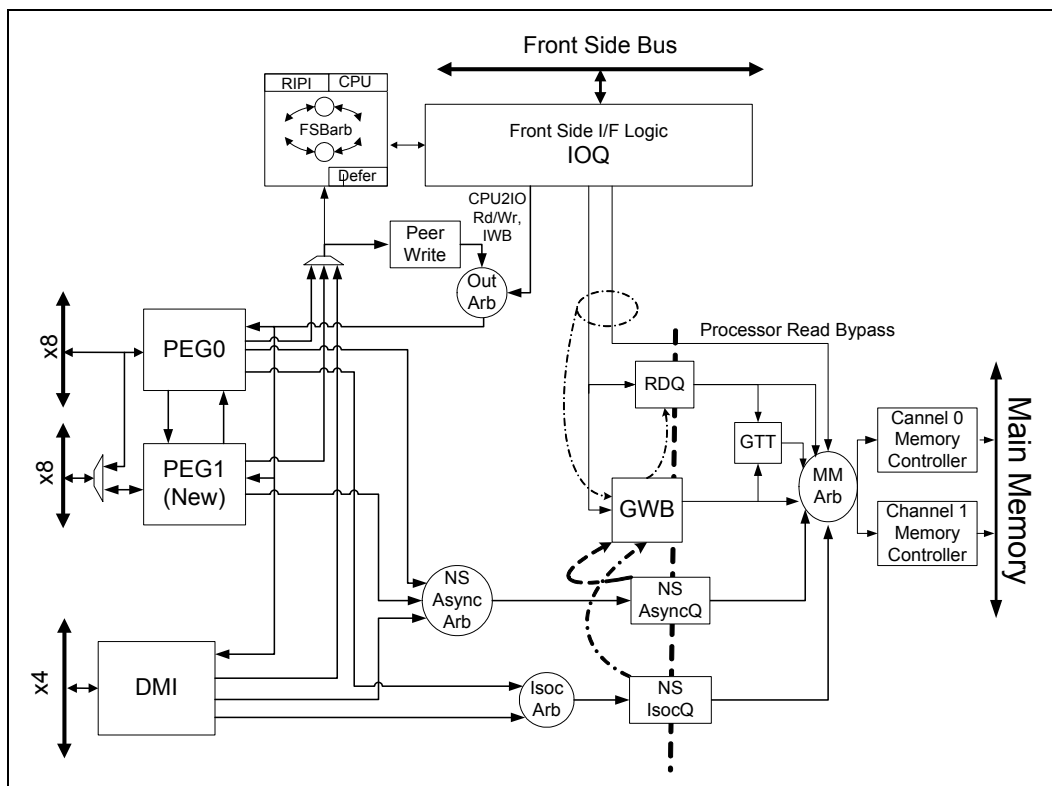

- No peer-to-peer reads are required nor supported.
- Peer-to-peer writes are supported from DMI to both PEG0 and PEG1. This is via the “central” peer path that existed in past products.
- Peer-to-peer writes are supported in both directions between PEG0 and PEG1 via the new “performance” peer path. The performance peer path supports 36-bit addressing. Relaxed ordering must be disabled when using the performance peer path.

The MCH has an in/out dependency when peer traffic is involved. This is a violation of the PCI 2.3 specification. To prevent potential lockup in the system the MCH requires that the devices attached to the root ports involved be PCI 2.3 compliant (so the devices are known to not have this in/out dependency).

Peer-to-peer writes through the performance peer path ignore the D state of both of the MCH PCI Express* ports. Software that follows the PCI Power Management specification should not allow for such upstream/peer cycles to occur; however, if software allows this, the cycles will flow through the MCH as if in the D0 state. Peer-to-peer writes through the central peer path would be an unsupported request on the primary side of a PCI Express* port virtual bridge if in a non-D0 state.

If the performance peer path is enabled and a write occurs to that range (appropriate device defined memory and prefetchable memory ranges), then the central peer path state (enabled/disabled) is a don't care. If the performance peer path is disabled and a write occurs to that range, then the central peer path state controls whether that write will be completed to the intended device (enabled) or the write becomes unsupported (disabled).

Figure 9-4. Bifurcated PCI Express* Microarchitecture

9.4.7 Peer-to-Peer Bandwidth

Performance of these paths is critical to support dual graphics card implementations. Peer-to-peer bandwidth numbers shown in the following table are the maximum attainable by simulation when cards are both streaming at maximum rates.

Table 9-8. Peer-to-Peer Bandwidths¹

| Product | Concurrent PEG0 ↔ PEG1 | DMI to PEG0/PEG1 only | Concurrent PEG ↔ DMI | PEG0/PEG1 to DMI only |
|---|---|---|--|---|
| <ul style="list-style-type: none"> Intel® 945G/945P Express chipset (G)MCH (measured via simulation) | <ul style="list-style-type: none"> Not Possible | <ul style="list-style-type: none"> 750 MB/s (Streaming on DMI x4) | <ul style="list-style-type: none"> PEG = 610 MB/s DMI = 610 MB/s 1.22 GB/s total | <ul style="list-style-type: none"> 750 MB/s (Streaming on DMI x4. This is Not a supported usage model.) |
| <ul style="list-style-type: none"> MCH Bifurcated PCI Express* Targets² | <ul style="list-style-type: none"> PEG0 = 1300 MB/s PEG1 = 1300 MB/s (2.6 GB/s total. Streaming x8 in both directions) | <ul style="list-style-type: none"> 750 MB/s (Streaming on DMI x4) | <ul style="list-style-type: none"> PEG = 610 MB/s DMI = 610 MB/s (1.22 GB/s total) This is Not a supported usage model | <ul style="list-style-type: none"> 750 MB/s This is Not a supported usage model |

NOTES:

- Data throughput as measured at the corresponding interfaces after subtracting out all bandwidth used by packet header and protocol overhead. For transactions with addresses above 4 GB, there is an additional 4B of packet overhead per TLP that will reduce these numbers slightly. This is true for all PCI Express transactions, not just those that are peer-to-peer.
- PCI Express* to PCI Express* peer-to-peer does not use the same path as DMI to PCI Express* peer-to-peer. A "direct connection" is made between the two transaction layers with the goal to support maximum possible throughput for 2 PCI Express* x8 cards doing concurrent peer streaming.

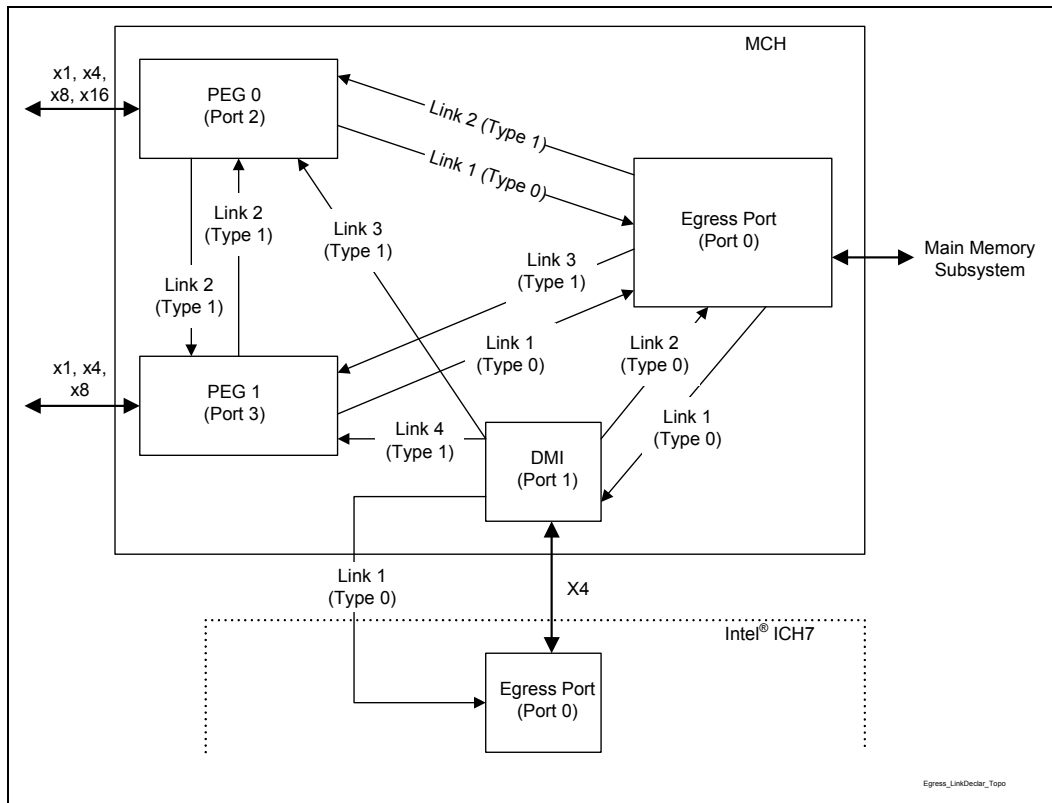

9.4.8 Peer-to-Peer Latency

Initial simulations indicate that the best case lead off latency is ~180 ns, with typical latencies ranging from 250 ns to greater than 600 ns. This time is measured from when an upstream write starts on the external pins until the start of the downstream write is seen on the external pins.

9.4.9 Link Declaration Topology

Registers exist in the PCI Express* Root Complex Link Declaration Capability structures of each PCI Express element in both the MCH and ICH7 to support software discovery of the topology of the root complex. Figure 9-5 shows the topology that is defined by the MCH registers (Device 1, DMIBAR, EPBAR) as specified in the post 1.0a specification Root Complex Topology Discovery ECN.

Figure 9-5. Link Declaration Topology

9.4.10 PCI Express* Interrupt and GPE Flow

Each PCI Express* port individually sends a single Assert/De-assert message to DMI for legacy interrupts, MSIs, and GPEs. The XT PCI and GPE interrupts need to be routed and connected to the DMI block. The only PCI legacy interrupt sent by the new Device 3 from internally generated sources is INTA, just like all other MCH internal devices. The Device 1 and Device 3 bridge devices can pass INTA–INTD from the PCI Express* link to DMI.

9.5 Thermal Considerations

PCI Express throttling is not supported; virtual sensor (filter) logic is not being updated to comprehend multiple PCI Express* ports.

Thermal throttling to protect the DIMMs is anticipated to be the only throttling used in production Bifurcated PCI Express* systems. With 2 PCI Express graphics cards up to 75 W, or maybe even higher, the typical ambient temperature in the chassis is likely to be higher than standard 945G Express chipset systems. High-end systems that use the 82975X MCH will likely have better than typical cooling solutions (higher air flow, etc), but it will be important to have Dynamic CKE and any other DIMM thermal throttling related features fully functional.

9.6 Power Management

Power management feature include:

- ACPI 1.0b support
- ACPI S0, S1D, S3 (both Cold and Chipset Hot), S4, S5, C0, and C1. The C2, C3, C4 states and corresponding Enhanced states- S3hot, C2, C3, and C4 are not used in the MCH.
- Enhanced power management state transitions for increasing time that the processor spends in low power states
- Graphics Adapter States: D0, D3.
- PCI Express Link States: L0, L0s, L1, L2/L3 Ready, L3

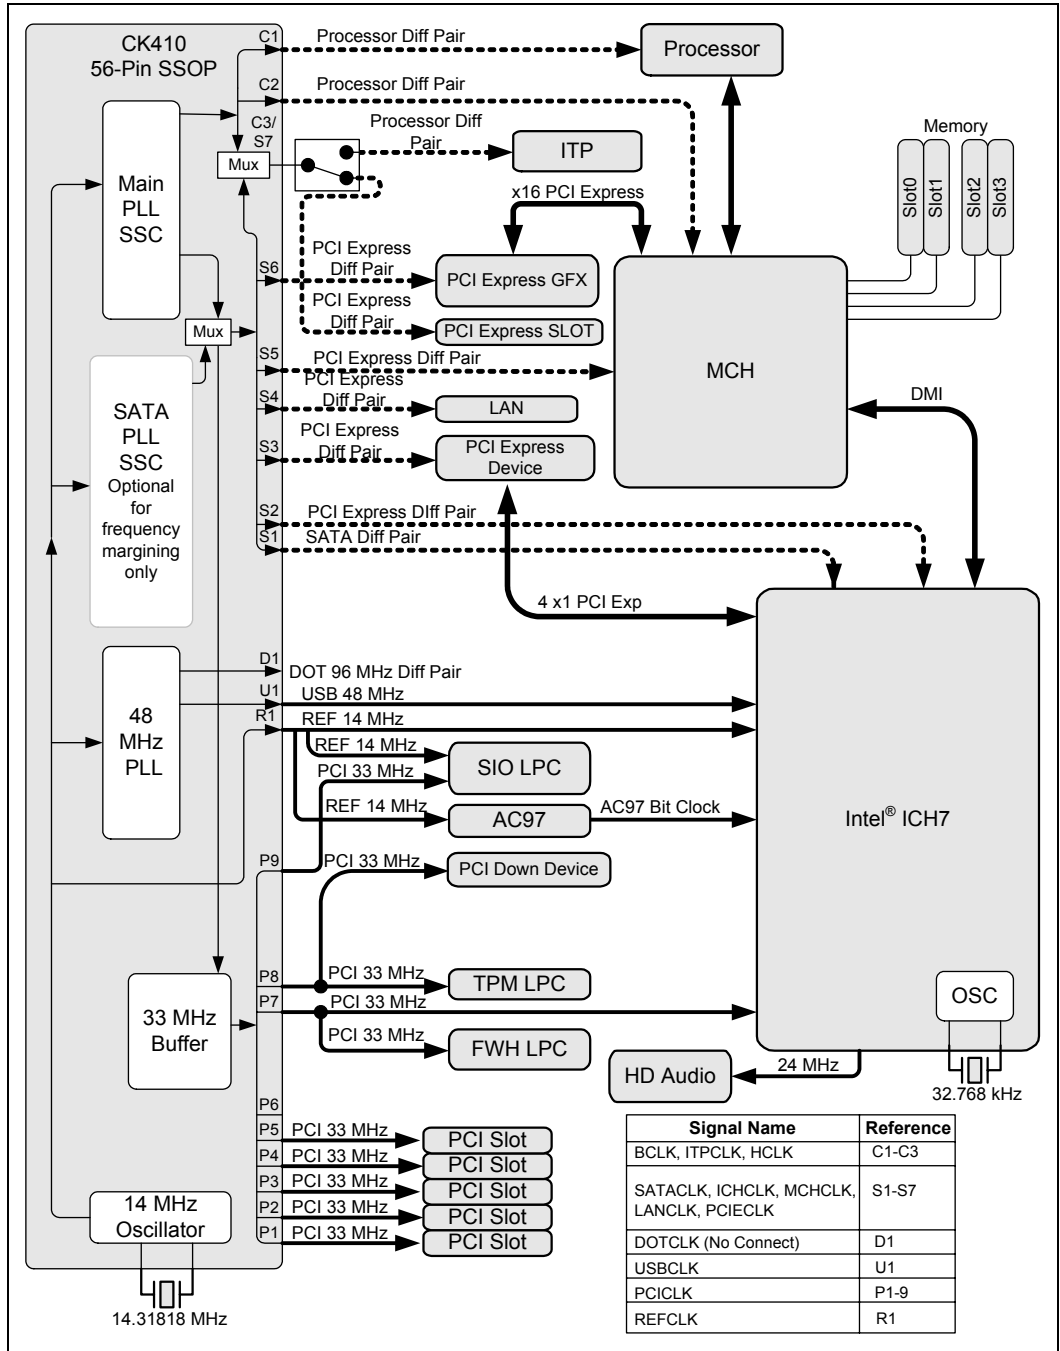

9.7 Clocking

The MCH has PLLs that provide the internal clocks. The PLLs are:

- Host PLL – Generates the main core clocks in the host clock domain. This PLL can also be used to generate memory core clocks. It uses the Host clock (HCLKIN) as a reference.
- Memory PLL – Can be used to generate memory core clocks, when not generated by the Host PLL. This PLL is not needed in all configurations, but exists to provide more flexible frequency combinations without an unreasonable VCO frequency. It uses the Host clock (HCLKIN) as a reference.
- PCI Express PLL – Generates all PCI Express related clocks, including the Direct Media Interface that connects to the ICH7. This PLL uses the 100 MHz (GCLKIN) as a reference.

Figure 9-6 illustrates the various clocks in the platform.

Figure 9-6. Platform Clocking Example

§

10 Electrical Characteristics

This chapter contains the MCH absolute maximum electrical ratings, power dissipation values, and DC characteristics.

10.1 Absolute Minimum and Maximum Ratings

Table 10-1 specifies the 82975X MCH's absolute maximum and minimum ratings. Within functional operation limits, functionality and long-term reliability can be expected.

At conditions outside functional operation condition limits, but within absolute maximum and minimum ratings, neither functionality nor long-term reliability can be expected. If a device is returned to conditions within functional operation limits after having been subjected to conditions outside these limits, but within the absolute maximum and minimum ratings, the device may be functional, but with its lifetime degraded depending on exposure to conditions exceeding the functional operation condition limits.

At conditions exceeding absolute maximum and minimum ratings, neither functionality nor long-term reliability can be expected. Moreover, if a device is subjected to these conditions for any length of time then, when returned to conditions within the functional operating condition limits, it will either not function, or its reliability will be severely degraded.

Although the MCH contains protective circuitry to resist damage from static electric discharge, precautions should always be taken to avoid high static voltages or electric fields.

Table 10-1. Absolute Minimum and Maximum Ratings

| Symbol | Parameter | Min | Max | Unit | Notes |
|--|---|------|------|------|-------|
| T _{storage} | Storage Temperature | -55 | 150 | °C | 1 |
| MCH Core | | | | | |
| V _{CC} | 1.5 V Core Supply Voltage with respect to V _{SS} | -0.3 | 1.65 | V | |
| Host Interface (800 MHz/1066 MHz) | | | | | |
| V _{TT} | System Bus Input Voltage with respect to V _{SS} | -0.3 | 1.65 | V | |
| V _{CCA_HPLL} | 1.5 V Host PLL Analog Supply Voltage with respect to V _{SS} | -0.3 | 1.65 | V | |
| DDR2 Interface (533 MHz/667 MHz) | | | | | |
| V _{CCSM} | 1.8 V DDR2 System Memory Supply Voltage with respect to V _{SS} | -0.3 | 4.0 | V | |
| V _{CCA_SMPLL} | 1.5 V System Memory PLL Analog Supply Voltage with respect to V _{SS} | -0.3 | 1.65 | V | |
| PCI Express*/DMI Interface | | | | | |
| V _{CC_EXP} | 1.5 V PCI Express* and DMI Supply Voltage with respect to V _{SS} | -0.3 | 1.65 | V | |

| Symbol | Parameter | Min | Max | Unit | Notes |
|-----------------------|--|------|------|------|-------|
| V_{CCA_EXPPLL} | 1.5 V PCI Express PLL Analog Supply Voltage with respect to V_{SS} | -0.3 | 1.65 | V | |
| V_{CCA_3GBG} | 2.5 V PCI Express Band-gap Supply Voltage with respect to V_{SS} | -0.3 | 2.65 | V | |
| CMOS Interface | | | | | |
| V_{CC2} | 2.5 V CMOS Supply Voltage with respect to V_{SS} | -0.3 | 2.65 | V | |

NOTES:

1. Possible damage to the MCH may occur if the MCH temperature exceeds 150 °C. Intel does not warrant functionality for parts that have exceeded temperatures above 150 °C since this exceeds Intel's specification.

10.2 Power Characteristics

Table 10-2. Non Memory Power Characteristics

| Symbol | Parameter | Signal Names | Min | Typ | Max | Unit | Notes |
|--------------------|---|--------------|-----|-----|-----|------|------------|
| I_{VTT} | System Bus Supply Current | VTT | — | — | 0.9 | A | 1, 4, 5 |
| I_{VCC} | 1.5 V Core Supply Current | VCC | — | — | 8.9 | A | 2, 3, 4, 5 |
| I_{VCC_EXP} | 1.5 V PCI Express* and DMI Supply Current | VCC_EXP | — | — | 1.5 | A | 5 |
| I_{VCCA_3GBG} | 2.5 V PCI Express Band-gap Supply Current | VCCA_3GBG | — | — | 1.0 | mA | 5 |
| I_{VCC2} | 2.5 V CMOS Supply Current | VCC2 | — | — | 2.0 | mA | 5 |
| I_{VCCA_EXPPLL} | 1.5 V PCI Express and DMI PLL Analog Supply Current | VCCA_EXPPLL | — | — | 45 | mA | 5 |
| I_{VCCA_HPLL} | 1.5 V Host PLL Supply Current | VCCA_HPLL | — | — | 45 | mA | 5 |

NOTES:

1. Estimate is only for maximum current coming through the MCH's supply balls.
2. Rail includes DLLs and FSB sense amps.
3. Includes worst case leakage.
4. Calculated for highest frequencies.
5. I_{CC} maximum values are determined on a per-interface basis. Maximum currents cannot occur simultaneously on all interfaces.

Table 10-3. DDR2 Power Characteristics

| Symbol | Parameter | Min | Max | Unit | Notes |
|-------------------------|---|-----|-----|------|-------|
| I _{VCCSM} | DDR2 System Memory Interface (1.8 V) Supply Current | — | 4.4 | A | 1,2,3 |
| I _{SUS_VCCSM} | DDR2 System Memory Interface (1.8 V) Standby Supply Current | — | 25 | mA | 1 |
| I _{SMVREF} | DDR2 System Memory Interface Reference Voltage (0.90 V) Supply Current | — | 2 | mA | 1 |
| I _{SUS_SMVREF} | DDR2 System Memory Interface Reference Voltage (0.90 V) Standby Supply Current | — | 10 | μA | 1 |
| I _{TTRC} | DDR2 System Memory Interface Resister Compensation Voltage (1.8 V) Supply Current | — | 36 | mA | 1 |
| I _{SUS_TTRC} | DDR2 System Memory Interface Resister Compensation Voltage (1.8 V) Standby Supply Current | — | 10 | μA | 1 |
| I _{VCCA_SMPLL} | System Memory PLL Analog (1.5 V) Supply Current | — | 66 | mA | 1 |

NOTES:

1. Estimate is only for maximum current coming through the MCH's supply balls.
2. Calculated for highest frequencies.
3. I_{CC} maximum values are determined on a per-interface basis. Maximum currents cannot occur simultaneously on all interfaces.

10.3 Signal Groups

The signal description includes the type of buffer used for the particular signal:

| | |
|--------------|---|
| GTL+ | Open Drain GTL+ interface signal. Refer to the GTL+ I/O specification for complete details. The 82975X MCH integrates most GTL+ termination resistors. |
| DDR2 | DDR2 system memory (1.8 V CMOS buffers) |
| PCI Express* | PCI Express interface signals. These signals are compatible with PCI Express 1.0a signaling environment AC Specifications. The buffers are not 3.3 V tolerant. |
| Analog | Analog signal interface |
| Ref | Voltage reference signal |
| HVCMOS | 2.5 V Tolerant High Voltage CMOS buffers |
| SSTL-1.8 | 1.8 V Tolerant Stub Series Termination Logic |

Table 10-4. Signal Groups

| Signal Group | Signal Type | Signals | Notes |
|---|--|--|-------|
| Host Interface Signal Groups | | | |
| (a) | GTL+ Input/Outputs | HADS#, HBNR#, HBREQ0#, HDBSY#, HDRDY#, HDINV[3:0]#, HA[31:3]#, HADSTB[1:0]#, HD[63:0], HDSTBP[3:0]#, HDSTBN[3:0]#, HHIT#, HHITM#, HREQ[4:0]#, HLOCK# | |
| (b) | GTL+ Common Clock Outputs | HBPRI#, HCPURST#, HDEFER#, HTRDY#, HRS[2:0]#, HEDRDY# | |
| (c) | Asynchronous GTL+ Input | HPCREQ# | |
| (d) | Analog Host I/F Ref & Comp. Signals | HDVREF, HACCVREF, HSWING HRCOMP, HSCOMP | |
| (c1) | Misc. CMOS Inputs | BSEL[2:0] | |
| PCI-Express* Graphics Interface Signal Groups | | | |
| (e) | PCI Express Input | PCI Express Interface: EXP_RXN[15:0], EXP_RXP[15:0] | |
| (f) | PCI Express Output | PCI Express Interface: EXP_TXN[15:0], EXP_TXP[15:0] | |
| (g) | Analog PCI Express I/F Compensation Signals | EXP_COMPO EXP_COMPI | |
| DDR2 Interface Signal Groups | | | |
| (h) | SSTL – 1.8 DDR2 CMOS I/O | SDQ_A[63:0], SDQ_B[63:0], SDQS_A[8:0], SDQS_A[8:0]#, SDQS_B[8:0], SDQS_B[8:0]#, SCB_A[7:0], SCB_B[7:0] | |
| (i) | SSTL – 1.8 DDR2 CMOS Output | SDM_A[7:0], SDM_B[7:0], SMA_A[13:0], SMA_B[13:0], SBS_A[2:0], SBS_B[2:0], SRAS_A#, SRAS_B#, SCAS_A#, SCAS_B#, SWE_A#, SWE_B#, SODT_A[3:0], SODT_B[3:0], SCKE_A[3:0], SCKE_B[3:0], SCS_A[3:0]#, SCS_B[3:0]#, SCLK_A[5:0], SCLK_A[5:0]#, SCLK_B[5:0], SCLK_B[5:0]# | |
| (j) | DDR2 Reference Voltage | SMVREF[1:0] | |
| Clocks, Reset, and Miscellaneous Signal Groups | | | |
| (k) | HVCMOS Input | EXTTS# | |
| (l) | Miscellaneous Inputs | RSTIN#, PWROK | |
| | Miscellaneous HVCMOS Output | ICH_SYNC# | |
| (m) | Low Voltage Diff. Clock Input | HCLKN, HCLKP, GCLKP, GCLKN | |

| Signal Group | Signal Type | Signals | Notes |
|-----------------------------------|---|------------------------|-------|
| I/O Buffer Supply Voltages | | | |
| (o) | System Bus Input Supply Voltage | VTT | |
| (p) | 1.5 V PCI Express Supply Voltages | VCC_EXP | |
| (q) | 1.8 V DDR2 Supply Voltage | VCCSM | |

| C_{IN} | (m) | Input Capacitance | 1 | — | 3 | pF | |
| V_{IL} | (l) | Input Low Voltage | — | — | 0.8 | V | |
| V_{IH} | (l) | Input High Voltage | 2.0 | — | — | V | |
| I_{LEAK} | (l) | Input Leakage Current | — | — | ± 100 | μA | $0 < V_{\text{in}} < V_{\text{CC3}_3}$ |
| C_{IN} | (l) | Input Capacitance | 4.690 | — | 5.370 | pF | |

NOTES:

1. Determined with 2x MCH DDR2 Buffer Strength Settings into a 50 ohm to $0.5 \times V_{\text{CCSM}}$ test load.
2. Specified at the measurement point into a timing and voltage compliance test load as shown in the Transmitter compliance eye diagram of the PCI Express specification and measured over any 250 consecutive TX UIs.
3. Specified at the measurement point and measured over any 250 consecutive UIs. The test load shown in the Receiver compliance eye diagram of the PCI Express spec should be used as the RX device when taking measurements.
4. This is the DC voltage supplied at the MCH and is inclusive of all noise up to 20 MHz. Any noise above 20 MHz at the MCH generated from any source other than the MCH itself may not exceed the DC voltage range of $1.8\text{V} \pm 100\text{ mV}$.
5. Applies to the pin to VCC or VSS leakage current for the SDQ_A[63:0], SDQ_B[63:0], SCB_A[7:0], and SCB_B[7:0] signals.
6. Applies to the pin to pin leakage current between the SDQS_A[8:0], SDQS_A[8:0]#, SDQS_B[8:0], and SDQS_B[8:0]# signals.
7. Crossing Voltage is defined as the instantaneous voltage value when the rising edge is equal to the falling edge.
8. V_{Havg} is the statistical average of the V_{H} measured by the oscilloscope.
9. The crossing point must meet the absolute and relative crossing point specifications simultaneously.
10. ΔV_{CROSS} is defined as the total variation of all crossing voltages as defined in note 7.
11. For all noise components ≤ 20 MHz, the sum of the DC voltage and AC noise component must be within the specified DC min/max operating range.

§

11 *Ballout and Package Information*

This chapter provides the ballout and package information.

11.1 **Ballout**

The following two figures diagram the MCH ballout for platforms using DDR2 system memory, as viewed from the top side of the package. The figures are broken into a left-side view and right-side view of the package.

Note: Balls that are listed as RSV are reserved. Board traces should Not be routed to these balls.

Note: Some balls marked as reserved (RSV) are used in XOR testing. See Chapter 12 for details.

Note: Some balls marked as reserved (RSV) can be used as test points. These are marked as RSV_TPx.

Note: Balls that are listed as NC are No Connects.

11.2 Package

The MCH package measures 34 mm × 34 mm; it is a 34 mm squared, 6-layer flip chip ball grid array (FC-BGA) package. The 1202 balls are located in a non-grid pattern. Figure 11-4 through Figure 11-6 show the physical dimensions of the package. For further information on the package, see the *Intel® 975X Express Chipset Thermal/Mechanical Design Guidelines*.

§

12 Testability

In the MCH, testability for Automated Test Equipment (ATE) board level testing has been implemented as an XOR chain. An XOR-tree is a chain of XOR gates each with one input pin connected to it.

12.1 Complimentary Pins

Table 12-1 contains pins that must remain complimentary while performing XOR testing. The first and third columns contain the pin and its compliment. The second and fourth columns specify which chain the associated pins are on. Also, in non ECC systems, SA_DQS8, SA_DQS8#, SB_DQS8 and SB_DQS8# do not need to be driven.

Table 12-1. Complimentary Pins to Drive

| Complimentary Pin | XOR Chain | Complimentary Pin | XOR Chain |
|-------------------|------------------|-------------------|-----------|
| SDQS_A0 | Not in XOR Chain | SDQS_A0# | 4 |
| SDQS_A1 | Not in XOR Chain | SDQS_A1# | 4 |
| SDQS_A2 | Not in XOR Chain | SDQS_A2# | 4 |
| SDQS_A3 | Not in XOR Chain | SDQS_A3# | 4 |
| SDQS_A4 | Not in XOR Chain | SDQS_A4# | 4 |
| SDQS_A5 | Not in XOR Chain | SDQS_A5# | 4 |
| SDQS_A6 | Not in XOR Chain | SDQS_A6# | 4 |
| SDQS_A7 | Not in XOR Chain | SDQS_A7# | 4 |
| SDQS_A8 | Not in XOR Chain | SDQS_A8# | 4 |
| SDQS_B0 | Not in XOR Chain | SDQS_B0# | 5 |
| SDQS_B1 | Not in XOR Chain | SDQS_B1# | 5 |
| SDQS_B2 | Not in XOR Chain | SDQS_B2# | 5 |
| SDQS_B3 | Not in XOR Chain | SDQS_B3# | 5 |
| SDQS_B4 | Not in XOR Chain | SDQS_B4# | 5 |
| SDQS_B5 | Not in XOR Chain | SDQS_B5# | 5 |
| SDQS_B6 | Not in XOR Chain | SDQS_B6# | 5 |
| SDQS_B7 | Not in XOR Chain | SDQS_B7# | 5 |
| SDQS_B8 | Not in XOR Chain | SDQS_B8# | 5 |

12.2 XOR Test Mode Initialization

XOR test mode can be entered by pulling XORTEST (H20) and PRIPRSNT# (C19) low through the de-assertion of external reset (RSTIN#). It was intended that no clocks should be required to enter this test mode; however, it is recommended that customers use the following sequence.

On power up, hold PWROK, RSTIN#, and XORTEST (H20) low and start external clocks. After a few clock cycles, pull PWROK high. After ~3–4 clocks, de-assert RSTIN# (pull it high). Release XORTEST (H20) and PRIPRSNT# (C19). No external drive. Allow the clocks to run for an additional 32 clocks. Begin testing the XOR chains. Refer to Figure 12-1.

Figure 12-1. XOR Test Mode Initialization Cycles

12.3 XOR Chain Definition

The MCH chipset has 10 XOR chains. The XOR chain outputs are driven out on the following output pins. During full width testing, XOR chain outputs will be visible on both pins.

Table 12-2. XOR Chain Outputs

| XOR Chain | Output Pins | Coordinate Location |
|-----------|-------------|---------------------|
| xor_out0 | BSEL2 | L20 |
| xor_out1 | ALLZTEST | J20 |
| xor_out2 | XORTEST | H20 |
| xor_out3 | PRIPRSNT# | C19 |
| xor_out4 | EXP_SLR | K21 |
| xor_out5 | RSV_TP4 | L21 |
| xor_out6 | DPEN# | F20 |
| xor_out7 | RSV_TP6 | N21 |
| xor_out8 | BSEL1 | H21 |
| xor_out9 | BSEL0 | F21 |

12.4 XOR Chains

Table 12-3 through Table 12-12 show the XOR chains. Table 12-13 has a pin exclusion list.

12.5 PADS Excluded from XOR Mode(s)

Some pads do not support XOR testing. The majority of the pads that fall into this category are analog related pins (see Table 12-13).

Table 12-13. XOR Pad Exclusion List

| PCI Express* | FSB | SM | Miscellaneous |
|--------------|--------|---------|---------------|
| GCLKN | HCLKN | SRCOMP1 | RSTIN# |
| GCLKP | HCLKP | SRCOMP0 | |
| EXP_COMPO | HRCOMP | SMVREF1 | |
| EXP_COMPI | HSCOMP | SMVREF0 | |
| | HDVREF | SOCOMP1 | |
