

4.8A I_{SW} , Synchronous Boost Regulator with Bi-Directional Load Disconnect

Features

- Up to 95% Efficiency
- Input Voltage Range: 2.5V to 5.5V
- Fully-Integrated, High-Efficiency, 2 MHz Synchronous Boost Regulator
- Bi-Directional True Load Disconnect
- Integrated Anti-Ringing Switch
- Minimum Switching Frequency of 45 kHz
- $<1 \mu\text{A}$ Shutdown Current
- Bypass Mode for $V_{IN} \geq V_{OUT}$
- Overcurrent Protection and Thermal Shutdown
- Fixed and Adjustable Output Versions
- 8-lead 2 mm × 2 mm UDFN Package

Applications

- Tablet and Smartphones
- USB OTG and HDMI Hosts
- Portable Power Reserve Supplies
- Low-Noise Audio Applications
- Portable Equipment

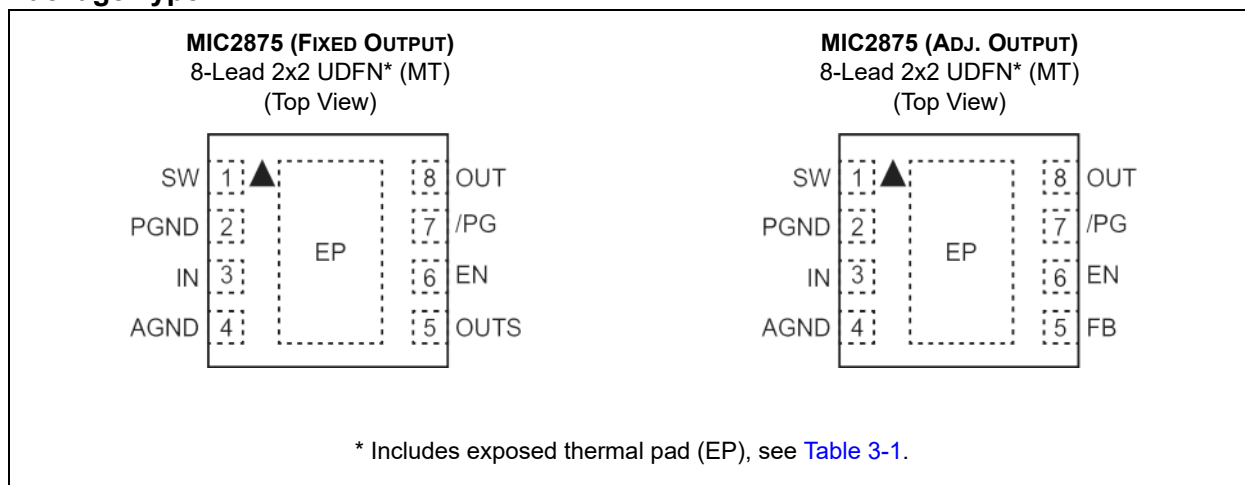

General Description

The MIC2875 is a compact and highly-efficient 2 MHz synchronous boost regulator with a 4.8A switch. It features a bi-directional load disconnect function which prevents any leakage current between the input and output when the device is disabled. The MIC2875 operates in bypass mode automatically when the input voltage is greater than the target output voltage. At light loads, the boost converter goes to the PFM mode to improve the efficiency.

To minimize switching artifacts in the audio band, the MIC2875 is designed to operate with a minimum switching frequency of 45 kHz. The MIC2875 also features an integrated anti-ringing switch to minimize EMI.

The MIC2875 is available in a 8-lead 2 mm × 2 mm ultra-thin DFN (UDFN) package, with a junction temperature range of -40°C to $+125^{\circ}\text{C}$.

Package Type

MIC2875

Typical Application Schematics

MIC2875 (Fixed Output)

* Two more 22 µF capacitors should be added in parallel with C2 for $V_{IN} > 5.0V$.

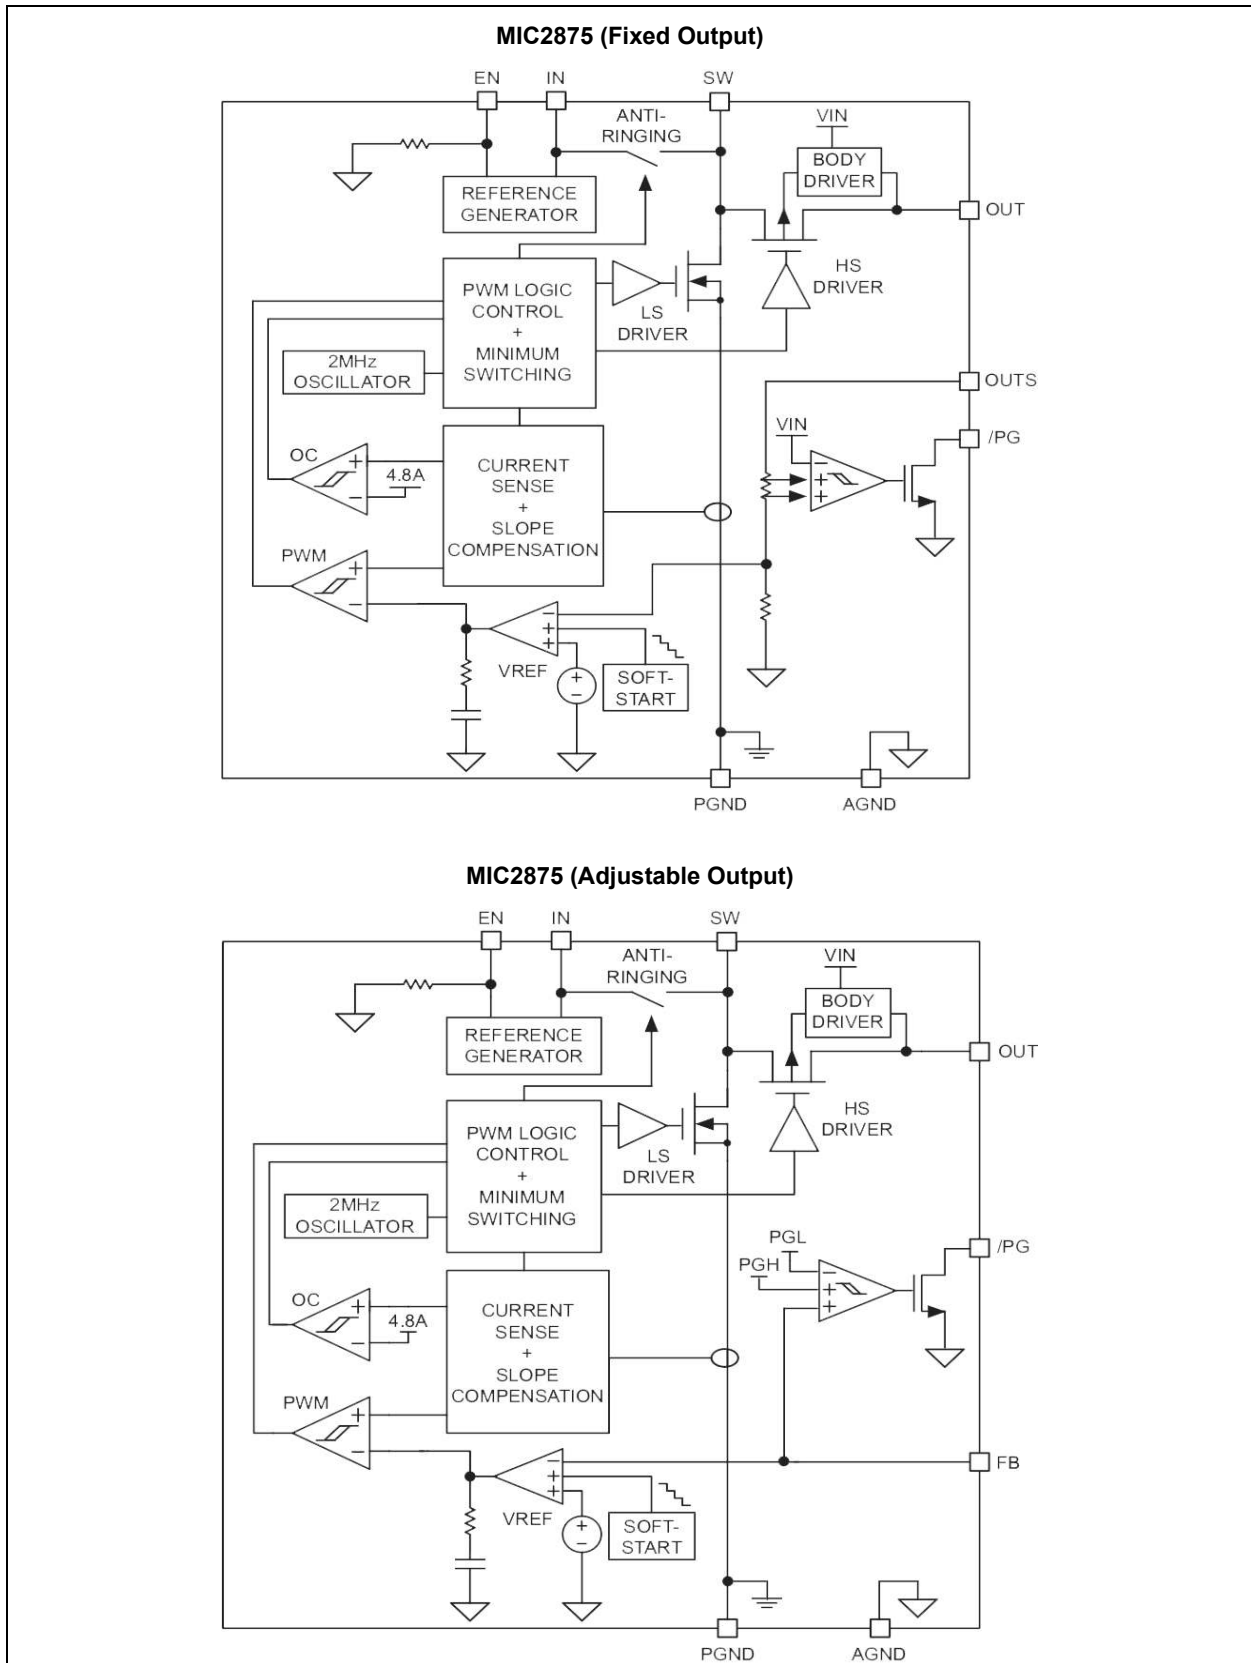

MIC2875 (Adjustable Output)

* Two more 22 µF capacitors should be added in parallel with C2 for $V_{IN} > 5.0V$.

Efficiency vs. Load Current

Load Current (A)	Efficiency (%) - $V_{IN} = 3.6V$	Efficiency (%) - $V_{IN} = 3.0V$	Efficiency (%) - $V_{IN} = 2.5V$
0.001	60	58	55
0.010	88	85	82
0.100	90	88	85
1.000	85	80	75

Functional Block Diagrams

MIC2875

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

IN, EN, OUT, FB, /PG to PGND	-0.3V to +6V
AGND to PGND.....	-0.3V to +0.3V
Power Dissipation.....	Internally Limited (Note 1)
ESD Rating (Note 2).....	±1.5 kV HBM, ±200V MM

Operating Ratings ††

Supply Voltage (V_{IN}).....	+2.5V to +5.5V
Output Voltage (V_{OUT}).....	Up to +5.5V
Enable Voltage (V_{EN}).....	0V to V_{IN}

† **Notice:** Exceeding the absolute maximum ratings may damage the device.

†† **Notice:** The device is not guaranteed to function outside its operating ratings.

Note 1: The maximum allowable power dissipation of any T_A (ambient temperature) is $P_{D(max)} = (T_{J(max)} - T_A) / \theta_{JA}$. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown

2: Devices are ESD sensitive. Handling precautions are recommended. Human body model, 1.5 k Ω in series with 100 pF.

ELECTRICAL CHARACTERISTICS (Note 1)

Electrical Characteristics: $V_{IN} = 3.6V$, $V_{OUT} = 5V$, $C_{IN} = 4.7 \mu F$, $C_{OUT} = 22 \mu F$, $L = 1 \mu H$, $T_A = 25^\circ C$, bold values are valid for $-40^\circ C \leq T_J \leq +125^\circ C$ Unless otherwise indicated.

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions

Power-Good Threshold (Rising)	$V_{/PG-THR}$	—	$0.90 \times V_{OUT}$	—	V	—
Power-Good Threshold (Falling)	$V_{/PG-THF}$	—	$0.83 \times V_{OUT}$	—	V	—

- Note 1:** Specification for packaged product only.
2: Guaranteed by design and characterization.

TEMPERATURE SPECIFICATIONS (Note 1)

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
Temperature Ranges						
Lead Temperature	—	—	260	—	°C	Soldering 10s
Storage Temperature Range	T _S	-65	—	+150	°C	—
Junction Operating Temperature	T _J	-40	—	+125	°C	—
Package Thermal Resistances						
Thermal Resistance, UDFN-2x2-8Ld	θ _{JA}	—	90	—	°C/W	—

Note 1: The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e., T_A, T_J, θ_{JA}). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +125°C rating. Sustained junction temperatures above +125°C can impact the device reliability.

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

TABLE 3-1: PIN FUNCTION TABLE

Pin Number Fixed Output	Pin Number Adj. Output	Pin Name	Description
1	1	SW	Boost Converter Switch Node: Connect the inductor between IN and SW pins.
2	2	PGND	Power Ground: The power ground for the synchronous boost DC/DC converter power stage.
3	3	IN	Supply Input: Connect at least 1 μ F ceramic capacitor between IN and AGND pins.
4	4	AGND	Analog Ground: The analog ground for the regulator control loop.
5	—	OUTS	Output Voltage Sense Pin: For output voltage regulation in fixed voltage version. Connect to the boost converter output.
—	5	FB	Feedback Pin: For output voltage regulation in adjustable version. Connect to the feedback resistor divider.
6	6	EN	Boost Converter Enable: When this pin is driven low, the IC enters shutdown mode. The EN pin has an internal 2.5 M Ω pull-down resistor. The output is disabled when this pin is left floating.
7	7	/PG	Open Drain Power Good Output (Active Low): The /PG pin is high impedance when the output voltage is below the power good threshold and becomes low once the output is above the power good threshold. The /PG pin has a typical $R_{DS(ON)} = 90\Omega$ and requires a pull up resistor of 1 M Ω . Connect /PG pin to AGND when the /PG signal is not used.
8	8	OUT	Boost Converter Output.
EP	EP	ePad	Exposed Heat Sink Pad. Connect to AGND for best thermal performance.

4.0 FUNCTIONAL DESCRIPTION

4.1 Input (IN)

The input supply provides power to the internal MOSFETs gate drivers and control circuitry for the boost regulator. The operating input voltage range is from 2.5V to 5.5V. A 1 μ F low-ESR ceramic input capacitor should be connected from IN to AGND as close to MIC2875 as possible to ensure a clean supply voltage for the device. A minimum voltage rating of 10V is recommended for the input capacitor.

4.2 Switch Node (SW)

The MIC2875 has internal low-side and synchronous MOSFET switches. The switch node (SW) between the internal MOSFET switches connects directly to one end of the inductor and provides the current path during switching cycles. The other end of the inductor is connected to the input supply voltage. Due to the high-speed switching on this pin, the switch node should be routed away from sensitive nodes wherever possible.

4.3 Ground Path (AGND)

The ground path (AGND) is for the internal biasing and control circuitry. AGND should be connected to the PCB pad for the package exposed pad. The current loop of the analog ground should be separated from that of the power ground (PGND). AGND should be connected to PGND and EP at a single point.

4.4 Power Ground (PGND)

The power ground (PGND) is the ground path for the high current in the boost switches. The current loop for the power ground should be as short as possible and separate from the AGND loop as applicable.

4.5 Boost Converter Output (OUT)

A low-ESR ceramic capacitor of 22 μ F (for operation with $V_{IN} \leq 5.0V$), or 66 μ F (for operation with $V_{IN} > 5.0V$) should be connected from V_{OUT} to PGND as close as possible to the MIC2875. A minimum voltage rating of 10V is recommended for the output capacitor.

4.6 Enable (EN)

Enable pin of the MIC2875. A logic high on this pin enables the MIC2875. When this pin is driven low, the MIC2875 enters the shutdown mode. When the EN pin is left floating, it is pulled-down internally by a built-in 2.5 M Ω resistor.

4.7 Feedback/Output Voltage Sense (FB/OUTS)

Feedback or output voltage sense pin for the boost converter. For the fixed voltage version, this pin should be connected to the OUT pin. For the adjustable version, connect a resistor divider to set the output voltage (see “Section 5.7 “Output Voltage Programming”” for more information).

4.8 Power Good Output (/PG)

The open-drain active-low power-good output (/PG) is low when the output voltage is above the power-good threshold. A pull-up resistor of 1 M Ω is recommended.

4.9 Exposed Heat Sink Pad (EP)

The exposed heat sink pad, or ePad (EP), should be connected to AGND for best thermal performance.

5.0 APPLICATION INFORMATION

5.1 General Description

The MIC2875 is a 2 MHz, current-mode, PWM, synchronous boost converter with an operating input voltage range of 2.5V to 5.5V. At light load, the converter enters pulse-skipping mode to maintain high efficiency over a wide range of load current. The maximum peak current in the boost switch is limited to 4.8A (typical).

5.2 Bi-Directional Output Disconnect

The power stage of the MIC2875 consists of a NMOS transistor as the main switch and a PMOS transistor as the synchronous rectifier. A control circuit turns off the back gate diode of the PMOS to isolate the output from the input supply when the chip is disabled ($V_{EN} = 0V$). An “always on” maximum supply selector switches the cathode of the back-gate diode to either the IN or the OUT (whichever of the two has the higher voltage). As a result, the output of the MIC2875 is bi-directionally isolated from the input as long as the device is disabled. The maximum supply selector and hence the output disconnect function requires only 0.3V at the IN pin to operate.

5.3 Minimum Switching Frequency

When the MIC2875 enters the pulse-skipping mode for more than 20 μs , an internal control circuitry forces the PMOS to turn on briefly to discharge V_{OUT} to V_{IN} through the inductor. When the inductor current reaches a predetermined threshold, the PMOS is turned off and the NMOS is turned on so that the inductor current can decrease gradually. Once the inductor current reaches zero, the NMOS is eventually turned off. The above cycle repeats if there is no switching activity for another 20 μs , effectively maintaining a minimum switching frequency of 45 kHz. The frequency control circuit is disabled when V_{OUT} is less than or within 200 mV of V_{IN} . This minimum switching frequency feature is advantageous for applications that are sensitive to low-frequency EMI, such as audio systems.

5.4 Integrated Anti-Ringing Switch

The MIC2875 includes an anti-ringing switch that eliminates the ringing on the SW node of a conventional boost converter operating in the discontinuous conduction mode (DCM). At the end of a switching cycle during DCM operation, both the NMOS and PMOS are turned off. The anti-ringing switch in the MIC2875 clamps the SW pin voltage to IN to dissipate the remaining energy stored in the inductor and the parasitic elements of the power switches.

5.5 Automatic Bypass Mode (when $V_{IN} > V_{OUT}$)

The MIC2875 automatically operates in bypass mode when the input voltage is higher than the target output voltage. In bypass mode, the NMOS is turned off while the PMOS is fully turned-on to provide a very low impedance path from IN to OUT.

5.6 Soft-Start

The MIC2875 integrates an internal soft-start circuit to limit the inrush current during start-up. When the device is enabled, the PMOS is turned-on slowly to charge the output capacitor to a voltage close to the input voltage. Then, the device begins boost switching cycles to gradually charge up the output voltage to the target V_{OUT} .

5.7 Output Voltage Programming

The MIC2875 has an adjustable version that allows the output voltage to be set by an external resistor divider R2 and R3. The typical feedback voltage is 900 mV, the recommended maximum and minimum output voltage is 5.5V and 3.2V, respectively. The current through the resistor divider should be significantly larger than the current into the FB pin (typically 0.01 μA). It is recommended that 0.1% tolerance feedback resistors must be used and the total resistance of R2 + R3 should be around 1 M Ω . The appropriate R2 and R3 values for the desired output voltage are calculated as in Equation 5-1:

EQUATION 5-1:

$$R2 = R3 \times \left(\frac{V_{OUT}}{0.9V} - 1 \right)$$

5.8 Current Limit Protection

The MIC2875 has a current limit feature to protect the part against heavy loading condition. When the current limit comparator determines that the NMOS switch has a peak current higher than 4.8A, the NMOS is turned off and the PMOS is turned on until the next switching cycle. The overcurrent protection is reset cycle by cycle.

6.0 COMPONENT SELECTION

6.1 Inductor

Inductor selection is a trade-off between efficiency, stability, cost, size, and rated current. Because the boost converter is compensated internally, the recommended inductance is limited from 1 μH to 2.2 μH to ensure system stability and presents a good balance between these considerations.

A large inductance value reduces the peak-to-peak inductor ripple current hence the output ripple voltage. This also reduces both the DC loss and the transition loss at the same inductor's DC resistance (DCR). However, the DCR of an inductor usually increases with the inductance in the same package size. This is due to the longer windings required for an increase in inductance.

Since the majority of the input current passes through the inductor, the higher the DCR the lower the efficiency is, and more significantly at higher load currents. On the other hand, inductor with smaller DCR but the same inductance usually has a larger size. The saturation current rating of the selected inductor must be higher than the maximum peak inductor current to be encountered and should be at least 20% to 30% higher than the average inductor current at maximum output current.

6.2 Input Capacitor to the Device Supply

A ceramic capacitor of 1 μF or larger with low ESR is recommended to reduce the input voltage ripple to ensure a clean supply voltage for the device. The input capacitor should be placed as close as possible to the MIC2875 IN pin and AGND pin with short traces to ensure good noise performance. X5R or X7R type ceramic capacitors are recommended for better tolerance over temperature.

The Y5V and Z5U type temperature rating ceramic capacitors are not recommended due to their large reduction in capacitance over temperature and increased resistance at high frequencies. The use of these reduces the ability to filter out high-frequency noise. The rated voltage of the input capacitor should be at least 20% higher than the maximum operating input voltage over the operating temperature range.

6.3 Input Capacitor to the Power Path

A ceramic capacitor of a 4.7 μF or larger with low ESR is recommended to reduce the input voltage fluctuation at the voltage supply of the high current power path. An input capacitor should be placed close to the V_{IN} supply to the power inductor and PGND for good device

performance at heavy load condition. X5R or X7R type ceramic capacitors are recommended for better tolerance over temperature.

The Y5V and Z5U type temperature rating ceramic capacitors are not recommended due to their large reduction in capacitance over temperature and increased resistance at high frequencies. These reduce their ability to filter out high-frequency noise.

The rated voltage of the input capacitor should be at least 20% higher than the maximum operating input voltage over the operating temperature range.

6.4 Output Capacitor

Output capacitor selection is also a trade-off between performance, size, and cost. Increasing output capacitor will lead to an improved transient response, however, the size and cost also increase. For operation with $V_{\text{IN}} \leq 5.0\text{V}$, a minimum of 22 μF output capacitor with ESR less than 10 m Ω is required.

For operation with $V_{\text{IN}} > 5.0\text{V}$, a minimum of 66 μF output capacitor with ESR less than 10 m Ω is required. X5R or X7R type ceramic capacitors are recommended for better tolerance over temperature. Additional capacitors can be added to improve the transient response, and to reduce the ripple of the output when the MIC2875 operates in and out of bypass mode.

The Y5V and Z5U type ceramic capacitors are not recommended due to their wide variation in capacitance over temperature and increased resistance at high frequencies. The rated voltage of the output capacitor should be at least 20% higher than the maximum operating output voltage over the operating temperature range.

The 0805 size ceramic capacitor is recommended for smaller ESL at output capacitor which contributes to a smaller voltage spike value at the output voltage of the high-frequency switching boost converter.

MIC2875

7.0 POWER DISSIPATION

As with all power devices, the ultimate current rating of the output is limited by the thermal properties of the device package and the PCB on which the device is mounted. There is a simple, Ohm's law-type relationship between thermal resistance, power dissipation, and temperature which are analogous to an electrical circuit (see [Figure 7-1](#)):

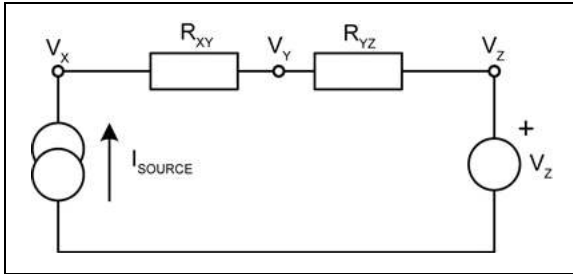

FIGURE 7-1: Series Electrical Resistance Circuit.

From this simple circuit we can calculate V_X if we know I_{SOURCE} , V_Z , and the resistor values, R_{XY} and R_{YZ} using [Equation 7-1](#):

EQUATION 7-1:

$$V_X = I_{SOURCE} \times (R_{XY} + R_{YZ}) + V_Z$$

Thermal circuits can be considered using this same rule and can be drawn similarly by replacing current sources with power dissipation (in watts), resistance with thermal resistance (in °C/W) and voltage sources with temperature (in °C).

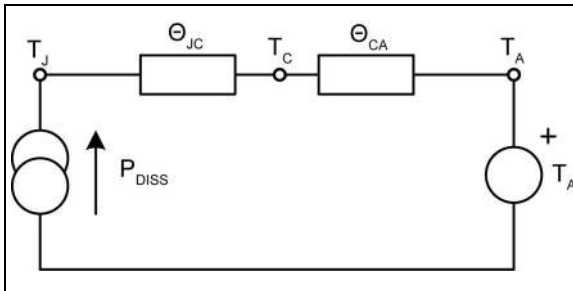

FIGURE 7-2: Series Thermal Resistance Circuit.

Now replacing the variables in the equation for V_X , we can find the junction temperature (T_J) from the power dissipation, ambient temperature and the known thermal resistance of the PCB (θ_{CA}) and the package (θ_{JC}).

EQUATION 7-2:

$$T_J = P_{DISS} \times (\theta_{JC} + \theta_{CA}) + T_A$$

As can be seen in the diagram, total thermal resistance $\theta_{JA} = \theta_{JC} + \theta_{CA}$. This can also be written as in [Equation 7-3](#):

EQUATION 7-3:

$$T_J = P_{DISS} \times (\theta_{JA}) + T_A$$

Given that all of the power losses (minus the inductor losses) are effectively in the converter and dissipated within the MIC2875 package, P_{DISS} can be calculated thusly:

EQUATION 7-4:

$$P_{DISS} = \left[P_{OUT} \times \left(\frac{1}{\eta} - 1 \right) \right] - I_{OUT}^2 \times DCR$$

For Linear Mode.

EQUATION 7-5:

$$P_{DISS} = \left[P_{OUT} \times \left(\frac{1}{\eta} - 1 \right) \right] - \left(\frac{I_{OUT}}{1-D} \right)^2 \times DCR$$

For Boost Mode.

EQUATION 7-6:

$$D = \frac{V_{OUT} - V_{IN}}{V_{OUT}}$$

In the equations above, η is the efficiency taken from the efficiency curves and DCR represents the inductor DCR. θ_{JC} and θ_{JA} are found in the temperature specifications section of the data sheet.

Where the real board area differs from 1" square, θ_{CA} (the PCB thermal resistance), values for various PCB copper areas can be taken from [Figure 7-3](#).

FIGURE 7-3: *Determining PCB Area for a Given PCB Thermal Resistance.*

Figure 7-3 shows the total area of a round or square pad, centered on the device. The solid trace represents the area of a square, single-sided, horizontal, solder masked, copper PC board trace heat sink, measured in square millimeters. No airflow is assumed.

The dashed line shows the PC board's trace heat sink covered in black oil-based paint and with 1.3 m/sec (250 feet per minute) airflow. This approaches a "best case" pad heat sink. Conservative design dictates using the solid trace data, which indicates that a maximum pad size of 5000 mm² is needed. This is a pad 71 mm × 71 mm (2.8 inches per side).

8.0 PCB LAYOUT GUIDELINES

PCB layout is critical to achieve reliable, stable and efficient performance. A ground plane is required to control EMI and minimize the inductance in power, signal and return paths. The following guidelines should be followed to ensure proper operation of the device. Please refer to the MIC2875 evaluation board document for the recommended components placement and layouts.

8.1 Integrated Circuit (IC)

- Place the IC close to the point-of-load.
- Use fat traces to route the input and output power lines.
- Analog grounds and power ground should be kept separate and connected at a single location at the PCB pad for exposed pad of the IC.
- Place as much thermal vias as possible on the PCB pad for exposed pad and connected it to the ground plane to ensure a good PCB thermal resistance can be achieved.

8.2 IN Decoupling Capacitor

- The IN decoupling capacitor must be placed close to the IN pin of the IC and preferably connected directly to the pin and not through any via. The capacitor must be located right at the IC.
- The IN decoupling capacitor should be connected as close as possible to AGND.
- The IN terminal is noise sensitive and the placement of capacitor is very critical.

8.3 V_{IN} Power Path Bulk Capacitor

- The V_{IN} power path bulk capacitor should be placed and connected close to the V_{IN} supply to the power inductor and the PGND of the IC.
- Use either X5R or X7R temperature rating ceramic capacitors. Do not use Y5V or Z5U type ceramic capacitors.

8.4 Inductor

- Keep both the inductor connections to the switch node (SW) and input power line short and wide enough to handle the switching current. Keep the areas of the switching current loops small to minimize the EMI problem.
- Do not route any digital lines underneath or close to the inductor.
- Keep the switch node (SW) away from the noise sensitive pins.
- To minimize noise, place a ground plane underneath the inductor.

8.5 Output Capacitor

- Use wide and short traces to connect the output capacitor as close as possible to the OUT and PGND pins without going through via holes to minimize the switching current loop during the main switch off cycle and the switching noise.
- Use either X5R or X7R temperature rating ceramic capacitors. Do not use Y5V or Z5U type ceramic capacitors.

9.0 PACKAGING INFORMATION

9.1 Package Marking Information

8-Lead UDFN*

Example

Legend:	XX...X	Product code or customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC® designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.
	•, ▲, ▼	Pin one index is identified by a dot, delta up, or delta down (triangle mark).
Note:	In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or may not include the corporate logo.	
	Underbar (¯) and/or Overbar (¯) symbol may not be to scale.	

Note 1: If the full seven-character YYWWNNN code cannot fit on the package, the following truncated codes are used based on the available marking space:

6 Characters = YWWNNN; 5 Characters = WWNNN; 4 Characters = WNNN; 3 Characters = NNN; 2 Characters = NN; 1 Character = N.

2: The "C" on the left package marking drawing represents copper bonding wire.

- Dimensioning and tolerancing per ASME Y14.5M
 BSC: Basic Dimension. Theoretically exact value shown without tolerances.
 REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing C04-1158-HZA Rev B Sheet 2 of 2

MIC2875

8-Lead UDFN 2 mm x 2 mm Package Outline and Recommended Land Pattern

Note: For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

RECOMMENDED LAND PATTERN

Dimension Limits	Units	MILLIMETERS		
		MIN	NOM	MAX
Contact Pitch	E	0.50 BSC		
Optional Center Pad Width	X2			1.30
Optional Center Pad Length	Y2			0.70
Contact Pad Spacing	C		1.90	
Contact Pad Width (X8)	X1			0.30
Contact Pad Length (X8)	Y1			0.80
Contact Pad to Center Pad (X8)	G1	0.20		
Thermal Via Diameter	V		0.30	

Notes:

- Dimensioning and tolerancing per ASME Y14.5M
BSC: Basic Dimension. Theoretically exact value shown without tolerances.
- For best soldering results, thermal vias, if used, should be filled or tented to avoid solder loss during reflow process

Microchip Technology Drawing C04-3158-HZA Rev. B

APPENDIX A: REVISION HISTORY

Revision A (May 2016)

- Converted Micrel document DSC2875 to Microchip data sheet template DS20005549A.
- Minor text changes throughout.

Revision B (July 2022)

- Corrected package marking drawings and added note below legend in [Section 9.1, Package Marking Information](#).
- Corrected package type information throughout text. Replaced previous package outline images with most current images.
- Other minor corrections to the text made as requested by engineering team.

MIC2875

NOTES:

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, contact your local Microchip representative or sales office.

<u>PART NO.</u>	-	<u>XX</u>	<u>X</u>	<u>XX</u>
Device		Output Voltage	Temperature	Package
Device: MIC2875: 4.8A I _{SW} , Synchronous Boost Regulator with Bi-Directional Load Disconnect Output Voltage: 4.75 = 4.75V 5.0 = 5.00V 5.25 = 5.25V 5.5 = 5.50V A = Adjustable Temperature: Y = -40°C to +125°C Package: MT = 8-Pin 2 mm x 2 mm UDFN (Note 1)				
Note 1: Ultra-Thin DFN is an RoHS-compliant package. Lead finish is Pb-free and Matte Tin. Mold compound is Halogen free. ▲ = UDFN Pin 1 identifier				
Examples: a) MIC2875-4.75YMT: 4.8A I _{SW} , Synchronous Boost Regulator with Bi-Directional Load Disconnect, 4.75V Output Voltage, -40°C to +125°C Temp. Range, 8-Lead UDFN b) MIC2875-5.0YMT: 4.8A I _{SW} , Synchronous Boost Regulator with Bi-Directional Load Disconnect, 5.00V Output Voltage, -40°C to +125°C Temp. Range, 8-Lead UDFN c) MIC2875-5.25YMT: 4.8A I _{SW} , Synchronous Boost Regulator with Bi-Directional Load Disconnect, 5.25V Output Voltage, -40°C to +125°C Temp. Range, 8-Lead UDFN d) MIC2875-5.5YMT: 4.8A I _{SW} , Synchronous Boost Regulator with Bi-Directional Load Disconnect, 5.50V Output Voltage, -40°C to +125°C Temp. Range, 8-Lead UDFN e) MIC2875-AYMT: 4.8A I _{SW} , Synchronous Boost Regulator with Bi-Directional Load Disconnect, Adjustable Output Voltage, -40°C to +125°C Temp. Range, 8-Lead UDFN

NOTES:

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable" Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at <https://www.microchip.com/en-us/support/design-help/client-support-services>.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
