

#### **Features**

- ESD protect for one line with uni-directional
- Provide transient protection for one line to IEC 61000-4-2 (ESD) ±30kV (air/contact)
   IEC 61000-4-4 (EFT) 80A (5/50ns)
   IEC 61000-4-5 (Lightning) 200A (8/20μs)
- Suitable for, 14V and below, operating voltage applications
- 2.0mm x 2.0mm DFN package saves board space
- High surge protection
- Protect one I/O line or one power line
- Fast turn-on and low clamping voltage
- Solid-state silicon-avalanche and active circuit triggering technology
- Green part

## **Applications**

- Power supply protection
- USB VBUS protection
- Cellular handsets and accessories
- Panel modules
- Portable devices
- Touch panels
- Notebooks and handhelds
- Peripherals

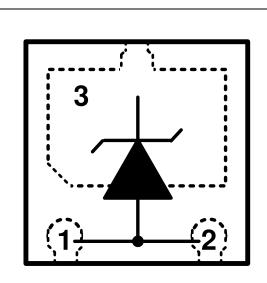

## **Description**

AZ4714-01F is a design which includes a uni-directional surge rated clamping cell to protect one power line, or one control line, or one low-speed data line in an electronic system. The AZ4714-01F has been specifically designed to protect sensitive components which are connected to power and control lines from over-voltage damage and latch-up caused by Electrostatic Discharging (ESD), Electrical Fast Transient (EFT), Lightning, and Cable Discharge Event (CDE).

AZ4714-01F is a unique design which includes proprietary clamping cell in a single package. During transient conditions, the proprietary clamping cell prevents over-voltage on the power line or control/data lines, protecting any downstream component.

AZ4714-01F may be used to meet the ESD immunity requirements of IEC 61000-4-2, Level 4 (±15kV air, ±8kV contact discharge).

## **Applications**

The AZ4714-01F is designed to protect one line against system ESD/EFT/Lightning pulses by clamping them to an acceptable reference.

The usage of the AZ4714-01F is shown in Fig. 1. Protected lines, such as data lines, control lines, or power lines, are connected to pin 3. The pin 1 and pin 2 should be connected directly to a ground plane on the board. All path lengths connected to the pins of AZ4714-01F should be kept as short as possible to minimize parasitic inductance in the board traces.

In order to obtain enough suppression of ESD induced transient, a good circuit board is critical. Thus, the following guidelines are recommended:

- Minimize the path length between the protected lines and the AZ4714-01F.
- Place the AZ4714-01F near the input terminals or connectors to restrict transient coupling.
- The ESD current return path to ground should be kept as short as possible.
- Use ground planes whenever possible.
- NEVER route critical signals near board edges and near the lines which the ESD transient easily injects to.

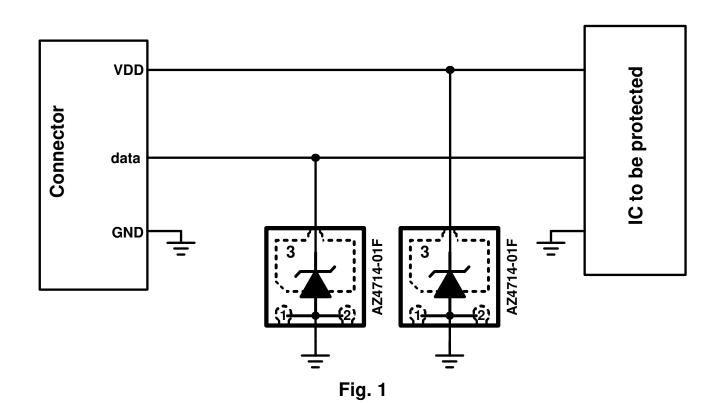

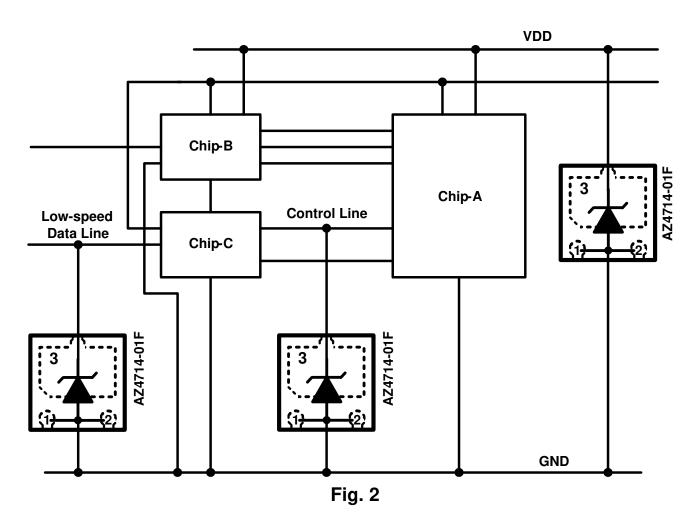

Fig. 2 shows another simplified example of using AZ4714-01F to protect the control lines,

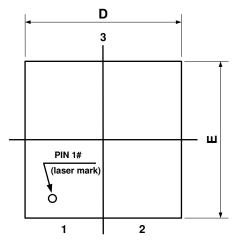

low-speed data lines, and power lines from ESD transient stress.
