

To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1st, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
 - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
 - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
 - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

RENEASAS 32-BIT RISC SINGLE-CHIP
MICROCOMPUTER
M32R FAMILY / M32R/ECU SERIES

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

Keep safety first in your circuit designs!

- Renesas Technology Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

- These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corporation product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corporation or a third party.
- Renesas Technology Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
- All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor for the latest product information before purchasing a product listed herein.

The information described here may contain technical inaccuracies or typographical errors. Renesas Technology Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.

Please also pay attention to information published by Renesas Technology Corporation by various means, including the Renesas Technology Corporation Semiconductor home page (<http://www.renesas.com>).

- When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
- Renesas Technology Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- The prior written approval of Renesas Technology Corporation is necessary to reprint or reproduce in whole or in part these materials.
- If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- Please contact Renesas Technology Corporation for further details on these materials or the products contained therein.

REVISION HISTORY

32171 Group User's Manual

Rev.	Date	Description	
		Page	Summary
0.1	Apr 8, 2000	–	First edition issued
1.0	Nov 1, 2002	all	Explanation of the M32171F2 added
		all	Designation of M32R/E changed to M32R/ECU
		P1-6	Description in Section 1.1.6, Built-in Full-CAN Function, corrected Incorrect: Compliant with CAN Specification V2.0B Correct: Compliant with CAN Specification V2.0B active
		P1-7	M32171F2 added to the internal flash memory in Figure 1.2.1
		P1-8	M32171F2 added to the internal flash memory in Table 1.2.2
		P1-10	Table 1.2.4, List of Type Name added
		P1-11	Note 1 in Figure 1.3.1 corrected Incorrect: Operates with a 5 V power supply Correct: Operates with a 3.3 V or 5 V power supply
			Functional description of pin names VCCE and OSC-VCC in Table 1.3.1 corrected Explanation of \overline{WR} added to the functional description of clock in Table 1.3.1
		P1-13	Explanation of the A-D converter in Table 1.3.1 corrected
		P1-17	Figure 1.4.1 corrected
		P3-5	Figure 3.1.3, "M32171F2 address space," added
		P3-6	Table 3.2.1 corrected Note 1 in Table 3.2.1 corrected
			Figure 3.2.3 "M32171F2 operation mode and internal ROM/external extended areas," added
		P3-8	M32171F2 added to Table 3.3.1
		P4-25	Section 4.13, "Precautions on EIT," added
		P5-13	Relevant names of causes added to Table 5.4.1
		P5-17	Relevant names of causes added to Table 5.5.1
		P5-19	Explanation added to (4) "Enabling multiple interrupts" in Section 5.5.2, "Processing of Internal Peripheral I/O Interrupts by Handler"
		P6-2	Description in Section 6.1, "Outline of the Internal Memory," corrected Precautions added to Table 6.2.1
			M32171F2 added to Table 6.3.1
		P6-3	M32171F2 added to Table 6.3.1
		P6-5	Precautions added
		P6-7	Precautions (Note 2) added
		P6-8	Precautions added
		P6-13	Figure 6.4.4, "FCNT4 Register Usage Example 2," added
		P6-22	Table 6.5.1 corrected
		P6-25	Precautions (Note 2, 3, 4) added to Table 6.5.2

REVISION HISTORY

32171 Group User's Manual

Rev.	Date	Description	
		Page	Summary
1.0	Nov 1, 2002	P6-27	Table 6.5.5, "M32171F2's relevant block and specifaion address," added
		P6-30	Table 6.5.9, "Block configuration of M32171F2 flash memory," added
		P6-38	Figure 6.5.15, Figure 6.5.16 and Figure 6.5.17 corrected
		P6-40	(3) M32171F2 added to Section 6.5.4, "Flash Programming Time (Reference Value)"
		P6-43	Precautios (Notes 2, 3, 4) added
		P6-46	Figure 6.7.6, "Virtual-flash emulation area of the M32171F2 divided in 8 Kbyte units," added
			Figure 6.7.7, "Virtual-flash emulation area of the M32171F2 divided in 4 Kbyte units," added
		P6-47, P6-48	Incorrect register names in Figures 6.7.8 through 6.7.11 corrected Incorrect: LBAKNKAD Correct: LBANKAD
		P6-49	Figure 6.7.12, "Virtual-flash bank register setup values for the M32171F2 when divided in 8 Kbyte units," added
			Figure 6.7.13, "Virtual-flash bank register setup values for the M32171F2 when divided in 4 Kbyte units," added
		P6-55	Section 6.9, "Internal Flash Memory Protect Functions," added
		P6-56	Explanation in Section 6.10, "Precautions to Be Taken when Reprogramming Flash Memory," changed
		P7-3	Table 7.3.1 corrected
		P7-4 to P7-7	Tables 7.3.2 to 7.3.5, " Pin Status When Reset," added or corrected
		P8-4	Table 8.2.1 corrected
			Precautions in Table 8.2.1 corrected
		P8-22 to P8-25	Figures 8.4.1 to 8.4.4 corrected
		P8-26	Section 8.5, "Precautions on Input/output Ports," added
		P9-4	Figure 9.1.2, "Causes of DMAC Requests Connection Diagram," added
		P10-1 to P10-142	Chapter 10 overall, designation of the prescaler unified to PRS
		P10-4	Port numbers added to Figure 10.1.1
		P10-5	Port numbers added to Figure 10.1.2
		P10-12	Port numbers added to Figure 10.2.2
P10-31	Figure 10.2.5 changed		
P10-47	Port numbers added to Figure 10.3.1		
P10-55	Port number added to Figure 10.3.5		
P10-66	Figure 10.3.8 corrected		

REVISION HISTORY

32171 Group User's Manual

Rev.	Date	Description	
		Page	Summary
1.0	Nov 1, 2002	P10-84	Port numbers added to Figure 10.4.1
		P10-93	Port numbers added to Figure 10.4.5
		P10-96	Port numbers added to Figure 10.4.6
		P10-124	Port numbers added to Figure 10.5.1
		P10-130	Figure 10.5.3 corrected
		P10-133	Port numbers added to Figure 10.6.1
		P10-141	Note 1 in Figure 10.6.3 corrected
		P11-3	Table 11.1.1 corrected
			Precautions in Table 11.1.1 corrected
		P11-4	Register names in Figure 11.1.1 corrected
		P11-35	Method for calculating the conversion time during A-D conversion mode and that for conversion time during compare mode explained separately
			Table 11.3.1 and precautions corrected
			Figure 11.3.4, "Conceptual Diagram of Conversion Time in Compare Mode," added
			Table 11.3.2, "Conversion Clock Cycles in Compare Mode," added
		P11-37 to P11-38	Explanation in Section 11.3.5, "Definition of the A-D Conversion Accuracy," changed
		P11-40 to P11-42	A section "Regarding the analog input pins" added to Section 11.4, "Precautions on Using A-D Converters"
		P12-12	Figure 12.2.4 corrected
		P12-24	Description of the last line in Section 12.2.8, "SIO Baud Rate Register," corrected Incorrect: 7 or less Correct: greater than 7
		P12-58	Figure 12.7.5, "Detecting the Start Bit, added
			Figure 12.7.6, "Example of an Invalid Start Bit (Not Received)," added
			Figure 12.7.7, "Delay when Receiving," added
		P13-2	Description in Section 13.1, "Outline of the CAN Module," corrected Incorrect: Compliant with CAN (Controller Area Network) Specification V2.0B Correct: Compliant with CAN (Controller Area Network) Specification V2.0B active
			Protocol explanation in Table 13.1.1 corrected Incorrect: CAN Specification V2.0B Correct: CAN Specification V2.0B active
			Explanation of acceptance filters in Table 13.1.1 changed
			Precautions in Table 13.1.1 changed
			Figure 13.1.1 corrected
		P13-19	Table 13.2.2, "Example for Setting Bit Timing when CPU Clock: 32 MHz," added
P13-20	Note 3 added		

REVISION HISTORY

32171 Group User's Manual

Rev.	Date	Description	
		Page	Summary
1.0	Nov 1, 2002	P13-28	Figure 13.2.5 corrected
		P13-29	Figure 13.2.6 corrected
		P13-30	Figure 13.2.7 corrected
		P13-35	Figure 13.2.8, "Relationship between Mask Registers and the Controlled Slots," added Figure 13.2.9, "Operation of the Acceptance Filter," added
		P13-61	Explanation in (2) Confirming that transmission is idle corrected
		P13-64	Figure 13.5.2 corrected
		P13-65	Explanation in (2) Confirming that reception is idle corrected
		P13-68	Figure 13.6.2 corrected
		P13-71	Explanation in (2) Confirming that transmission is idle corrected
		P13-75	Figure 13.7.2 corrected
		P13-78	Explanation in (2) Confirming that reception is idle corrected
		P13-82	Figure 13.8.2 corrected
		P15-6 to P15-11	Figures 15.2.1 to 15.2.6 corrected (Address signals A12 to A30 and chip select signals CS0, CS1 separately shown)
		P15-12 to P15-13	Figures 15.3.1 and 15.3.2 corrected (Address signals A12 to A30 and chip select signals CS0, CS1 separately shown)
		P16-6 to P16-19	Figures 16.3.1 to 16.3.14 corrected (Address signals A12 to A30 and chip select signals CS0, CS1 separately shown)
		P18-2	Precautions added to Figure 18.1.1
		P19-7	Figure 19.4.2 corrected
		P19-14	Precautions added to Section 19.5, "Boundary Scan Description Language"
		P19-14	BSDL description language for the 32171 (Figures 19.5.1 to 19.5.14) deleted
		P19-15	Precautions added to Figure 19.6.1
		P19-16	Precautions added to Section 19.7, "Processing Pins when Not Using JTAG" Figure 19.7.1, "Processing Pins when Not Using JTAG," added
		P20-1 to P20-16	In Chapter 20, explanation of power supply turn-on/turn-off sequences during VCCE=3.3V added Chapter 20 overall, designations of "5V system" and "3.3V system" changed to "external I/O" and "internal," respectively
		P20-12	Figure 20.3.6 corrected
		P20-13	Figure 20.3.8, "CPU Reset State" deleted
		P20-15	Figure 20.3.12, "SRAM Data Backup State" deleted
		P21-3, P21-4	Recommended operating conditions corrected (minimum value of analog reference voltage added)
		P21-5	(1) Electrical characteristics when f(XIN) = 10 MHz corrected

REVISION HISTORY

32171 Group User's Manual

Rev.	Date	Description	
		Page	Summary
1.0	Nov 1, 2002	P21-7	(3) Electrical characteristics when f(XIN) = 8 MHz corrected
		P21-10	Section 21.1.4, "A/D Conversion Characteristics," corrected
		P21-11 to P21-18	Section 21.2, "Electrical Characteristics (when VCCE = 3.3V)," added
		P21-19	Explanation in Section 21.3.1, "Timing Requirements," corrected
		P21-22	(9) Table of rated RTD timings corrected
		P21-32	Figure 21.3.12 corrected
		Appendix 3	Appendix 3, "Processing Unused Pins," added
		Appendix 4	Appendix 4, "Summary of Precautions," added
		"Precautions about Noise" in Appendix 3 moved to Appendix 4, "Summary of Precautions"	
2.00	Sep 19, 2003	all	The word "Mitsubishi" deleted or replaced by "Renesas"
		P1-4	Figure 1.1.1 and Table 1.1.1 newly added
		P2-14	Section 2.7, "Precautions on CPU" added
		P3-8	Addresses in the third line of Section 3.3 corrected Incorrect: H'0000 0000 to H'0003 FFFF Correct: H'0000 0000 to H'003F FFFF
		P3-9	Addresses in Section 3.4.1 corrected Incorrect: H'0080 4000 through H'0080 3FFF Correct: H'0080 4000 through H'0080 7FFF
		P4-20	Designation in (2), "Updating SM, IE and C bits" in the Section [EIT processing] corrected Incorrect: SM ← 0 Correct: SM ← Unchanged
		P5-end	Section 5.2 and 5.3 placed in reversed Title of Section 5.3 (former 5.2) changed Before: Interrupt Sources of Internal Peripheral After: Interrupt Request Sources in Internal Peripheral
		P5-2	Description in the fourth line of Section 5.1 corrected Incorrect: total of 31 Correct: total of 22 Note added to Table 5.1.1
		P5-3	Figure 5.1.1 altered
		P5-5, P5-6	Note (former CAUTION) altered
		P5-7	Description in Section 5.2.3 altered
		P5-9	Description in (1), "IREQ (Interrupt Request) bit (D3 or D11)", altered
		P5-10	Figures 5.2.2, "Configuration of the Interrupt Control Register (Edge-recognized Type)", and 5.2.3, "Configuration of the Interrupt Control Register (Level-recognized Type)", changed

REVISION HISTORY

32171 Group User's Manual

Rev.	Date	Description	
		Page	Summary
2.00	Sep 19, 2003	P5-17	Table 5.5.1 corrected
		P5-19, P5-20	Description in (2) to (4), Section 5.5.2 changed
		P5-21	Figure 5.5.2 changed
		P6-43	Note 3 for Section 6.7.1 corrected
		P6-44	Notes in Figures 6.7.2 and 6.7.3 corrected
		P6-50	Figure, "Virtual-Flash Emulation Mode to Normal Mode Return Sequence" deleted
		P7-1 to P7-7	Chapter 7 overall, The phrase "reset release" changed to " exiting reset"
		P7-3	Registers R0-R15 added to Table 7.3.1
		P10-end	Sections 10.7 to 10.9 deleted
		P10-19, P10-20	Note added
		P10-49	Figure 10.3.2, "Count Clock Dependent Delay", newly added
		P10-72	Figure (former 10.3.13), "Prescaler Delay", deleted
		P10-82	Figure 10.3.22 deleted
		P10-83 to P10-122	Section 10.4 overall, Description of DMA transfer request generation (for only the TIO8) newly added
		P10-87	Description of "Count clock-dependent delay" along with Figure 10.4.2 newly added
		P10-96	Figure 10.4.7, "Outline Diagram of TIO5-9 Clock/Enable Inputs", altered
		P10-103	Description of $W=\Delta$ corrected
		P10-115	(3), "Precautions on using TIO PWM output mode", newly added
		P10-119	Last item of Section 10.4.13. (2) added
		P10-124	Figure 10.5.1 corrected Description of "Count clock-dependent delay" along with Figure 10.5.2 newly added
		P10-141	Second paragraph of Section 10.6.7. (1) corrected
		P11-6	Description added to Section 11.1.2
		P11-16	Note 1 added
		P11-36	Conversion time for Comparator mode in Table 11.3.3 corrected Incorrect: 27 Correct: 29
		P11-39	"AD1CSTP" is deleted from the explanation of "Forcible termination during scan operation" in Section 11.14
		P11-41, P11-42	Equations altered

REVISION HISTORY

32171 Group User's Manual

Rev.	Date	Description	
		Page	Summary
2.00	Sep 19, 2003	P12-3	Baud rate for UART mode in Table 12.1.1 changed Before: 156K bits/sec After: 1.25M bits/sec
		P12-14	Note in Section 12.2.3. (1) corrected
		P12-24	Last paragraph of Section 12.2.8 changed
		P12-34	Figure 12.4.1 corrected
		P12-42	Note deleted
		P12-46	Figure 12.6.3 corrected
			Note deleted
		P12-53	Figure 12.7.1 corrected
			Note deleted
		P12-60	Description in "Setting of Baud Rate (BRG) Register" partly deleted
		P13-9	Notes and Explanation added for 13.2.1. (4), "RFST (Forcible Reset) bit"
		P13-77	Figure 13.7.3 altered
		P15-16	Figure 5.4.3 corrected
		P17-4	Note 4 for Figure 17.2.3 corrected
		P17-6	Note 2 for Figure 17.3.2 altered
		P18-5	Figure 18.2.1 altered
		P19-13	TAP states for (2) continuous access to the same datagister in Figure 19.4.5 corrected
		P19-14	Note in Section 19.5 altered
		P21-5, P21-7	Note 3 changed
		P21-9	Figures of ICCI-3V temperature characteristics newly added
		P21-11	Descriptions of IIAN in the tables, Section 21.1.4 added
		P21-18	(2) Electrical characteristics of each power supply pin when f(XIN)=10 MHz corrected to (4) Electrical characteristics of each power supply pin when f(XIN)= 8 MHz
		P21-19	"A-D conversion characteristics (Referenced to AVCC=VREF=VCCE=3.3V, Ta=25°C, f(XIN) = 8.0 MHz Unless Otherwise Noted)" corrected to "A-D conversion characteristics (Referenced to AVCC=VREF=VCCE=3.3V, Ta = -40 to 85°C, f(XIN) = 8.0 MHz Unless Otherwise Noted)"
			Descriptions of IIAN in the tables, Section 21.2.4 added
		P21-23	Maximum rated value for td(RTDCLKH-RTDRXD) corrected
		P21-25	"tv(BCLKL-BHWL)" corrected to "td(BCLKL-D)"
		P21-26	Parameter, "Byte enable delay time after write" corrected to "Valid Byte enable timer after write"
P21-27	Figure 21.3.1 altered		
P22-2	Normal mode added to (1) Test conditions		

REVISION HISTORY

32171 Group User's Manual

Rev.	Date	Description	
		Page	Summary
2.00	Sep 19, 2003	Appendix 3-2, 3-3	Processing for Input/output ports in Table A3.1.1 altered Note 3 altered
		Appendix 4-11	Last item of Appendix 4.8.6 added
		Appendix 4-24	Last line of the 1st paragraph deleted
		Appendix 4-25	Description in (2), "Wiring of clock input/output pins", altered
			Figure A4.13.2 changed
		Appendix 4-26	(3), "Wiring of the VCNT pin", and Figure A4.13.3, "Example Wiring of the VCNT Pin", newly added
			Figure A4.13.7, "Exmple Wiring of the MOD0 and MOD1 Pins", altered
		Appendix 4-29	Description in (1), "Avoidance from large-current signal lines", altered
Figure A4.13.7, "Example Wiring of Large-current Signal Lines", changed			
Appendix 4-30	Figure A.4.13.8, "Example Wiring of Rapidly Level-changing Signal Lines", changed		
Appendix 4-31,32	(3), "Protection against signal lines that are the source of strong noise", and Figures A4.13.9, "Example Processing of a Noise-laden Pin", and A4.13.10, "Example Processing of Pins Adjacent to the Oscillator and VCNT Pins", newly added		

How to read internal I/O register tables

- ① Bit Numbers: Each register is connected with an internal bus of 16-bit wide, so the bit numbers of the registers located at even addresses are D0-D7, and those at odd addresses are D8-D15.
- ② State of Register at Reset: Represents the initial state of each register immediately after reset with hexadecimal numbers (undefined bits after reset are indicated each in column ③.)
- ③ At read:
 - ... read enabled
 - ? ... read disabled (read value invalid)
 - 0 ... Read always as 0
 - 1 ... Read always as 1
- ④ At write:
 - : Write enabled
 - : Write enable conditionally (include some conditions at write)
 - : Write disabled (Written value invalid)

<Example of representation>

② → <at reset: H'04>

D	Bit name	Function	R	W
0	Not assigned.		0	—
1	Abit (.....)	0: ----- 1: -----	<input type="radio"/>	<input type="radio"/>
2	Bbit (.....)	0: ----- 1: -----	<input type="radio"/>	<input type="radio"/>
3	Cbit (.....)	0: ----- 1: -----	<input type="radio"/>	<input type="radio"/>

③ ④

Table of contents

CHAPTER 1 OVERVIEW

1.1 Outline of the 32171	1-2
1.1.1 M32R Family CPU Core	1-2
1.1.2 Built-in Multiply-Accumulate Operation Function	1-3
1.1.3 Built-in Flash Memory and RAM	1-3
1.1.4 Built-in Clock Frequency Multiplier	1-4
1.1.5 Built-in Powerful Peripheral Functions	1-4
1.1.6 Built-in Full-CAN Function	1-6
1.1.7 Built-in Debug Function	1-6
1.2 Block Diagram	1-7
1.3 Pin Function	1-11
1.4 Pin Layout.....	1-17

CHAPTER 2 CPU

2.1 CPU Registers	2-2
2.2 General-purpose Registers	2-2
2.3 Control Registers	2-3
2.3.1 Processor Status Word Register: PSW (CR0)	2-4
2.3.2 Condition Bit Register: CBR (CR1)	2-5
2.3.3 Interrupt Stack Pointer: SPI (CR2).....	2-5
User Stack Pointer: SPU (CR3)	
2.3.4 Backup PC: BPC (CR6)	2-5
2.4 Accumulator	2-6
2.5 Program Counter	2-6
2.6 Data Formats	2-7
2.6.1 Data Types	2-7
2.6.2 Data Formats	2-8
2.7 Precautions on CPU	2-14

CHAPTER 3 ADDRESS SPACE

3.1 Outline of Address Space	3-2
3.2 Operation Modes	3-6
3.3 Internal ROM Area and External Extension Area	3-8
3.3.1 Internal ROM Area	3-8
3.3.2 External Extension Area	3-8
3.4 Internal RAM Area and SFR Area	3-9
3.4.1 Internal RAM Area	3-9
3.4.2 Special Function Register (SFR) Area	3-9
3.5 EIT Vector Entry	3-23
3.6 ICU Vector Table	3-24
3.7 Notes on Address Space	3-26

CHAPTER 4 EIT

4.1 Outline of EIT	4-2
4.2 EIT Events	4-3
4.2.1 Exception	4-3
4.2.2 Interrupt	4-3
4.2.3 Trap	4-3
4.3 EIT Processing Procedure	4-4
4.4 EIT Processing Mechanism	4-6
4.5 Acceptance of EIT Events	4-7
4.6 Saving and Restoring the PC and PSW	4-8
4.7 EIT Vector Entry	4-10
4.8 Exception Processing	4-11
4.8.1 Reserved Instruction Exception (RIE)	4-11
4.8.2 Address Exception (AE)	4-13
4.9 Interrupt Processing	4-15
4.9.1 Reset Interrupt (RI)	4-15
4.9.2 System Break Interrupt (SBI)	4-16
4.9.3 External Interrupt (EI)	4-18

4.10 Trap Processing	4-20
4.10.1 Trap (TRAP)	4-20
4.11 EIT Priority Levels	4-22
4.12 Example of EIT Processing	4-23
4.13 Precautions on EIT	4-25

CHAPTER 5 INTERRUPT CONTROLLER (ICU)

5.1 Outline of the Interrupt Controller (ICU)	5-2
5.2 ICU Related Registers	5-4
5.2.1 Interrupt Vector Register	5-5
5.2.2 Interrupt Mask Register	5-6
5.2.3 SBI (System Break Interrupt) Control Register	5-7
5.2.4 Interrupt Control Registers	5-8
5.3 Interrupt Sources in Internal Peripheral I/O	5-12
5.4 ICU Vector Table	5-13
5.5 Description of Interrupt Operation	5-16
5.5.1 Acceptance of Internal Peripheral I/O Interrupts	5-16
5.5.2 Processing of Internal Peripheral I/O Interrupts by Handlers	5-19
5.6 Description of System Break Interrupt (SBI) Operation	5-22
5.6.1 Acceptance of SBI	5-22
5.6.2 SBI Processing by Handler	5-22

CHAPTER 6 INTERNAL MEMORY

6.1 Outline of the Internal Memory	6-2
6.2 Internal RAM	6-2
6.3 Internal Flash Memory	6-3
6.4 Registers Associated with the Internal Flash Memory	6-3
6.4.1 Flash Mode Register	6-4
6.4.2 Flash Status Registers	6-5
6.4.3 Flash Control Registers	6-8
6.4.4 Virtual Flash L Bank Register	6-14
6.4.5 Virtual Flash S Bank Registers	6-15

6.5 Programming of the Internal Flash Memory	6-16
6.5.1 Outline of Programming Flash Memory	6-16
6.5.2 Controlling Operation Mode during Programming Flash	6-22
6.5.3 Programming Procedure to the Internal Flash Memory	6-25
6.5.4 Flash Program Time (for Reference)	6-39
6.6 Boot ROM	6-41
6.7 Virtual Flash Emulation Function	6-42
6.7.1 Virtual Flash Emulation Area	6-43
6.7.2 Entering Virtual Flash Emulation Mode	6-50
6.7.3 Application Example of Virtual Flash Emulation Mode	6-51
6.8 Connecting to A Serial Programmer	6-53
6.9 Internal Flash Memory Protect Functions	6-55
6.10 Precautions to Be Taken When Reprogramming Flash Memory	6-56

CHAPTER 7 RESET

7.1 Outline of Reset	7-2
7.2 Reset Operation	7-2
7.2.1 Reset at Power-on	7-2
7.2.2 Reset during Operation	7-2
7.2.3 Reset Vector Relocation during Flash Reprogramming	7-2
7.3 Internal State after Exiting Reset	7-3
7.4 Things To Be Considered after Exiting Reset	7-8

CHAPTER 8 INPUT/OUTPUT PORTS AND PIN FUNCTIONS

8.1 Outline of Input/Output Ports	8-2
8.2 Selecting Pin Functions	8-4
8.3 Input/Output Port Related Registers	8-6
8.3.1 Port Data Registers	8-8
8.3.2 Port Direction Registers	8-9
8.3.3 Port Operation Mode Registers	8-10
8.4 Port Peripheral Circuits	8-22
8.5 Precautions on Input/output Ports	8-26

CHAPTER 9 DMAC

9.1 Outline of the DMAC	9-2
9.2 DMAC Related Registers	9-5
9.2.1 DMA Channel Control Register	9-7
9.2.2 DMA Software Request Generation Registers	9-18
9.2.3 DMA Source Address Registers	9-19
9.2.4 DMA Destination Address Registers	9-20
9.2.5 DMA Transfer Count Registers	9-21
9.2.6 DMA Interrupt Request Status Registers	9-22
9.2.7 DMA Interrupt Mask Registers	9-24
9.3 Functional Description of the DMAC	9-28
9.3.1 Cause of DMA Request	9-28
9.3.2 DMA Transfer Processing Procedure	9-32
9.3.3 Starting DMA	9-33
9.3.4 Channel Priority	9-33
9.3.5 Gaining and Releasing Control of the Internal Bus	9-33
9.3.6 Transfer Units	9-34
9.3.7 Transfer Counts	9-34
9.3.8 Address Space	9-34
9.3.9 Transfer Operation	9-34
9.3.10 End of DMA and Interrupt	9-38
9.3.11 Status of Each Register after Completion of DMA Transfer	9-38
9.4 Precautions about the DMAC	9-39

CHAPTER 10 MULTIJUNCTION TIMERS

10.1 Outline of Multijunction Timers	10-2
10.2 Common Units of Multijunction Timer	10-7
10.2.1 Timer Common Register Map	10-7
10.2.2 Prescaler Unit	10-9
10.2.3 Clock Bus/Input-Output Event Bus Control Unit	10-10
10.2.4 Input Processing Control Unit	10-15
10.2.5 Output Flip-Flop Control Unit	10-21
10.2.6 Interrupt Control Unit	10-29

10.3 TOP (Output-related 16-bit Timer)	10-46
10.3.1 Outline of TOP	10-46
10.3.2 Outline of Each Mode of TOP	10-48
10.3.3 TOP Related Register Map	10-50
10.3.4 TOP Control Registers	10-53
10.3.5 TOP Counters (TOP0CT-TOP10CT)	10-60
10.3.6 TOP Reload Registers (TOP0RL-TOP10RL)	10-61
10.3.7 TOP Correction Registers (TOP0CC-TOP10CC)	10-62
10.3.8 TOP Enable Control Register	10-63
10.3.9 Operation in TOP Single-shot Output Mode (with Correction Function)	10-67
10.3.10 Operation in TOP Delayed Single-shot Output Mode (With Correction Function)	10-74
10.3.11 Operation in TOP Continuous Output Mode (Without Correction Function)	10-79
10.4 TIO (Input/Output-related 16-bit Timer)	10-83
10.4.1 Outline of TIO	10-83
10.4.2 Outline of Each Mode of TIO	10-85
10.4.3 TIO Related Register Map	10-88
10.4.4 TIO Control Registers	10-91
10.4.5 TIO Counter (TIO0CT-TIO9CT)	10-102
10.4.6 TIO Reload 0/ Measure Register (TIO0RL0-TIO9RL0)	10-103
10.4.7 TIO Reload 1 Registers (TIO0RL1-TIO9RL1)	10-104
10.4.8 TIO Enable Control Registers	10-105
10.4.9 Operation in TIO Measure Free-run/Clear Input Modes	10-108
10.4.10 Operation in TIO Noise Processing Input Mode	10-112
10.4.11 Operation in TIO PWM Output Mode	10-113
10.4.12 Operation in TIO Single-shot Output Mode (without Correction Function) ..	10-117
10.4.13 Operation in TIO Delayed Single-shot Output Mode (without Correction Function) ..	10-119
10.4.14 Operation in TIO Continuous Output Mode (Without Correction Function) ..	10-121
10.5 TMS (Input-related 16-bit Timer)	10-123
10.5.1 Outline of TMS	10-123
10.5.2 Outline of TMS Operation	10-123
10.5.3 TMS Related Register Map	10-125
10.5.4 TMS Control Registers	10-126
10.5.5 TMS Counter (TMS0CT, TMS1CT)	10-128
10.5.6 TMS Measure Registers (TMS0MR3-0, TMS1MR3-0)	10-129
10.5.7 Operation of TMS Measure Input	10-130

10.6 TML (Input-related 32-bit Timer)	10-132
10.6.1 Outline of TML	10-132
10.6.2 Outline of TML Operation	10-133
10.6.3 TML Related Register Map	10-134
10.6.4 TML Control Registers	10-135
10.6.5 TML Counters	10-137
10.6.6 TML Measure Registers	10-139
10.6.7 Operation of TML Measure Input	10-141

CHAPTER 11 A-D CONVERTER

11.1 Outline of A-D Converter	11-2
11.1.1 Conversion Modes	11-5
11.1.2 Operation Modes	11-6
11.1.3 Special Operation Modes	11-10
11.1.4 A-D Converter Interrupt and DMA Transfer Requests	11-13
11.2 A-D Converter Related Registers	11-14
11.2.1 A-D Single Mode Register 0	11-16
11.2.2 A-D Single Mode Register 1	11-19
11.2.3 A-D Scan Mode Register 0	11-21
11.2.4 A-D Scan Mode Register 1	11-24
11.2.5 A-D Successive Approximation Register	11-26
11.2.6 A-D0 Compare Data Register	11-27
11.2.7 10-bit A-D Data Registers	11-28
11.2.8 8-bit A-D Data Registers	11-29
11.3 Functional Description of A-D Converter	11-30
11.3.1 How to Find Analog Input Voltages	11-30
11.3.2 A-D Conversion by Successive Approximation Method	11-31
11.3.3 Comparator Operation	11-33
11.3.4 Calculation of the A-D Conversion Time	11-34
11.3.5 Definition of the A-D Conversion Accuracy	11-37
11.4 Precautions on Using A-D Converter	11-39

CHAPTER 12 SERIAL I/O

12.1 Outline of Serial I/O	12-2
---	-------------

12.2 Serial I/O Related Registers	12-6
12.2.1 SIO Interrupt Related Registers	12-7
12.2.2 SIO Interrupt Control Registers	12-9
12.2.3 SIO Transmit Control Registers	12-13
12.2.4 SIO Transmit/Receive Mode Registers	12-15
12.2.5 SIO Transmit Buffer Registers	12-18
12.2.6 SIO Receive Buffer Registers	12-19
12.2.7 SIO Receive Control Registers	12-20
12.2.8 SIO Baud Rate Registers	12-23
12.3 Transmit Operation in CSIO Mode	12-25
12.3.1 Setting the CSIO Baud Rate	12-25
12.3.2 Initial Settings for CSIO Transmission	12-26
12.3.3 Starting CSIO Transmission	12-28
12.3.4 Successive CSIO Transmission	12-28
12.3.5 Processing at End of CSIO Transmission	12-29
12.3.6 Transmit Interrupt	12-29
12.3.7 Transmit DMA Transfer Request	12-29
12.3.8 Typical CSIO Transmit Operation	12-31
12.4 Receive Operation in CSIO Mode	12-33
12.4.1 Initial Settings for CSIO Reception	12-33
12.4.2 Starting CSIO Reception	12-35
12.4.3 Processing at End of CSIO Reception	12-35
12.4.4 About Successive Reception	12-36
12.4.5 Flags Indicating the Status of CSIO Receive Operation	12-37
12.4.6 Typical CSIO Receive Operation	12-38
12.5 Precautions on Using CSIO Mode	12-40
12.6 Transmit Operation in UART Mode	12-42
12.6.1 Setting the UART Baud Rate	12-42
12.6.2 UART Transmit/Receive Data Formats	12-43
12.6.3 Initial Settings for UART Transmission	12-45
12.6.4 Starting UART Transmission	12-47
12.6.5 Successive UART Transmission	12-47
12.6.6 Processing at End of UART Transmission	12-48
12.6.7 Transmit Interrupt	12-48
12.6.8 Transmit DMA Transfer Request	12-48

12.6.9 Typical UART Transmit Operation	12-50
12.7 Receive Operation in UART Mode	12-52
12.7.1 Initial Settings for UART Reception	12-52
12.7.2 Starting UART Reception	12-54
12.7.3 Processing at End of UART Reception	12-54
12.7.4 Typical UART Receive Operation	12-56
12.7.5 Detecting the Start Bit during UART Reception	12-58
12.8 Fixed Period Clock Output Function	12-59
12.9 Precautions on Using UART Mode	12-60

CHAPTER 13 CAN MODULE

13.1 Outline of the CAN Module	13-2
13.2 CAN Module Related Registers	13-4
13.2.1 CAN Control Register	13-8
13.2.2 CAN Status Register	13-11
13.2.3 CAN Extended ID Register	13-15
13.2.4 CAN Configuration Register	13-16
13.2.5 CAN Time Stamp Count Register	13-20
13.2.6 CAN Error Count Registers	13-21
13.2.7 CAN Baud Rate Prescaler	13-22
13.2.8 CAN Interrupt Related Registers	13-23
13.2.9 CAN Mask Registers	13-31
13.2.10 CAN Message Slot Control Registers	13-36
13.2.11 CAN Message Slots	13-40
13.3 CAN Protocol	13-55
13.3.1 CAN Protocol Frame	13-55
13.4 Initializing the CAN Module	13-58
13.4.1 Initialization of the CAN Module	13-58
13.5 Transmitting Data Frames	13-61
13.5.1 Data Frame Transmit Procedure	13-61
13.5.2 Data Frame Transmit Operation	13-63
13.5.3 Transmit Abort Function	13-64

13.6 Receiving Data Frames	13-65
13.6.1 Data Frame Receive Procedure	13-65
13.6.2 Data Frame Receive Operation	13-67
13.6.3 Reading Out Received Data Frames	13-69
13.7 Transmitting Remote Frames	13-71
13.7.1 Remote Frame Transmit Procedure	13-71
13.7.2 Remote Frame Transmit Operation	13-73
13.7.3 Reading Out Received Data Frames when Set for Remote Frame Transmission	13-76
13.8 Receiving Remote Frames	13-78
13.8.1 Remote Frame Receive Procedure	13-78
13.8.2 Remote Frame Receive Operation	13-80

CHAPTER 14 REAL-TIME DEBUGGER (RTD)

14.1 Outline of the Real-Time Debugger (RTD)	14-2
14.2 Pin Function of the RTD	14-3
14.3 Functional Description of the RTD	14-4
14.3.1 Outline of RTD Operation	14-4
14.3.2 Operation of RDR (Real-time RAM Content Output)	14-5
14.3.3 Operation of WRR (RAM Content Forcible Rewrite)	14-7
14.3.4 Operation of VER (Continuous Monitor)	14-9
14.3.5 Operation of VEI (Interrupt Request)	14-10
14.3.6 Operation of RCV (Recover from Runaway)	14-11
14.3.7 Method to Set a Specified Address when Using the RTD	14-12
14.3.8 Resetting the RTD	14-13
14.4 Typical Connection with the Host	14-14

CHAPTER 15 EXTERNAL BUS INTERFACE

15.1 External Bus Interface Related Signals	15-2
15.2 Read/Write Operations	15-6
15.3 Bus Arbitration	15-12
15.4 Typical Connection of External Extension Memory	15-14

CHAPTER 16 WAIT CONTROLLER

16.1 Outline of the Wait Controller	16-2
16.2 Wait Controller Related Registers	16-4
16.2.1 Wait Cycles Control Register (WTCCR)	16-5
16.3 Typical Operation of the Wait Controller	16-6

CHAPTER 17 RAM BACKUP MODE

17.1 Outline of RAM Backup Mode	17-2
17.2 Example of RAM Backup when Power is Down	17-2
17.2.1 Normal Operating State	17-3
17.2.2 RAM Backup State	17-4
17.3 Example of RAM Backup for Saving Power Consumption	17-5
17.3.1 Normal Operating State	17-6
17.3.2 RAM Backup State	17-7
17.3.3 Precautions to Be Observed at Power-on	17-8
17.4 Exiting RAM Backup Mode (Wakeup)	17-9

CHAPTER 18 OSCILLATION CIRCUIT

18.1 Oscillator Circuit	18-2
18.1.1 Example of an Oscillator Circuit	18-2
18.1.2 System Clock Output Function	18-3
18.1.3 Oscillation Stabilization Time at Power-on	18-4
18.2 Clock Generator Circuit	18-5

CHAPTER 19 JTAG

19.1 Outline of JTAG	19-2
19.2 Configuration of the JTAG Circuit	19-3
19.3 JTAG Registers	19-4
19.3.1 Instruction Register (JTAGIR)	19-4
19.3.2 Data Registers	19-5

19.4 Basic Operation of JTAG	19-6
19.4.1 Outline of JTAG Operation	19-6
19.4.2 IR Path Sequence	19-8
19.4.3 DR Path Sequence	19-10
19.4.4 Examining and Setting Data Registers	19-12
19.5 Boundary Scan Description Language	19-14
19.6 Precautions on Board Design when Using JTAG	19-15
19.7 Processing Pins when Not Using JTAG	19-16

CHAPTER 20 POWER-ON/POWER-OFF SEQUENCE

20.1 Configuration of the Power Supply Circuit	20-2
20.2 Power-On Sequence	20-4
20.2.1 Power-On Sequence When Not Using RAM Backup	20-4
20.2.2 Power-On Sequence When Using RAM Backup	20-6
20.3 Power-off Sequence	20-8
20.3.1 Power-off Sequence When Not Using RAM Backup	20-8
20.3.2 Power-off Sequence When Using RAM Backup	20-10

CHAPTER 21 ELECTRICAL CHARACTERISTICS

21.1 Electrical Characteristics (VCCE = 5 V)	21-2
21.1.1 Absolute Maximum Ratings	21-2
21.1.2 Recommended Operating Conditions	21-3
21.1.3 DC Characteristics	21-5
21.1.4 A-D Conversion Characteristics	21-11
21.2 Electrical Characteristics (VCCE = 3.3 V)	21-12
21.2.1 Absolute Maximum Ratings	21-12
21.2.2 Recommended Operating Conditions	21-13
21.2.3 DC Characteristics	21-15
21.2.4 A-D Conversion Characteristics	21-19
21.3 AC Characteristics	21-20
21.3.1 Timing Requirements	21-20
21.3.2 Switching Characteristics	21-24
21.3.3 AC Characteristics	21-27

CHAPTER 22 TYPICAL CHARACTERISTICS

22.1 A-D Conversion Characteristics	22-2
---	------

APPENDIX 1 MECHANICAL SPECIFICATIONS

Appendix 1.1 Dimensional Outline Drawing.....	Appendix 1-2
---	--------------

APPENDIX 2 INSTRUCTION PROCESSING TIME

Appendix 2.1 M32R/ECU Instruction Processing Time	Appendix 2-2
---	--------------

APPENDIX 3 PROCESSING OF UNUSED PINS

Appendix 3.1 Example for Processing Unused Pins	Appendix 3-2
---	--------------

APPENDIX 4 SUMMARY OF PRECAUTIONS

Appendix 4.1 Precautions Regarding the CPU	Appendix 4-2
Appendix 4.1.1 Things to be noted for data transfer	Appendix 4-2
Appendix 4.2 Precautions on Address Space	Appendix 4-2
Appendix 4.2.1 Virtual flash emulation function	Appendix 4-2
Appendix 4.3 Precautions on EIT	Appendix 4-3
Appendix 4.4 Precautions to Be Taken When Reprogramming	
Flash Memory	Appendix 4-3
Appendix 4.5 Things to Be Considered after Exiting Reset	Appendix 4-4
Appendix 4.5.1 Input/output Ports	Appendix 4-4
Appendix 4.6 Precautions on Input/output Ports	Appendix 4-4
Appendix 4.6.1 When using the ports in output mode	Appendix 4-4
Appendix 4.7 Precautions about the DMAC	Appendix 4-5
Appendix 4.7.1 About writing to DMAC related registers	Appendix 4-5
Appendix 4.7.2 Manipulating DMAC related registers by	
DMA transfer	Appendix 4-6
Appendix 4.7.3 About the DMA Interrupt Request Status	
Register	Appendix 4-6

Appendix 4.7.4	About the stable operation of DMA transfer	Appendix 4-6
Appendix 4.8	Precautions on Multijunction Timers	Appendix 4-7
Appendix 4.8.1	Precautions to be observed when using TOP single-shot output mode	Appendix 4-7
Appendix 4.8.2	Precautions to be observed when using TOP delayed single-shot output mode	Appendix 4-9
Appendix 4.8.3	Precautions to be observed when using TOP continuous output mode	Appendix 4-10
Appendix 4.8.4	Precautions to be observed when using TIO measure free-run/clear input modes	Appendix 4-11
Appendix 4.8.5	Precautions to be observed when using TIO single-shot output mode	Appendix 4-11
Appendix 4.8.6	Precautions to be observed when using TIO delayed single-shot output mode	Appendix 4-11
Appendix 4.8.7	Precautions to be observed when using TIO continuous output mode	Appendix 4-12
Appendix 4.8.8	Precautions to be observed when using TMS measure input	Appendix 4-12
Appendix 4.8.9	Precautions to be observed when using TML measure input	Appendix 4-13
Appendix 4.9	Precautions on Using A-D Converters	Appendix 4-14
Appendix 4.10	Precautions on Serial I/O	Appendix 4-18
Appendix 4.10.1	Precautions on Using CSIO mode	Appendix 4-18
Appendix 4.10.2	Precautions on Using UART mode	Appendix 4-20
Appendix 4.11	Precautions on RAM Backup Mode	Appendix 4-21
Appendix 4.11.1	Precautions to be observed at Power-on	Appendix 4-21
Appendix 4.12	Precautions on Processing JTAG Pins	Appendix 4-22
Appendix 4.12.1	Precautions on Board Design when Using JTAG	Appendix 4-22
Appendix 4.12.2	Processing Pins when Not Using JTAG	Appendix 4-23
Appendix 4.13	Precautions about Noise	Appendix 4-24
Appendix 4.13.1	Reduction of Wiring Length	Appendix 4-24

CHAPTER 1

OVERVIEW

- 1.1 Outline of the 32171
- 1.2 Block Diagram
- 1.3 Pin Function
- 1.4 Pin Layout

1.1 Outline of the 32171

1.1.1 M32R Family CPU Core

(1) Based on RISC architecture

- The 32171 is a 32-bit RISC single-chip microcomputer which is built around the M32R family CPU core (hereafter referred to as the M32R) and incorporates flash memory, RAM, and various other peripheral functions—all integrated into a single chip.
- The M32R is based on RISC architecture. Memory access is performed using load and store instructions, and various arithmetic operations are executed using register-to-register operation instructions. The M32R internally contains sixteen 32-bit general-purpose registers and has 83 distinct instructions.
- The M32R supports compound instructions such as Load & Address Update and Store & Address Update, in addition to ordinary load and store instructions. These compound instructions help to speed up data transfers.

(2) 5-stage pipelined processing

- The M32R uses 5-stage pipelined instruction processing consisting of Instruction Fetch, Decode, Execute, Memory Access, and Write Back. Not just load and store instructions or register-to-register operation instructions, compound instructions such as Load & Address Update and Store & Address Update also are executed in one cycle.
- Instructions are entered into the execution stage in the order they are fetched, but this does not always mean that the first instruction entered is executed first. If the execution of a load or store instruction entered earlier is delayed by one or more wait cycles inserted in memory access, a register-to-register operation instruction entered later may be executed before said load or store instruction. By using "out-of-order-completion" like this, the M32R controls instruction execution without wasting clock cycles.

(3) Compact instruction code

- The M32R instructions come in two types: one consisting of 16 bits in length, and the other consisting of 32 bits in length. Use of the 16-bit length instruction format especially helps to suppress the program code size.
- Some 32-bit long instructions can branch directly to a location 32 Mbytes forward or backward from the instruction address being executed. Compared to architectures where address space is segmented, this direct jump allows for easy programming.

1.1.2 Built-in Multiply-Accumulate Operation Function

(1) Built-in high-speed multiplier

- The M32R incorporates a 32-bit \times 16-bit high-speed multiplier which enables it to execute a 32-bit \times 32-bit integral multiplication instruction in three cycles (1 cycle = 25 ns when using a 40 MHz internal CPU clock).

(2) Supports Multiply-Accumulate operation instructions comparable to DSP

- The M32R supports the following four modes of Multiply-Accumulate operation instructions (or multiplication instructions) using a 56-bit accumulator. Any of these operations can be executed in one cycle.
 - (a) 16 high-order register bits \times 16 high-order register bits
 - (b) 16 low-order register bits \times 16 low-order register bits
 - (c) Entire 32 register bits \times 16 high-order register bits
 - (d) Entire 32 register bits \times 16 low-order register bits
- The M32R has instructions to round off the value stored in the accumulator to 16 or 32 bits, as well as instructions to shift the accumulator value to adjust digits and store the digit-adjusted value in a register. These instructions also can be executed in one cycle, so that when combined with high-speed data transfer instructions such as Load & Address Update and Store & Address Update, they enable the M32R to exhibit high data processing capability comparable to that of DSP.

1.1.3 Built-in Flash Memory and RAM

- The 32171 contains flash memory and RAM which can be accessed with no wait states, allowing you to build a high-speed embedded system.
- The internal flash memory allows for on-board programming (you can write to it while being mounted on the printed circuit board). Use of flash memory means the chip engineered at the development phase can be used directly in mass-production, so that you can smoothly migrate from prototype to mass-production without changing the printed circuit board.
- The internal flash memory can be rewritten 100 times.
- The internal flash memory has a virtual-flash emulation function, allowing the internal RAM to be artificially mapped into part of the internal flash memory. This function, when combined with the internal Real-Time Debugger (RTD), facilitates data tuning on ROM tables.
- The internal RAM can be accessed for read or rewrite from an external device independently of the M32R by using RTD (real-time debugger). It is communicated with external devices by RTD's exclusive clock-synchronized serial I/O.

1.1.4 Built-in Clock Frequency Multiplier

- The 32171 internally multiplies the input clock signal frequency by 4 and the internal peripheral clock by 2. If the input clock frequency is 10.0 MHz, the CPU clock frequency will be 40 MHz and the internal clock frequency 20 MHz.

Figure 1.1.1 Conceptual Diagram of the Clock Frequency Multiplier

Table 1.1.1 Clock

Functional Block	Features
CPUCLK	<ul style="list-style-type: none"> CPU clock: Defined as $f(\text{CPUCLK})$ when it indicates the operating clock frequency for the M32R core, internal flash memory and internal RAM.
BCLK	<ul style="list-style-type: none"> Peripheral clock: Defined as $f(\text{BCLK})$ when it indicates the operating clock frequency for the internal peripheral I/O and external data bus.
Clock output (BCLK pin output)	<ul style="list-style-type: none"> A clock with the same frequency as $f(\text{BCLK})$ is output from this pin.
1/2 peripheral clock	<ul style="list-style-type: none"> Count-source clock of MJT. Sampling clock of TCLK, TIN.

1.1.5 Built-in Powerful Peripheral Functions

(1) Built-in multijunction timer (MJT)

- The multijunction timer is configured with the following 37 channels timers:
 - 16-bit output-related timer \times 11 channels
 - 16-bit input/output-related timer \times 10 channels
 - 16-bit input-related timer \times 8 channels
 - 32-bit input-related timer \times 8 channels

Each timer has multiple modes of operation, which can be selected according of the purpose of use.

- The multijunction timer has internal clock bus, input event bus, and output event bus, allowing multiple timers to be combined for use internally. This provides a flexible way to make use of timer functions.
- The output-related timers (TOP) have a correction function. This function allows the timer's count value in progress to be increased or reduced as desired, thus materializing real-time output control.

(2) Built-in 10-channel DMA

- The 10-channel DMA is built-in, supporting data transfers between internal peripheral I/Os or between internal peripheral I/O and internal RAM. Not only can DMA transfer requests be generated in software, but can also be triggered by a signal generated by an internal peripheral I/O (e.g., A-D converter, MJT, or serial I/O).
- Cascaded connection between DMA channels (DMA transfer in a channel is started by completion of transfer in another) is also supported, allowing for high-speed transfer processing without imposing any extra load on the CPU.

(3) Built-in 16-channel A-D converter

- The 32171 contains one 16-channel A-D converter which can convert data in 10-bit resolution. In addition to single A-D conversion in each channel, successive A-D conversion in four, eight, or 16 channels combined into one unit is possible.
- In addition to ordinary A-D conversion, a comparator mode is supported in which the A-D conversion result is compared with a given set value to determine the relative magnitudes of two quantities.
- When A-D conversion is completed, the 32171 can generate not only an interrupt, but can also generate a DMA transfer request.
- The 32171 supports two readout modes, so that A-D conversion results can be read out in 8 bits or 10 bits.

(4) High-speed serial I/O

- The 32171 incorporates 3 channels of serial I/O, which can be set for clock-synchronized serial I/O or UART.
- When set for clock-synchronized serial I/O, the data transfer rate is a high 2 Mbits per second.
- When data reception is completed or the transmit buffer becomes empty, the serial I/O can generate a DMA transfer request signal.

(5) Built-in Real-Time Debugger (RTD)

- The Real-Time Debugger (RTD) provides a function for the M32R/ECU's internal RAM to be accessed directly from an external device. The debugger communicates with external devices through its exclusive clock-synchronized serial I/O.
- By using the RTD, you can read the contents of the internal RAM or rewrite its data from an external device independently of the M32R.
- The debugger can generate an RTD interrupt to notify that RTD-based data transmission or reception is completed.

(6) Eight-level interrupt controller

- The interrupt controller manages interrupt requests from each internal peripheral I/O by resolving interrupt priority in eight levels including an interrupt-disabled state. Also, it can accept external interrupt requests due to power-down detection or generated by a watchdog timer as a System Break Interrupt (SBI).

(7) Three operation modes

- The M32R/ECU has three operation modes: single-chip mode, external extension mode, and processor mode. The address space and external pin functions of the M32R/ECU are switched over according to a mode in which it operates. The MOD0 and MOD1 pins are used to set a mode.

(8) Wait controller

- The wait controller supports access to external devices by the M32R. In all but single-chip mode, the external extension area provides 4 Mbytes of space.

1.1.6 Built-in Full-CAN Function

- The 32171 contains CAN Specification V2.0B active-compliant CAN module, thereby providing 16 message slots.

1.1.7 Built-in Debug Function

- The 32171 supports JTAG interface. Boundary scan test can be performed using this JTAG interface.

1.2 Block Diagram

Figure 1.2.1 shows a block diagram of the 32171. Features of each block are shown in Tables 1.2.1 through 1.2.3.

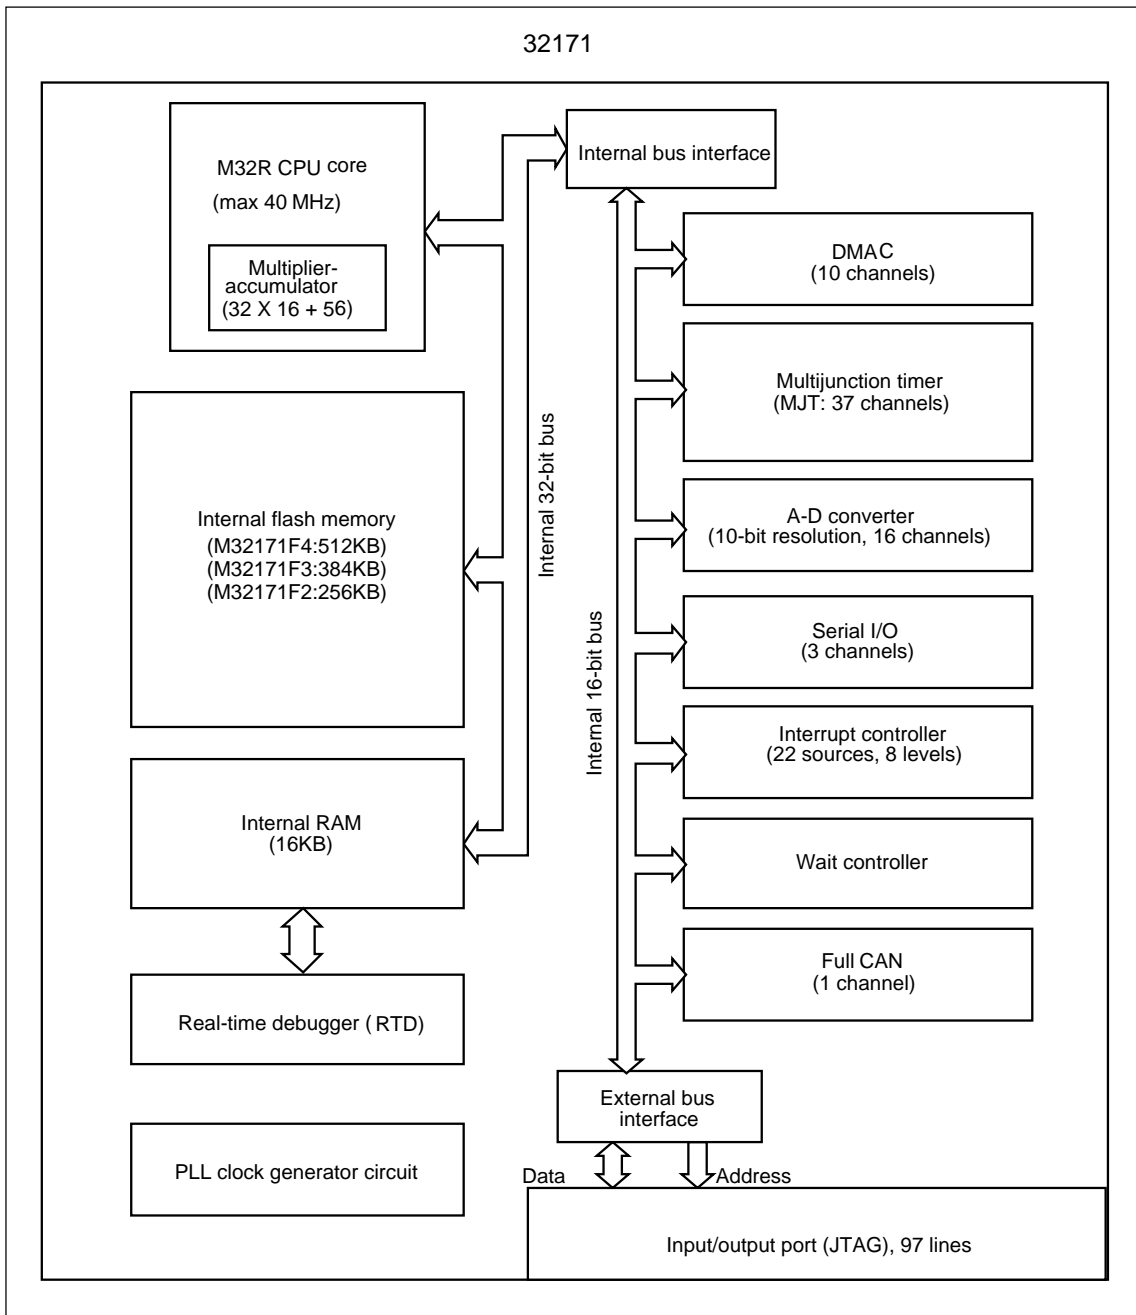

Figure 1.2.1 Block Diagram of the 32171

Table 1.2.1 Features of the M32R Family CPU Core

Functional Block	Features
M32R family	<ul style="list-style-type: none"> • Bus specifications
CPU core	<ul style="list-style-type: none"> Basic bus cycle: 25 ns (when operating with 40 MHz CPU clock) Logical address space: 4Gbytes, linear External extension area: Maximum 4 Mbytes External data bus: 16 bits • Implementation: Five-stage pipeline • Internal 32-bit architecture for the core • Register configuration <ul style="list-style-type: none"> General-purpose register: 32 bits × 16 registers Control register: 32 bits × 5 registers • Instruction set <ul style="list-style-type: none"> 16-bit and 32-bit instruction formats 83 distinct instructions and 6 addressing modes • Built-in multiplier/accumulator (32 × 16 + 56)

Table 1.2.3 Features of Internal Peripheral I/O

Functional Block	Features
DMA	<ul style="list-style-type: none"> • 10-channel DMA • Supports transfer between internal peripheral I/Os, between internal RAMs, and between internal peripheral I/O and internal RAM. • Capable of advanced DMA transfer when operating in combination with internal peripheral I/O • Capable of cascaded connection between DMA channels (DMA transfer in a channel is started by completion of transfer in another)
Multijunction	<ul style="list-style-type: none"> • 37-channel multifunction timer • Contains output-related timer × 11 channels, input/output-related timer × 10 channels, 16-bit input-related timer × 8 channels, and 32-bit input-related timer × 8 channels. • Capable of flexible timer configuration by mutual connection between each channel.
A-D converter	<ul style="list-style-type: none"> • 16-channel, 10-bit resolution A-D converter • Incorporates comparator mode • Can generate interrupt or start DMA transfer upon completion of A-D conversion. • Can read out conversion results in 8 or 10 bits.
Serial I/O	<ul style="list-style-type: none"> • 3-channel serial I/O • Can be set for clock-synchronized serial I/O or UART. • Capable of high-speed data transfer at 2 Mbits per second when clock synchronized or 156 Kbits per second during UART.
Real-time debugger	<ul style="list-style-type: none"> • Can rewrite or monitor the internal RAM independently of the CPU by command input from an external source. • Has its exclusive clock-synchronized serial port.
Interrupt controller	<ul style="list-style-type: none"> • Accepts and manages interrupt requests from internal peripheral I/O. • Resolves interrupt priority in 8 levels including interrupt-disabled state.
Wait controller	<ul style="list-style-type: none"> • Controls wait state for access to external extension areas. • Can insert 1 to 4 wait cycles by setting in software and extend wait period by external $\overline{\text{WAIT}}$ signal.
Clock PLL	<ul style="list-style-type: none"> • Multiply-by-4 clock generator circuit • Maximum 40 MHz of CPU clock (CPU, internal ROM, internal RAM access) • Maximum 20 MHz of internal peripheral clock (peripheral module access) • Maximum external input clock frequency=10 MHz
CAN	<ul style="list-style-type: none"> • Sixteen message slots
JTAG	<ul style="list-style-type: none"> • Capable of boundary scan

Table 1.2.4 List of Type Name

Type Name	RAM Size (K bytes)	ROM Size (K bytes)	Package	Number of Pins
M32171F2VFP	16	256	144LQFP	144
M32171F3VFP	16	384	144LQFP	144
M32171F4VFP	16	512	144LQFP	144

1.3 Pin Function

Figure 1.3.1 shows pin functions of the M32171FxVFP. Table 1.3.1 explains the pin functions.

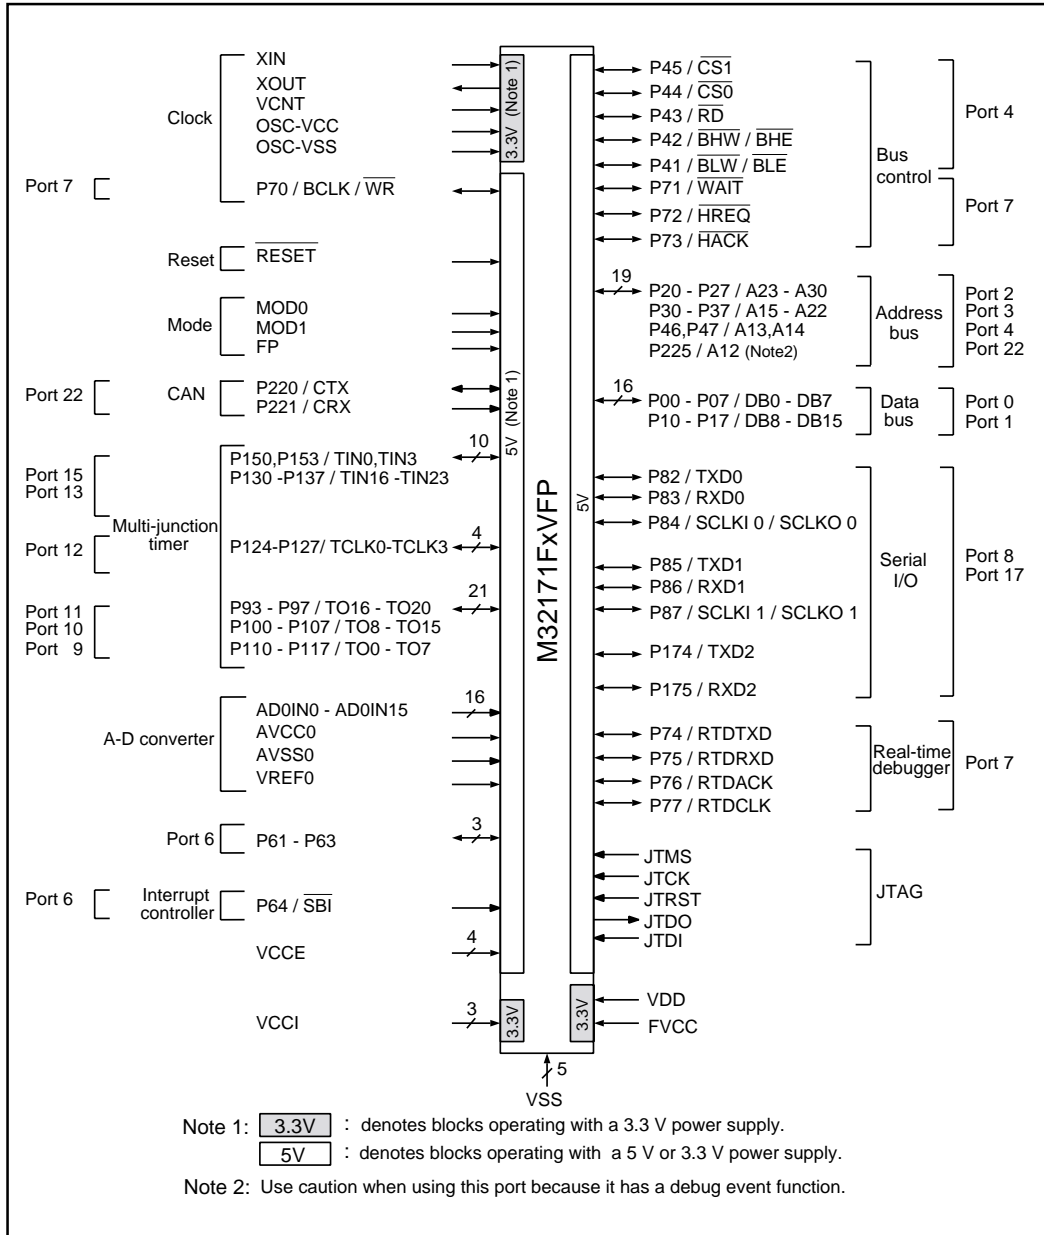

Figure 1.3.1 Pin Function Diagram of 144LQFP

Table 1.3.1 Description of the 32171 Pin Function (1/5)

Type	Pin Name	Signal Name	Input/Output	Function															
Power supply	VCCE	Power supply	—	Power supply to external I/O ports (5 V or 3.3 V).															
	VCCI	Power supply	—	Power supply to internal logic (3.3 V).															
	VDD	RAM power supply	—	Power supply for internal RAM backup (3.3 V).															
	FVCC	Flash power supply	—	Power supply for internal flash memory (3.3 V).															
	VSS	Ground	—	Connect all VSS to ground (GND).															
Clock	XIN, XOUT	Clock	Input Output	Clock input/output pins. These pins contains a PLL-based frequency multiplier circuit. Apply a clock whose frequency is 1/4 the operating frequency. (When using 40 MHz CPU clock, XIN input = 10.0 MHz)															
	BCLK/ \overline{WR}	System clock/write	Output	This pin outputs a clock whose frequency is twice that of external input clock. (When using 10 MHz external input clock, BCLK output = 20 MHz). Use this output when external operation needs to be synchronized. If \overline{WR} is selected, it indicates the byte position to which valid data is transferred when writing to an external device.															
	OSC-VCC	Power supply	—	Power supply for PLL circuit. Connect OSC-VCC to the power supply rail (3.3 V).															
	OSC-VSS	Ground	—	Connect OSC-VSS to ground.															
	VCNT	PLL control	Input	This pin controls the PLL circuit. Connect a resistor and capacitor to it. (For external circuits, refer to Section 18.1.1, "Example of an Oscillator Circuit.")															
Reset	\overline{RESET}	Reset	Input	This pin resets the internal circuit.															
Mode	MOD0 MOD1	Mode	Input	These pins set operation mode.															
				<table border="1"> <thead> <tr> <th>MOD0</th> <th>MOD1</th> <th>Mode</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>Single-chip mode</td> </tr> <tr> <td>0</td> <td>1</td> <td>External extension mode</td> </tr> <tr> <td>1</td> <td>0</td> <td>Processor mode (Boot mode) (Note1)</td> </tr> <tr> <td>1</td> <td>1</td> <td>(Reserved)</td> </tr> </tbody> </table>	MOD0	MOD1	Mode	0	0	Single-chip mode	0	1	External extension mode	1	0	Processor mode (Boot mode) (Note1)	1	1	(Reserved)
	MOD0	MOD1	Mode																
	0	0	Single-chip mode																
	0	1	External extension mode																
1	0	Processor mode (Boot mode) (Note1)																	
1	1	(Reserved)																	
Address Bus	A12 – A30	Address Bus	Output	The device has 19 address lines (A12-A30) to allow two channels of up to 1 MB of memory space to be added external to the chip. A31 is not output.															

Note 1: For boot mode, refer to Chapter 6, "Internal Memory."

Table 1.3.1 Description of the 32171 Pin Function (2/5)

Type	Pin Name	Signal Name	Input/Output	Function
Data bus	DB0-DB15	Data bus	Input/output	These pins comprise 16-bit data bus to connect external devices. In write cycles, the valid byte positions to be written on the 16-bit data bus are output as $\overline{\text{BHW}}/\overline{\text{BHE}}$ and $\overline{\text{BLW}}/\overline{\text{BLE}}$. In read cycles, data is always read from the 16-bit data bus. However, when transferring to the internal circuit of the M32R, only data at the valid byte positions are transferred.
Bus control	$\overline{\text{CS0}}$, $\overline{\text{CS1}}$	Chip select	Output	These pins comprise external device chip select signal. For areas for which a chip select signal is output, refer to Chapter 3, "Address Space."
	$\overline{\text{RD}}$	Read	Output	This signal is output when reading an external device.
	$\overline{\text{BHW}}/\overline{\text{BHE}}$	Byte high write/enable	Output	Indicates the byte position to which valid data is transferred when writing to an external device. $\overline{\text{BHW}}/\overline{\text{BHE}}$ corresponds to the upper address (D0-D7 is valid); $\overline{\text{BLW}}/\overline{\text{BLE}}$ corresponds to the lower address (D8-D15 is valid).
	$\overline{\text{BLW}}/\overline{\text{BLE}}$	Byte low write/enable	Output	
	$\overline{\text{WAIT}}$	Wait	Input	When the M32R accesses an external device, a low on this $\overline{\text{WAIT}}$ input extends the wait cycle.
	$\overline{\text{HREQ}}$	Hold request	Input	This pin is used by an external device to request control of the external bus. A low on this $\overline{\text{HREQ}}$ input causes the M32R to enter a hold state.
	$\overline{\text{HACK}}$	Hold acknowledge	Output	This signal is used to notify that the M32R has entered a hold state and relinquished control of the external bus.
Multi-junction timer	$\overline{\text{TIN0}}$, $\overline{\text{TIN3}}$ $\overline{\text{TIN16}}$ – $\overline{\text{TIN23}}$	Timer input	Input	Input pins for multijunction timer.
	TO 0– TO 20	Timer output	Output	Output pins for the multijunction timer.
	TCLK 0– TCLK 3	Timer clock	Input	Clock input pins for the multijunction timer.
A-D converter	AVCC0	Analog power supply	—	AVCC0 is the power supply for the A-D0 converter. Connect AVCC0 to the power supply rail (5 V or 3.3 V).
	AVSS0	Analog ground	—	AVSS0 is analog ground for the A-D0 converter. Connect AVSS0 to the ground.

Table 1.3.1 Description of the 32171 Pin Function (3/5)

Type	Pin Name	Signal Name	Input/Output	Function
A-D converter	AD0IN0 – AD0IN15	Analog input	Input	16-channel analog input pins for the A-D0 converter.
	VREF0	voltage input	Input	VREF0 is the reference voltage input pin for the A-D0 converter.
Interrupt controller	SBI	System break interrupt	Input	System break interrupt (SBI) input pin for the interrupt controller
Serial I/O	SCLKI0 / SCLKO0	UART transmit/receive clock output or CSIO transmit/receive clock input/output	Input/output	When channel 0 is in UART mode: This pin outputs a clock derived from BRG output by halving it. When channel 0 is in CSIO mode: This pin accepts as its input a transmit/receive clock when external clock source is selected or outputs a transmit/receive clock when internal clock source is selected.
	SCLKI1 / SCLKO1	UART transmit/receive clock output or CSIO transmit/receive clock input/output	Input/output	When channel 1 is in UART mode: This pin outputs a clock derived from BRG output by halving it. When channel 1 is in CSIO mode: This pin accepts as its input a transmit/receive clock when external clock source is selected or outputs a transmit/receive clock when internal clock source is selected.
	TXD0	Transmit data	output	Transmit data output pin for serial I/O channel 0
	RXD0	Receive data	Input	Receive data input pin for serial I/O channel 0
	TXD1	Transmit data	Output	Transmit data output pin for serial I/O channel 1.
	RXD1	Receive data	Input	Receive data input pin for serial I/O channel 1.
	TXD2	Transmit data	Output	Transmit data output pin for serial I/O channel 2.
	RXD2	Receive data	Input	Receive data input pin for serial I/O channel 2.
Real-time debugger	RTD TXD	Transmit data	Output	Serial data output pin for the real-time debugger.
	RTD RXD	Receive data	Input	Serial data input pin for the real-time debugger.
	RTD CLK	Clock input	Input	Serial data transmit/receive clock input pin for the real-time debugger.
	RTD ACK	Acknowledge	Output	This pin outputs a low pulse synchronously with the beginning clock of the real-time debugger's serial data output word. The duration of this low pulse indicates the type of command/data that the real-time debugger has received.
Flash -only	FP	Flash Protect	Input	This mode pin has a function to protect the flash memory against E/W in hardware.

Table 1.3.1 Description of the 32171 Pin Function (4/5)

Type	Pin Name	Signal Name	Input/Output Function	
CAN	CTX	Data output	Output	This pin outputs data from the CAN module.
	CRX	Data input	Input	This pin is used to input data to the CAN module.
JTAG	JTMS	Test mode	Input	Test mode select input to control state transition of the test circuit.
	JTCK	clock	Input	Clock input for the debug module and test circuit.
	JTRST	Test reset	Input	Test reset input to initialize the test circuit asynchronously.
	JTDI	Serial input	Input	This pin is used to input test instruction code or test data serially.
	JTDO	Serial output	Output	This pin outputs test instruction code or test data serially.
Input/ output port (Note 1)	P00 – P07	Input/output port 0	Input/output	Programmable input/output port.
	P10 – P17	Input/output port 1	Input/output	Programmable input/output port.
	P20 – P27	Input/output port 2	Input/output	Programmable input/output port.
	P30 – P37	Input/output port 3	Input/output	Programmable input/output port.
	P41 – P47	Input/output port 4	Input/output	Programmable input/output port.
	P61 – P64	Input/output port 6	Input/output	Programmable input/output port. (However, P64 is a $\overline{\text{SBI}}$ input-only port.)
	P70 – P77	Input/output port 7	Input/output	Programmable input/output port.
	P82 – P87	Input/output port 8	Input/output	Programmable input/output port.
	P93 – P97	Input/output port 9	Input/output	Programmable input/output port.
	P100 – P107	Input/output port 10	Input/output	Programmable input/output port.
	P110 – P117	Input/output port 11	Input/output	Programmable input/output port.

Note 1: Input/output port 5 is reserved for future use.

Table 1.3.1 Description of the 32171 Pin Function (5/5)

Type	Pin Name	Signal Name	Input/Output	Function
Input/ output port (Note 1)	P124 – P127	Input/output port 12	Input/output	Programmable input/output port.
	P130 – P137	Input/output port 13	Input/output	Programmable input/output port.
	P150, P153	Input/output port 15	Input/output	Programmable input/output port.
	P174, P175	Input/output port 17	Input/output	Programmable input/output port.
	P220,P221 P225(Note 2)	Input/output port 22	Input/output	Programmable input/output port. (However, P221 is a CAN input only port.)

Note 1: For the 32171, input/output ports 14, 16, 18, 19, 20, and 21 are nonexistent.

Note 2: Use caution when using P225 because they have a debug event function.

1.4 Pin Layout

Figure 1.4.1 shows pin assignments on the M32171FxVFP. Table 1.4.1 lists the pin assignments.

Figure 1.4.1 Pin Layout Diagram of the M32171FxVFP (Top View)

Table 1.4.1 Pin Assignments of the M32171FxVFP

CHAPTER 2

CPU

- 2.1 CPU Registers
- 2.2 General-purpose Registers
- 2.3 Control Registers
- 2.4 Accumulator
- 2.5 Program Counter
- 2.6 Data Formats
- 2.7 Precautions on CPU

2.1 CPU Registers

The M32R has sixteen general-purpose registers, five control registers, an accumulator, and a program counter. The accumulator is a 56-bit configuration, and all other registers are a 32-bit configuration.

2.2 General-purpose Registers

General-purpose registers are 32 bits in width and there are sixteen of them (R0 to R15), which are used to hold data and base addresses. Especially, R14 is used as a link register, and R15 is used as a stack pointer. The link register is used to store the return address when executing a subroutine call instruction. The stack pointer is switched between an interrupt stack pointer (SPI) and a user stack pointer (SPU) depending on the value of the Processor Status Word register (PSW)'s stack mode (SM) bit.

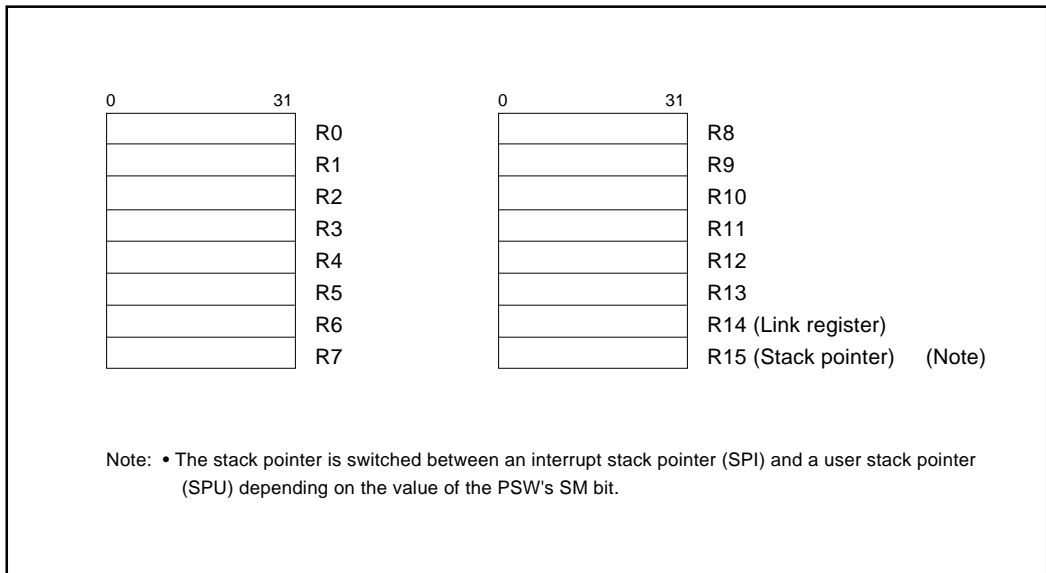

Figure 2.2.1 General-purpose Registers

2.3 Control Registers

There are five control registers-Processor Status Word Register (PSW), Condition Bit Register (CBR), Interrupt Stack Pointer (SPI), User Stack Pointer (SPU), and Backup PC (BPC). Dedicated "MVTC" and "MVFC" instructions are used to set and read these control registers.

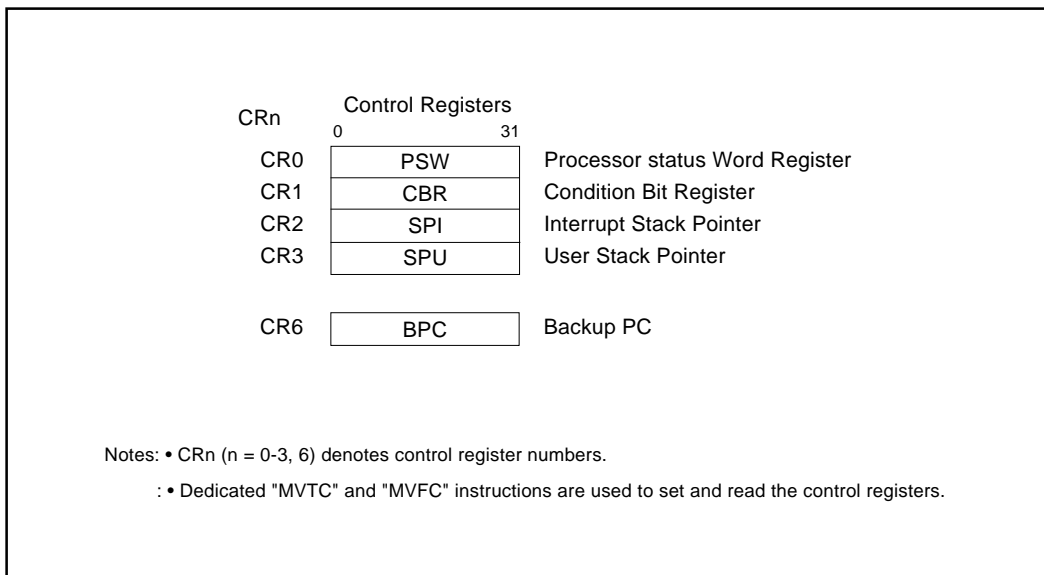

Figure 2.3.1 Control Registers

2.3.1 Processor Status Word Register: PSW (CR0)

The Processor Status Word Register (PSW) is used to indicate the status of the M32R. It consists of a regularly used PSW field and a special BPSW field which is used to save the PSW field when an EIT occurs.

The PSW field consists of several bits labeled Stack Mode (SM), Interrupt Enable (IE), and Condition bit (C). The BPSW field consists of backup bits of the foregoing, i.e., Backup SM bit (BSM), Backup IE bit (BIE), and Backup C bit (BC).

(Note 1)

D	Bit Name	Function	Initial	R	W
16	BSM (Backup SM)	Holds the value of SM bit when EIT is accepted.	Indeterminate	<input type="radio"/>	<input type="radio"/>
17	BIE (Backup IE)	Holds the value of IE bit when EIT is accepted.	Indeterminate	<input type="radio"/>	<input type="radio"/>
23	BC (Backup C)	Holds the value of C bit when EIT is accepted.	Indeterminate	<input type="radio"/>	<input type="radio"/>
24	SM (Stack Mode)	0: Interrupt stack pointer is used. 1: User stack pointer is used.	0	<input type="radio"/>	<input type="radio"/>
25	IE (Interrupt Enable)	0: No interrupt is accepted. 1: Interrupt is accepted.	0	<input type="radio"/>	<input type="radio"/>
31	C (Condition bit)	Depending on instruction execution, it indicates whether operation resulted in a carry, borrow, or overflow.	0	<input type="radio"/>	<input type="radio"/>

Note 1: "Initial" shows the state immediately after reset, R = 0 means the register is readable, W = 0 means the register is writable.

Note: • For changes of the state of each bit when an EIT event occurs, refer to Chapter 4, "EIT."

2.4 Accumulator

The accumulator (ACC) is a 56-bit register used by DSP function instructions. When read out or written to, it is handled as a 64-bit register. When reading, the value of bit 8 is sign-extended. When writing, bits 0--7 are ignored. Also, the accumulator is used by the multiplication instruction "MUL." Note that when executing this instruction, the value of the accumulator is destroyed.

The "MVTACHI" and "MVTACLO" instructions are used to write to the accumulator. The "MVTACHI" instruction writes data to the 32 high-order bits (bits 0-31), and the "MVTACLO" instruction writes data to the 32 low-order bits (bits 32-63).

The "MVFACHI," "MVFACLO," and "MVFACMI" instructions are used to read data from the accumulator. The "MVFACHI" instruction reads data from the 32 high-order bits (bits 0-31), the "MVFACLO" instruction reads data from the 32 low-order bits (bits 32-63), and the "MVFACMI" instruction reads data from the 32 middle bits (bits 16-47).

Note 1: Bits 0-7 always show the sign-extended value of bit 8. Writes to this bit field are ignored.

2.5 Program Counter

The Program Counter (PC) is a 32-bit counter used to hold the address of the currently executed instruction. Because M32R instructions each start from an even address, the LSB (bit 31) is always 0.

2.6 Data Formats

2.6.1 Data Types

There are several data types that can be handled by the M32R's instruction set. These include signed and unsigned 8, 16, and 32-bit integers. Values of signed integers are represented by 2's complements.

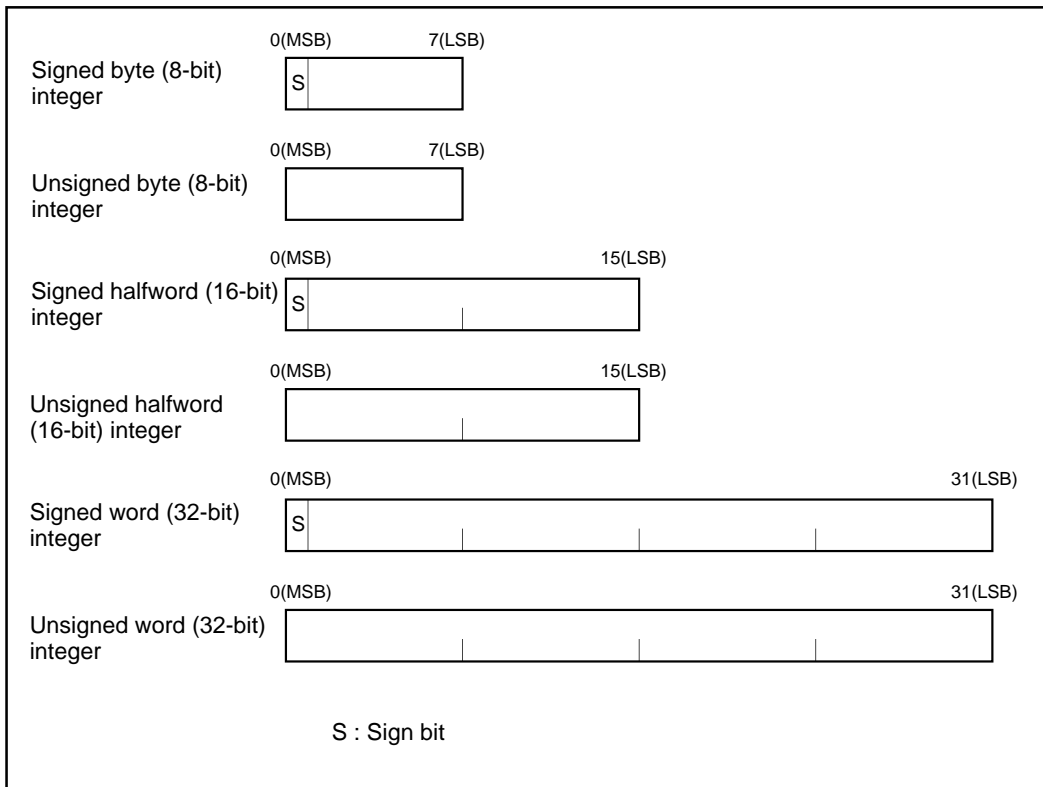

Figure 2.6.1 Data Types

2.6.2 Data Formats

(1) Data formats in register

Data sizes in M32R registers are always words (32 bits).

When loading byte (8-bit) or halfword (16-bit) data from memory into a register, the data is sign-extended (LDB, LDH instructions) or zero-extended (LDUB, LDUH instructions) into word (32-bit) data before being stored in the register. When storing data from M32R register into memory, the register data is stored in memory in different sizes depending on the instructions used. The ST instruction stores the entire 32-bit data of the register, the STH instruction stores the least significant 16-bit data, and the STB instruction stores the least significant 8-bit data.

Figure 2.6.2 Data Formats in Register

(2) Data formats in memory

Data sizes in memory are either byte (8 bits), halfword (16 bits), or word (32 bits). Byte data can be located at any address. However, halfword data must be located at halfword boundaries (where the LSB address bit = "0"), and word data must be located at word boundaries (where two LSB address bits = "00"). If an attempt is made to access memory data across these halfword or word boundaries, an address exception is generated.

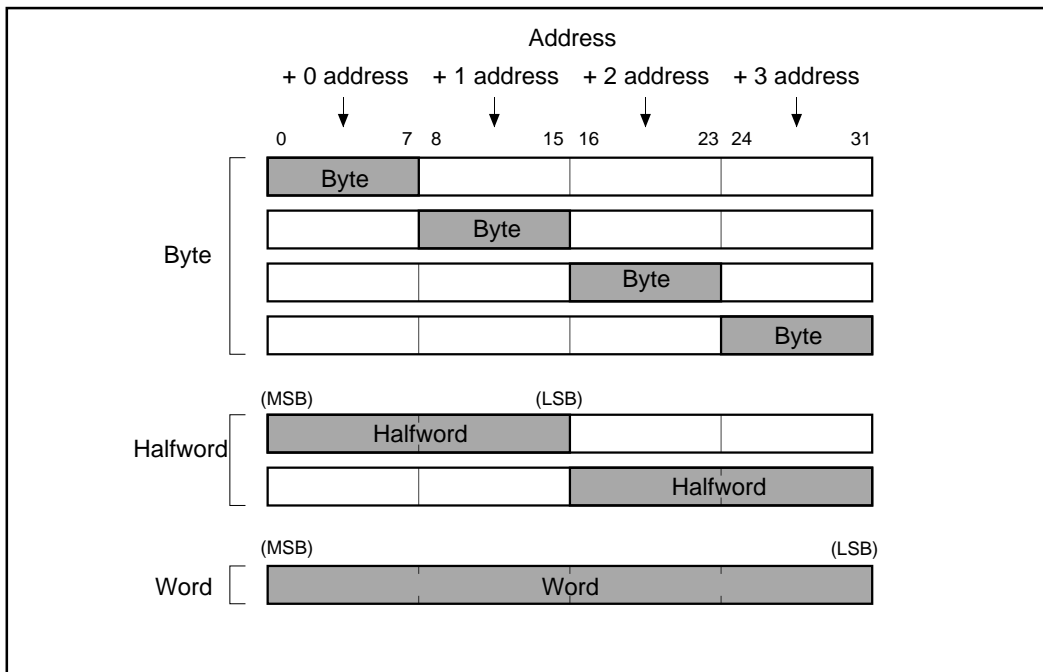

Figure 2.6.3 Data Formats in Memory

(4) Transfer instructions

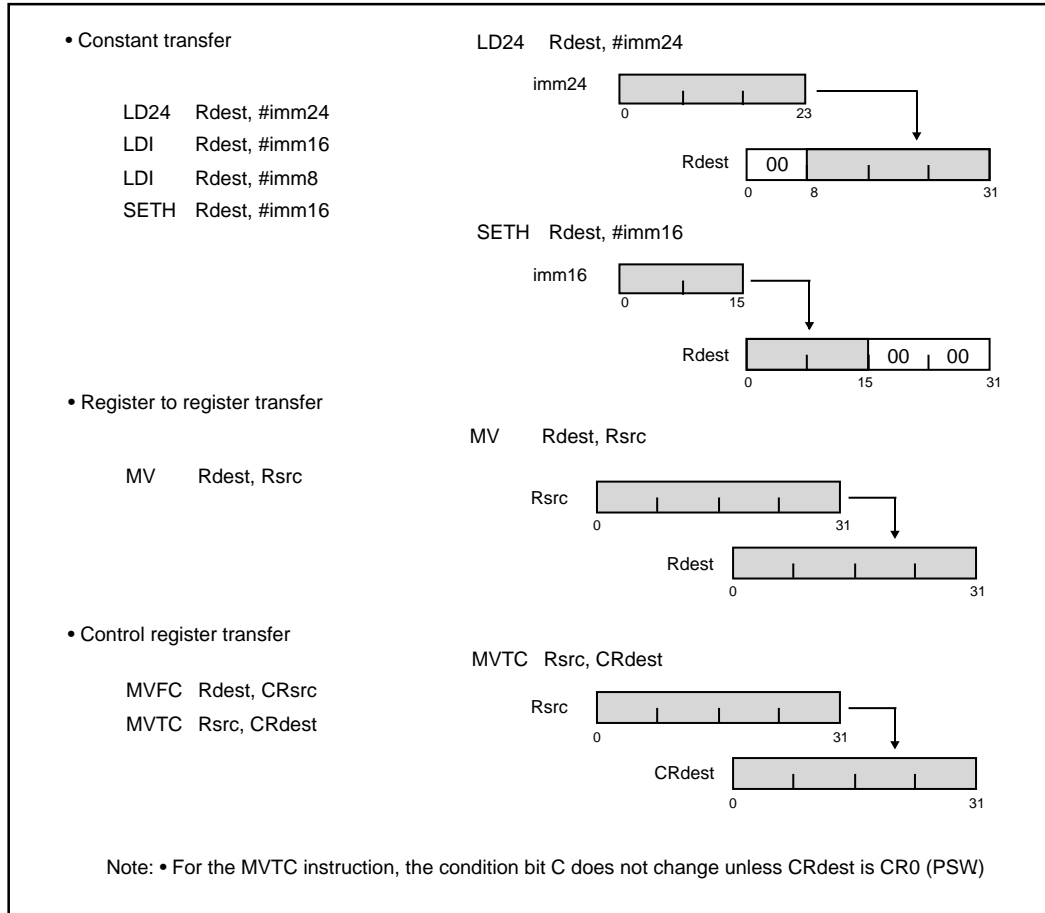

Figure 2.6.6 Transfer instructions

(5) Memory (signed) to register transfer

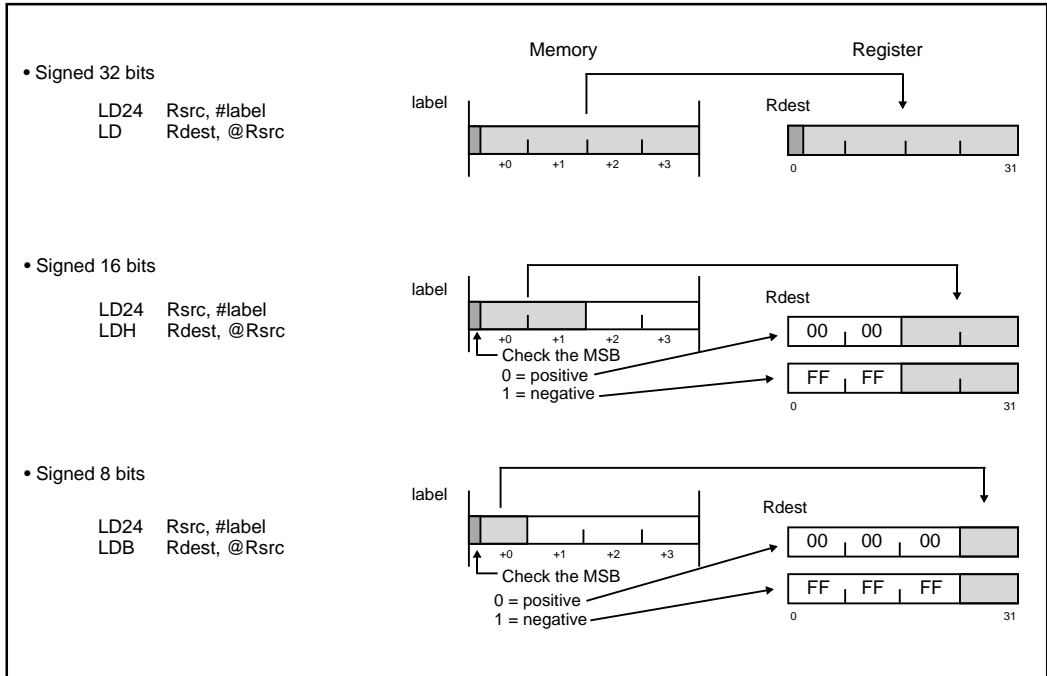

Figure 2.6.7 Memory (signed) to register transfer

(6) Memory (unsigned) to register transfer

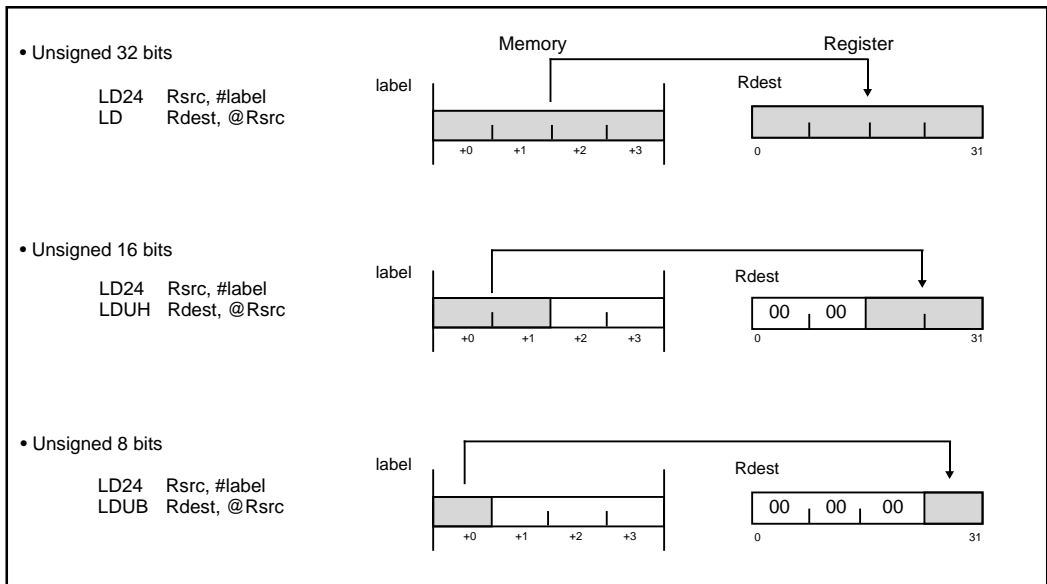

Figure 2.6.8 Memory (unsigned) to register transfer

(7) Things to be noted for data transfer

Note that in data transfer, data arrangements in registers and those in memory are different.

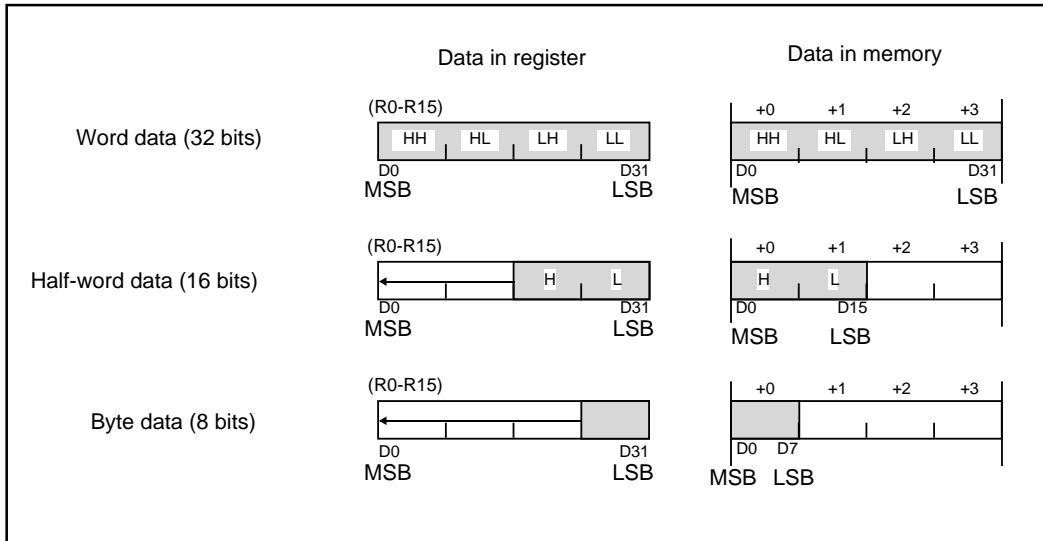

Figure 2.6.9 Difference in Data Arrangements

2.7 Precautions on CPU

• Usage Notes for 0 Division Instruction

Problem and Conditions

Inaccurate calculations for the instructions listed in (2) will result from execution of the 0 division instruction under the conditions described in (1).

- (1) If 0 division calculation is executed when the divisor = 0 for instructions DIV, DIVU, REM and REMU,
- (2) the result will be inaccurate calculations for any of the following instructions that are executed immediately after 0 division:

ADDV, ADDX, ADD, ADDI, ADDV3, ADD3,
CMP, CMPU, CMPI, CMPUI,
SUBV, SUBX, SUB,
DIV, DIVU,
REM, REMU.

Countermeasure

Assuming that the 0 division occurrence itself is not expected by the system and therefore is the cause of miscalculations, before executing division or remainder instructions, do a 0 check on the divisor to make sure 0 division does not occur.

CHAPTER 3

ADDRESS SPACE

- 3.1 Outline of Address Space
- 3.2 Operation Modes
- 3.3 Internal ROM Area and External Extension Area
- 3.4 Internal RAM Area and SFR Area
- 3.5 EIT Vector Entry
- 3.6 ICU Vector Table
- 3.7 Notes on Address Space

3.1 Outline of Address Space

The M32R's logical addresses are always handled in 32 bits, providing 4 Gbytes of linear address space. The M32R/E's address space consists of the following:

- (1) User space
 - Internal ROM area
 - External extension area
 - Internal RAM area
 - Special Function Register (SFR) area
- (2) Boot program space
- (3) System space (areas not open to the user)

(1) User space

A 2 Gbytes of address space from H'0000 0000 to H'7FFF FFFF is the user space. Located in this space are the internal ROM area, external extension area, internal RAM area, and Special Function Register (SFR) area, an area containing a group of internal peripheral I/O registers. Of these, the internal ROM and external extension areas are located differently depending on mode settings which will be described later.

(2) Boot program space

A 1 Gbyte of address space from H'8000 0000 to H'BFFF FFFF is the boot program space. This space stores a program (boot program) which enables on-board programming when the internal flash area is blank.

(3) System space

A 1 Gbyte of address space from H'C000 0000 to H'FFFF FFFF is the system space. This space is reserved for use by development tools such as an in-circuit emulator or a debug monitor, and cannot be used by the user.

Figure 3.1.3 Address Space of the M32171F2

3.2 Operation Modes

The 32171 is placed in one of the following modes by setting its operation mode (using MOD0 and MOD1 pins). For details about the mode used to rewrite the internal flash memory, refer to Section 6.5, "Programming of Internal Flash Memory."

Table 3.2.1 Setting Operation Modes

MOD0	MOD1 (Note 1)	Operation Mode (Note 2)
VSS	VSS	Single-chip mode
VSS	VCCE	External extension mode
VCCE	VSS	Processor mode (FP = VSS)
VCCE	VCCE	Reserved (cannot be used)

Note 1: VCCE connects to +5 V or +3.3 V, and VSS connects to GND.

Note 2: For flash rewrite mode (FP = VCCE) not listed in the above table, refer to Section 6.5, "Programming of Internal Flash Memory."

The internal ROM and external extension areas are located differently depending on the 32171's operation mode. (All other areas in address space are located the same way.) The address maps of internal ROM and external extension areas in each mode are shown below. (For flash rewrite mode (FP = VCCE) not listed in the above table, refer to Section 6.5, "Programming of Internal Flash Memory.")

Figure 3.2.1 M32171F4 Operation Mode and Internal ROM/External Extension Areas

Figure 3.2.2 M32171F3 Operation Mode and Internal ROM/External extension Areas

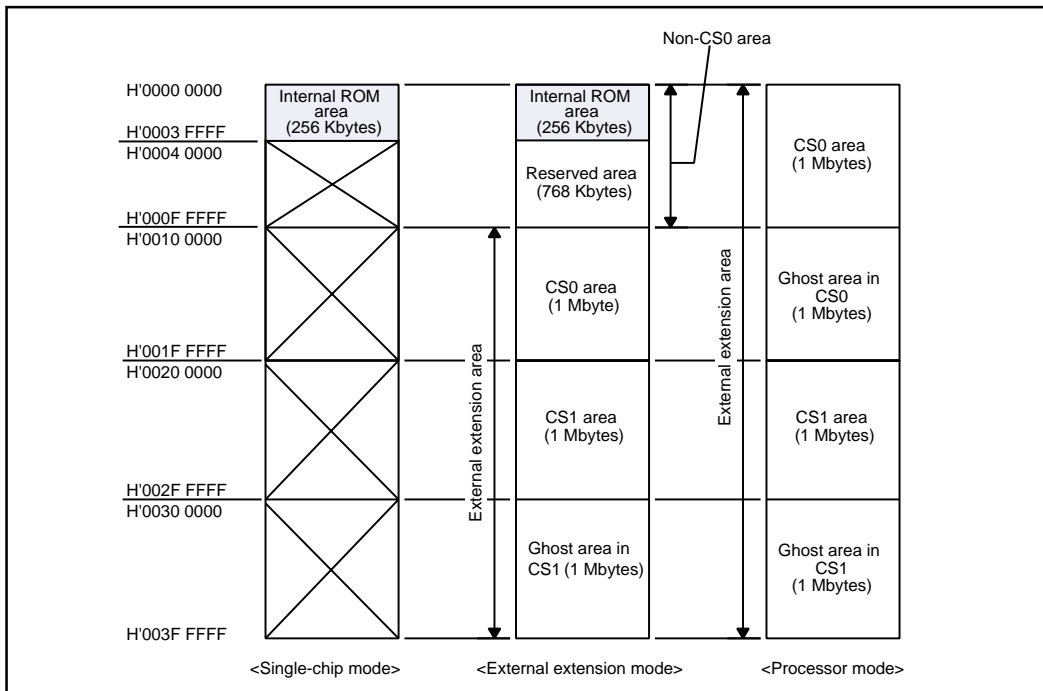

Figure 3.2.3 M32171F2 Operation Mode and Internal ROM/External extension Areas

3.3 Internal ROM Area and External Extension Area

The 8 Mbyte area at addresses H'0000 0000 to H'007F FFFF in the user space accommodates the internal ROM and external extension areas. Of this, a 4 Mbytes of address space from H'0000 0000 to H'003F FFFF is the area that the user can actually use. All other areas here comprise a 4 Mbytes of ghost area. (When programming, do not use this ghost area intentionally.)

For details on how the internal ROM and external extension areas are located differently depending on the 32171's operation modes set, refer to Section 3.2, "Operation Modes."

3.3.1 Internal ROM Area

The internal ROM is located in the area shown below. Also, this area has an EIT vector entry (and ICU vector table) located in it at the beginning.

Table 3.3.1 Addresses at Which the 32171's Internal ROM is Located

Type Name	Size	Located address
M32171F4	512 Kbytes	H'0000 0000 - H'0007 FFFF
M32171F3	384 Kbytes	H'0000 0000 - H'0005 FFFF
M32171F2	256 Kbytes	H'0000 0000 - H'0003 FFFF

3.3.2 External Extension Area

An external extension area is provided only when external extension mode or processor mode has been selected when setting the 32171's operation mode. For access to this external extension area, the 32171 outputs the control signals necessary to access external devices.

The 32171's $\overline{CS0}$ and $\overline{CS1}$ signals are output corresponding to the address mapping of the external extension area. The $\overline{CS0}$ signal is output for the CS0 area, and the $\overline{CS1}$ signal is output for the CS1 area.

Table 3.3.2 Address Mapping of the External Extension Area in Each Operation Mode of the 32171

Operation Mode	Address mapping of the external extension area
Single-chip mode	None
External extension mode	Addresses H'0010 0000 to H'001F FFFF (CS0 area: 1 Mbytes) Addresses H'0020 0000 to H'002F FFFF (CS1 area: 1 Mbytes) (Note 1)
Processor mode	Addresses H'0000 0000 to H'000F FFFF (CS0 area: 1 Mbytes) (Note 2) Addresses H'0020 0000 to H'002F FFFF (CS1 area: 1 Mbytes) (Note 2)

Note 1: During external extension mode, a ghost (1 Mbyte) of the CS1 area appears in an area of H'0030 0000 through H'003F FFFF.

Note 2: During processor mode, a ghost (1 Mbyte) of the CS0 area appears in an area of H'0010 0000 through H'001F FFFF and a ghost (1 Mbyte) of the CS1 area appears in an area of H'0030 0000 through H'003F FFFF.

3.4 Internal RAM Area and SFR Area

The 8 Mbyte area at addresses H'0080 0000 to H'00FF FFFF in the user space accommodates the internal RAM area and Special Function Register (SFR) area. Of this, a 128 Kbytes of address space from H'0080 0000 to H'0081 FFFF is the area that the user can actually use. All other areas here comprise a ghost area in units of 128 Kbytes. (When programming, do not use this ghost area intentionally.)

3.4.1 Internal RAM Area

The internal RAM (16-Kbyte) is allocated to the addresses H'0080 4000 through H'0080 7FFF.

3.4.2 Special Function Register (SFR) Area

Addresses H'0080 0000 to H'0080 3FFFF are the Special Function Register (SFR) area. This area has registers for internal peripheral I/O located in it.

3.5 EIT Vector Entry

The EIT vector entry is located at the beginning of the internal ROM/external extension areas. Instructions for branching to the start addresses of respective EIT event handlers are written here. Note that it is branch instructions and not the jump addresses that are written here. For details, refer to Chapter 4, "EIT."

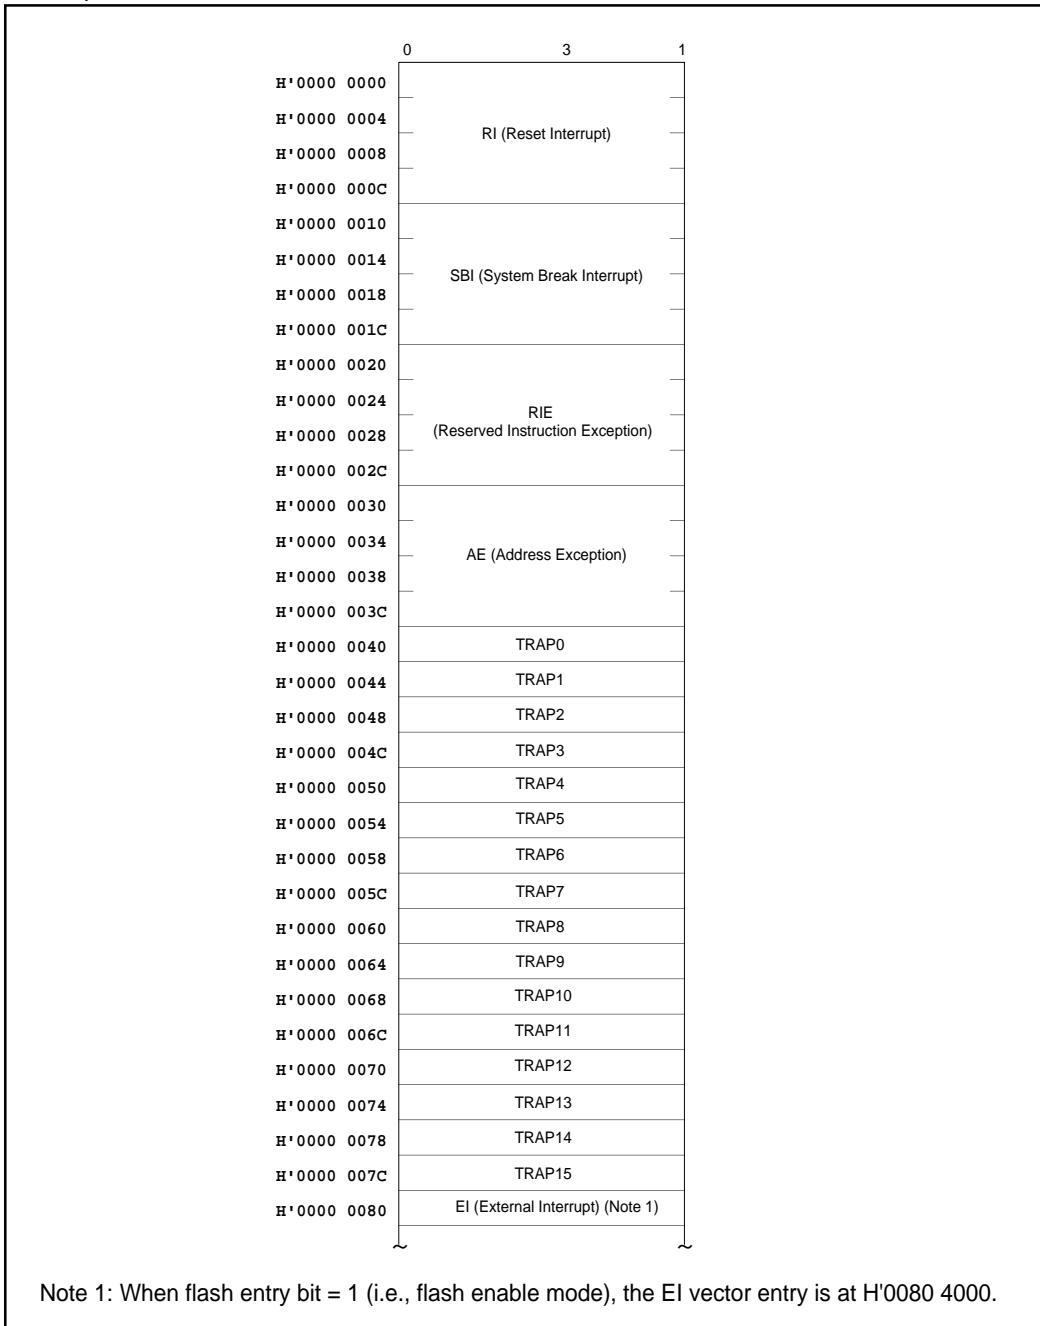

Figure 3.5.1 EIT Vector Entry

3.6 ICU Vector Table

The ICU vector table is used by the internal interrupt controller. The start addresses of interrupt handlers for the interrupt requests from respective internal peripheral I/Os are set at the addresses shown below. For details, refer to Chapter 5, "Interrupt Controller."

The 32171's ICU vector table is shown in Figures 3.6.1 and 3.6.2.

Address	D0	+0 Address	D7	D8	+1 Address	D15

Figure 3.6.2 ICU Vector Table of the 32171 (2/2)

3.7 Notes on Address Space

- **Virtual flash emulation function**

The 32171 can map one 8-Kbyte block of internal RAM beginning with the start address into one of 8-Kbyte areas (L banks) of the internal flash memory and can map up to two 4-Kbyte blocks of internal RAM beginning with address H'0080 6000 into one of 4-Kbyte areas (S banks) of the internal flash memory. This capability is referred to as the "virtual-flash emulation" function. For details about this function, refer to Section 6.7, "Virtual-Flash Emulation Function."

- 4.2 EIT Events
- 4.3 EIT Processing Procedure
- 4.4 EIT Processing Mechanism
- 4.5 Acceptance of EIT Events
- 4.6 Saving and Restoring the PC and PSW
- 4.7 EIT Vector Entry
- 4.8 Exception Processing
- 4.9 Interrupt Processing
- 4.10 Trap Processing
- 4.11 EIT Priority Levels
- 4.12 Example of EIT Processing
- 4.13 Precautions on EIT

4.1 Outline of EIT

If some event occurs when the CPU is executing an ordinary program, it may become necessary to suspend the program being executed and execute another program. Events like this one are referred to by a generic name as EIT (Exception, Interrupt, and Trap).

(1) Exception

This is an event related to the context being executed. It is generated by an error or violation during instruction execution. In the M32R/ECU, this type of event includes Address Exception (AE) and Reserved Instruction Exception (RIE).

(2) Interrupt

This is an event generated irrespective of the context being executed. It is generated in hardware by a signal from an external source. In the M32R/ECU, this type of event includes External Interrupt (EI), System Break Interrupt (SBI), and Reset Interrupt (RI).

(3) Trap

This refers to a software interrupt generated by executing a TRAP instruction. This type of event is intentionally generated in a program as in the OS's system call by the programmer.

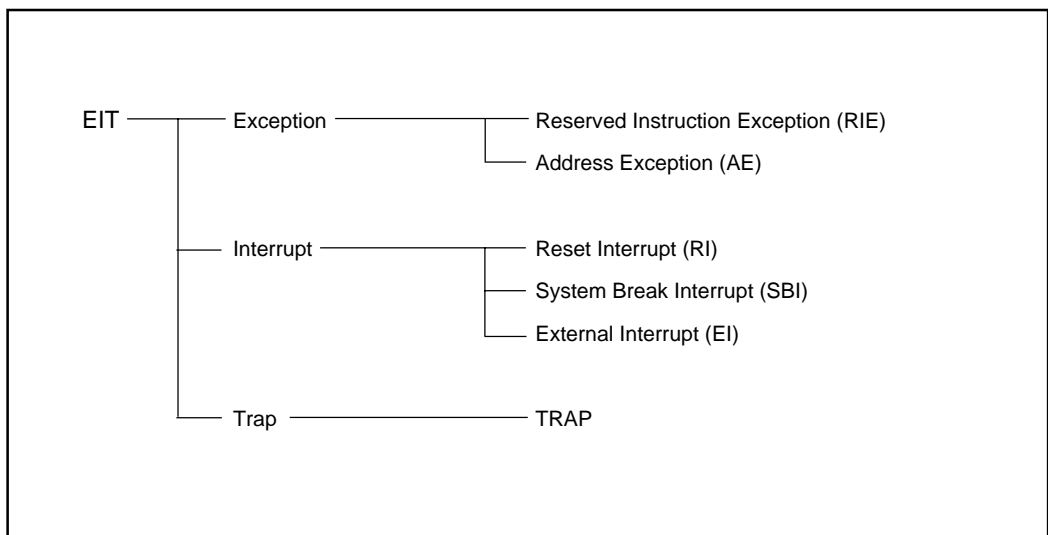

Figure 4.1.1 Classification of EITs

4.2 EIT Events

4.2.1 Exception

(1) Reserved Instruction Exception (RIE)

Reserved Instruction Exception (RIE) is generated when execution of a reserved instruction (unimplemented instruction) is detected.

(2) Address Exception (AE)

Address Exception (AE) is generated when an attempt is made to access a misaligned address in Load or Store instructions.

4.2.2 Interrupt

(1) Reset Interrupt (RI)

Reset Interrupt (RI) is always accepted by entering the $\overline{\text{RESET}}$ signal. The reset interrupt is assigned the highest priority.

(2) System Break Interrupt (SBI)

System Break Interrupt (SBI) is an emergency interrupt which is used when power outage is detected or a fault condition is notified by an external watchdog timer. This interrupt can only be used in cases when after interrupt processing, control will not return to the program that was being executed when the interrupt occurred.

(3) External Interrupt (EI)

External Interrupt (EI) is requested from internal peripheral I/Os managed by the interrupt controller. The 32171's internal interrupt controller manages these interrupts by assigning each one of eight priority levels including an interrupt-disabled state.

4.2.3 Trap

Traps are software interrupts which are generated by executing the TRAP instruction. Sixteen distinct vector addresses are provided corresponding to TRAP instruction operands 0-15.

4.3 EIT Processing Procedure

EIT processing consists of two parts, one in which they are handled automatically by hardware, and one in which they are handled by user-created programs (EIT handlers). The procedure for processing EITs when accepted, except for a rest interrupt, is shown below.

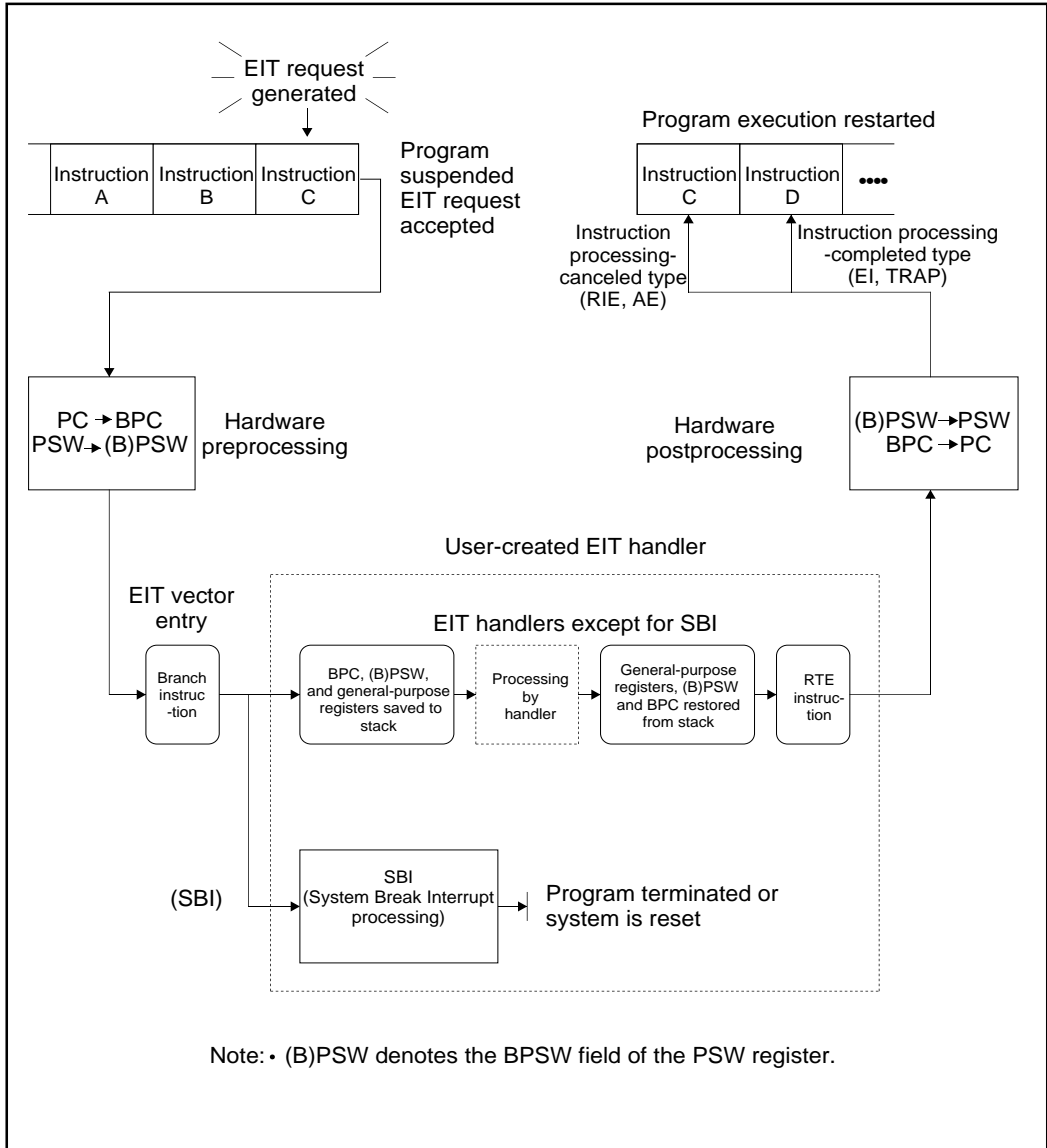

Figure 4.3.1 Outline of EIT Processing Procedure

When an EIT is accepted, the M32R/ECU saves the PC and PSW (as will be described later) and branches to the EIT vector. The EIT vector has an entry address assigned for each EIT. This is where the BRA (branch) instruction (note that these are not branch address) for the EIT handler is written.

In the M32R/ECU's hardware preprocessing, only the contents of the PC and PSW registers are transferred to the backup registers (BPC register and the BPSW field of the PSW register), and no other operations are performed. Therefore, please make sure the BPC register, the PSW register (including the BPSW field), and the general-purpose registers to be used in the EIT handler are saved to the stack by the EIT handler you write. (Remember that these registers must be saved to the stack in a program by the user.)

When processing by the EIT handler is completed, restore the saved registers from the stack and finally execute the "RTE" instruction. Control is thereby returned from EIT processing to the program that was being executed when the EIT occurred. (This does not apply to the System Break Interrupt, however.)

In the M32R/ECU's hardware postprocessing, the contents of the backup registers (BPC register and the BPSW field of the PSW register) are moved back to the PC and PSW registers.

4.4 EIT Processing Mechanism

The M32R/ECU's EIT processing mechanism consists of the M32R CPU core and the interrupt controller for internal peripheral I/Os. It also has the backup registers for the PC and PSW (BPC register and the BPSW field of the PSW register). The M32R/ECU's internal EIT processing mechanism is shown below.

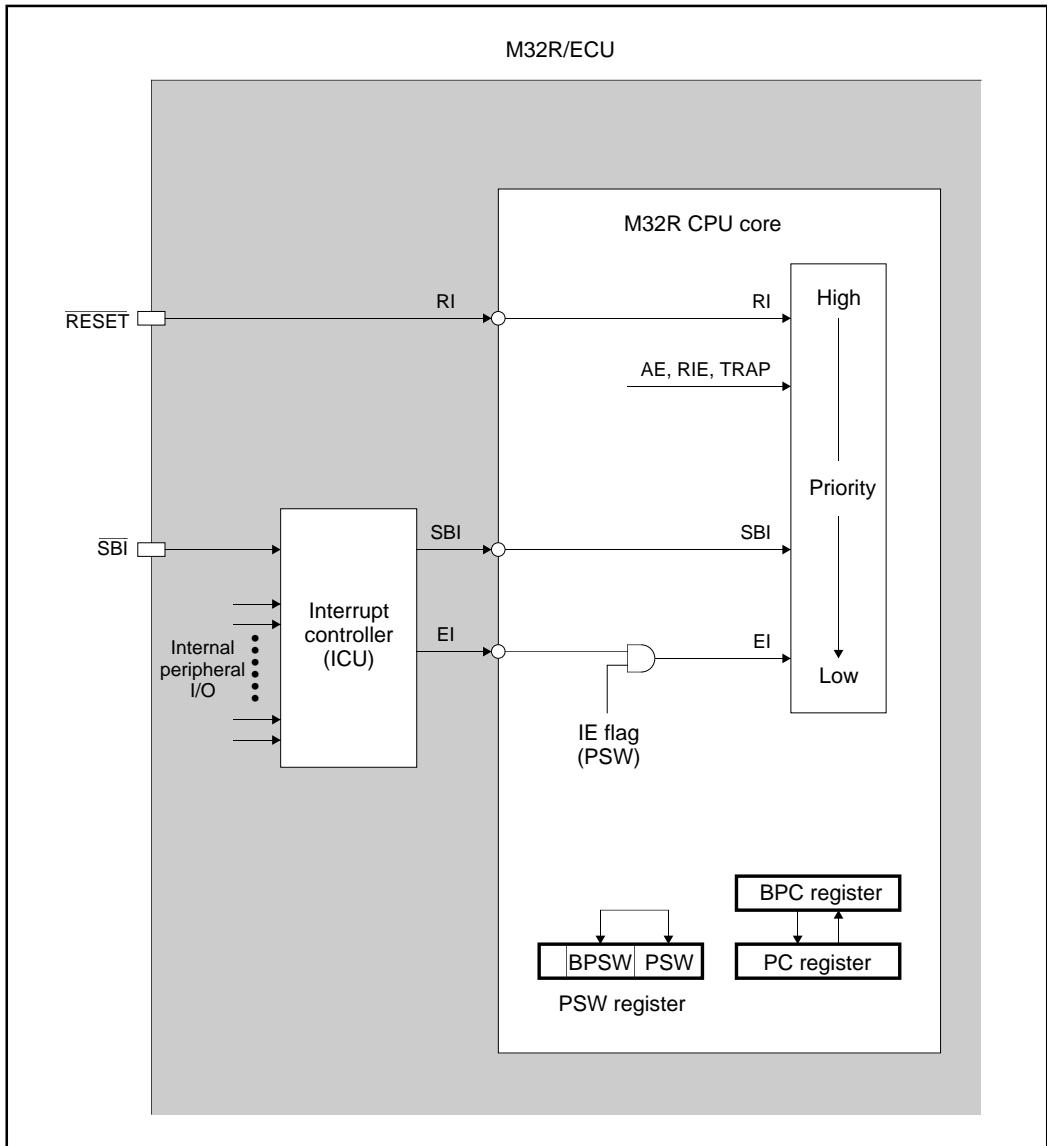

Figure 4.4.1 The M32R/ECU's EIT Processing Mechanism

4.5 Acceptance of EIT Events

When an EIT event occurs, the M32R/ECU suspends the program it has hitherto been executing and branches to EIT processing by the relevant handler. Conditions under which each EIT event occurs and the timing at which they are accepted are shown below.

Table 4.5.1 Acceptance of EIT Events

EIT Event	Type of Processing	Acceptance Timing	Values Set in BPC Register
Reserved Instruction Exception (RIE)	Instruction processing-canceled type	During instruction execution	PC value of the instruction which generated RIE
Address Exception (AE)	Instruction processing-canceled type	During instruction execution	PC value of the instruction which generated AE
Reset Interrupt (RI)	Instruction processing-aborted type	Each machine cycle	Indeterminate value
System Break Interrupt (SBI)	Instruction processing-completed type	Break in instructions (only word boundaries)	PC value of the next instruction
External Interrupt (EI)	Instruction processing-completed type	Break in instructions (only word boundaries)	PC value of the next instruction
Trap (TRAP)	Instruction processing-completed type	Break in instructions	PC value of TRAP instruction + 4

4.6 Saving and Restoring the PC and PSW

The following describes operation of the M32R at the time when it accepts an EIT and when it executes the "RTE" instruction.

(1) Hardware preprocessing when an EIT is accepted

- (a) Save the SM, IE, and C bits of the PSW register

BSM ← SM

BIE ← IE

BC ← C

- (b) Update the SM, IE, and C bits of the PSW register

SM ← Remains unchanged (RIE, AE, TRAP)
or set to 0 (SBI, EI, RI)

IE ← Set to 0

C ← Set to 0

- (c) Save the PC register

BPC ← PC

- (d) Set the vector address in the PC register

Branches to the EIT vector and executes the branch instruction ("BRA" instruction) written in it, thereby transferring control to the user-created EIT handler.

(2) Hardware postprocessing when the "RTE" instruction is executed

- (e) Restore the SM, IE, and C bits of the PSW register from their backup bits.

SM ← BSM

IE ← BIE

C ← BC

- (f) Restore the value of the PC register from the BPC register

PC ← BPC

Note: • The value of the BPC register and those of the BSM, BIE, and BC bits of the PSW register after execution of the "RTE" instruction are indeterminate.

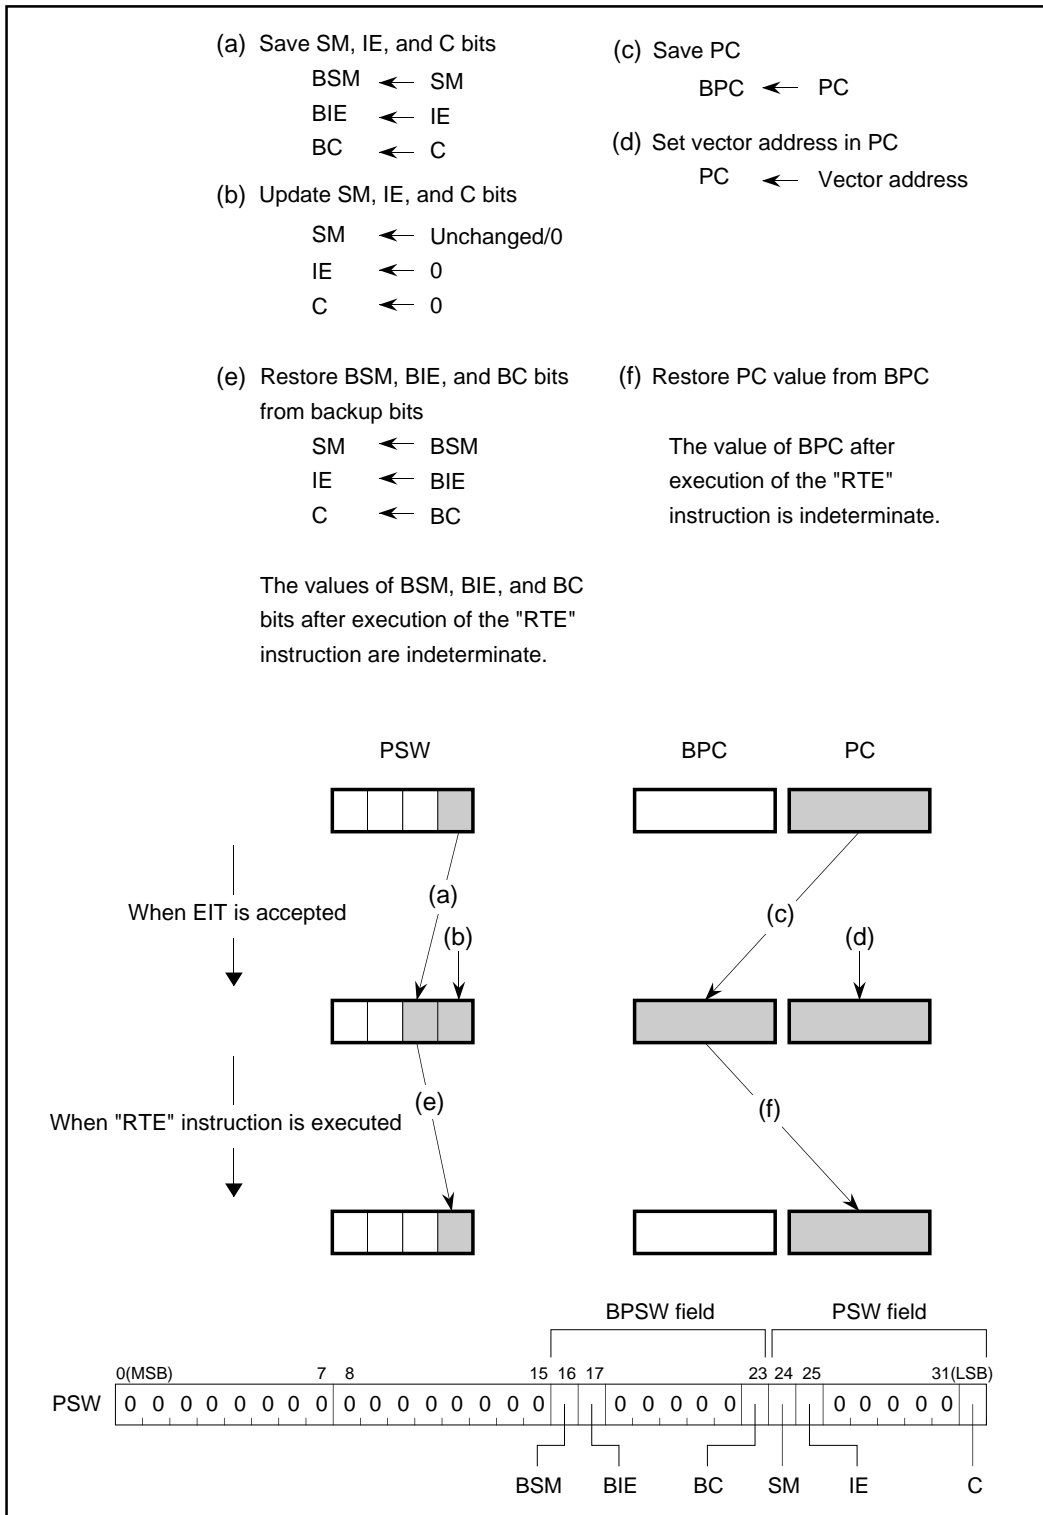

Figure 4.6.1 Saving and Restoring the PC and PSW

4.7 EIT Vector Entry

The EIT vector entry is located in the user space starting from address H'0000 0000. The table below lists the EIT vector entry.

Table 4.7.1 EIT Vector Entry

Name	Abbreviation	Vector Address	SM	IE	BPC
Reset Interrupt	RI	H'0000 0000 (Note 1)	0	0	Indeterminate
System Break Interrupt	SBI	H'0000 0010	0	0	PC of the next instruction
Reserved Instruction Exception	RIE	H'0000 0020	Indeterminate	0	PC of the instruction that generated EIT
Address Exception	AE	H'0000 0030	Indeterminate	0	PC of the instruction that generated RIE
Trap	TRAP0	H'0000 0040	Indeterminate	0	PC of TRAP instruction + 4
	TRAP1	H'0000 0044	Indeterminate	0	PC of TRAP instruction + 4
	TRAP2	H'0000 0048	Indeterminate	0	PC of TRAP instruction + 4
	TRAP3	H'0000 004C	Indeterminate	0	PC of TRAP instruction + 4
	TRAP4	H'0000 0050	Indeterminate	0	PC of TRAP instruction + 4
	TRAP5	H'0000 0054	Indeterminate	0	PC of TRAP instruction + 4
	TRAP6	H'0000 0058	Indeterminate	0	PC of TRAP instruction + 4
	TRAP7	H'0000 005C	Indeterminate	0	PC of TRAP instruction + 4
	TRAP8	H'0000 0060	Indeterminate	0	PC of TRAP instruction + 4
	TRAP9	H'0000 0064	Indeterminate	0	PC of TRAP instruction + 4
	TRAP10	H'0000 0068	Indeterminate	0	PC of TRAP instruction + 4
	TRAP11	H'0000 006C	Indeterminate	0	PC of TRAP instruction + 4
	TRAP12	H'0000 0070	Indeterminate	0	PC of TRAP instruction + 4
	TRAP13	H'0000 0074	Indeterminate	0	PC of TRAP instruction + 4
	TRAP14	H'0000 0078	Indeterminate	0	PC of TRAP instruction + 4
TRAP15	H'0000 007C	Indeterminate	0	PC of TRAP instruction + 4	
External Interrupt	EI	H'0000 0080 (Note 2)	0	0	PC of the next instruction

Note 1: During boot mode, this vector address is moved to the beginning of the boot ROM (address H'8000 0000). For details, refer to Section 6.5, "Programming of Internal Flash Memory."

Note 2: During flash E/W enable mode, this vector address is moved to the beginning of the internal RAM (address H'0080 4000). For details, refer to Section 6.5, "Programming of Internal Flash Memory."

4.8 Exception Processing

4.8.1 Reserved Instruction Exception (RIE)

[Occurrence Conditions]

Reserved Instruction Exception (RIE) is generated when execution of a reserved instruction (unimplemented instruction) is detected. Instruction check is performed on the op-code part of the instruction.

When a reserved instruction exception occurs, the instruction which generated it is not executed. If an external interrupt is requested at the same time a reserved instruction exception is detected, it is the reserved instruction exception that is accepted.

[EIT Processing]

(1) Saving SM, IE, and C bits

The SM, IE, and C bits of the PSW register are saved to their backup bits – the BSM, BIE, and BC bits.

```
BSM ← SM
BIE ← IE
BC  ← C
```

(2) Updating SM, IE, and C bits

The SM, IE, and C bits of the PSW register are updated as shown below.

```
SM ← Unchanged
BIE ← 0
BC  ← 0
```

(3) Saving PC

The PC value of the instruction that generated the reserved instruction exception is set in the BPC register. For example, if the instruction that generated the reserved instruction exception is at address 4, the value 4 is set in the BPC register. Similarly, if the instruction is at address 6, the value 6 is set in the BPC register. In this case, the value of the BPC register bit 30 indicates whether the instruction that generated the reserved instruction exception resides on a word boundary (BPC[30] = 0) or not on a word boundary (BPC[30] = 1).

However, in either case of the above, the address to which the "RTE" instruction returns after completion of processing by the EIT handler is address 4. (This is because the two low-order bits are cleared to "00" when returning to the PC.)

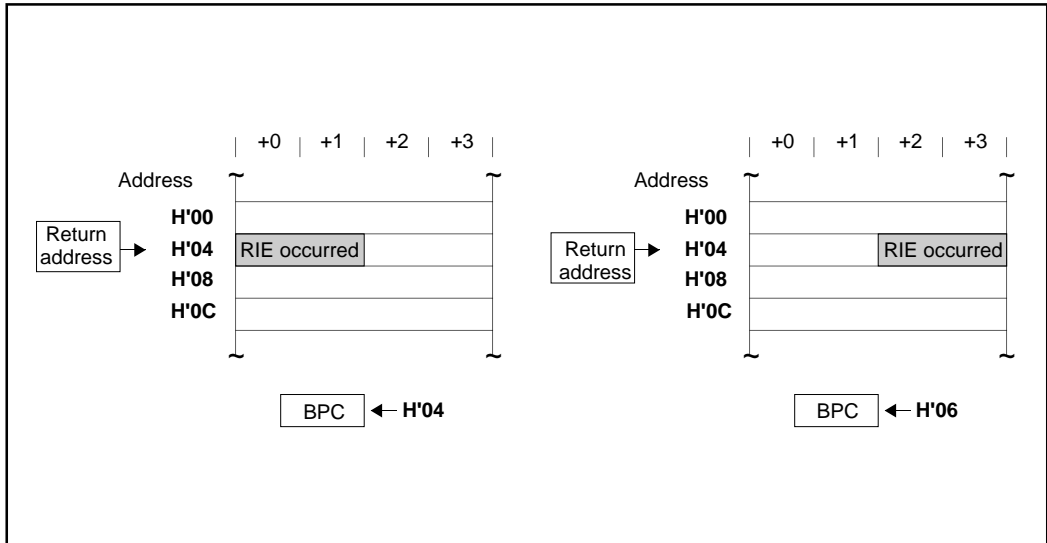

Figure 4.8.1 Example of a Return Address for Reserved Instruction Exception (RIE)

(4) Branching to the EIT vector entry

Control branches to the address H'0000 0020 in the user space. This is the last operation performed in hardware preprocessing by the M32R/ECU.

(5) Jumping from the EIT vector entry to the user-created handler

The M32R/ECU executes the "BRA" instruction written at address H'0000 0020 of the EIT vector entry by the user to jump to the start address of the user-created handler. At the beginning of the EIT handler you created, first save the BPC and PSW registers and the necessary general-purpose registers to the stack.

(6) Returning from the EIT handler

At the end of the EIT handler, restore the general-purpose registers and the BPC and PSW registers from the stack and then execute the "RTE" instruction. As you execute the "RTE" instruction, hardware postprocessing is automatically performed by the M32R/ECU.

4.8.2 Address Exception (AE)

[Occurrence Conditions]

Address Exception (AE) is generated when an attempt is made to access a misaligned address in Load or Store instructions. The following lists the combination of instructions and accessed addresses that may cause address exceptions to occur:

- When the LDH, LDUH, or STH instruction accessed an address whose two low-order bits are "01" or "11"
- When the LD, ST, LOCK, or UNLOCK instruction accessed an address whose two low-order bits are "01," "10," or "11"

When an address exception occurs, memory access by the instruction that generated the exception is not performed. If an external interrupt is requested at the same time an address exception is detected, it is the address exception that is accepted.

[EIT Processing]

(1) Saving SM, IE, and C bits

The SM, IE, and C bits of the PSW register are saved to their backup bits – the BSM, BIE, and BC bits.

```
BSM ← SM
BIE ← IE
BC ← C
```

(2) Updating SM, IE, and C bits

The SM, IE, and C bits of the PSW register are updated as shown below.

```
SM ← Unchanged
IE ← 0
C ← 0
```

(3) Saving PC

The PC value of the instruction that generated the address exception is set in the BPC register. For example, if the instruction that generated the address exception is at address 4, the value 4 is set in the BPC register. Similarly, if the instruction is at address 6, the value 6 is set in the BPC register. In this case, the value of the BPC register bit 30 indicates whether the instruction that generated the address exception resides on a word boundary (BPC[30] = 0) or not on a word boundary (BPC[30] = 1).

However, in either case of the above, the address to which the "RTE" instruction returns after completion of processing by the EIT handler is address 4. (This is because the two low-order bits are cleared to "00" when returning to the PC.)

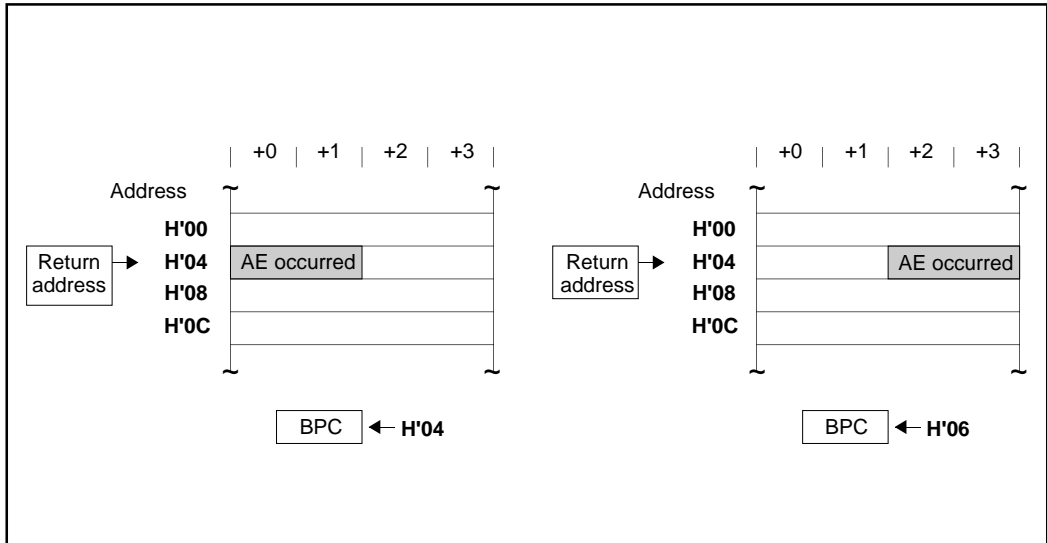

Figure 4.8.2 Example of a Return Address for Address Exception (AE)

(4) Branching to the EIT vector entry

Control branches to the address H'0000 0030 in the user space. This is the last operation performed in hardware preprocessing by the M32R/ECU.

(5) Jumping from the EIT vector entry to the user-created handler

The M32R/ECU executes the "BRA" instruction written at address H'0000 0030 of the EIT vector entry by the user to jump to the start address of the user-created handler. At the beginning of the EIT handler you created, first save the BPC and PSW registers and the necessary general-purpose registers to the stack.

(6) Returning from the EIT handler

At the end of the EIT handler, restore the general-purpose registers and the BPC and PSW registers from the stack and then execute the "RTE" instruction. As you execute the "RTE" instruction, hardware postprocessing is automatically performed by the M32R/ECU.

4.9 Interrupt Processing

4.9.1 Reset Interrupt (RI)

[Occurrence Conditions]

Reset Interrupt (RI) is unconditionally accepted in any machine cycle by pulling the `RESET` input signal low. The reset interrupt is assigned the highest priority among all EITs.

[EIT Processing]

(1) Initializing SM, IE, and C bits

The SM, IE, and C bits of the PSW register are initialized in the manner shown below.

SM	←	0
IE	←	0
C	←	0

For the reset interrupt, the values of BSM, BIE, and BC bits are indeterminate.

(2) Branching to the EIT vector entry

Control branches to the address H'0000 0000 in the user space. However, when operating in boot mode, control goes to the beginning of the boot ROM (address H'8000 0000). For details, refer to Section 6.5, "Programming of Internal Flash Memory."

(3) Jumping from the EIT vector entry to the user program

The M32R/ECU executes the instruction written at address H'0000 0000 of the EIT vector entry by the user. In the reset vector entry, be sure to initialize the PSW and SPI registers before jumping to the start address of the program you created.

4.9.2 System Break Interrupt (SBI)

System Break Interrupt (SBI) is an emergency interrupt which is used when power outage is detected or a fault condition is notified by an external watchdog timer. The system break interrupt cannot be masked by the PSW register IE bit. Therefore, the system break interrupt can only be used when some fatal event has already occurred to the system when the interrupt is detected. Also, this interrupt must be used on condition that after processing by the SBI handler, control will not return to the program that was being executed when the system break interrupt occurred.

[Occurrence Conditions]

A system break interrupt is accepted by a falling edge on $\overline{\text{SBI}}$ input pin. (The system break interrupt cannot be masked by the PSW register IE bit.)

In no case will a system break interrupt be activated immediately after executing a 16-bit instruction that starts from a word boundary. (For 16-bit branch instructions, however, the interrupt may be accepted immediately after branching.)

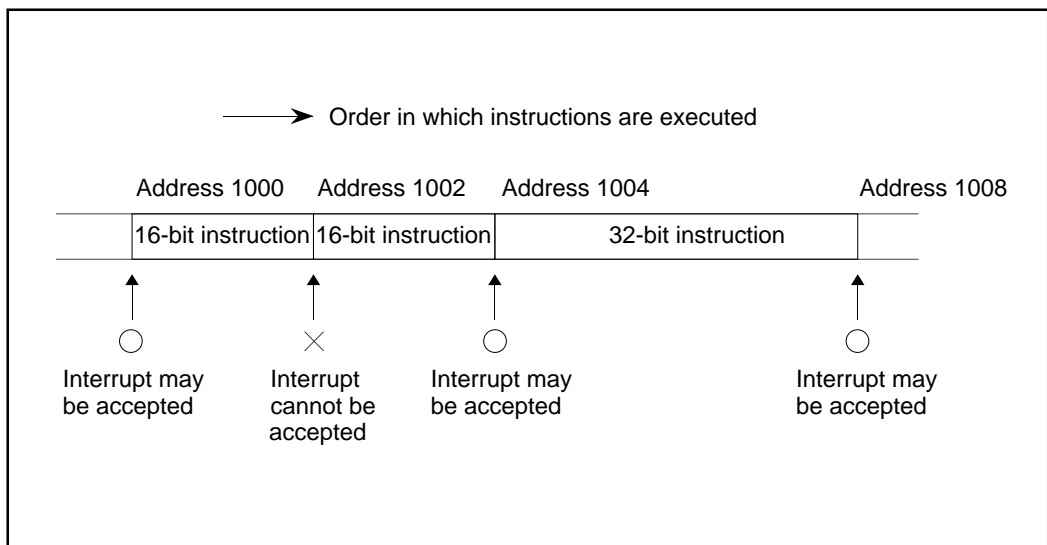

Figure 4.9.1 Timing at Which System Break Interrupt (SBI) is Accepted

[EIT Processing]

(1) Saving SM, IE, and C bits

The SM, IE, and C bits of the PSW register are saved to their backup bits—the BSM, BIE, and BC bits.

```
BSM ← SM
BIE ← IE
BC ← C
```

(2) Updating SM, IE, and C bits

The SM, IE, and C bits of the PSW register are updated as shown below.

```
SM ← 0
IE ← 0
C ← 0
```

(3) Saving PC

The content (always word boundary) of the PC register is saved to the BPC register.

(4) Branching to the EIT vector entry

Control branches to the address H'0000 0010 in the user space. This is the last operation performed in hardware preprocessing by the M32R/ECU.

(5) Jumping from the EIT vector entry to the user-created handler

The M32R/ECU executes the "BRA" instruction written at address H'0000 0010 of the EIT vector entry by the user to jump to the start address of the user-created handler. The system break interrupt can only be used when some fatal event has occurred to the system. Also, this interrupt must be used on condition that after processing by the SBI handler, control will not return to the program that was being executed when the system break interrupt occurred.

4.9.3 External Interrupt (EI)

An external interrupt is generated upon an interrupt request which is output by the 32171's internal interrupt controller. The interrupt controller manages interrupt requests by assigning each one of seven priority levels. For details, refer to Chapter 5, "Interrupt Controller." For details about the interrupt sources, refer to each section in which the relevant internal peripheral I/O is described.

[Occurrence Conditions]

External interrupts are managed based on interrupt requests from each internal peripheral I/O by the 32171's internal interrupt controller. These interrupt requests are notified to the M32R CPU by the interrupt controller. The M32R/ECU checks these interrupt requests at a break in instructions residing on word boundaries, and when an interrupt request is detected and the PSW register IE flag = 1, accepts it as an external interrupt.

In no case will an external interrupt be activated immediately after executing a 16-bit instruction that starts from a word boundary. (For 16-bit branch instructions, however, the interrupt may be accepted immediately after branching.)

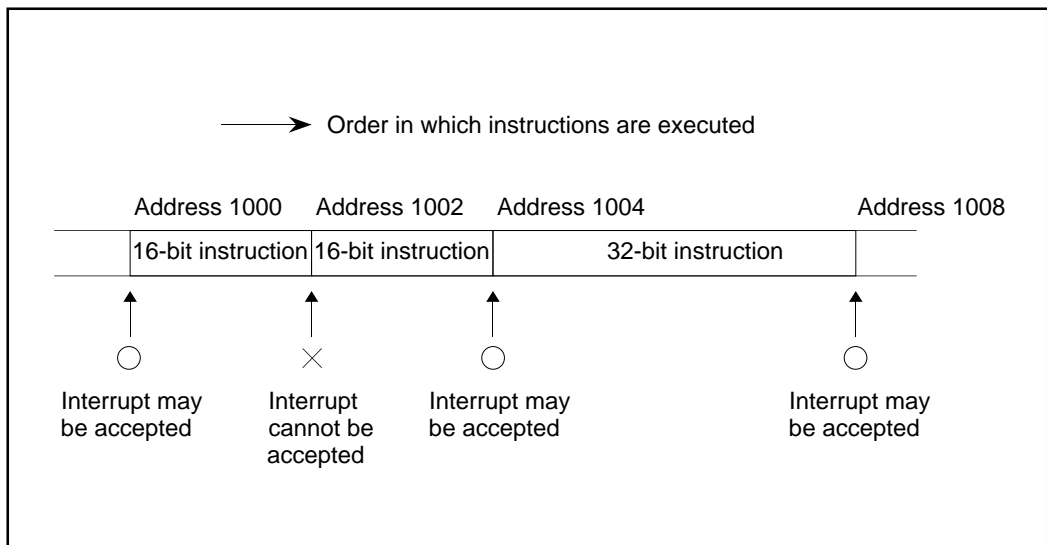

Figure 4.9.2 Timing at Which External Interrupt (EI) is Accepted

[EIT Processing]

(1) Saving SM, IE, and C bits

The SM, IE, and C bits of the PSW register are saved to their backup bits – the BSM, BIE, and BC bits.

```
BSM ← SM
BIE ← IE
BC ← C
```

(2) Updating SM, IE, and C bits

The SM, IE, and C bits of the PSW register are updated as shown below.

```
SM ← 0
IE ← 0
C ← 0
```

(3) Saving PC

The content (always word boundary) of the PC register is saved to the BPC register.

(4) Branching to the EIT vector entry

Control branches to the address H'0000 0080 in the user space. However, when operating in flash E/W enable mode, control goes to the beginning of the internal RAM (address H'0080 4000). (For details, refer to Section 6.5, "Writing to Internal Flash Memory.") This is the last operation performed in hardware preprocessing by the M32R/ECU.

(5) Jumping from the EIT vector entry to the user-created handler

The M32R/ECU executes the "BRA" instruction written at address H'0000 0080 of the EIT vector entry by the user to jump to the start address of the user-created handler. At the beginning of the EIT handler you created, first save the BPC and PSW registers and the necessary general-purpose registers to the stack.

(6) Returning from the EIT handler

At the end of the EIT handler, restore the general-purpose registers and the BPC and PSW registers from the stack and then execute the "RTE" instruction. As you execute the "RTE" instruction, hardware postprocessing is automatically performed by the M32R/ECU.

4.10 Trap Processing

4.10.1 Trap (TRAP)

[Occurrence Conditions]

Traps refer to software interrupts which are generated by executing the "TRAP" instruction. Sixteen distinct traps are generated, each corresponding to one of "TRAP" instruction operands 0-15. Accordingly, sixteen vector entries are provided.

[EIT Processing]

(1) Saving SM, IE, and C bits

The SM, IE, and C bits of the PSW register are saved to their backup bits – the BSM, BIE, and BC bits.

```
BSM ← SM
BIE ← IE
BC  ← C
```

(2) Updating SM, IE, and C bits

The SM, IE, and C bits of the PSW register are updated as shown below.

```
SM ← Unchanged
IE ← 0
C  ← 0
```

(3) Saving PC

When the trap instruction is executed, the "PC value of the TRAP instruction + 4" is set in the BPC register. For example, if the "TRAP" instruction is located at address 4, the value H'08 is set in the BPC register. Similarly, if the instruction is located at address 6, the value H'0A is set in the BPC register. In this case, the value of the BPC register bit 30 indicates whether the trap instruction resides on a word boundary (BPC[30] = 0) or not on a word boundary (BPC[30] = 1).

However, in either case of the above, the address to which the "RTE" instruction returns after completion of processing by the EIT handler is address 8. (This is because the two low-order bits are cleared to "00" when returning to the PC.)

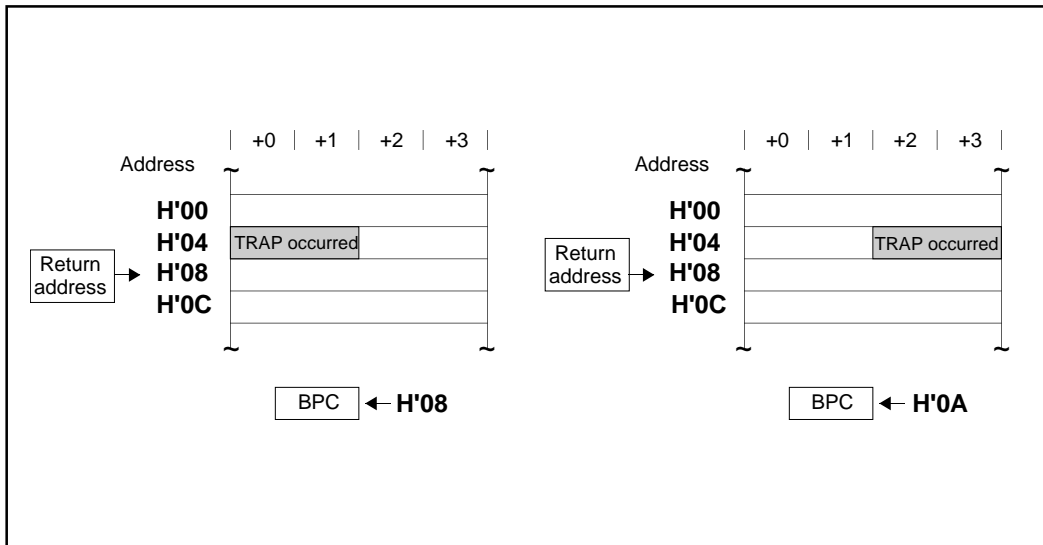

Figure 4.10.1 Example of a Return Address for Trap (TRAP)

(4) Branching to the EIT vector entry

Control branches to the addresses H'0000 0040 through H'0000 007C in the user space. This is the last operation performed in hardware preprocessing by the M32R/ECU.

(5) Jumping from the EIT vector entry to the user-created handler

The M32R/ECU executes the "BRA" instruction written at addresses H'0000 0040 through H'0000 007C of the EIT vector entry by the user to jump to the start address of the user-created handler. At the beginning of the EIT handler you created, first save the BPC and PSW registers and the necessary general-purpose registers to the stack.

(6) Returning from the EIT handler

At the end of the EIT handler, restore the general-purpose registers and the BPC and PSW registers from the stack and then execute the "RTE" instruction. As you execute the "RTE" instruction, hardware postprocessing is automatically performed by the M32R/ECU.

4.11 EIT Priority Levels

The table below lists the priority levels of EIT events. When multiple EITs occur simultaneously, the event with the highest priority is accepted first.

Table 4.11.1 Priority of EIT Events and How Returned from EIT

Priority	EIT Event	Type of Processing	Values Set in BPC Register
1(Highest)	Reset Interrupt (RI)	Instruction processing- -aborted type	Indeterminate
2	Address Exception (AE)	Instruction processing- canceled type	PC of the instruction that generated AE
	Reserved Instruction Exception (RIE)	Instruction processing- canceled type	PC of the instruction that generated AE
	Trap (TRAP)	Instruction processing- completed type	TRAP instruction + 4
3	System Break Interrupt (SBI)	Instruction processing- completed type	PC of the next instruction
4	External Interrupt (EI)	Instruction processing- completed type	PC of the next instruction

Note that for External Interrupt (EI), the priority levels of interrupt requests from each peripheral I/O are set by the 32171's internal interrupt controller. For details, refer to Chapter 5, "Interrupt Controller."

4.12 Example of EIT Processing

(1) When RIE, AE, SBI, EI, or TRAP occurs singly

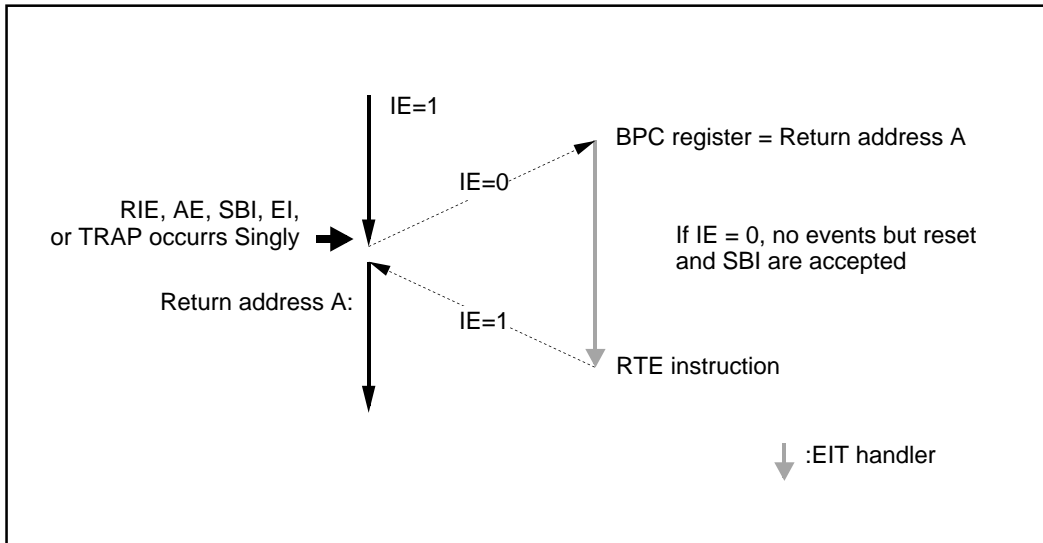

Figure 4.12.1 Processing of Events When RIE, AE, SBI, EI, or TRAP Occurs Singly

(2) When RIE, AE, or TRAP and EI occurs simultaneously

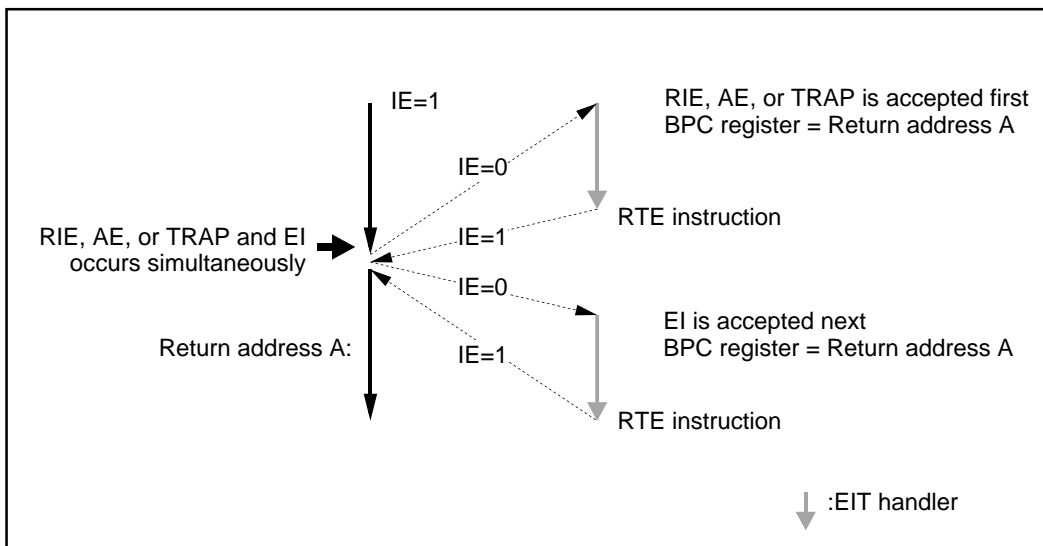

Figure 4.12.2 Processing of Events when RIE, AE, or TRAP and EI Occurs Simultaneously

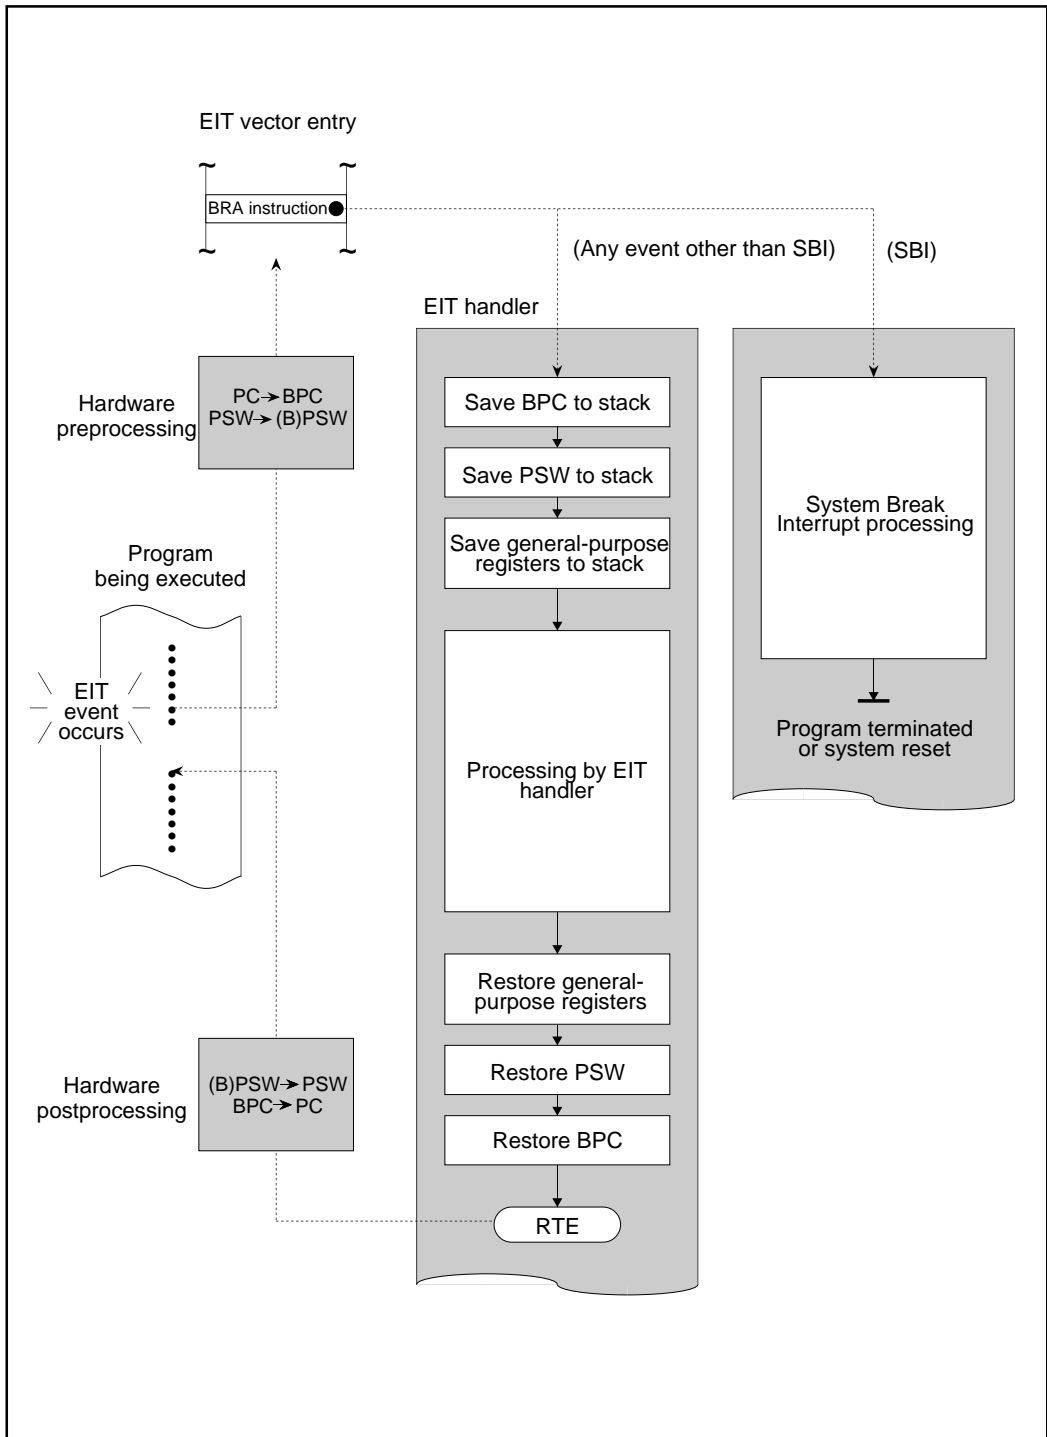

Figure 4.12.3 Example of EIT Processing

4.13 Precautions on EIT

Address Exception requires caution because when an address exception occurs pursuant to execution of an instruction (one of the following three) that uses the “register indirect + register update” addressing mode, the value of the automatically updated register (Rsrc or Rsrc2) becomes indeterminate.

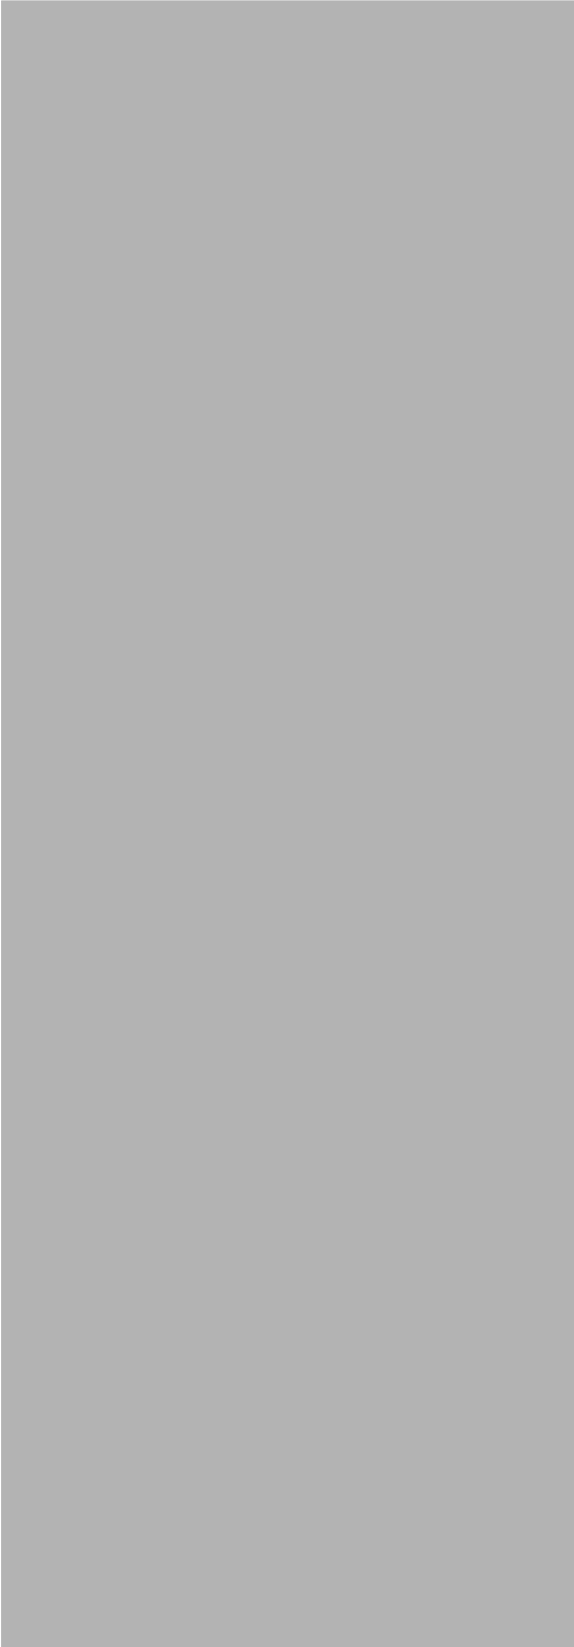

Except that the values of Rsrc and Rsrc2 are indeterminate, the behavior is the same as when using other addressing modes.

- **Applicable instructions**

LD	Rdest, @Rsrc+
ST	Rsrc1, @-Rsrc2
ST	Rsrc1, @+Rsrc2

If the above applies, because the register value becomes indeterminate as explained, consideration must be taken before continuing with system processing. (If an address exception occurs, it means that some fatal fault already occurred in the system at that point in time. Therefore, use EIT on condition that after processing by the address exception handler, the CPU will not return to the program it was executing when the exception occurred.)

* This is a blank page. *

CHAPTER 5

INTERRUPT CONTROLLER (ICU)

- 5.1 Outline of the Interrupt Controller (ICU)
- 5.2 ICU Related Registers
- 5.3 Interrupt Request Sources in Internal Peripheral I/O
- 5.4 ICU Vector Table
- 5.5 Description of Interrupt Operation
- 5.6 Description of System Break Interrupt (SBI) Operation

5.1 Outline of the Interrupt Controller (ICU)

The Interrupt Controller (ICU) manages maskable interrupts from internal peripheral I/Os and a system break interrupt (SBI). The maskable interrupts from internal peripheral I/Os are notified to the M32R CPU as external interrupts (EI).

There are a total of 22 interrupt sources for the maskable interrupts from internal peripheral I/Os, which are managed by assigning them one of eight priority levels including an interrupt-disabled state. When multiple interrupt requests of the same priority level occur simultaneously, their priorities are resolved by predetermined hardware priority. The source of an interrupt request generated in internal peripheral I/Os is identified by reading the relevant interrupt status register provided for internal peripheral I/Os.

On the other hand, the system break interrupt (SBI) is an interrupt request generated by a falling edge on the $\overline{\text{SBI}}$ signal input pin. This interrupt is used for emergency purposes such as when power outage is detected or a fault condition is notified by an external watchdog timer, so that it is always accepted irrespective of the PSW register IE bit status. When the ICU has finished servicing an SBI, terminate or reset the system without returning to the program that was being executed when the interrupt occurred.

Specifications of the interrupt controller are outlined in the table below.

Table 5.1.1 Outline of Interrupt Controller (ICU)

Item	Specification
Interrupt source	Maskable interrupt from internal peripheral I/O : 22 sources (Note 1) System break interrupt : 1 source (entered from $\overline{\text{SBI}}$ pin)
Level management	Eight levels including an interrupt-disabled state (However, interrupts of the same level have their priorities resolved by fixed hardware priority.)

Note 1: This is the number of interrupt requests divided into groups. There are actually a total of 70 interrupt request sources when counted individually.

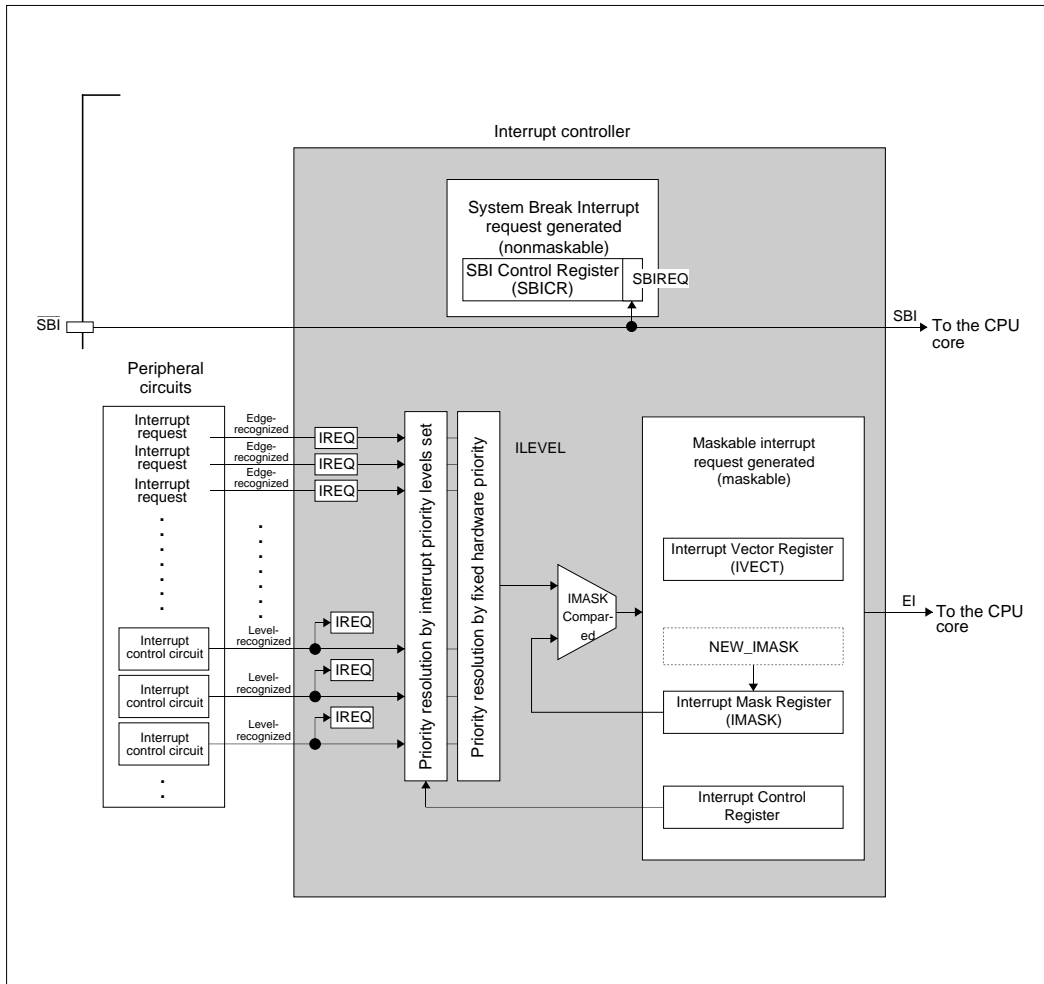

Figure 5.1.1 Block Diagram of the Interrupt Controller

5.2 ICU Related Registers

The diagram below shows a register map associated with the Interrupt Controller (ICU).

Address	D0	+0 Address	D7	D8	+1 Address	D15

Blank addresses are reserved for future use.
 Note: • The registers in the thick frames must always be accessed in halfwords.

Figure 5.2.1 Interrupt Controller (ICU) Related Register Map

5.2.1 Interrupt Vector Register

■ Interrupt Vector Register (IVECT)

<Address:H'0080 0000>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0 – 15	IVECT (16 low-order bits of ICU vector table address)	When an interrupt request is accepted, the 16 low-order bits in ICU vector table address for the accepted interrupt source is stored in this register.	○	–

Note: • This register must always be accessed in halfwords. (This is a read-only register).

The Interrupt Vector Register (IVECT) is used when an interrupt is accepted to store the 16 low-order bits of ICU vector table address for the accepted interrupt source.

Before this function can work, the ICU vector table (addresses H'0000 0094 through H'0000 010F) must have set in it the start addresses of interrupt handlers for each internal peripheral I/O. When an interrupt request is accepted, the 16 low-order bits of ICU vector table address for the accepted interrupt request source is stored in this IVECT register. In the EIT handler, read the content of this IVECT register using "LDH" instruction to get the ICU vector table address.

When the IVECT register is read, operations (1) to (4) below are automatically performed in hardware:

- (1) The interrupt priority level (ILEVEL) of the accepted interrupt request source is set in the IMASK register as a new IMASK value. (Interrupts with lower priority levels than that of the accepted interrupt request source are masked.).
- (2) The interrupt request bit for the accepted interrupt request source is cleared (not cleared for level-recognized interrupt request sources).
- (3) The interrupt request (EI) to the CPU core is deasserted.
- (4) The ICU's internal sequencer is activated to start internal processing (interrupt priority resolution).

Notes: • Do not read the Interrupt Vector Register (IVECT) in the EIT handler unless interrupts are disabled (PSW register IE bit = "0") . In the EIT handler, furthermore, read the Interrupt Request Mask Register (IMASK) first before reading the IVECT register.

- To reenale interrupts (by setting the IE bit to "1") after reading the Interrupt Vector Register (IVECT), perform a dummy access to the internal memory, etc. before reenabling interrupts, (The ICU vector table readout in the EI handler processing example in Figure 5.5.2 Typical Handler Operation for Interrupts from Internal Peripheral I/O is an access to the internal ROM and, therefore, does not require adding a dummy access).

5.2.2 Interrupt Request Mask Register

■ Interrupt Request Mask Register (IMASK)

<Address:H'0080 0004>

<When reset: H'07>

D	Bit Name	Function	R	W
0 – 4	No functions assigned		0	–
5– 7	IMASK (Interrupt request mask bit)	000 : Maskable interrupts are disabled 001 : Level 0 interrupts can be accepted 010 : Level 0-1 interrupts can be accepted 011 : Level 0-2 interrupts can be accepted 100 : Level 0-3 interrupts can be accepted 101 : Level 0-4 interrupts can be accepted 110 : Level 0-5 interrupts can be accepted 111 : Level 0-6 interrupts can be accepted	○	○

The Interrupt Request Mask Register (IMASK) is used to finally determine whether or not to accept an interrupt request after comparing its priority levels (Interrupt Control Register ILEVEL bits) that have been set for each interrupt source.

When the Interrupt Vector Register (IVECT) described above is read, the interrupt priority level of the accepted interrupt request source is set in this IMASK register as a new mask value.

When any value is written to the IMASK register, operations (1) to (2) below are automatically performed in hardware:

- (1) The interrupt request (EI) to the CPU core is deasserted.
- (2) The ICU's internal sequencer is activated to start internal processing (interrupt priority resolution).

- Notes:
- Do not write to the Interrupt Request Mask Register (IMASK) in the EIT handler unless interrupts are disabled (PSW register IE bit = "0").
 - To reenble interrupts (by setting the IE bit to "1") after writing to the Interrupt Request Mask Register (IMASK), perform a dummy access to the internal memory, etc. before reenabling interrupts.

5.2.3 SBI (System Break Interrupt) Control Register

■ SBI (System Break Interrupt) Control Register

<Address:H'0080 0006>

<When reset: H'00>

D	Bit Name	Function	R	W
0 – 6	No functions assigned		0	–
7	SBI REQ (SBI request bit)	0 : SBI is not requested 1 : SBI is requested	○	△ (Note 1)

Note 1: This bit can only be cleared (see below).

The System Break Interrupt (SBI) is an interrupt request generated by a falling edge on the $\overline{\text{SBI}}$ signal input pin. When a falling edge on the $\overline{\text{SBI}}$ signal input pin is detected and this bit is set to "1", a system break interrupt (SBI) request is generated to the CPU.

This bit cannot be set to "1" in software, it can only be cleared.

To clear this bit to "0", follow the procedure described below.

1. Write "1" to the SBI request bit.
2. Write "0" to the SBI request bit.

Note: • Unless this bit is set to "1", do not perform the above clearing operation.

5.2.4 Interrupt Control Registers

■ CAN0 Transmit/Receive & Error Interrupt Control Register (ICAN0CR)	<Address:H'0080 0060>
■ RTD Interrupt Control Register (IRTDCR)	<Address:H'0080 0067>
■ SIO2,3 Transmit/Receive Interrupt Control Register (ISIO23CR)	<Address:H'0080 0068>
■ DMA5-9 Interrupt Control Register (IDMA59CR)	<Address:H'0080 0069>
■ A-D0 Converter Interrupt Control Register (IAD0CCR)	<Address:H'0080 006C>
■ SIO0 Transmit Interrupt Control Register (ISIO0TXCR)	<Address:H'0080 006D>
■ SIO0 Receive Interrupt Control Register (ISIO0RXCR)	<Address:H'0080 006E>
■ SIO1 Transmit Interrupt Control Register (ISIO1TXCR)	<Address:H'0080 006F>
■ SIO1 Receive Interrupt Control Register (ISIO1RXCR)	<Address:H'0080 0070>
■ DMA0-4 Interrupt Control Register (IDMA04CR)	<Address:H'0080 0071>
■ MJT Output Interrupt Control Register 0 (IMJTOCR0)	<Address:H'0080 0072>
■ MJT Output Interrupt Control Register 1 (IMJTOCR1)	<Address:H'0080 0073>
■ MJT Output Interrupt Control Register 2 (IMJTOCR2)	<Address:H'0080 0074>
■ MJT Output Interrupt Control Register 3 (IMJTOCR3)	<Address:H'0080 0075>
■ MJT Output Interrupt Control Register 4 (IMJTOCR4)	<Address:H'0080 0076>
■ MJT Output Interrupt Control Register 5 (IMJTOCR5)	<Address:H'0080 0077>
■ MJT Output Interrupt Control Register 6 (IMJTOCR6)	<Address:H'0080 0078>
■ MJT Output Interrupt Control Register 7 (IMJTOCR7)	<Address:H'0080 0079>
■ MJT Input Interrupt Control Register 1 (IMJTICR1)	<Address:H'0080 007B>
■ MJT Input Interrupt Control Register 2 (IMJTICR2)	<Address:H'0080 007C>
■ MJT Input Interrupt Control Register 3 (IMJTICR3)	<Address:H'0080 007D>
■ MJT Input Interrupt Control Register 4 (IMJTICR4)	<Address:H'0080 007E>

<When reset: H'07>

D	Bit Name	Function	R	W
0 – 2 (8-10)	No functions assigned		0	–
3 (11)	IREQ Interrupt request bit	<When edge recognized> At read 0: Interrupt not requested 1: Interrupt requested At write 0: Clear interrupt request 1: Generate interrupt request <When level-recognized> At read 0: Interrupt not requested 1: Interrupt requested	R	W
4 (12)	No functions assigned		0	–
5-7 (13-15)	ILEVEL Interrupt priority level bits	000 : Interrupt priority level 0 001 : Interrupt priority level 1 010 : Interrupt priority level 2 011 : Interrupt priority level 3 100 : Interrupt priority level 4 101 : Interrupt priority level 5 110 : Interrupt priority level 6 111 : Interrupt priority level 7 (Interrupt disabled)	R	W

(1) IREQ (Interrupt Request) bit (D3 or D11)

When an interrupt request from some internal peripheral I/O occurs, the corresponding IREQ (Interrupt Request) bit is set to "1".

This bit can be set and cleared in software for only edge-recognized interrupt request sources (and not for level-recognized interrupt request sources). Also, when this bit is set by an edge-recognized interrupt request generated, it is automatically cleared to "0" by reading the Interrupt Vector Register (IVECT) (not cleared in the case of level-recognized interrupt request).

If the IREQ bit is cleared in software at the same time it is set by an interrupt request generated, clearing in software has priority. Also, if the IREQ bit is cleared by reading the Interrupt Vector Register (IVECT) at the same time it is set by an interrupt request generated, clearing by a read of the IVECT register has priority.

Note: • External Interrupt (EI) to the CPU core is not deasserted by clearing the IREQ bit. External Interrupt (EI) to the CPU core can only be deasserted by the following operation:

- (1) Reset
- (2) IVECT register read
- (3) Write to the IMASK register

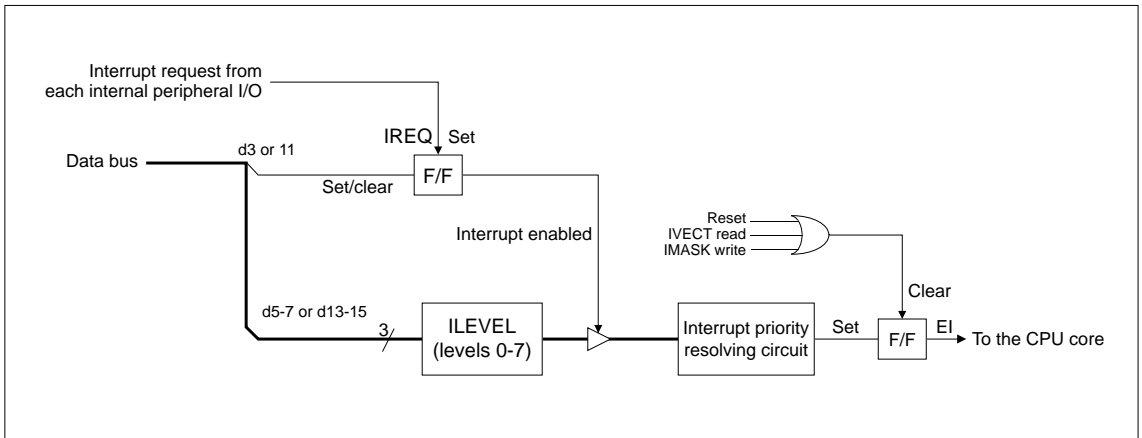

Figure 5.2.2 Configuration of the Interrupt Control Register (Edge-recognized Type)

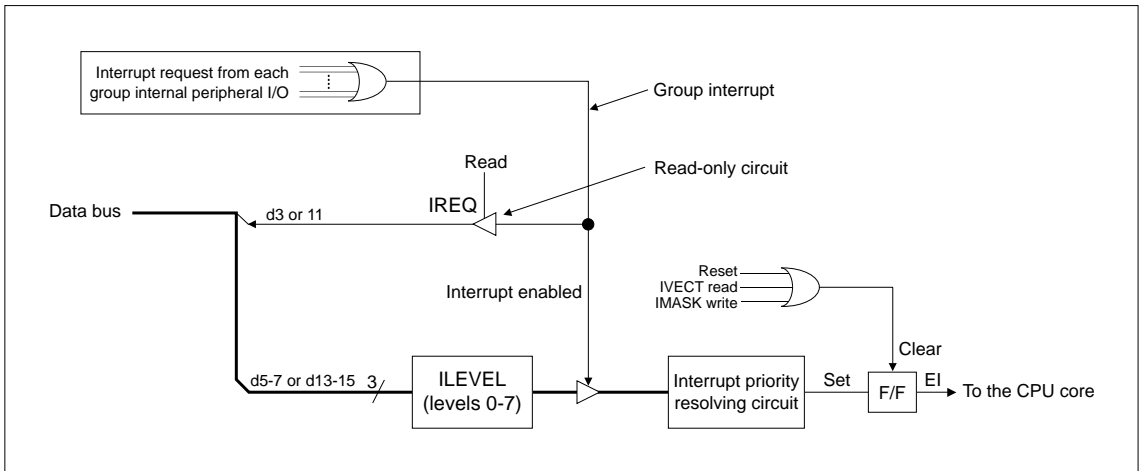

Figure 5.2.3 Configuration of the Interrupt Control Register (Level-recognized Type)

(2) ILEVEL (Interrupt Priority Level) (D5-D7 or D13-D15)

These bits set the priority levels of interrupt requests from each internal peripheral I/O. Set priority level 7 to disable interrupts from some internal peripheral I/O or priority levels 0-6 to enable interrupts.

When an interrupt occurs, the interrupt controller resolves priority between this interrupt and other interrupt sources based on ILEVEL settings and finally compares its priority with the IMASK value to determine whether to forward an EI request to the CPU or keep it pending.

The table below shows the relationship between ILEVEL settings and the IMASK values at which interrupts are accepted.

Table 5.2.1 ILEVEL Settings and Accepted IMASK Values

ILEVEL values set	IMASK values at which interrupts are accepted
0 (ILEVEL="000")	Accepted when IMASK is 1-7
1 (ILEVEL="001")	Accepted when IMASK is 2-7
2 (ILEVEL="010")	Accepted when IMASK is 3-7
3 (ILEVEL="011")	Accepted when IMASK is 4-7
4 (ILEVEL="100")	Accepted when IMASK is 5-7
5 (ILEVEL="101")	Accepted when IMASK is 6-7
6 (ILEVEL="110")	Accepted when IMASK is 7
7 (ILEVEL="111")	Not accepted (interrupts disabled)

5.3 Interrupt Request Sources in Internal Peripheral I/O

The interrupt controller receives as its inputs the interrupt requests from MJT (multijunction timer), DMAC, serial I/O, A-D converter, RTD, and CAN. For details about these interrupts, refer to each section in which the relevant internal peripheral I/O is described.

Table 5.3.1 Interrupt Request Sources in Internal Peripheral I/O

Interrupt Request Sources	Contents	Number of Input Sources	ICU Type of Input Source(Note 1)
A-D0 conversion interrupt	Single-shot conversion in A-D0 converter scan mode completed, single mode completed, or comparator mode completed	1	Edge-recognized
SIO0 transmit interrupt	SIO0 transmit buffer empty interrupt	1	Edge-recognized
SIO0 receive interrupt	SIO0 reception completed or receive error interrupt	1	Edge-recognized
SIO1 transmit interrupt	SIO1 transmit buffer empty interrupt	1	Edge-recognized
SIO1 receive interrupt	SIO1 reception completed or receive error interrupt	1	Edge-recognized
SIO2,3 transmit/receive interrupt	SIO2 reception completed or receive error interrupt, transmit buffer empty interrupt	2	Level-recognized
RTD interrupt	RTD interrupt generation command	1	Edge-recognized
DMA transfer interrupt 0	DMA0-4 transfer completed	5	Level-recognized
DMA transfer interrupt 1	DMA5-9 transfer completed	5	Level-recognized
CAN0 transmit/receive & error interrupt	CAN0 transmission completed, CAN0 reception completed, CAN0 error passive, CAN0 error bus-off, CAN0 bus error	19	Level-recognized
MJT output interrupt 7	MJT output interrupt group 7 (TMS0, TMS1 output)	2	Level-recognized
MJT output interrupt 6	MJT output interrupt group 6 (TOP8, TOP9 output)	2	Level-recognized
MJT output interrupt 5	MJT output interrupt group 5 (TOP10 output)	1	Edge-recognized
MJT output interrupt 4	MJT output interrupt group 4 (TIO4 - TIO7 output)	4	Level-recognized
MJT output interrupt 3	MJT output interrupt group 3 (TIO8, TIO9 output)	2	Level-recognized
MJT output interrupt 2	MJT output interrupt group 2 (TOP0 - TOP5 output)	6	Level-recognized
MJT output interrupt 1	MJT output interrupt group 1 (TOP6, TOP7 output)	2	Level-recognized
MJT output interrupt 0	MJT output interrupt group 0 (TIO0 - TIO3 output)	4	Level-recognized
MJT input interrupt 4	MJT input interrupt group 4 (TIN3 input)	1	Level-recognized
MJT input interrupt 3	MJT input interrupt group 3 (TIN20-TIN23 input)	4	Level-recognized
MJT input interrupt 2	MJT input interrupt group 2 (TIN16-TIN19 input)	4	Level-recognized
MJT input interrupt 1	MJT input interrupt group 1 (TIN0 input)	1	Level-recognized

Note 1: ICU type of input source

- Edge-recognized: Interrupt requests are generated on a falling edge of the interrupt signal applied to the ICU.
- Level-recognized: Interrupt requests are generated when the interrupt signal applied to the ICU is held low. For these level-recognized interrupts, the ICU's Interrupt Control register IRQ bit cannot be set or cleared in software.

5.4 ICU Vector Table

The ICU vector table is used to set the start addresses of interrupt handlers for each internal peripheral I/O. The 22-source interrupts are assigned the following addresses:

Table 5.4.1 ICU Vector Table Addresses

Interrupt Source	ICU Vector Table Address
MJT Input Interrupt request 4 (TIN3 input)	H'0000 0094-H'0000 0097
MJT Input Interrupt request 3 (TIN20-TIN23 input)	H'0000 0098-H'0000 009B
MJT Input Interrupt request 2 (TIN16-TIN19 input)	H'0000 009C-H'0000 009F
MJT Input Interrupt request 1 (TIN0 input)	H'0000 00A0-H'0000 00A3
MJT Output Interrupt request 7 (TMS0, TMS1 output)	H'0000 00A8-H'0000 00AB
MJT Output Interrupt request 6 (TOP8, TOP9 output)	H'0000 00AC-H'0000 00AF
MJT Output Interrupt request 5 (TOP10 output)	H'0000 00B0-H'0000 00B3
MJT Output Interrupt request 4 (TIO4 - TIO7 output)	H'0000 00B4-H'0000 00B7
MJT Output Interrupt request 3 (TIO8, TIO9 output)	H'0000 00B8-H'0000 00BB
MJT Output Interrupt request 2 (TOP0 - TOP5 output)	H'0000 00BC-H'0000 00BF
MJT Output Interrupt request 1 (TOP6, TOP7 output)	H'0000 00C0-H'0000 00C3
MJT Output Interrupt request 0 (TIO0 - TIO3 output)	H'0000 00C4-H'0000 00C7
DMA0-4 Interrupt request	H'0000 00C8-H'0000 00CB
SIO1 Receive Interrupt request	H'0000 00CC-H'0000 00CF
SIO1 Transmit Interrupt request	H'0000 00D0-H'0000 00D3
SIO0 Receive Interrupt request	H'0000 00D4-H'0000 00D7
SIO0 Transmit Interrupt request	H'0000 00D8-H'0000 00DB
A-D0 Converter Interrupt request	H'0000 00DC-H'0000 00DF
DMA5-9 Interrupt request	H'0000 00E8-H'0000 00EB
SIO2,3 Transmit/Receive Interrupt request	H'0000 00EC-H'0000 00EF
RTD Interrupt request	H'0000 00F0-H'0000 00F3
CAN0 Transmit/Receive & Error Interrupt request	H'0000 010C-H'0000 010F

Figure 5.4.2 ICU Vector Table Memory Map (2/2)

5.5 Description of Interrupt Operation

5.5.1 Acceptance of Internal Peripheral I/O Interrupts

An interrupt from any internal peripheral I/O is checked to see whether or not to accept by comparing its ILEVEL value set in the Interrupt Control Register and the IMASK value of the Interrupt Request Mask Register. If its priority is higher than the IMASK value, the interrupt request is accepted. However, when multiple interrupt requests occur simultaneously, the interrupt controller resolves priority between these interrupt requests following the procedure described below.

- (a) The ILEVEL values set in the Interrupt Control Register for each interrupt peripheral I/Os are compared with each other.
- (b) If the ILEVEL values are the same, they are resolved according to the predetermined hardware priority.
- (c) The ILEVEL value is compared with IMASK value.

When multiple interrupt requests occur simultaneously, the interrupt controller first compares their priority levels set in each Interrupt Control Register's ILEVEL bit to select an interrupt request which has the highest priority. If the interrupt requests have the same LEVEL value, they are resolved according to the hardware-fixed priority.

The interrupt request thus selected has its ILEVEL value compared with IMASK value and if its priority is higher than the IMASK value, the interrupt controller sends an EI request to the CPU.

Interrupt requests may be masked by setting the Interrupt Mask Register and the Interrupt Control Register's ILEVEL bit (level 7 = disabled) provided for each internal peripheral I/O and the PSW register IE bit.

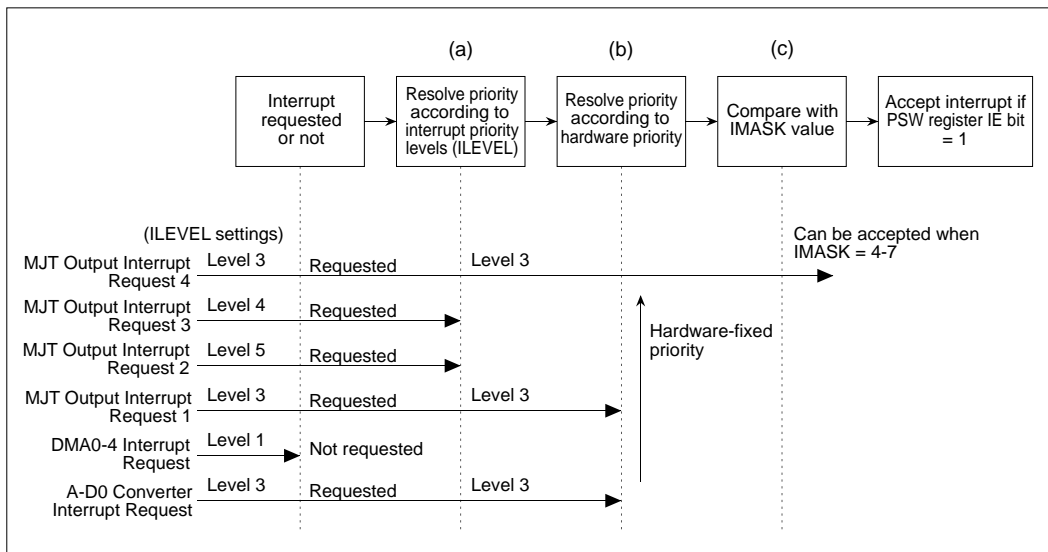

Figure 5.5.1 Example of Priority Resolution When Accepting Interrupt Requests

Table 5.5.2 ILEVEL Settings and Accepted IMASK Values

ILEVEL values set	IMASK values at which interrupts are accepted
0 (ILEVEL="000")	Accepted when IMASK is 1-7
1 (ILEVEL="001")	Accepted when IMASK is 2-7
2 (ILEVEL="010")	Accepted when IMASK is 3-7
3 (ILEVEL="011")	Accepted when IMASK is 4-7
4 (ILEVEL="100")	Accepted when IMASK is 5-7
5 (ILEVEL="101")	Accepted when IMASK is 6-7
6 (ILEVEL="110")	Accepted when IMASK is 7
7 (ILEVEL="111")	Not accepted (interrupts disabled)

5.5.2 Processing of Internal Peripheral I/O Interrupts by Handler

(1) Branching to the interrupt handler

When the CPU accepts an interrupt, control branches to the EIT vector entry after hardware preprocessing as described in Section 4.3, "EIT Processing Procedure." The EIT vector entry for External Interrupt (EI) is located at address H'0000 0080. This address is where the instruction (not the jump address) for branching to the beginning of the interrupt processing routine for External Interrupt (EI) is written.

(2) Processing in the External Interrupt (EI) handler

A typical operation of the External Interrupt (EI) handler (for interrupts from internal peripheral I/O) is shown in Figure 5.5.2.

[1] Saving each register to the stack

Save the BPC, PSW and general-purpose registers to the stack. Also, save the accumulator as necessary.

[2] Reading the Interrupt Request Mask Register (IMASK) and saving to the stack

Read the Interrupt Request Mask Register and save its content to the stack.

[3] Reading the Interrupt Vector Register (IVECT)

Read the Interrupt Vector Register. This register holds the 16 low-order address bits of the ICU vector table for the accepted interrupt request source that was stored in it when accepting an interrupt request. When the Interrupt Vector Register is read, the following processing is automatically performed in hardware:

- The interrupt priority level of the accepted interrupt request (ILEVEL) is set in the IMASK register as a new IMASK value. (Interrupts with lower priority levels than that of the accepted interrupt request source are masked.)
- The accepted interrupt request source is cleared (not cleared for level-recognized interrupt request sources).
- The interrupt request (EI) to the CPU core is dropped.
- The ICU's internal sequencer is activated to start internal processing (interrupt priority resolution).

[4] Reading and overwriting the Interrupt Request Mask Register (IMASK)

Read the Interrupt Request Mask Register and overwrite it with the read value. This write to the IMASK register causes the following processing to be automatically performed in hardware:

- The interrupt request (EI) to the CPU core is dropped.
- The ICU's internal sequencer is activated to start internal processing (interrupt priority resolution).

Note: • Processing in [4] here is unnecessary when multiple interrupts are to be enabled in [6] below.

[5] Reading the ICU vector table

Read the ICU vector table for the accepted interrupt request source. The relevant ICU vector table address can be obtained by zero-extending the content of the Interrupt Vector Register that was read in [3] (i.e., the 16 low-order address bits of the ICU vector table for the accepted interrupt request source). The ICU vector table must have set in it the start address of the interrupt handler for the interrupt request source concerned.)

[6] Enabling multiple interrupts

To enable another higher priority interrupt while processing the accepted interrupt (i.e., enabling multiple interrupts), set the PSW register IE bit to "1".

[7] Branching to the internal peripheral I/O interrupt handler

Branch to the start address of the interrupt handler that was read out in [5].

[8] Processing in the internal peripheral I/O interrupt handler

[9] Disabling interrupts

Clear the PSW register IE bit to "0" to disable interrupts.

[10] Restoring the Interrupt Request Mask Register (IMASK)

Restore the Interrupt Request Mask Register that was saved to the stack in [2].

[11] Restoring registers from the stack

Restore the registers that were saved to the stack in [1].

[12] Completion of external interrupt processing

Execute the RTE instruction to complete the external interrupt processing. The program returns to the state in which it was before the currently processed interrupt request was accepted.

(3) Identifying the source of the interrupt request generated

If any internal peripheral I/O has two or more interrupt request sources, check the Interrupt Request Status Register provided for each internal peripheral I/O to identify the source of the interrupt request generated.

(4) Enabling multiple interrupts

To enable multiple interrupts in the interrupt handler, set the PSW register IE (Interrupt Enable) bit to enable interrupt requests to be accepted. However, before writing "1" to the IE bit, be sure to save each register (BPC, PSW, general-purpose registers and IMASK) to the stack.

Note: • Before enabling multiple interrupts, read the Interrupt Vector Register (IVECT) and then the ICU vector table, as shown in Figure 5.5.2, "Typical Handler Operation for Interrupts from Internal Peripheral I/O."

Figure 5.5.2 Typical Operation for Interrupts from Internal Peripheral I/O

5.6 Description of System Break Interrupt (SBI) Operation

5.6.1 Acceptance of SBI

System Break Interrupt (SBI) is an emergency interrupt which is used when power failure is detected or a fault condition is notified by an external watchdog timer. The system break interrupt is accepted anytime upon detection of a falling edge on the $\overline{\text{SBI}}$ signal input pin regardless of how the PSW register IE bit is set, and cannot be masked.

5.6.2 SBI Processing by Handler

When the system break interrupt generated has been serviced, always be sure to terminate or reset the system without returning to the program that was being executed when the interrupt occurred.

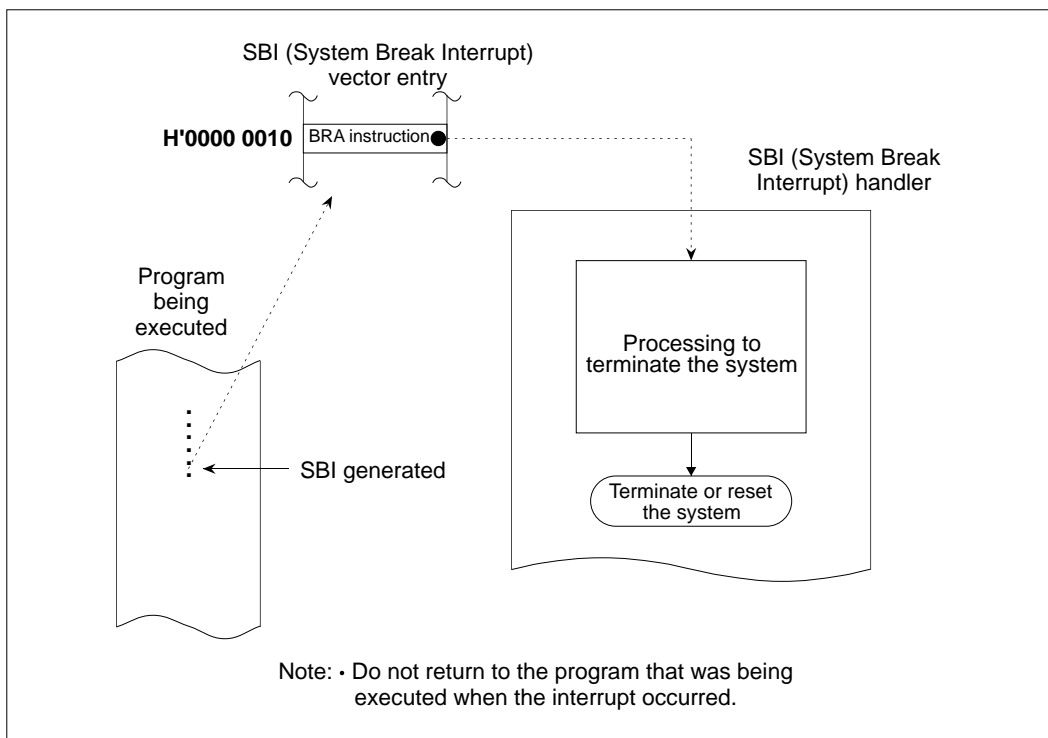

Figure 5.6.1 Typical SBI Operation

CHAPTER 6

INTERNAL MEMORY

- 6.1 Outline of the Internal Memory
- 6.2 Internal RAM
- 6.3 Internal Flash Memory
- 6.4 Registers Associated with the Internal Flash Memory
- 6.5 Programming of the Internal Flash Memory
- 6.6 Boot ROM

- 6.9 Internal Flash Memory Protect Functions
- 6.10 Precautions to Be Taken When Reprogramming Flash Memory

6.1 Outline of the Internal Memory

The 32171 internally contains the following types of memory:

- 16 Kbyte RAM
- 512 Kbyte, 384 Kbyte, or 256 Kbyte flash memory

6.2 Internal RAM

Specifications of the 32171's internal RAM are shown below.

Table 6.2.1 Specifications of the Internal RAM

Item	Specification
Capacity	16 Kbytes
Location address	H'0080 4000 - H'0080 7FFF
Wait insertion	Operates with no wait states (when using 40 MHz CPU clock)
Internal bus connection	Connected by 32-bit bus
Dual port	By using the Real-Time Debugger (RTD), data can be read (monitored) or written to any area of the internal RAM via serial communication from external devices independently of the CPU. (Refer to Chapter 14, "Real-Time Debugger.")

Note: • At power-on reset, the internal RAM value is indeterminate. (However, if the device is reset and placed out of reset while the VDD pin has 2.0 V to 3.6 V being applied to it, the RAM content before a reset is retained.)

6.3 Internal Flash Memory

Specifications of the 32171's internal flash memory are shown below.

Table 6.3.1 Specifications of the Internal Flash Memory

Item	Specification
Capacity	M32171F4 : 512 Kbytes M32171F3 : 384Kbytes M32171F2 : 256 Kbytes
Location address	M32171F4 : H'0000 0000 - H'0007 FFFF M32171F3 : H'0000 0000 - H'0005 FFFF M32171F2 : H'0000 0000 - H'0003 FFFF
Wait insertion	Operates with no wait states (when using 40 MHz CPU clock)
Durability	Can be rewritten 100 times
Internal bus connection	Connected by 32-bit bus
Other	Virtual flash emulation function is included. (Refer to Section 6.7, "Virtual Flash Emulation Function.")

6.4 Registers Associated with the Internal Flash Memory

The diagram below shows a register map associated with the internal flash memory.

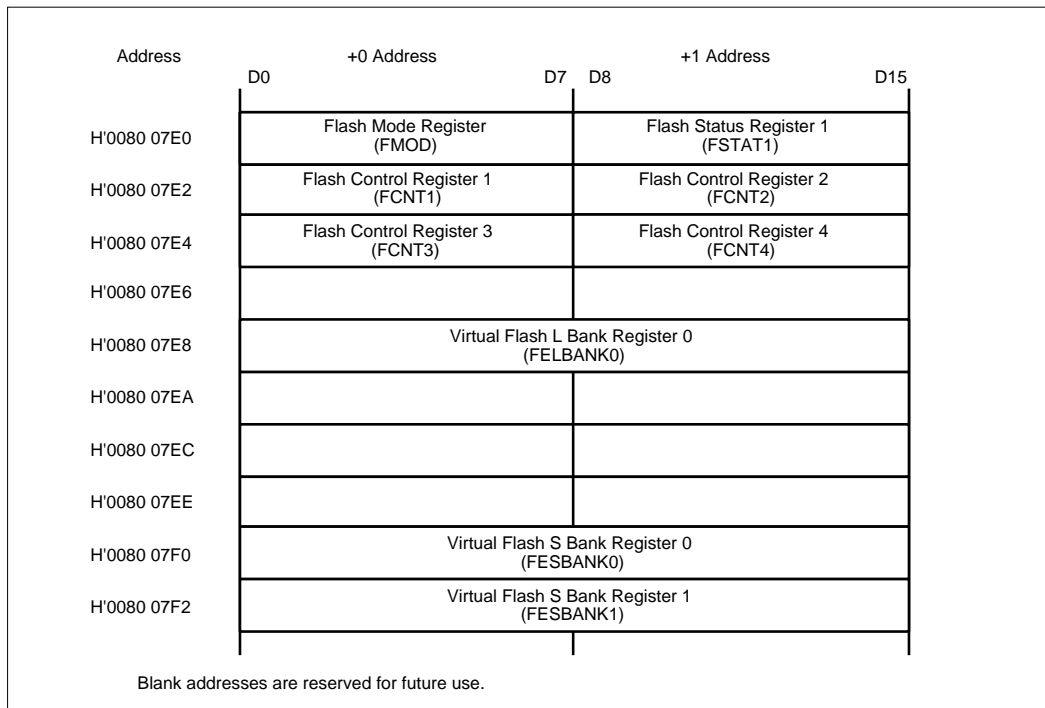

Figure 6.4.1 Register Map Associated with the Internal Flash Memory

6.4.1 Flash Mode Register

■ Flash Mode Register (FMODE)

<Address: H'0080 07E0>

<When reset : H'0?>

D	Bit Name	Function	R	W
0 - 6	No functions assigned		0	—
7	FPMOD (External FP pin status)	0 : FP pin = low 1 : FP pin = high	○	—

The Flash Mode Register (FMODE) is a read-only status register, with its FPMOD bit indicating the status of the FP (Flash Protect) pin. Write to the flash memory is enabled only when FPMOD = 1. Writing to the flash memory when FPMOD = 0 has no effect.

6.4.2 Flash Status Registers

The 32171 has two registers to indicate the flash memory status, one of which is Flash Status Register 1 (FSTAT1) located in the SFR area (address: H'0080 07E1), and the other is Flash Status Register 2 (FSTAT2) included in the flash memory itself. When programming or erasing the flash memory, use these two status registers (FSTAT1, FSTAT2) to control the program/erase operations.

■ Flash Status Register 1 (FSTAT1)

<Address: H'0080 07E1>

<When reset : H'01>

D	Bit Name	Function	R	W
8 - 14	No functions assigned		0	—
15	FSTAT	0 : Busy	○	—
	(Ready/Busy status)	1 : Ready		

The Flash Status Register 1 (FSTAT1) is a read-only status register used to know the execution status of whether the flash memory is being programmed or erased.

Note: • While FSTAT bit = 0 (Busy), do not manipulate Flash Control Register 4 (FCNT4)'s FRESET bit.

■ Flash Status Register 2 (FSTAT2)

<When reset : H'80>

D	Bit Name	Function	R	W
8	FBUSY (Flash busy)	0 : Program or erase under way 1 : Ready state	○	—
9	No functions assigned		0	—
10	ERASE (Auto Erase operating condition)	0 : Erase normally operating/terminated 1 : Erase error occurred	○	—
11	WRERR1 (Program operating condition)	0 : Program normally operating/terminated 1 : Program error occurred	○	—
12	WRERR2 (Program operating condition)	0 : Program normally operating/terminated 1 : Over-programming occurred	○	—
13 - 15	No functions assigned		0	—

The Flash Status Register 2 (FSTAT2) consists of the following four read-only status bits which indicate the operating condition of the flash memory.

(1) FBUSY (Flash Busy) bit (D8)

The FBUSY bit is used to determine whether the operation is terminated when programming or erasing the flash memory. When FBUSY = 0, it means the program or erase operation is being executed; when FBUSY = 1, the operation is terminated.

(2) ERASE (Auto Erase operating condition) bit (D10)

The ERASE bit is used to determine whether execution of the flash memory erase operation has resulted in an error. When ERASE = 0, it means the erase operation terminated normally; when ERASE = 1, the operation terminated in an error.

(3) WRERR1 (Program operating condition) bit (D11)

The WRERR1 bit is used to determine after completion of execution whether the flash memory program operation resulted in an error. When WRERR1 = 0, it means the program operation terminated normally; when WRERR1 = 1, the operation terminated in an error. The condition under which WRERR1 is set to 1 is when any bit other than those that must be 0 is found to be a 0 by comparison between the write data and the data in the flash memory.

(4) WRERR2 (Program operating condition) bit (D12)

The WRERR2 bit is used to determine after execution whether the flash memory program operation resulted in an error. When WRERR2 = 0, it means the program operation terminated normally; when WRERR2 = 1, the operation terminated in an error. The condition under which WRERR2 is set to 1 is when the flash memory could not be programmed to by repeating the program operation a specified number of times.

- Notes:
- This status register is included in the internal flash memory itself, and can be read out by writing the Read Status Command (H'7070) to any address of the flash memory. For details, refer to Section 6.5, "Programming of Internal Flash Memory."
 - While FBUSY bit = 0 (program/erase in progress), do not manipulate Flash Control Register 4 (FCNT4)'s FRESET bit.

6.4.3 Flash Control Registers

■ Flash Control Register 1 (FCNT1)

<Address: H'0080 07E2>

<When reset : H'00>

D	Bit Name	Function	R	W
0 - 2	No functions assigned		0	—
3	FENTRY (Flash mode entry)	0 : Normal read 1 : Erase/program enable	○	○
4 - 6	No functions assigned		0	—
7	FEMMOD (Virtual flash emulation mode)	0 : Normal mode 1 : Virtual Flash emulation mode	○	○

The Flash Control Register 1 (FCNT1) consists of the following two bits to control the internal flash memory.

(1) FENTRY (Flash Mode Entry) bit (D3)

The FENTRY bit controls entry to flash E/W enable mode. Flash E/W enable mode can be entered only when FENTRY = 1.

To set the FENTRY bit to 1, write a 0 and then a 1 to the FENTRY bit in succession while the FP pin = high.

The FENTRY bit is cleared in the following cases:

- When a 0 is written to the FENTRY bit
- When the device is reset
- When the FP pin changes state from high to low

Note: • If while programming or erasing the flash memory, Flash Status Register 1 (FSTAT1)'s FSTAT bit = 0 (Busy) or Flash Status Register 2 (FSTAT2)'s FBUSY bit = 0 (program/erase in progress), do not clear the FENTRY bit.

When using a program in the flash memory while the FENTRY bit = 0, the EI vector entry is located at address H'0000 0080 of the flash memory. When running a flash write/erase program in RAM while the FENTRY bit = 1, the EI vector entry is located at address H'0080 4000 of the RAM, allowing for flash reprogram operation to be controlled using interrupts.

Table 6.4.1 Changes of EI Vector Entry by FENTRY

FENTRY	EI Vector Entry	Address
0	Flash memory area	H'0000 0080
1	Internal RAM area	H'0080 4000

(2) FEMMOD (Virtual Flash Emulation Mode) bit (D7)

The FEMMOD bit controls entry to Virtual flash emulation mode. Virtual flash emulation mode is entered by setting the FEMMOD bit to 1 while the FENTRY bit = 0. (For details, refer to Section 6.7, "Virtual Flash Emulation Function.")

■ Flash Control Register 2 (FCNT2)

<Address: H'0080 07E3>

<When reset : H'00>

D	Bit Name	Function	R	W
8 - 14	No functions assigned		0	—
15	FPROT (Unlock)	0 : Protection by lock bit effective 1 : Protection by lock bit not effective	○	○

The Flash Control Register 2 (FCNT2) controls invalidation of the internal flash memory protection by a lock bit (to disable erasing or programming of the flash memory). The flash memory protection becomes invalid (unlocked) by setting the FPROT bit to 1, so that any blocks protected by the lock bit can be erased or programmed.

To set the FPROT bit to 1, write a 0 and then a 1 to the FPROT bit in succession while the FENTRY bit = 1.

Also, the FPROT bit is cleared to 0 in one of the following cases:

- A low-level signal entered to the $\overline{\text{RESET}}$ pin
- FPROT bit reset by writing 0
- FP pin = low
- FENTRY bit cleared to 0

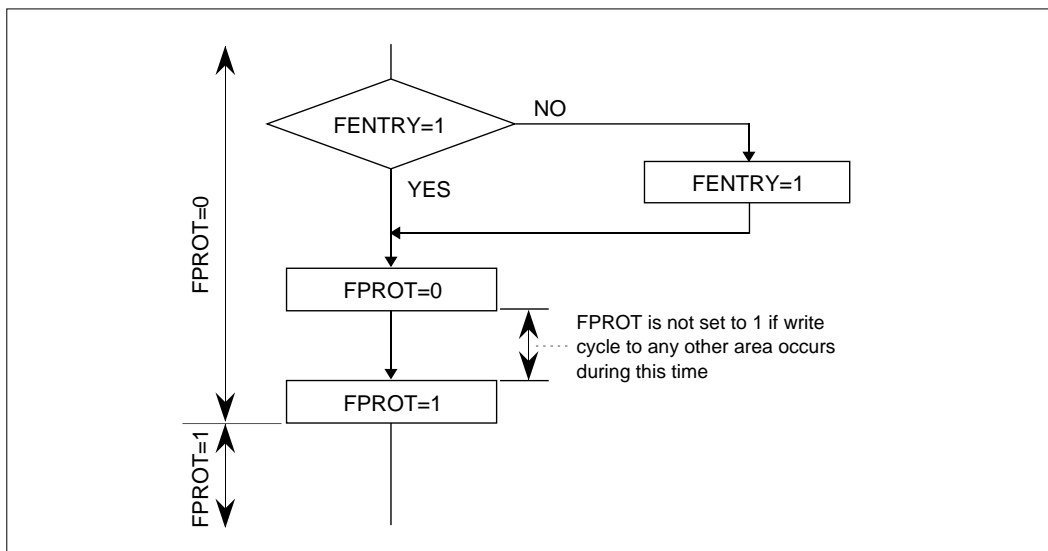

Figure 6.4.2 Protection Unlocking Flow

■ Flash Control Register 3 (FCNT3)

<Address: H'0080 07E4>

<When reset : H'00>

D	Bit Name	Function	R	W
0 - 6	No functions assigned		0	—
7	FELEVEL	0 : Normal level	○	○
	(Raise erase margin)	1 : Raise erase margin		

The Flash Control Register 3 (FCNT3) controls the depth of erase levels when erasing the internal flash memory with one of erase commands. By setting the FELEVEL bit to 1, the flash memory erase level can be deepened, which will result in an increased reliability margin.

■ Flash Control Register 4 (FCNT4)

<Address: H'0080 07E5>

<When reset : H'00>

D	Bit Name	Function	R	W
8 - 14	No functions assigned		0	—
15	FRESET	0 : No operation performed	○	○
	(Reset flash)	1 : Reset the flash memory		

The Flash Control Register 4 (FCNT4) controls canceling program/erase operation in the middle and initializing each status bit of Flash Status Register 2 (FSTAT2). When the FRESET bit is set to 1, program/erase operation is canceled in the middle and each status bit of FSTAT2 is initialized (H'80).

The FRESET bit is effective only when the FENTRY bit = 1. Information on FRESET bit is ignored unless the FENTRY bit = 1.

Make sure that when programming or erasing the flash memory, the FRESET bit remains 0.

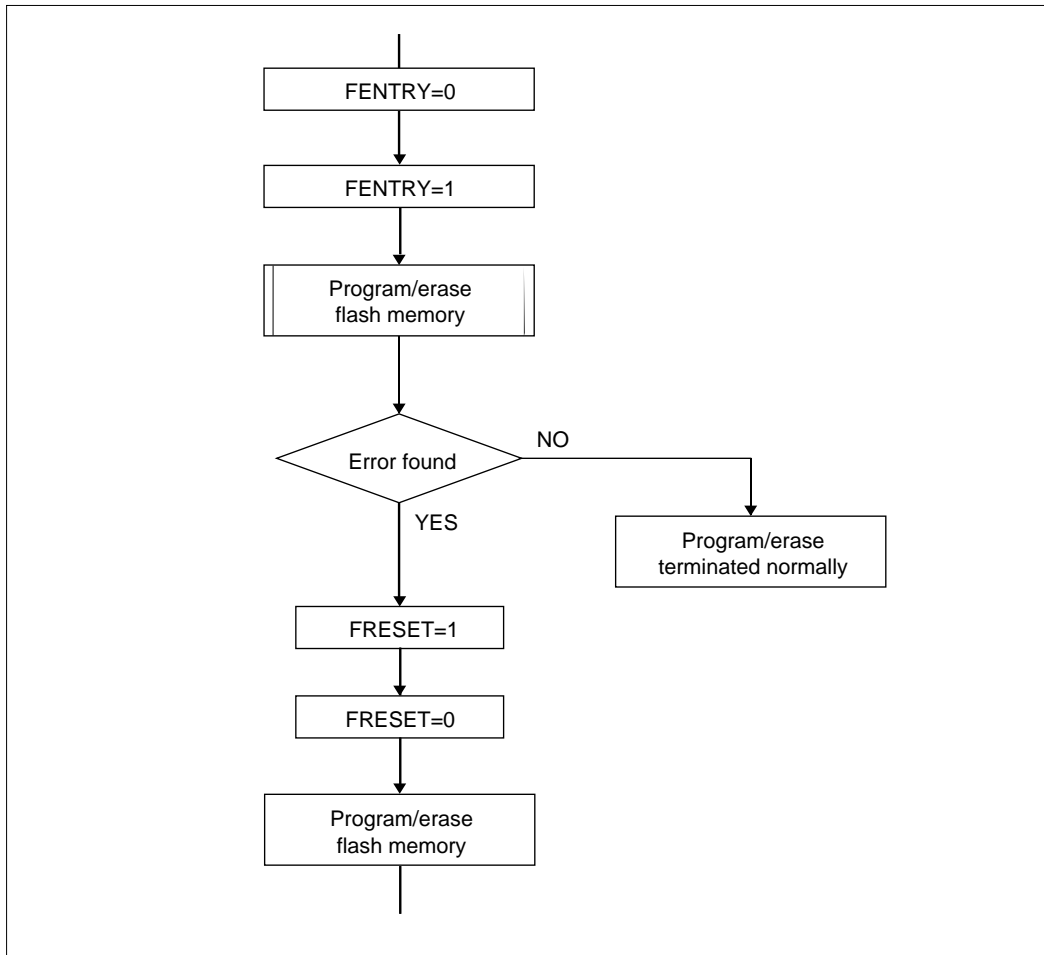

Figure 6.4.3 FCNT4 Register Usage Example 1 (Initializing Flash Status Register 2)

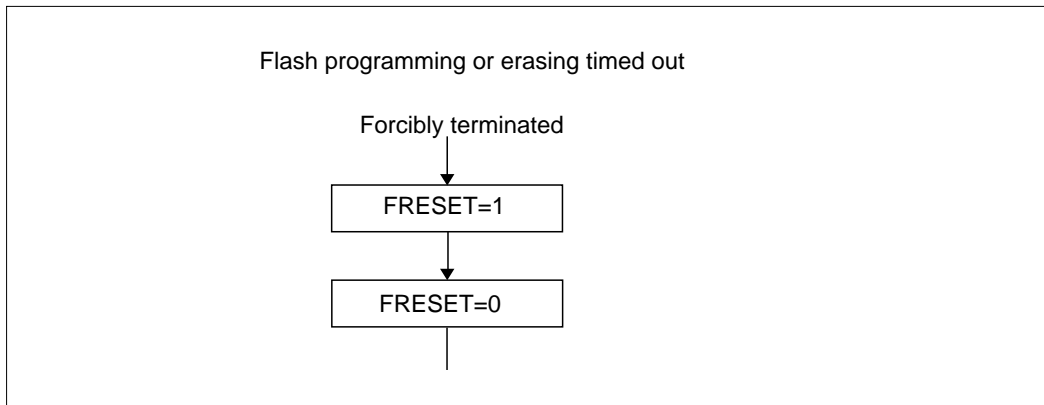

Figure 6.4.4 FCNT4 Register Usage Example 2 (Forcibly terminating flash memory programming/erasing)

6.4.4 Virtual Flash L Bank Register

■ Virtual Flash L Bank Register 0 (FELBANK0)

<Address: H'0080 07E8>

<When reset : H'0000>

D	Bit Name	Function	R	W
0	MODENL (Virtual flash emulation enable)	0 : Disable virtual flash function 1 : Enable virtual flash function	<input type="radio"/>	<input type="radio"/>
1 - 7	No functions assigned		0	—
8 - 14	LBANKAD (L bank address)	A12 - A18 of start address of the L bank to be selected	<input type="radio"/>	<input type="radio"/>
15	No functions assigned		0	—

Note: • This register must always be accessed in halfword.

(1) MODENL (Virtual Flash Emulation Enable) bit (D0)

The MODENL bit can be set to 1 after entering virtual flash emulation mode (by setting the FEMMOD bit to 1 while the FENTRY bit = 0). This causes the virtual flash emulation function to become effective for the L bank area selected by the LBANKAD bits.

(2) LBANKAD (L Bank Address) bits (D8-D14)

The LBANKAD bits are provided for selecting one L bank from L banks separated every 8 KB. Use these LBANKAD bits to set the seven bits, A12-A18, of the 32-bit start address of the L bank you want to select.

(For details, refer to Section 6.7, "Virtual Flash Emulation Function.")

6.4.5 Virtual Flash S Bank Registers

■ Virtual Flash S Bank Register 0 (FESBANK0) <Address: H'0080 07F0>

■ Virtual Flash S Bank Register 1 (FESBANK1) <Address: H'0080 07F2>

<When reset : H'0000>

D	Bit Name	Function	R	W
0	MODENS (Virtual flash emulation enable)	0 : Disable virtual flash function 1 : Enable virtual flash function	<input type="radio"/>	<input type="radio"/>
1 - 7	No functions assigned		0	—
8 - 15	SBANKAD (S bank address)	A12 - A19 of start address of the S bank to be selected	<input type="radio"/>	<input type="radio"/>

Note: • This register must always be accessed in halfword.

(1) MODENS (Virtual Flash Emulation Enable) bit (D0)

The MODENS bit can be set to 1 after entering virtual flash emulation mode (by setting the FEMMOD bit to 1 while the FENTRY bit = 0). This causes the virtual flash emulation function to become effective for the S bank area selected by the SBANKAD bits.

(2) SBANKAD (S Bank Address) bits (D8-D15)

The SBANKAD bits are provided for selecting one S bank from S banks separated every 4 KB. Use these SBANKAD bits to set the eight bits, A12-A19, of the 32-bit start address of the S bank you want to select.

(For details, refer to Section 6.7, "Virtual Flash Emulation Function.")

6.5 Programming of the Internal Flash Memory

6.5.1 Outline of Programming Flash Memory

When programming to the internal flash memory, there are following two methods to use depending on situation:

- (1) When the write program does not exist in the internal flash memory
- (2) When the write program already exists in the internal flash memory

For (1), set the FP pin = high, MOD0 = high, and MOD1 = low to enter boot mode. In this case, the reset vector entry is located at the beginning of the boot program area (H'8000 0000). (Normally, the reset vector entry is located at the start address of the internal flash memory.) Transfer the "flash write/erase program" from the boot area into the internal RAM using a boot program. After this transfer, jump to the RAM and set the Flash Control Register 1 FENTRY bit to 1 to make the flash memory ready for program (flash E/W enable mode). You now can program to the internal flash memory using the "flash write/erase program" that has been transferred into the internal RAM.

For (2), set the FP pin = high, MOD0 = low, and MOD1 = low to enter single-chip mode. Transfer the "flash write/erase program" from the internal flash memory in which it has been prepared beforehand into the internal RAM. After this transfer, jump to the RAM and set the Flash Control Register 1 (FCNT1) FENTRY bit to 1 using a program in the RAM to make the flash memory ready for program (flash E/W enable mode). You now can program to the internal flash memory using the "flash write/erase program" that has been transferred into the internal RAM. Or you can set the FP pin = high, MOD0 = low, and MOD1 = high to enter flash E/W enable mode in external extension mode.

When in flash E/W enable mode (FP pin = 1, FENTRY bit = 1), the EIT vector entry for External Interrupt (EI) is moved to the beginning of the internal RAM (H'0080 4000). During normal mode, the EIT vector entry exists in the flash area (H'0000 0080).

When using external interrupts (EI) in flash E/W enable mode, write at the beginning of the internal RAM the instruction for branching to the external interrupt (EI) handler that has been transferred into the internal RAM. Also, because the IVECT register which is read out in the external interrupt (EI) handler has stored in it the flash memory address of the ICU vector table, prepare the ICU vector table to be used during flash E/W enable mode in the internal RAM and convert its address from the IVECT register value to the internal RAM address (by, for example, adding an offset) when jumping to the handler.

Figure 6.5.1 EI Vector Entry When in Flash E/W Enable Mode

(1) When the write program does not exist in the internal flash memory

Use a program in the boot ROM located on memory map to program to the flash memory. To transfer the write data, use serial I/O1 in clock-synchronized serial mode. Use this serial transfer when writing to the flash memory using a flash programmer.

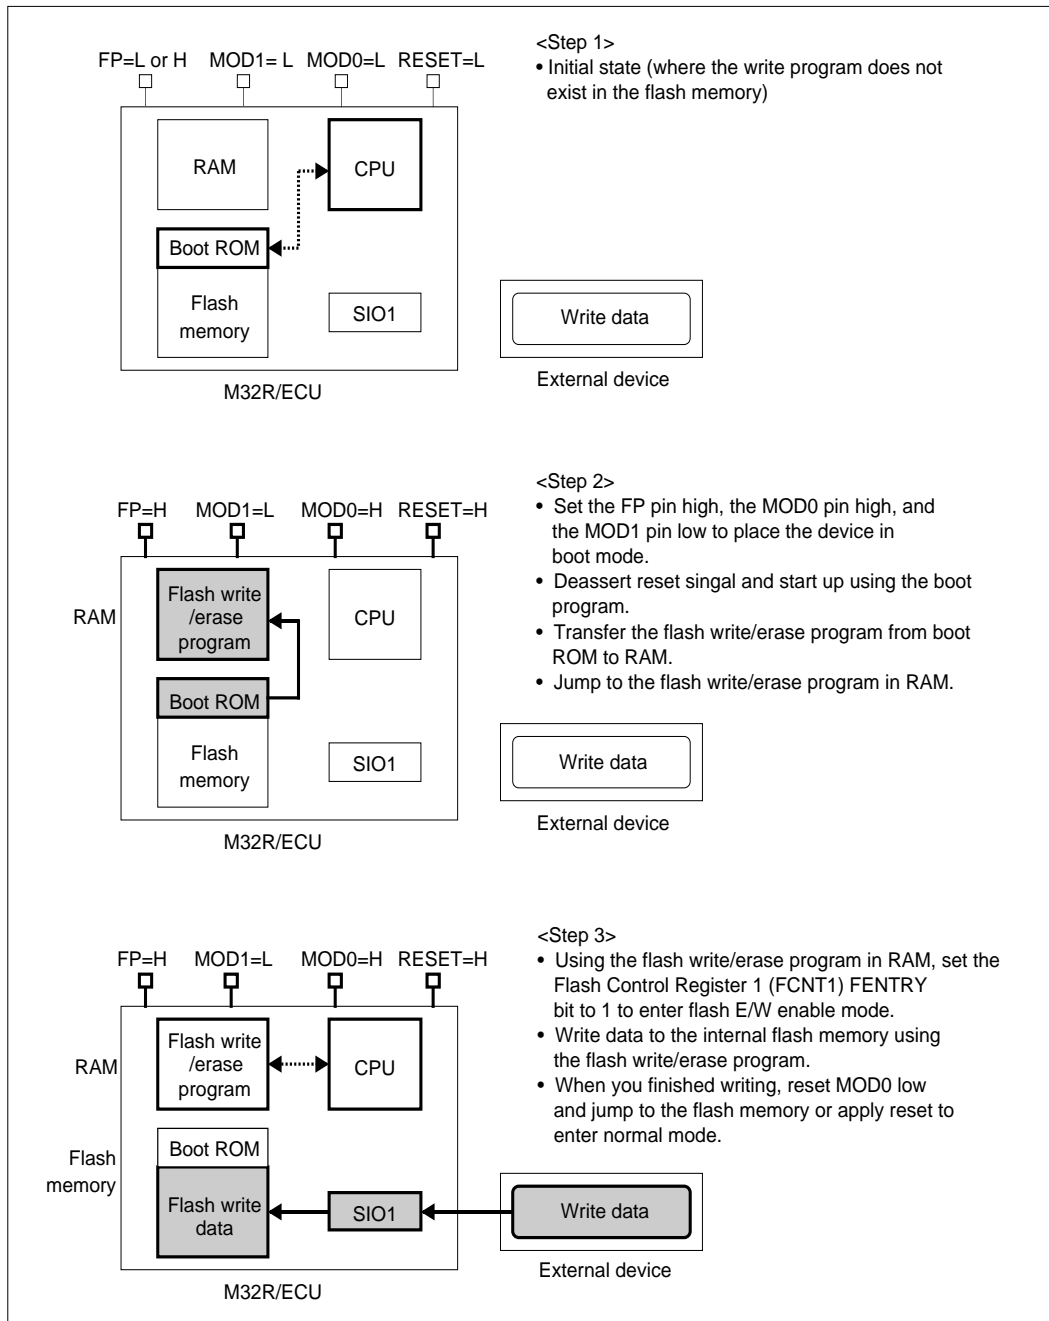

Figure 6.5.2 Procedure for Writing to Internal Flash Memory (when the write program does not exist in the flash memory)

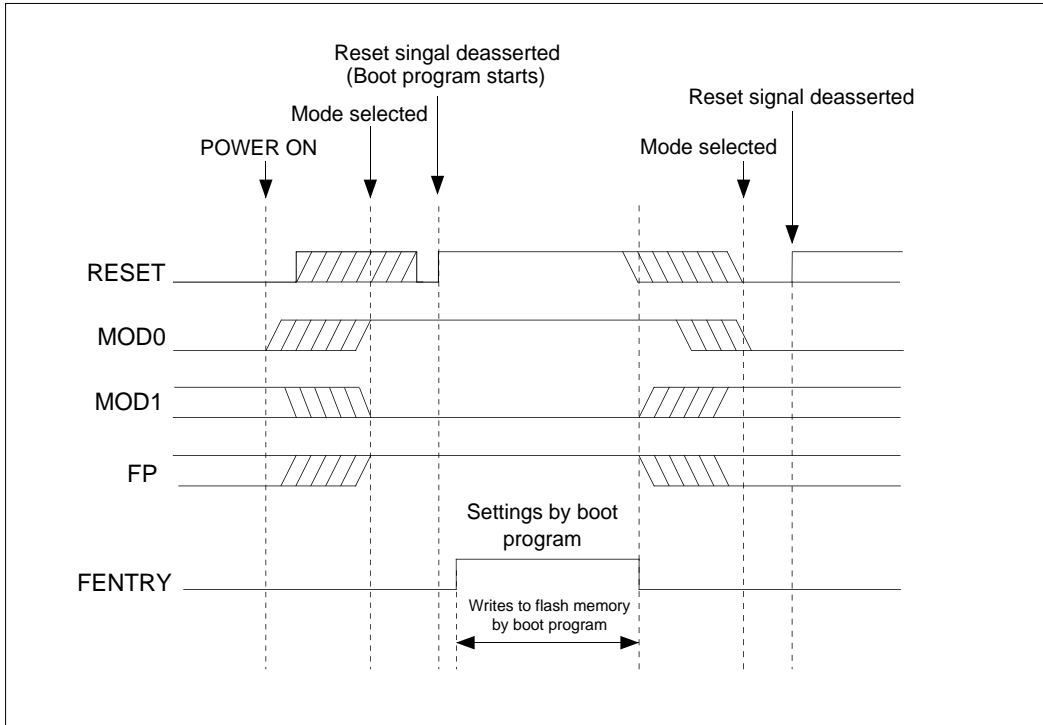

Figure 6.5.3 Internal Flash Memory Write Timings (when the write program does not exist in the flash memory)

(2) When the write program already exists in the internal flash memory

Use the flash write/erase program already stored in the internal flash memory to program to the flash memory. For program to the flash memory, use the internal peripheral circuits according to your programming system. (The data bus, serial I/O, and ports can be used.)

The following shows an example for writing to the flash memory by using serial I/O in single-chip mode.

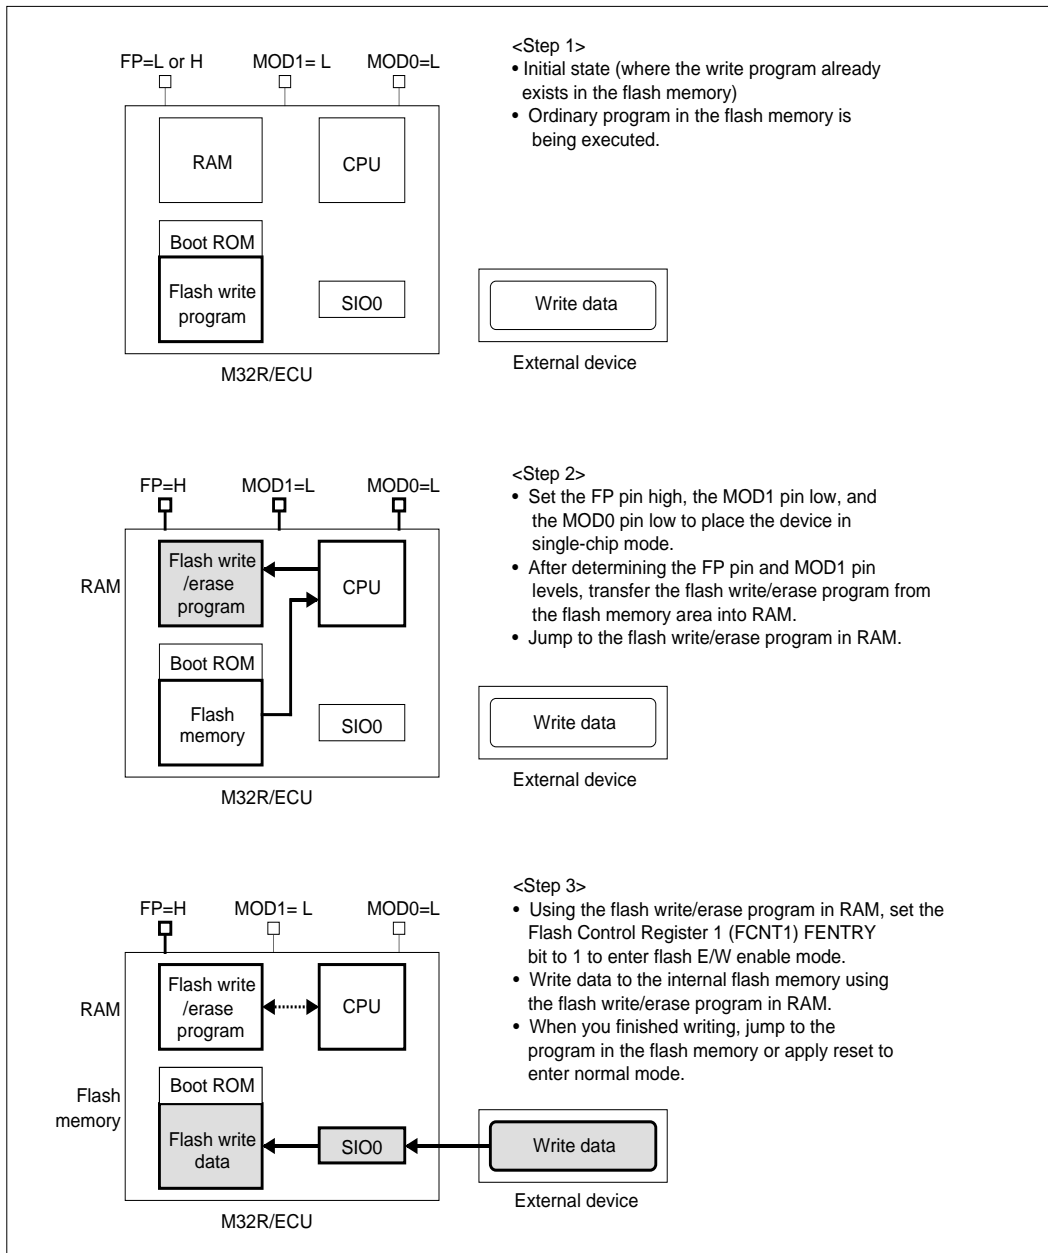

Figure 6.5.4 Procedure for Writing to Internal Flash Memory (when the write program already exists in the flash memory)

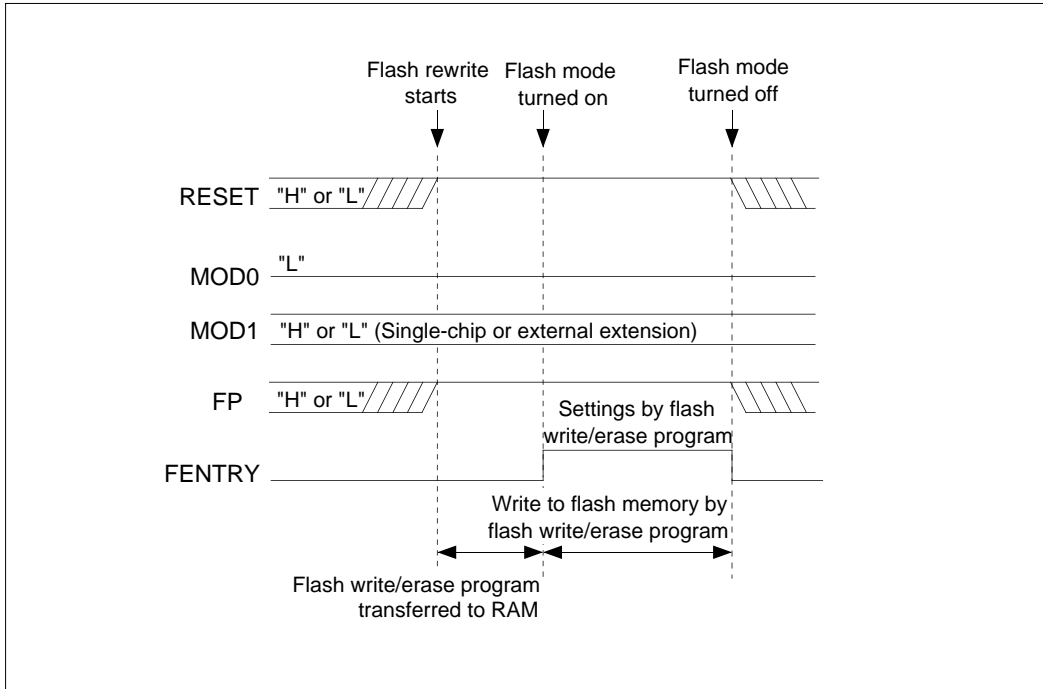

Figure 6.5.5 Internal Flash Memory Write Timings (when the write program already exists in the flash memory)

6.5.2 Controlling Operation Mode during Programming Flash

The device's operation modes are set by MOD0, MOD1, and Flash Control Register 1 (FCNT1) FENTRY bit. The table below lists operation modes that may be set during flash program.

Table 6.5.1 Operation Modes Set during Flash Program

FP	MOD0	MOD1	FENTRY	Operation Mode	Reset Vector Entry	EI Vector Entry
L	L	L	0	Single-chip mode	Start address of	Flash area
H	L	L	0		flash memory (H'0000 0000)	(H'0000 0080)
L	H	L	0	Processor mode	Start address of external area (H'0000 0000)	External area (H'0000 0080)
L	L	H	0	External extension mode	Start address of	Flash area
H	L	H	0		flash memory (H'0000 0000)	(H'0000 0080)
H	L	L	1	Single-chip mode + flash E/W enable	Start address of flash memory (H'0000 0000)	Beginning of internal RAM (H'0080 4000)
H	H	L	0	Boot mode	Start address of boot program area (H'8000 0000)	Flash area (H'0000 0080)
H	H	L	1	Boot mode + flash E/W enable	Start address of boot program area (H'8000 0000)	Beginning of internal RAM (H'0080 4000)
H	L	H	1	External extension mode + flash E/W enable	Start address of flash memory (H'0000 0000)	Beginning of internal RAM (H'0080 4000)
— (Note 1)	H	H	— (Note 1)	reserved (use inhibited)		

Note 1: The bar "—" denotes "Don't Care."

(1) Flash E/W enable mode

Flash E/W enable mode is a mode in which the internal flash memory can be programmed or erased. In flash E/W enable mode, no programs can be executed in the internal flash memory. Therefore, before entering flash E/W enable mode, you need to transfer the necessary program into the internal RAM and run the program in RAM.

(2) Entering flash E/W enable mode

Flash E/W enable mode can be entered only when the device is operating in single-chip mode or external extension mode. Namely, you can enter flash E/W enable mode only when the FP pin = high and the Flash Control Register 1 (FCNT1) FENTRY bit = 1. You cannot enter flash E/W enable mode when the device is operating in processor mode or the FP pin = low.

(3) Detecting the MOD0 and MOD1 pin levels

The MOD0 and MOD1 pin levels (high or low) can be verified using the P8 Data Register (Port Data Register, H'00800 0708) MOD0DT and MOD1DT bits.

■ P8 Data Register (P8DATA)

<Address: H'0080 0708>

D0	1	2	3	4	5	6	D7
MOD0DT	MOD1DT	P82DT	P83DT	P84DT	P85DT	P86DT	P87DT

<When reset : Indeterminate>

D	Bit Name	Function	R	W
0	MOD0DT (MOD0 data)	0 : MOD0 pin = low 1 : MOD0 pin = high	○	—
1	MOD1DT (MOD1 data)	0 : MOD1 pin = low 1 : MOD1 pin = high	○	—
2	P82DT (Port P82 data)	Depending on how the Port Direction Register is set • When direction bit = 0 (input mode)	○	○
3	P83DT (Port P83 data)	0: Port input pin = low 1: Port input pin = high	○	○
4	P84DT (Port P84 data)	• When direction bit = 1 (output mode) 0: Port output latch = low	○	○
5	P85DT (Port P85 data)	1: Port output latch = high	○	○
6	P86DT (Port P86 data)		○	○
7	P87DT (Port P87 data)		○	○

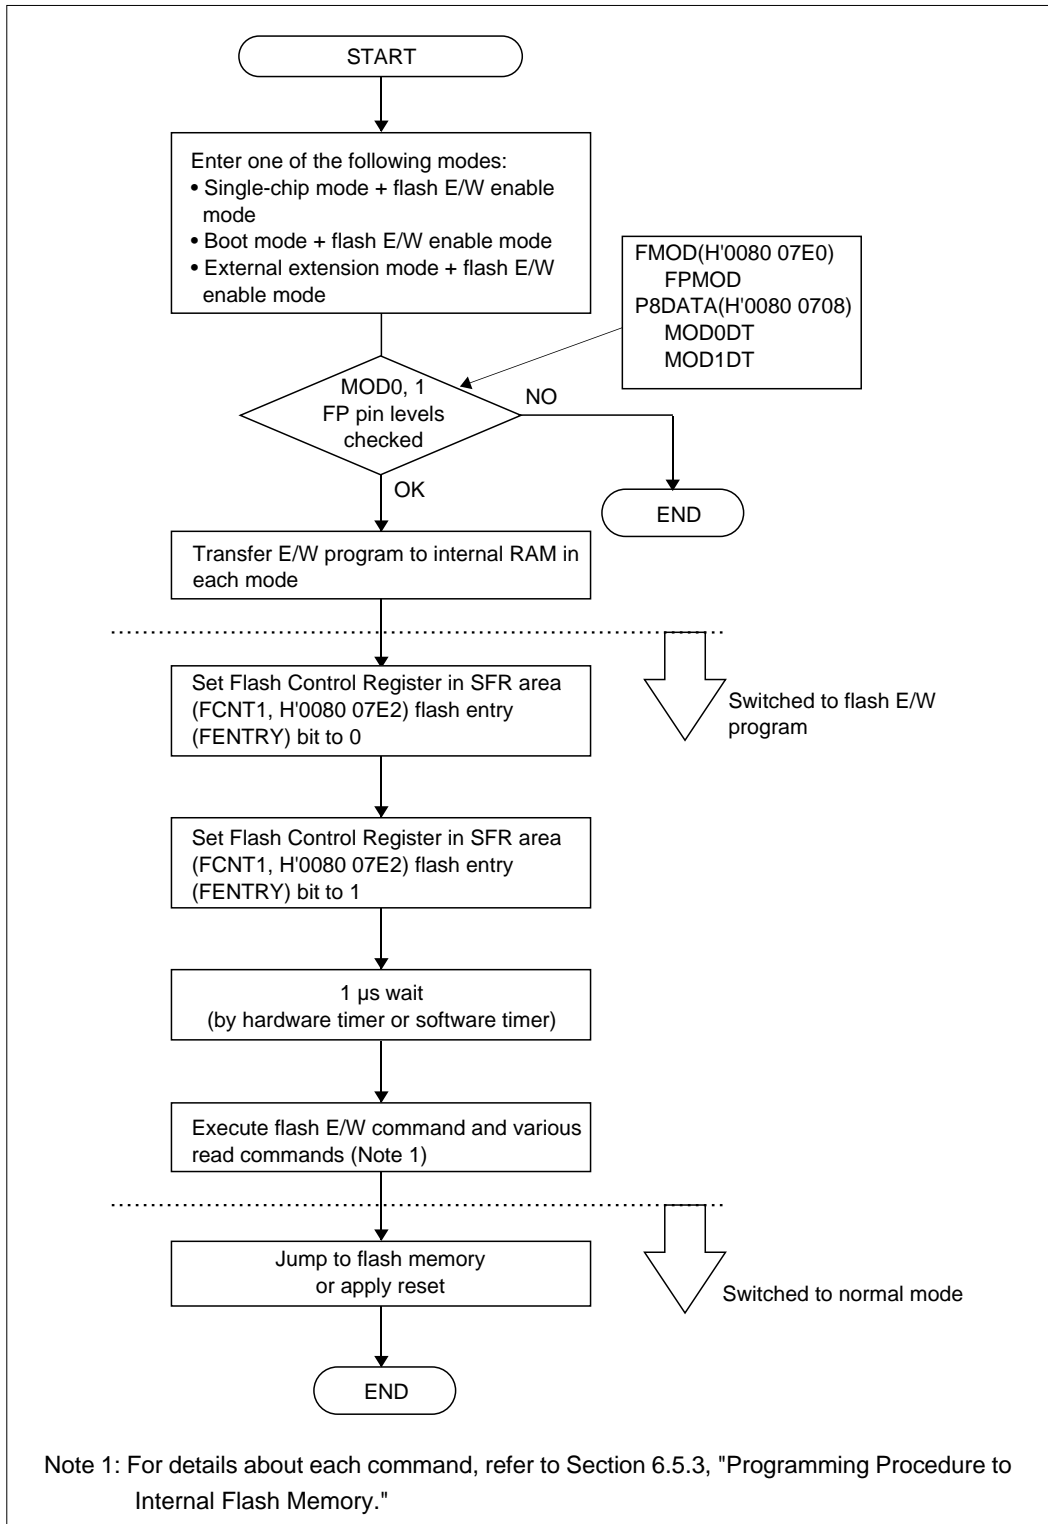

Figure 6.5.6 Procedure for Entering Flash E/W Enable Mode

6.5.3 Programming Procedure to the Internal Flash Memory

To program to the internal flash memory, set the device's operation mode to enter flash E/W enable mode first and then use the flash write/erase program that has already been transferred from the flash memory into the internal RAM.

In flash E/W enable mode, no data can be read out from the internal flash memory as in normal mode, so you cannot execute a program that exists in the internal flash memory. Therefore, the flash write/erase program must be prepared in the internal RAM before entering flash E/W enable mode. (Once you've entered flash E/W enable mode, you cannot use any command except flash commands to access the flash memory.)

To access the internal flash memory in flash memory E/W enable mode, issue commands for the internal flash memory address to be operated on. The table below lists the commands that can be issued in flash memory E/W enable mode.

Note: • During flash E/W enable mode, the flash memory cannot be accessed for read or write wordwise.

Table 6.5.2 Commands in Flash Memory E/W Enable Mode

Command Name	Issued Command Data
Read Array command	H'FFFF
Page Program command	H'4141
Lock Bit Program command	H'7777
Block Erase command	H'2020
Erase All Unlock Block command	H'A7A7
Read Status Register command	H'7070
Clear Status Register command	H'5050
Read Lock Bit Status command	H'7171
Verify command (Note1 - 4)	H'D0D0

Note 1: This command is used in conjunction with Lock Bit Program, Block Erase, and Erase All Unlock Block operations.

Note 2: Always issue this command successively after the Lock Bit Program, Block Erase, or Erase All Unlock Block command.

Note 3: If the Read Array command (H'FFFF) is issued after the Lock Bit Program, Block Erase, or Erase All Unlock Block command, each of those preceding commands is canceled.

Note 4: If other than the Verify command (H'D0D0) and Read Array command (H'FFFF) are issued after the Lock Bit Program, Block Erase, or Erase All Unlock Block command, each of those preceding commands terminates in an error without ever being executed.

(1) Read Array command

Read mode is entered by writing command data H'FFFF to any address of the internal flash memory. Then read the flash memory address you want to read out, and the content of that address will be read out.

Before exiting flash E/W enable mode, always be sure to execute the Read Array command.

(2) Page Program command

Flash memory is programmed one page at a time, each page consisting of 256 bytes (lower addresses H'00 to H'FF). To write data to the flash memory (i.e., to program the flash memory), write the program command H'4141 to any address of the internal flash memory and then the program data to the address to which you want to write.

With the Page Program command, you cannot program to the protected blocks.

Page Program is automatically performed by the internal control circuit, and the completion of programming can be verified by checking the Flash Status Register 1 (FSTAT1) FSTAT bit. (Refer to Section 6.4.2, "Flash Status Registers.") While the FSTAT bit = 0, the next programming can not be performed.

(3) Lock Bit Program command

Flash memory can be protected against program/erase one block at a time. The Lock Bit Program command is provided for protecting memory blocks.

Write the Lock Bit Program command data H'7777 to any address of the internal flash memory. Next, write the Verify command data H'D0D0 to the last even address of the block you want to protect, and this memory block is protected against program/erase. To remove protection, disable lock bit-effectuated protection using the Flash Control Register 2 (FCNT2) FPROT bit (see Section 6.4.3, "Flash Control Registers") and erase the block whose protection you want to remove. (The content of this memory block is also erased.)

The tables 6.5.3 to 6.5.5 list the target blocks and their specified addresses when writing the Verify command data.

Table 6.5.3 M32171F4 Target Blocks and Specified Addresses

Target Block	Specified Address
0	H'0000 3FFE
1	H'0000 5FFE
2	H'0000 7FFE
3	H'0000 FFFE
4	H'0001 FFFE
5	H'0002 FFFE
6	H'0003 FFFE
7	H'0004 FFFE
8	H'0005 FFFE
9	H'0006 FFFE
10	H'0007 FFFE

Table 6.5.4 M32171F3 Target Blocks and Specified Addresses

Target Block	Specified Address
0	H'0000 3FFE
1	H'0000 5FFE
2	H'0000 7FFE
3	H'0000 FFFE
4	H'0001 FFFE
5	H'0002 FFFE
6	H'0003 FFFE
7	H'0004 FFFE
8	H'0005 FFFE

Table 6.5.5 M32171F2 Target Blocks and Specified Addresses

Target Block	Specified Address
0	H'0000 3FFE
1	H'0000 5FFE
2	H'0000 7FFE
3	H'0000 FFFE
4	H'0001 FFFE
5	H'0002 FFFE
6	H'0003 FFFE

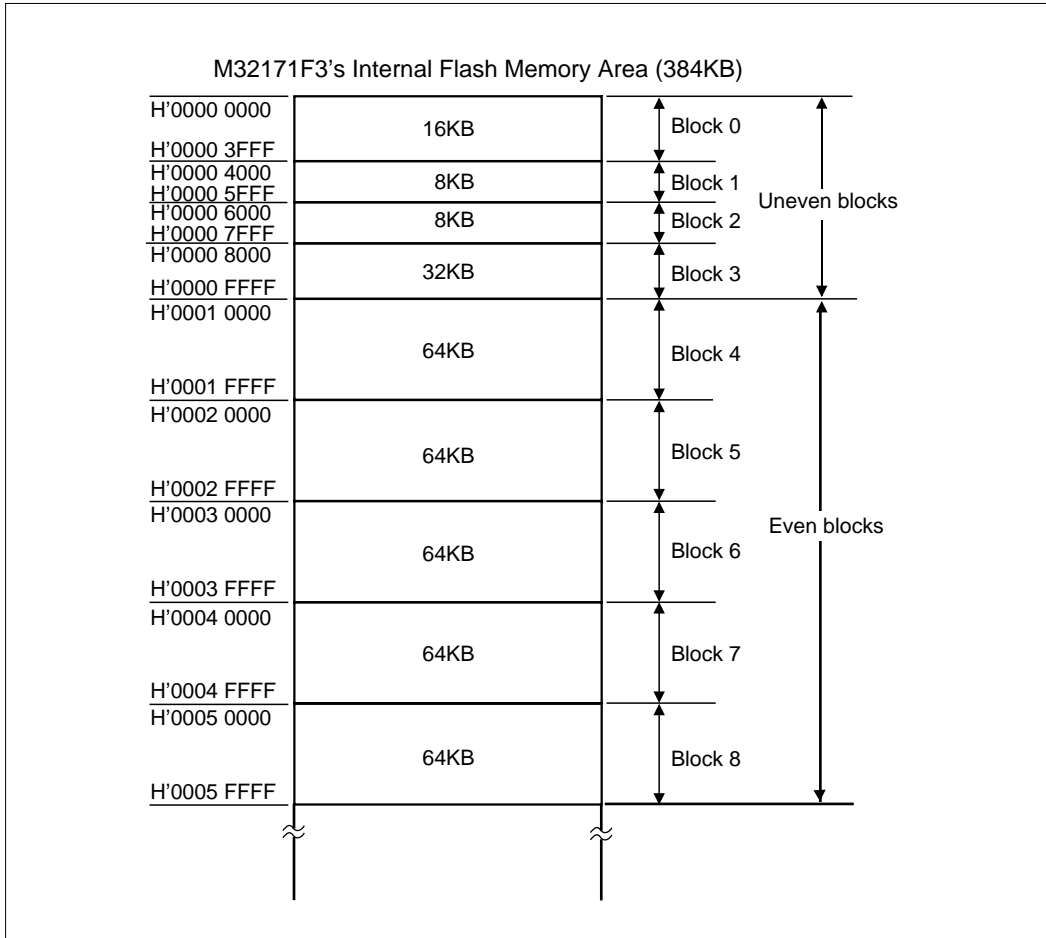

Figure 6.5.8 Block Configuration of the M32171F3 Flash Memory

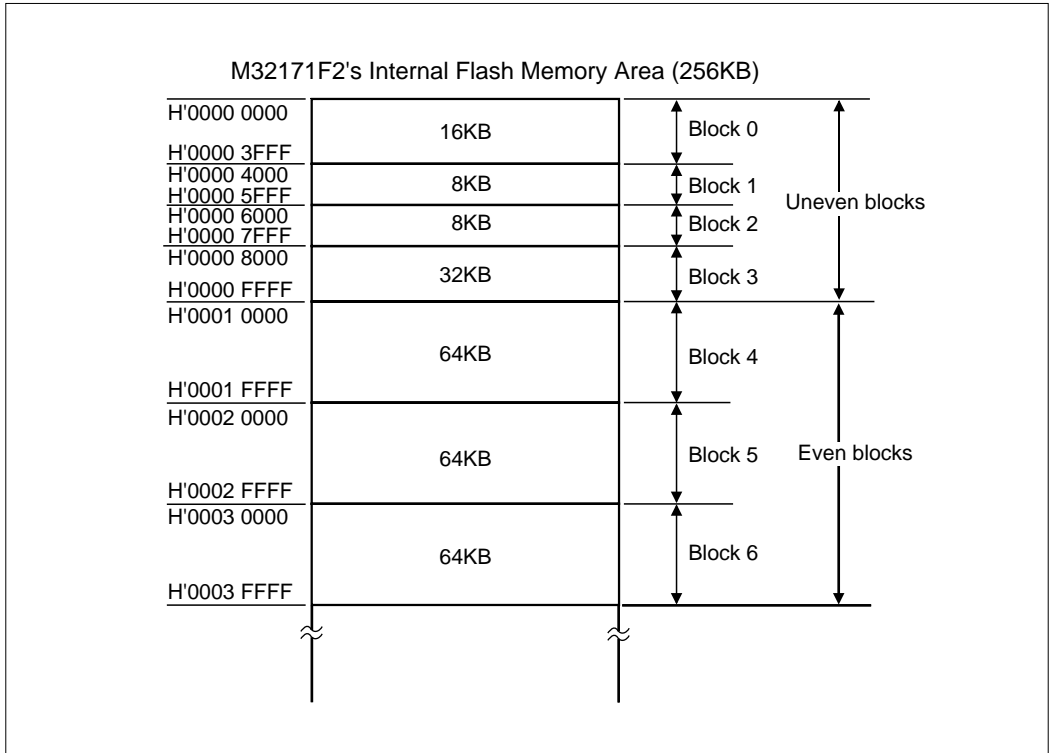

Figure 6.5.9 Block Configuration of the M32171F2 Flash Memory

(4) Block Erase command

The Block Erase command erases the contents of internal flash memory one block at a time. For Block Erase, write the command data H'2020 to any address of the internal flash memory. Next, write the Verify command data H'D0D0 to the last even address of the memory block you want to erase (see Table 6.5.3, Table 6.5.4, and Table 6.5.5, "Target Blocks and Specified Addresses"). The content of this memory block is erased.

With the Block Erase command, you cannot erase the protected blocks.

Block Erase is automatically performed by the internal control circuit, and the completion of Block Erase can be verified by checking the Flash Status Register 1 (FSTAT1) FSTAT bit. (Refer to Section 6.4.2, "Flash Status Registers.") While the FSTAT bit = 0, you cannot erase the next block.

(5) Erase All Unlock Block command

The Erase All Unlock Block command erases all memory blocks that are not protected. To erase all unlock blocks, write the command data H'A7A7 to any address of the internal flash memory. Next, write the command data H'D0D0 to any address of the internal flash memory, and all of unprotected memory blocks are erased.

(6) Read Status Register command

The Read Status Register command reads out the content of Flash Status Register 2 (FSTAT2) that indicates whether flash memory write or erase operation has terminated normally or not. To read Flash Status Register 2, write the command data H'7070 to any address of the internal flash memory. Next, read any address of the internal flash memory, and the content of Flash Status Register 2 (FSTAT2) is read out.

(7) Clear Status Register command

The Clear Status Register command clears the Flash Status Register 2 (FSTAT2) ERASE (Auto Erase operating condition), WRERR1 (Program operating condition 1), and WRERR2 (Program operating condition 2) bits to 0. Write the command data H'5050 to any address of the internal flash memory, and Flash Status Register 2 is cleared to 0.

If an error occurs when programming or erasing the flash memory and the Flash Status Register 2 (FSTAT2) ERASE (Auto Erase operating condition), WRERR1 (Program operating condition 1) or WRERR2 (Program operating condition 2) bit is set to 1, you cannot perform the next program or erase operation unless ERASE (Auto Erase operating condition), WRERR1 (Program operating condition 1) or WRERR2 (Program operating condition 2) is cleared to 0.

(8) Read Lock Bit Status command

The Read Lock Bit Status command allows you to check whether or not a memory block is protected against program/erase. Write the command data H'7171 to any address of the internal flash memory. Next, read the last even address of the block you want to check (see Table 6.5.3, Table 6.5.4, and Table 6.5.5, "Target Blocks and Specified Addresses"), and the data you read shows whether or not the target block is protected. If the FLBST0 (lock bit 0) bit and FLBST1 (lock bit 1) bit of the data you read are 0s, it means that the target memory block is protected. If the FLBST0 (lock bit 0) bit and FLBST1 (lock bit 1) bit are 1s, it means that the target memory block is not protected.

■ Lock Bit Status Register (FLBST)

<When reset : Indeterminate>

D	Bit Name	Function	R	W
0	No functions assigned		?	—
1	FLBST0 (Lock bit 0)	0 : Protected 1 : Not protected	○	—
2 - 8	No functions assigned		?	—
9	FLBST1 (Lock bit 1)	0 : Protected 1 : Not protected (Same content as FLBST0 is output.)	○	—
10 - 15	No functions assigned		?	—

The Lock Bit Status Register is a read-only register, which contains said lock bits independently for each block.

Follow the procedure described below to write to the lock bits.

a) Setting the lock bit to 0 (protect the block)

Issue the Lock Bit Program command (H'7777) to the memory block you want to protect.

b) Setting the lock bit to 1 (unprotect the block)

After setting the Flash Control Register 2 FPROT bit to invalidate lock bit-effectuated protection, use the Block Erase command (H'2020) or Erase All Unprotect Block command (H'A7A7) to erase the memory block you want to unprotect. This is the only way to unprotect a memory block. You cannot set the lock bit alone to 1.

c) Status when the lock bit is reset

The lock bit is unaffected by a reset or power outage because it is a nonvolatile bit.

(9) Execution flow of each command

The diagrams below show an execution flow of each command.

6.5.4 Flash Program Time (for Reference)

The time required for programming to the internal flash memory is shown below for your reference.

(1) M32171F4

- a) Transfer time by SIO (for a transfer data size of 512 KB)

$$1/57600 \text{ bps} \times 1 \text{ (frame)} \times 11 \text{ (number of transfer bits)} \times 512 \text{ KB} \approx 100.1 \text{ [s]}$$

- b) Flash program time

$$512 \text{ KB}/256\text{-byte block} \times 8 \text{ ms} \approx 16.4 \text{ [s]}$$

- c) Erase time (entire area)

$$50 \text{ ms} \times \text{number of blocks} \approx 550 \text{ [ms]}$$

- d) Total flash program time (entire 512 KB area)

- When communicating at 57600 bps using UART, the flash program time can be ignored because it is very short compared to the serial communication time. Therefore, the flash program time can be calculated using the equation below:

$$a + c \approx 101 \text{ [s]}$$

When programming data to flash memory at high speed by speeding up the serial communication or by other means, the fastest program time possible is as follows:

$$b + c \approx 17 \text{ [s]}$$

(2) M32171F3

- a) Transfer time by SIO (for a transfer data size of 384 KB)

$$1/57600 \text{ bps} \times 1 \text{ (frame)} \times 11 \text{ (number of transfer bits)} \times 384 \text{ KB} \approx 75.1 \text{ [s]}$$

- b) Flash program time

$$384 \text{ KB}/256\text{-byte block} \times 8 \text{ ms} \approx 12.3 \text{ [s]}$$

- c) Erase time (entire area)

$$50 \text{ ms} \times \text{number of blocks} \approx 450 \text{ [ms]}$$

- d) Total flash program time (entire 384 KB area)

- When communicating at 57600 bps using UART, the flash program time can be ignored because it is very short compared to the serial communication time. Therefore, the flash program time can be calculated using the equation below:

$$a + c \approx 76 \text{ [s]}$$

When programming data to flash memory at high speed by speeding up the serial communication or by other means, the fastest program time possible is as follows:

$$b + c \approx 13 \text{ [s]}$$

(3) M32171F2

a) Transfer time by SIO (for a transfer data size of 256 KB)

$$1/57600 \text{ bps} \times 1 \text{ (frame)} \times 11 \text{ (number of transfer bits)} \times 256 \text{ KB} \doteq 50.1 \text{ [s]}$$

b) Flash program time

$$256 \text{ KB}/256\text{-byte block} \times 8 \text{ ms} \doteq 8.2 \text{ [s]}$$

c) Erase time (entire area)

$$50 \text{ ms} \times \text{number of blocks} \doteq 350 \text{ [ms]}$$

d) Total flash program time (entire 256 KB area)

- When communicating at 57600 bps using UART, the flash program time can be ignored because it is very short compared to the serial communication time. Therefore, the flash program time can be calculated using the equation below:

$$a + c \doteq 50.5 \text{ [s]}$$

When programming data to flash memory at high speed by speeding up the serial communication or by other means, the fastest program time possible is as follows:

$$b + c \doteq 8.6 \text{ [s]}$$

6.6 Boot ROM

The table below shows boot memory specifications of the 32171.

Table 6.6.1 Boot Memory Specifications

Item	Specification
Capacity	8 Kbytes
Location address	H'8000 0000 - H'8000 1FFF
Wait insertion	Operates with no wait states (with 40 MHz internal CPU memory clock)
Internal bus connection	Connected by 32-bit bus
Read	Can only be read when FP = 1, MOD0 = 1, and MOD1 = 0. When read in other modes, indeterminate values are read out. Cannot be accessed for write.
Other	Because the boot ROM area is a reserved area that can only be used in boot mode, the program cannot be modified.

6.7 Virtual-Flash Emulation Function

The 32171 can map one 8-Kbyte block of internal RAM beginning with the start address into one of 8-Kbyte areas (L banks) of the internal flash memory and can map up to two 4-Kbyte blocks of internal RAM beginning with address H'0080 6000 into one of 4-Kbyte areas (S banks) of the internal flash memory. This capability is referred to as the “virtual-flash emulation” function.

This function allows the data located in an 8-Kbyte block or one or two 4-Kbyte blocks of the internal RAM to be switched for use to or from the L or S bank of flash memory specified by the Virtual-Flash Bank Register. Therefore, applications that require changes of data during program operation can have data dynamically changed using 8 or 4 Kbytes of RAM area. The RAM used for virtual-flash emulation can be accessed for read and write from both the internal RAM and the internal flash memory areas.

When this function is used in combination with the internal Real Time Debugger (RTD), the data tables created in the internal flash memory can be referenced or rewritten from outside, thus facilitating data table tuning.

Before programming to the internal flash memory, always be sure to terminate this virtual-flash emulation mode.

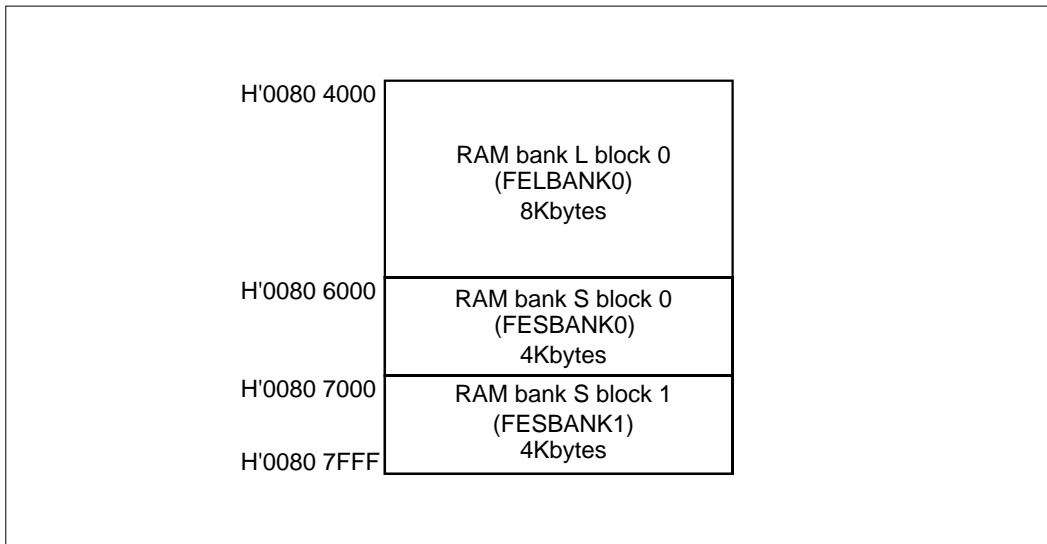

Figure 6.7.1 Internal RAM Bank Configuration of the 32171

6.7.1 Virtual-Flash Emulation Areas

The following shows the areas effective for the virtual-flash emulation function.

Select one of 8-Kbyte blocks or L banks of flash memory using the Virtual-Flash L Bank Register (FELBANK0) (by setting the seven address bits A12–A18 of the start address of the desired L bank in the Virtual-Flash L Bank Register LBANKAD bits). Then set the Virtual-Flash L Bank Register MODENL bit (MODENL0 bit) to 1. The selected L bank area can be rewritten with the 8-Kbyte content of the internal RAM beginning with its start address.

Also, select one or two of 4-Kbyte blocks or S banks of flash memory using the Virtual-Flash S Bank Registers (FESBANK0 and FESBANK1) (by setting the eight address bits A12–A19 of the start address of each desired S bank in the Virtual-Flash S Bank Register SBANKAD bits). Then set the Virtual-Flash S Bank Register MODENS0 and MODENS1 bits to 1. The selected S bank areas can be replaced with 4 Kbytes of the internal RAM, for up to two blocks, beginning with the address H'0080 6000.

In this way, one 8-Kbyte block or L bank and two 4-Kbyte blocks or S banks for up to a total of three banks can be selected.

- Notes:
- If the virtual-flash emulation enable bit is enabled after setting the same bank area in multiple virtual-flash bank registers, the corresponding internal RAM area (8 or 4 Kbytes) is allocated in order of priority FELBANK0 > FESBANK0 > FESBANK1.
 - During virtual-flash emulation mode, RAM can be accessed for read and write from the internal RAM area and virtual-flash setup area.
 - When performing virtual-flash read after setting Flash Control Register 1's Virtual-Flash Emulation Mode bit to 1, be sure to wait for three CPU clock periods or more before performing virtual-flash read after setting the said bit to 1.
 - Before performing virtual-flash read after setting the Virtual-flash Bank Register(L Bank and S Bank Registers)'s virtual-flash emulation enable and bank address bits, be sure to insert wait states equal to or greater than three CPU clock periods.

6.7.2 Entering Virtual Flash Emulation Mode

To enter Virtual Flash Emulation Mode, set the Flash Control Register 1 (FCNT1) FEMMOD bit to 1. After entering Virtual Flash Emulation Mode, set the Virtual Flash Bank Register MODEN bit to 1 to enable the Virtual Flash Emulation Function.

Even during virtual-flash emulation mode, the internal RAM area (H'0080 4000 through H'0080 7FFF) can be accessed as internal RAM.

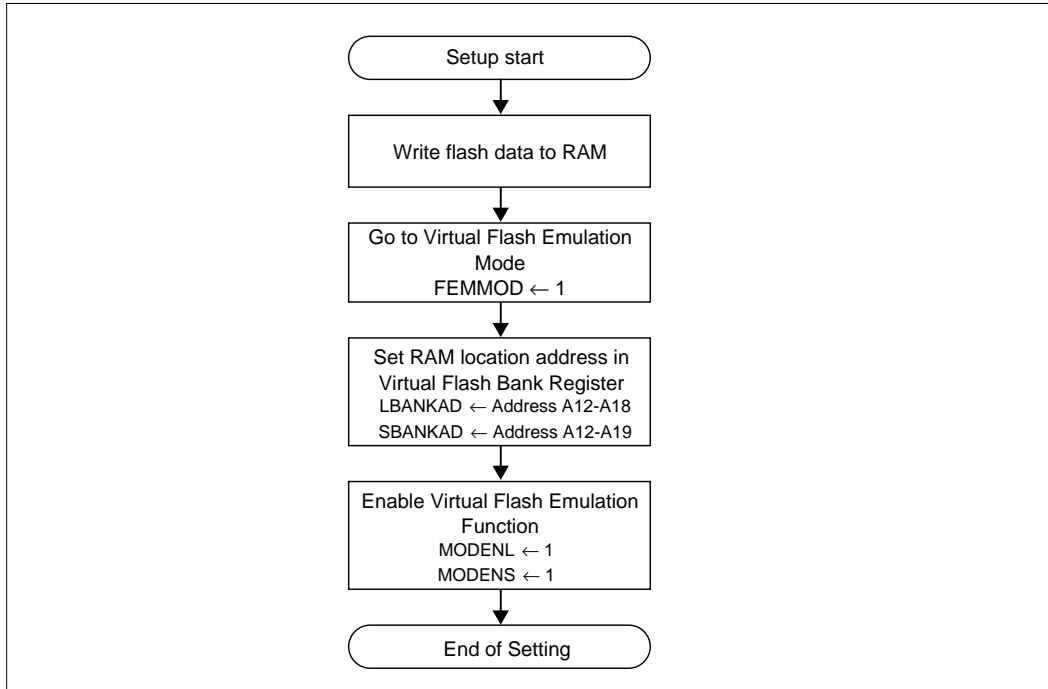

Figure 6.7.14 Virtual-flash Emulation Mode Sequence

6.7.3 Application Example of Virtual Flash Emulation Mode

By locating two RAM areas in the same virtual flash area using the Virtual Flash Emulation Function, you can rewrite data in the flash memory successively.

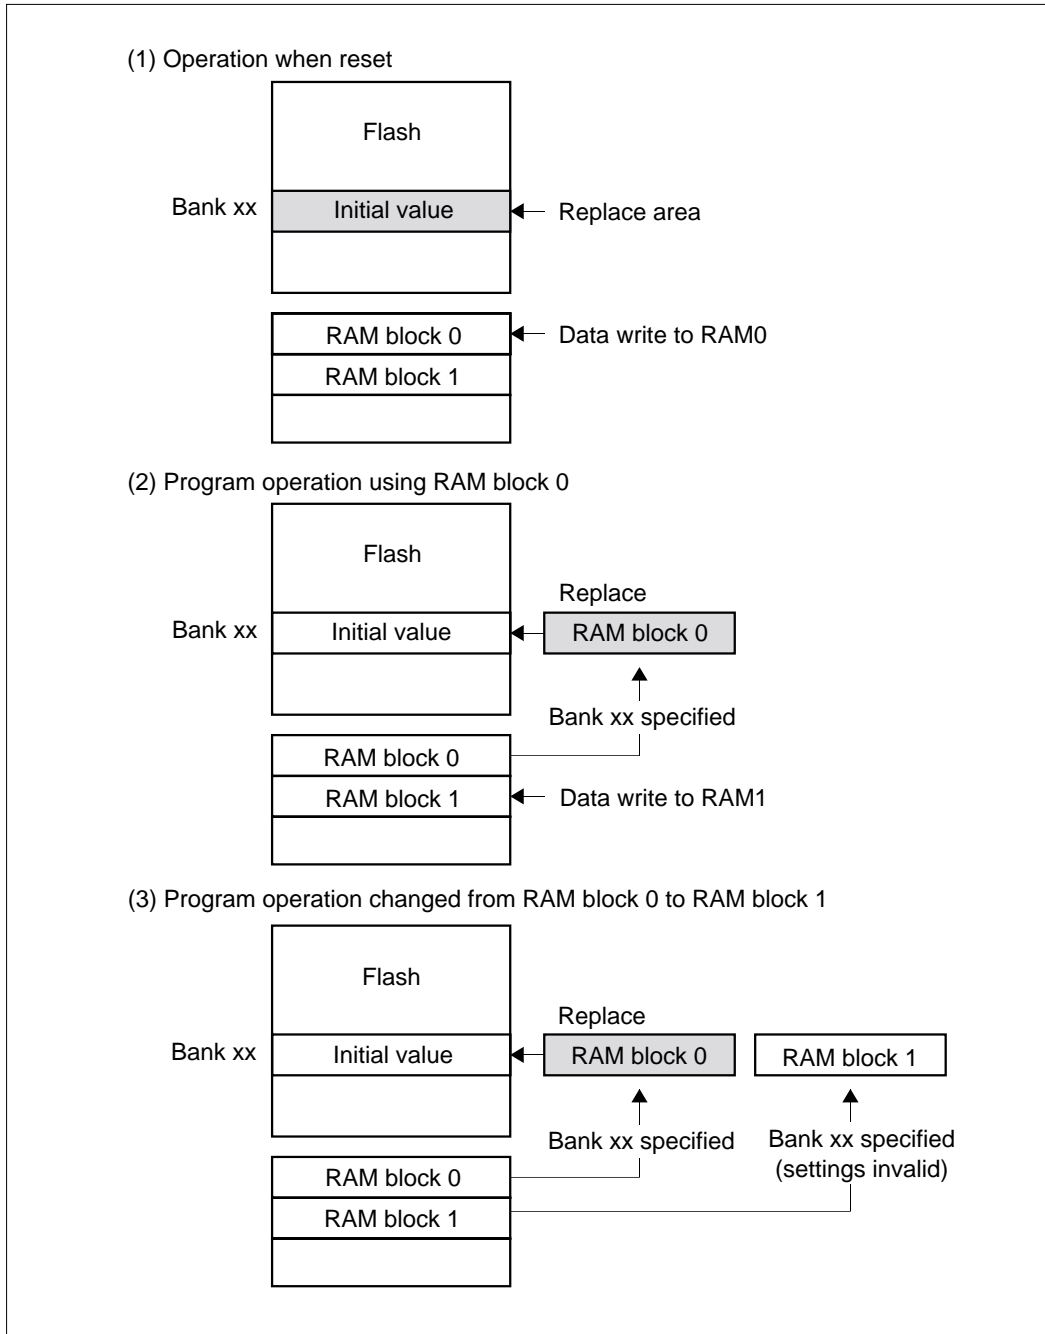

Figure 6.7.15 Application Example of Virtual Flash Emulation (1/2)

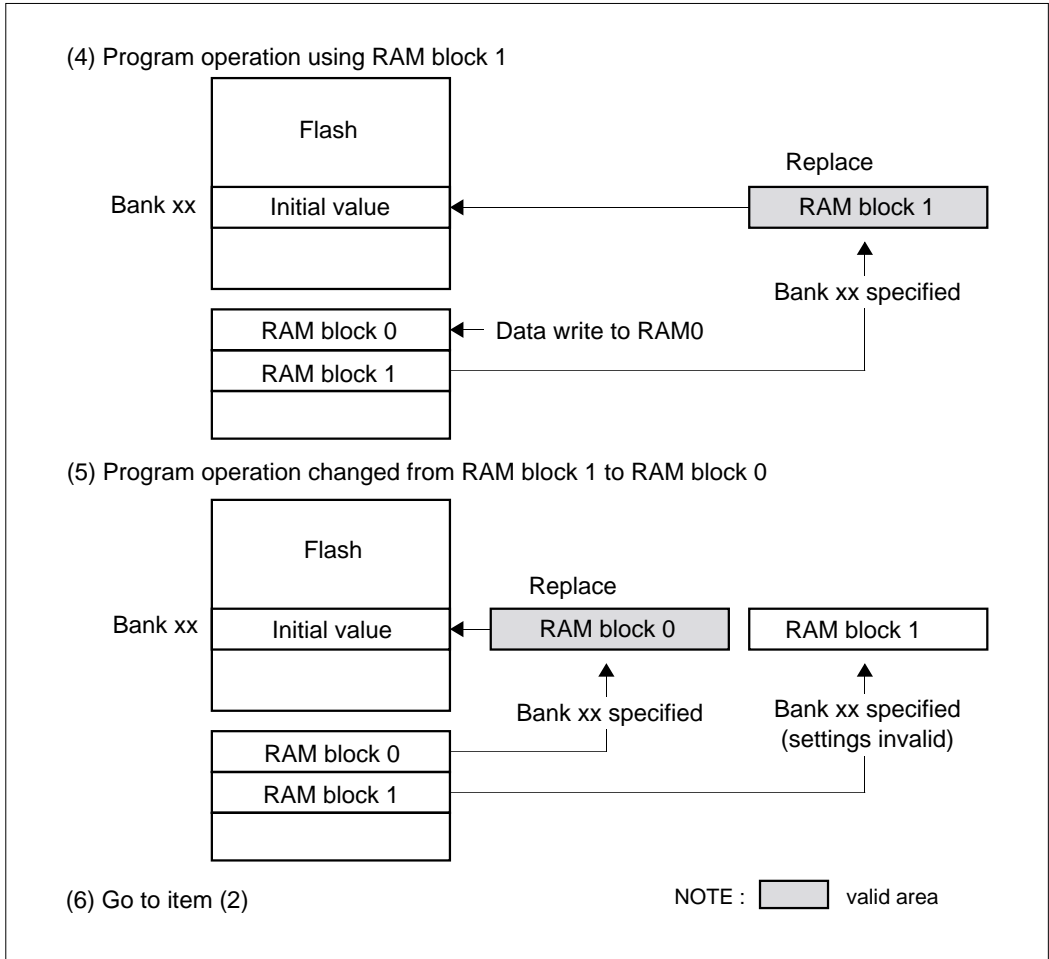

Figure 6.7.16 Application Example of Virtual Flash Emulation (2/2)

6.8 Connecting to A Serial Programmer

When you reprogram the internal flash memory using a general-purpose serial programmer in Boot Flash E/W Enable mode, you need to process the pins on the 32171 shown below to make them suitable for the serial programmer.

Table 6.8.1 Processing the 32171 Pins when Using a Serial Programmer

Pin Name	Pin Number	Function	Remark
SCLKI1	71	Transfer clock input	Need to be pulled high
RXD1	70	Serial data input (receive data)	Need to be pulled high
TXD1	69	Serial data output (transmit data)	
P84	68	Transmit/receive enable output	Need to be pulled high
FP	94	Flash memory protect	
MOD0	92	Operation mode 0	
MOD1	93	Operation mode 1	Connect to ground
$\overline{\text{RESET}}$	91	Reset	
XIN	4	Clock input	
XOUT	5	Clock output	
VCNT	7	PLL circuit control input	
OSC-VCC	6	PLL circuit power supply	Connect to 3.3 V power supply
OSC-VSS	3	PLL circuit ground	Connect to ground
VREF0	42	A-D converter reference voltage input	Connect to 5 V power supply
AVCC0	43	Analog power supply	Connect to 5 V power supply
AVSS0	60	Analog ground	Connect to ground
FVCC	73	Flash memory power supply	Connect to 3.3 V power supply
VDD	108	RAM backup power supply	Connect to 3.3 V power supply
VCCE	20, 65, 95, 132	5 V power supply	
VCCI	61, 123, 137	3.3 V power supply	
VSS	21, 62, 72, 96, 138	Ground	

Note: • All other pins do not need to be processed.

The diagram below shows an example of user system configuration which has had a serial programmer connected. After the user system is powered on, the serial programmer programs to the flash memory in clock-synchronized serial mode. No communication problems associated with the oscillation frequency may occur. If the system uses any 32171 pins which will connect to a serial programmer, care must be taken to prevent adverse effects on the system when a serial programmer is connected. Note that the serial programmer uses the addresses H'0000 0084 through H'0000 0093 as an area to check ID for flash memory protection.

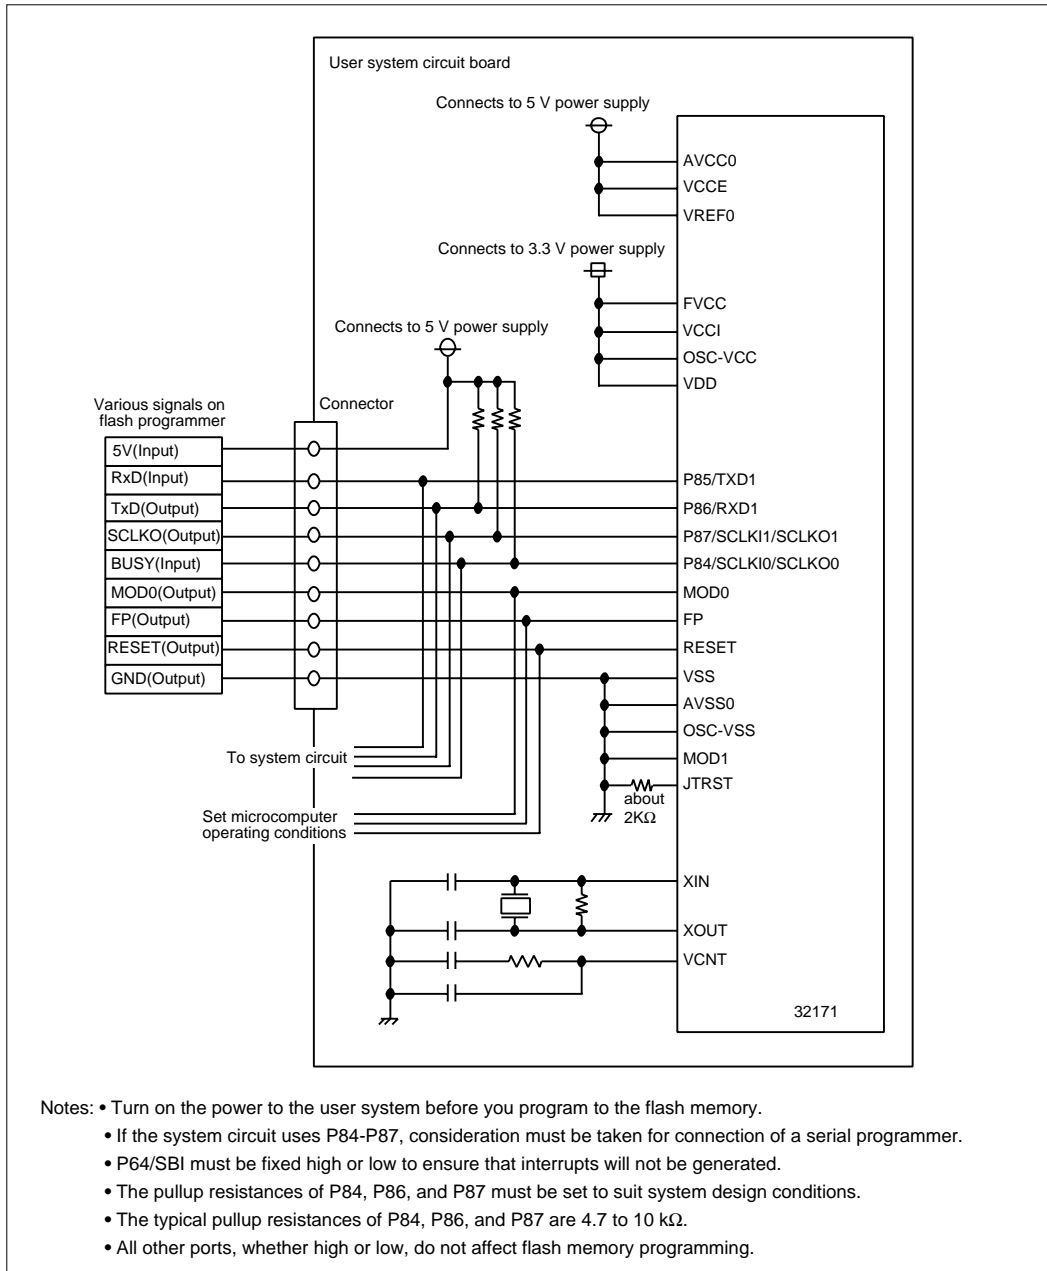

Figure 6.8.1 Pin Connection Diagram

6.9 Internal Flash Memory Protect Functions

The 32171's internal flash memory has the following four protect functions to prevent unintended reprogramming by an erratic operation or unauthorized copying or reprogramming of its contents.

(1) Flash memory protect ID

When using flash memory reprogramming tools such as a general-purpose serial programmer or an emulator, the ID entered from the keyboard is checked against the flash memory's internal ID. In no case can reprogramming be executed unless the correct ID is entered. (For some tools, erasing of the entire area only can be executed.)

(2) Protection by FP pin

The flash memory is protected in hardware against E/W by pulling the FP (Flash Protect) pin low. Furthermore, because the FP pin level can be known by reading the Flash Mode Register (FMODE)'s FPMODE (external FP pin status) bit in a flash write program, the flash memory can also be protected in software. For systems that do not require protection by external pin settings, holding the FP pin high will help to simplify operation while reprogramming the flash memory.

(3) Protection by FENTRY bit

Flash E/W enable mode cannot be entered unless Flash Control Register 1 (FCNT1)'s FENTRY (flash mode entry) bit is set to 1. Furthermore, the FENTRY bit can only be set to 1 by writing 0 and 1 in succession while the FP pin is high.

(4) Protection by a lock bit

Each block of flash memory has a lock bit, so that any memory block can be protected against E/W by setting this bit to 0.

6.10 Precautions to Be Taken When Reprogramming Flash Memory

The following describes precautions to be taken when you reprogram the flash memory using a general-purpose serial programmer in Boot Flash E/W Enable mode.

- When reprogramming the flash memory, a high voltage is generated inside the chip. Because this high voltage could cause the chip to break down, be careful about mode pin and power supply management not to move from one mode to another while reprogramming.
- If the system uses any pin that is to be used by a general-purpose reprogramming tool, take appropriate measures to prevent adverse effects when connecting the tool.
- If flash memory protection is needed when using a general-purpose reprogramming tool, set any ID in the flash memory protect ID check area (H'0000 0084–H'0000 0093).
- If flash memory protection is not needed when using a general-purpose reprogramming tool, set H'FF in the entire flash memory protect ID check area (H'0000 0084–H'0000 0093).
- Before using a reset by Flash Control Register 4 (FCNT4)'s FRESET bit to clear each error status in Flash Status Register 2 (FSTAT2) (initialized to H'80), check to see that Flash Status Register 1 (FSTAT1)'s FSTAT bit = 1 (Ready).
- Before changing Flash Control Register 1 (FCNT1)'s FENTRY bit from 1 to 0, check to see that Flash Status Register 1 (FSTAT1)'s FSTAT bit = 1 (Ready) or Flash Status Register 2 (FSTAT2)'s FBUSY bit = 1 (Ready).
- If Flash Control Register 1 (FCNT1)'s FENTRY bit = 1 and Flash Status Register 1 (FSTAT1)'s FSTAT bit = 0 (Busy) or Flash Status Register 2 (FSTAT2)'s FBUSY bit = 0 (program/erase in progress), do not clear the FENTRY bit.

CHAPTER 7

RESET

- 7.1 Outline of Reset
- 7.2 Reset Operation
- 7.3 Internal State after Exiting
Reset
- 7.4 Things To Be Considered after
Exiting Reset

7.1 Outline of Reset

The device is reset by applying a low-level signal to the $\overline{\text{RESET}}$ input pin. The device is gotten out of a reset state by releasing the $\overline{\text{RESET}}$ input back high, upon which the reset vector entry address is set in the Program Counter (PC) and the program starts executing from the reset vector entry.

7.2 Reset Operation

7.2.1 Reset at Power-on

When powering on the device, hold the $\overline{\text{RESET}}$ input low until its internal multiply-by-4 clock generator becomes oscillating stably.

7.2.2 Reset during Operation

To reset the device during operation, hold the $\overline{\text{RESET}}$ input low for more than four clock periods of XIN signal.

7.2.3 Reset Vector Relocation during Flash Reprogramming

When placed in boot mode, the reset vector entry address is moved to the start address of the boot program space (address H'8000 0000). For details, refer to Section 6.5, "Programming of Internal Flash Memory."

7.3 Internal State after Exiting Reset

The table below lists the register state of the device after it has gotten out of reset. For details about the initial register state of each internal peripheral I/O, refer to each section in this manual where the relevant internal peripheral I/O is described.

Table 7.3.1 Internal State after Exiting Reset

Register	State after Exiting Reset
PSW (CR0)	B'0000 0000 0000 0000 ??00 000? 0000 0000 (BSM, BIE, BC bits = indeterminate)
CBR (CR1)	H'0000 0000 (C bit = 0)
SPI (CR2)	Indeterminate
SPU (CR3)	Indeterminate
BPC (CR6)	Indeterminate
PC	H'0000 0000 (Executed beginning with address H'0000 0000) (Note 1)
R0–R15	Indeterminate
ACC (accumulator)	Indeterminate
RAM	Indeterminate at power-on reset (However, if the device is reset and placed out of reset while the VDD pin has 2.0 V to 3.6 V being applied to it, the RAM content before a reset is retained.)

Note 1: When in boot mode, this changes to the start address of the boot program space (H'8000 0000).

The pins that were set for input when reset go to a high-impedance state (Hi-Z). Here, “when reset” means that the RESET# pin input is held low (the device being reset) and is released back high (the device being placed out of reset).

Table 7.3.2 Pin Status When Reset (1/4)

PIN NO	Pin Name	Function			Input/output	Condition	Pin status when reset			
		Port	Other than port	Other than port			function	Input/output	Status during reset	Status after exiting reset
1	P221/CRX (Note 1)	P221	CRX	-	Input		P221	Input	Hi-z	Hi-z
2	P225/A12	P225	A12	-	Input/output	During single-chip mode	P225	Input	Hi-z	Hi-z

119	P124/TCLK0	P124	TCLK0	-	Input/output		P124	input	Hi-z	Hi-z
120	P125/TCLK1	P125	TCLK1	-	Input/output		P125	input	Hi-z	Hi-z

Note 1: P64 is used exclusively for SBI input.

Note 2: The JTCK, JTDI, JTDO, and JTMS pins are reset by the JTRST pin, and not by the RESET pin.

All of these pins are placed in the high-impedance state while the JTRST pin input is held low.

7.4 Things To Be Considered after Exiting Reset

- **Input/output ports**

After exiting reset, the 32171's input/output ports are disabled against input in order to prevent current from flowing through the port. To use any ports in input mode, enable them for input using the Port Input Function Enable Register (PIEN) PIEN0 bit. For details, refer to Section 8.3, "Input/Output Port Related Registers."

CHAPTER 8

INPUT/OUTPUT PORTS AND PIN FUNCTIONS

- 8.1 Outline of Input/Output Ports
- 8.2 Selecting Pin Functions
- 8.3 Input/Output Port Related Registers
- 8.4 Port Peripheral Circuits
- 8.5 Precautions on Input/output Ports

8.1 Outline of Input/Output Ports

The 32171 has a total of 97 input/output ports consisting of P0–P13, P15, P17, and P22 (with P5 reserved for future use, however). These input/output ports can be used as input ports or output ports by setting up the direction registers.

Each input/output port serves as a dual-function or triple-function pin, sharing the pin with other internal peripheral I/O or external extension bus signal line. Pin functions are selected depending on the device's operation mode you choose or by setting the input/output port's Operation Mode Register. (If any internal peripheral I/O has still another function, you need to set the register provided for that peripheral I/O.)

As a new function, the 32171 internally contains a Port Input Function Enable bit that can be used to prevent current from flowing into the input ports. This helps to simplify the software and hardware processing to be performed immediately after reset or during flash rewrite. To use any ports in input mode, you need to set the Port Input Function Enable bit accordingly.

The input/output ports are outlined in the next pages.

Table 8.1.1 Outline of Input/Output Ports

Item	Specification
Number of ports	Total 97 lines P0 : P00 - P07 (8 lines) P1 : P10 - P17 (8 lines) P2 : P20 - P27 (8 lines) P3 : P30 - P37 (8 lines) P4 : P41 - P47 (7 lines) P6 : P61 - P64 (4 lines) P7 : P70 - P77 (8 lines) P8 : P82 - P87 (6 lines) P9 : P93 - P97 (5 lines) P10 : P100 - P107 (8 lines) P11 : P110 - P117 (8 lines) P12 : P124 - P127 (4 lines) P13 : P130 - P137 (8 lines) P15 : P150 , P153 (2 lines) P17 : P174, P175 (2 lines) P22 : P220, P221, P225 (3 lines)
Port function	The input/output ports can individually be set for input or output mode using the Direction Control Register provided for each input/output port. (However, P64 is a SBI input-only port and P221 is a CAN input-only port.)
Pin function	Shared with peripheral I/O or external extension signals to serve dual functions (or with two or more peripheral I/O functions to serve multiple functions)
Pin function switchover	P0 - P4, P225 : Depends on CPU operation mode (determined by setting MOD0 and MOD1 pins) P6 - P22 : As set by each input/output port's Operation Mode Register (However, peripheral I/O pin functions are selected by peripheral I/O registers.)

Note: • P14, P16, and P18–P21 are nonexistent.

8.2 Selecting Pin Functions

Each input/output port serves dual purposes along with other internal peripheral I/Os or external extension bus signal lines (or triple purposes along with multiple functions of peripheral I/O). Pin functions are selected according to the operation modes set or using the input/output port operation mode registers.

When the selected CPU operation mode is external extension mode or processor mode, P0–P4 and P225 all are switched to signal pins for external access. The operation mode is determined depending on how MOD0 and MOD1 pins are set. (See the table below.)

Table 8.2.1 CPU Operation Modes and P0–P4 and P225 Pin Functions

MOD0	MOD1	Operation Mode	Pin Functions of P0-P4, P225
VSS	VSS	Single-chip mode	input/output port pin
VSS	VCCE	External extension mode	External extension signal pin
VCCE	VSS	Processor mode	
VCCE	VCC	Reserved (Use inhibited)	—

Note: • VCCE = 5 V or 3.3 V and VSS = GND.

Ports P6–P13, P15, P17, and P22 (except for P64, P221, P225) have their pin functions switched between input/output ports and internal peripheral I/Os by setting up the input/output port operation mode registers. If any internal peripheral I/O has multiple functions, select the desired pin function using the relevant internal peripheral I/O register.

Operation on FP and MOD1 pins during write to the internal flash memory does not affect the pin functions.

Note 1: Pin functions are switched over by setting MOD0 and MOD1 pins.

Note 2: Pin functions are switched over by setting MOD0 and MOD1 pins. Also, use of this pin requires caution because it has a debug event function.

Note: • P14, P16, P18, P19, P20 and P21 have no functions assigned in M32171.

Figure 8.2.1 Input/Output Ports and Pin Function Assignments

8.3 Input/Output Port Related Registers

The input/output port related registers consist of the Port Data Register, Port Direction Register, and Port Operation Mode Register. Of these, the Port Operation Mode Register is available for only P7–P22. Ports P0–P4 and P225 have their pin functions determined depending on CPU operation mode (selected by FP, MOD0, and MOD1 pins).

Port P5 is reserved for future use. An input/output port related register map is shown below.

Address	D0	+0 Address	D7	D8	+1 Address	D15

14	P136MOD (Port P136 operation mode)	0 : P136 1 : TIN22	○	○
15	P137MOD (Port P137 operation mode)	0 : P137 1 : TIN23	○	○

■ P15 Operation Mode Register (P15MOD)

<Address: H'0080 074F>

<When reset : H'00>

D	Bit Name	Function	R	W
8	P150MOD (Port P150 operation mode)	0 : P150 1 : TIN0	<input type="radio"/>	<input type="radio"/>
9, 10	No functions assigned		0	-
11	P153MOD (Port P153 operation mode)	0 : P153 1 : TIN3	<input type="radio"/>	<input type="radio"/>
12 - 15	No functions assigned		0	-

Note: • Ports P151, P152, and P154-157 are nonexistent.

■ P17 Operation Mode Register (P17MOD)

<Address: H'0080 0751>

<When reset : H'00>

D	Bit Name	Function	R	W
8 - 11	No functions assigned		0	—
12	P174MOD	0 : P174 (Port P174 operation mode)	○	○
13	P175MOD	0 : P175 (Port P175 operation mode)	○	○
14, 15	No functions assigned		0	—

Note : • Ports P170-P173, and P176, P177 are nonexistent.

■ P22 Operation Mode Register (P22MOD)

<Address: H'0080 0756>

<When reset : H'00>

D	Bit Name	Function	R	W
0	P220MOD (Port P220 operation mode)	0 : P220 1 : CTX	<input type="radio"/>	<input type="radio"/>
1 - 4	No functions assigned		0	—
5	P225MOD (Port P225 operation mode)	0 : P225 1 : Use inhibited	<input type="radio"/>	<input type="radio"/>
6 - 7	No functions assigned		0	—

Notes: • P221 is a CAN input-only pin.

- : • The pin function of P225 changes depending on how MOD0 and MOD1 pins are set. Also, because it has a debug event function, be careful when using this port.
- : • P222-224, P226, and P227 are nonexistent.

■ Port Input Function Enable Register (PIEN)

<Address: H'0080 0745>

<When reset : H'00>

D	Bit Name	Function	R	W
8 - 14	No functions assigned		0	—
15	PIEN0 (Port input function enable bit)	0 : Disables input (to prevent current from flowing in) 1 : Enables input	○	○

This register is provided to prevent current from flowing into the port input pin. Because after reset this register is set to disable input, it must be set to 1 before input can be processed.

During boot mode, all pins shared with serial I/O function are enabled for input, so that when rewriting the flash memory via serial communication, you can set this register to 0 to prevent current from flowing in from any pins other than serial I/O function.

The next page lists the pins that can be controlled by the Port Input Function Enable Register in each mode.

Table 8.3.1 Controllable Pins by Port Function Enable Bit

Mode Name	Controllable Pins	Noncontrollable Pins
Single chip	P00 - P07, P10 - P17, P20 - P27	P64, P221, FP
	P30 - P37, P41 - P47, P61 - P63	
	P70 - P77, P82 - P87, P93 - P97	
	P100 - P107, P110 - P117, P124 - P127	
	P130 - P137, P150, P153, P174, P175 P220, P225	
External extension	P61 - P63, P70 - P77, P82 - P87	P00 - P07, P10 - P17
	P93 - P97, P100 - P107, P110 - P117	P20 - P27, P30 - P37
Microprocessor	P124 - P127, P130 - P137	P41 - P47, P64, P221
	P150, P153, P174, P175, P220	P225, FP
Boot (single chip)	P00 - P07, P10 - P17, P20 - P27	P64, P82 - P87
	P30 - P37, P41 - P47, P61 - P63	P174, P175, P221, FP
	P67, P70 - P77, P93 - P97	
	P100 - P107, P110 - P117, P124 - P127	
	P130 - P137, P150, P153, P220, P225	

8.4 Port Peripheral Circuits

Figures 8.4.1 through 8.4.4 show the peripheral circuit diagrams of the input/output ports described in the preceding pages.

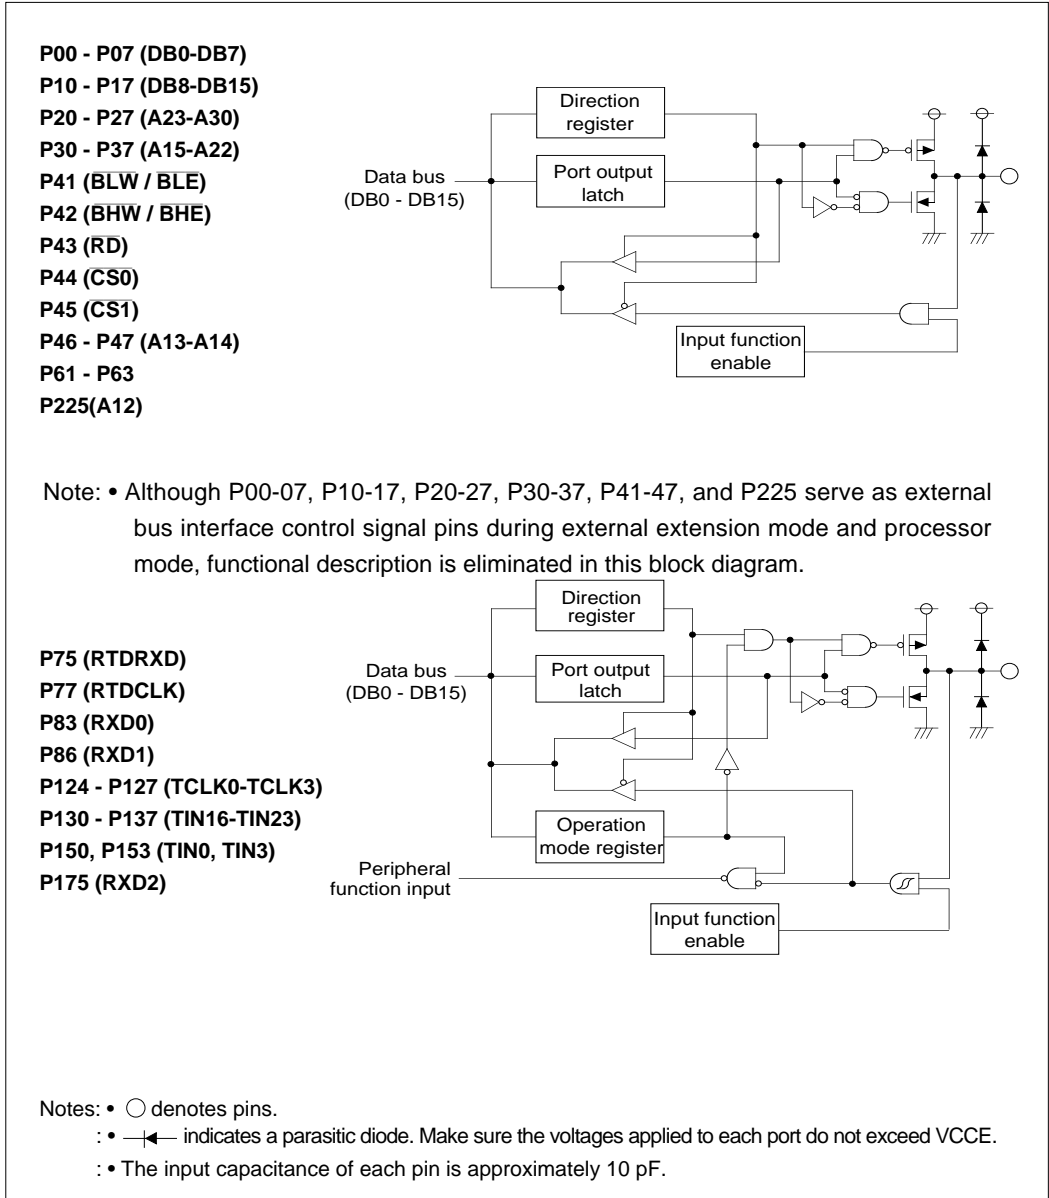

Figure 8.4.1 Port Peripheral Circuit Diagram (1)

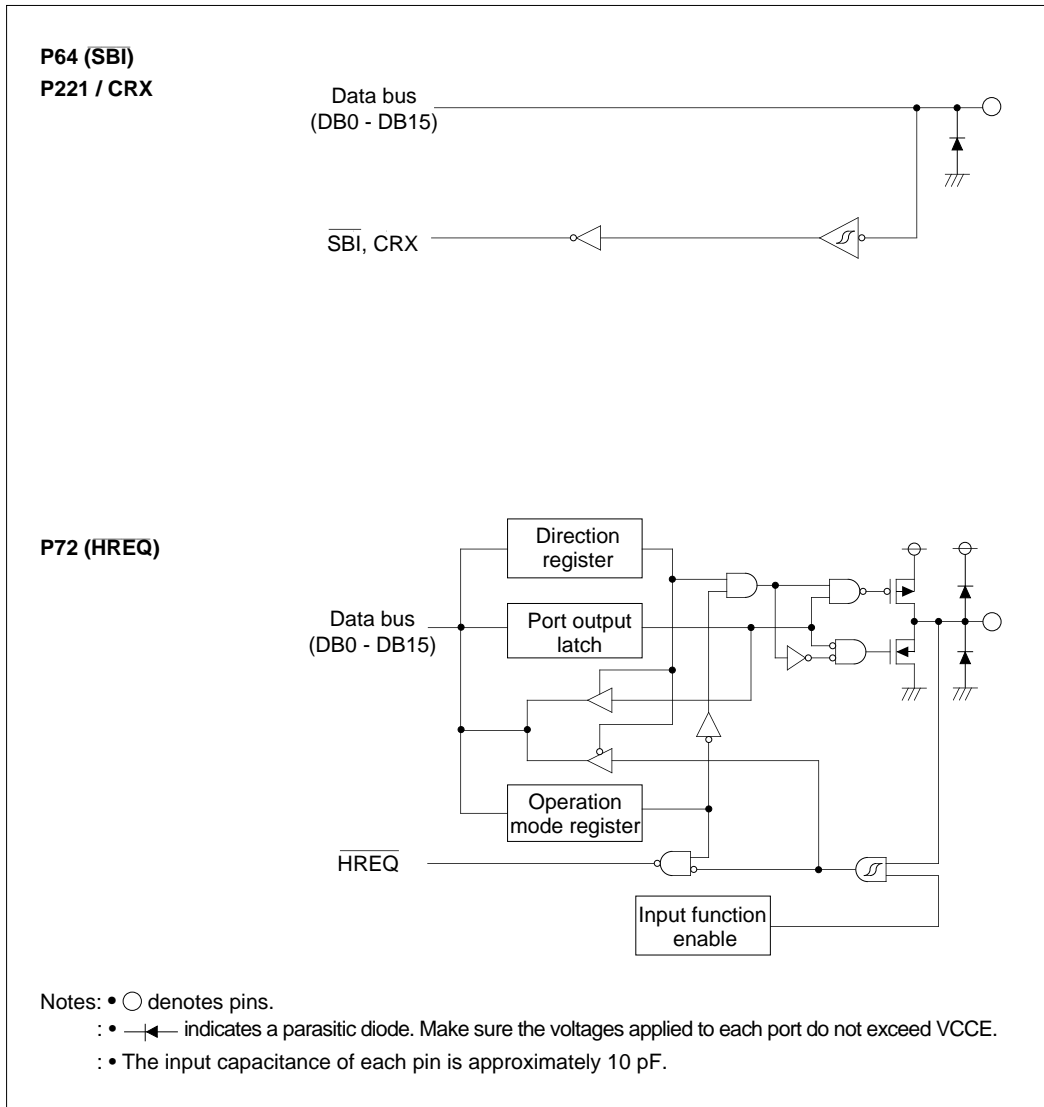

Figure 8.4.2 Port Peripheral Circuit Diagram (2)

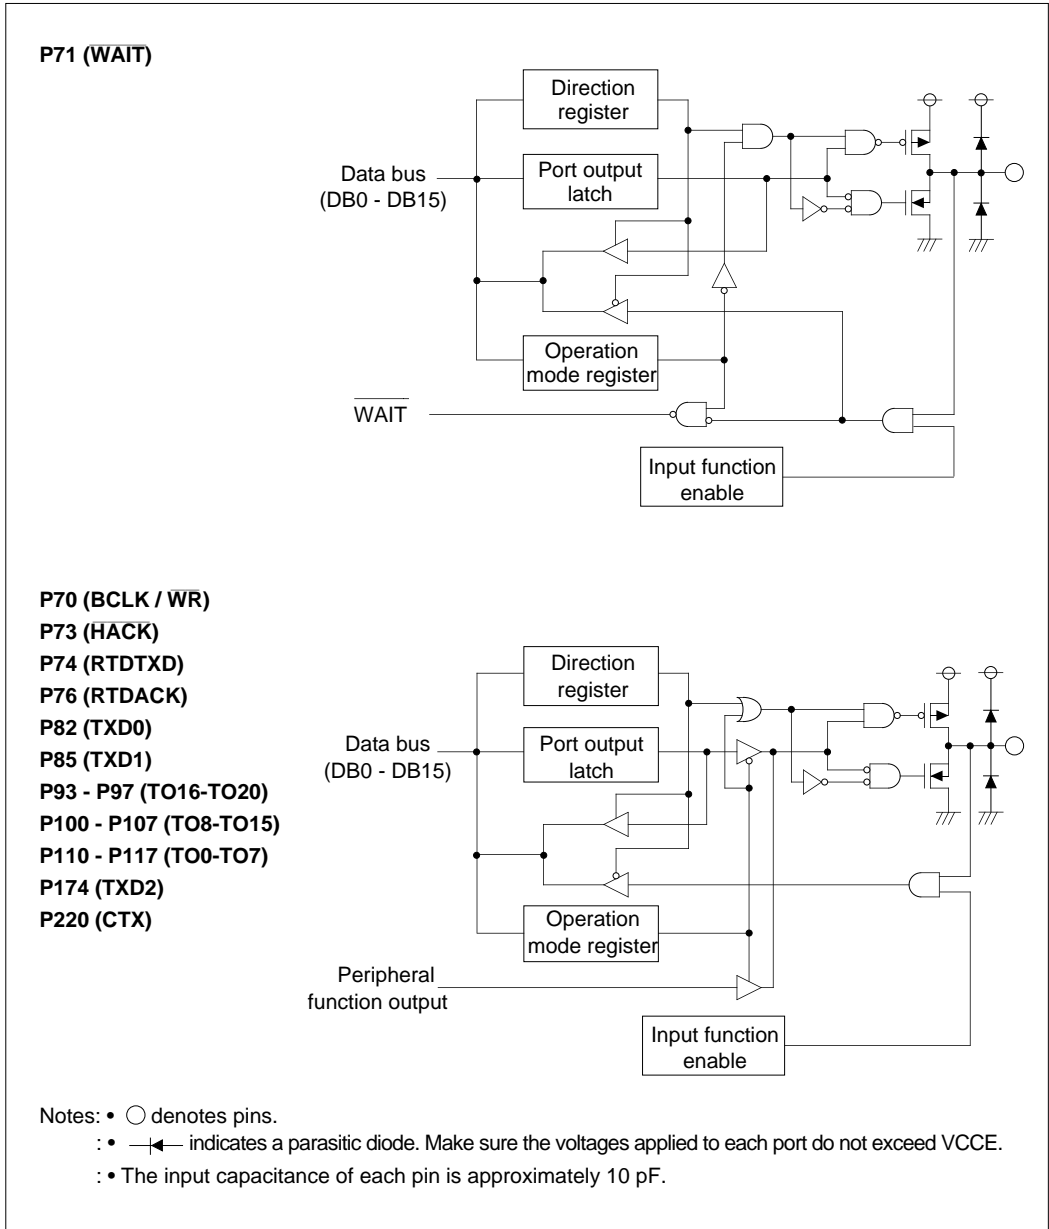

Figure 8.4.3 Port Peripheral Circuit Diagram (3)

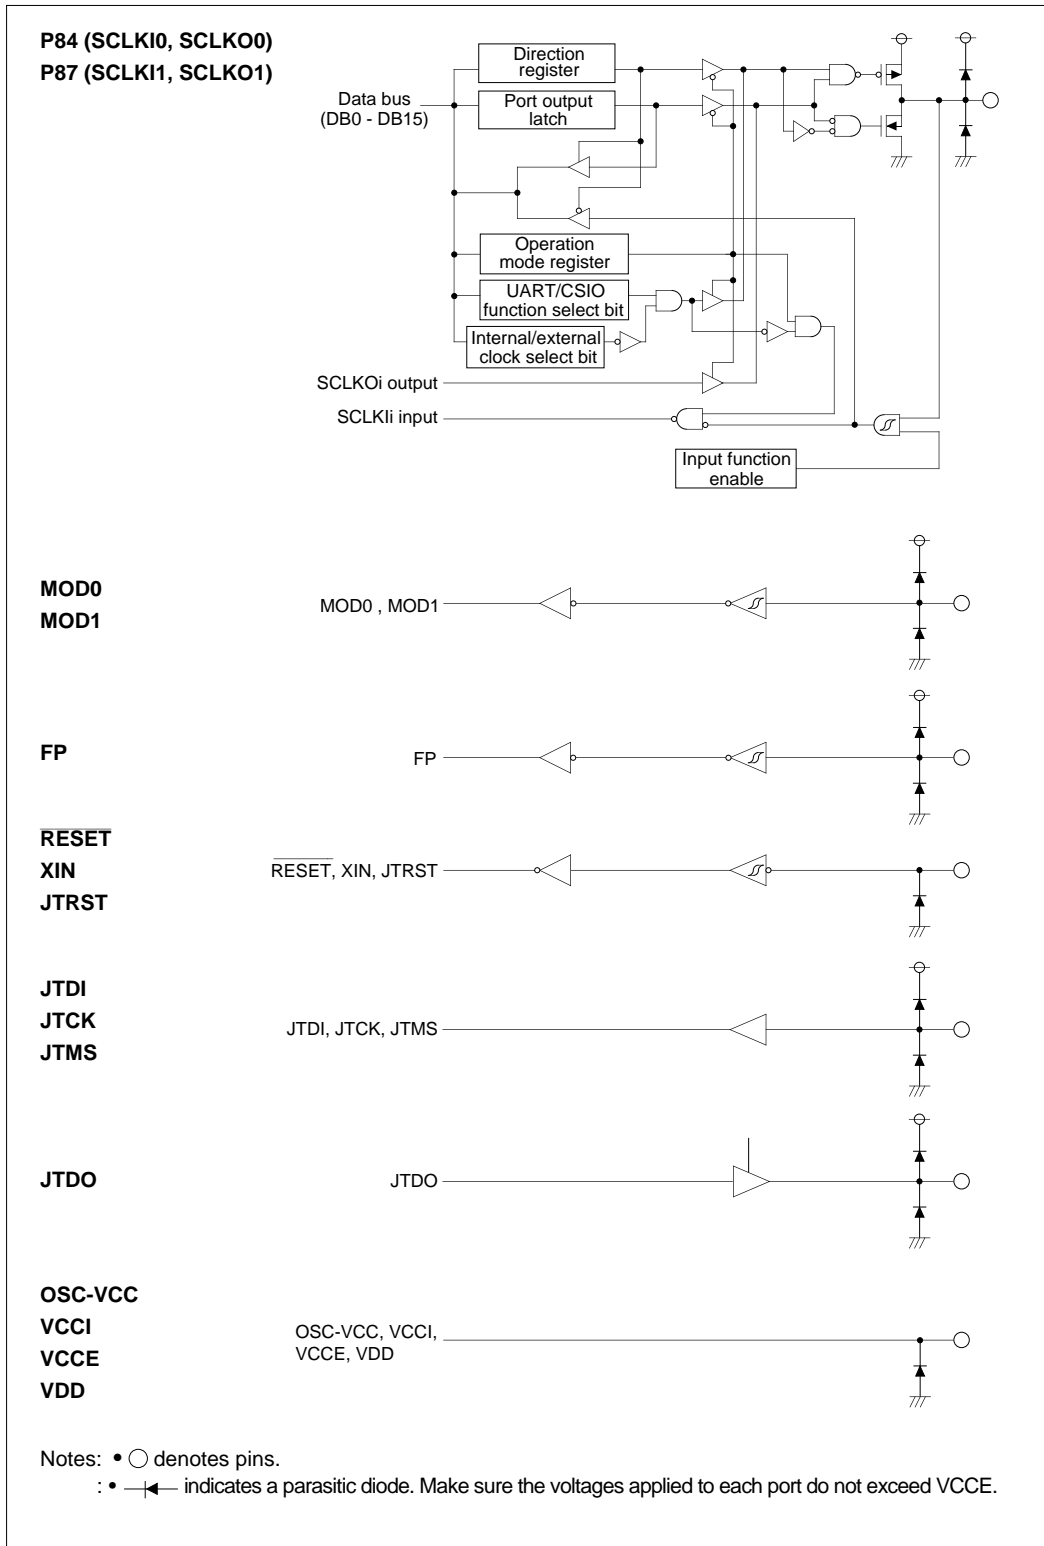

Figure 8.4.4 Port Peripheral Circuit Diagram (4)

8.5 Precautions on Input/output Ports

- **When using the ports in output mode**

Because the Port Data Register values immediately after a reset are indeterminate, it is necessary that the initial value be written to the Port Data Register before setting the Port Direction Register for output. Conversely, if the Port Direction Register is set for output before writing to the Port Data Register, indeterminate values will be output for a while until the initial value is set in the Port Data Register.

CHAPTER 9

DMAC

- 9.1 Outline of the DMAC
- 9.2 DMAC Related Registers
- 9.3 Functional Description of the DMAC
- 9.4 Precautions about the DMAC

9.1 Outline of the DMAC

The 32171 contains a 10 channel-DMA (Direct Memory Access) Controller. It allows you to transfer data at high speed between internal peripheral I/Os, between internal RAM and internal peripheral I/O, and between internal RAMs, as requested by a software trigger or from an internal peripheral I/O.

Table 9.1.1 Outline of the DMAC

Item	Description
Number of channel	10 channels
Transfer request	<ul style="list-style-type: none"> • Software trigger • Request from internal peripheral I/Os: A-D converter, multijunction timer, or serial I/O (reception completed, transmit buffer empty) • Transfer operation can be cascaded between DMA channels (Note)
Maximum number of times transferred	256 times
Transferable address space	<ul style="list-style-type: none"> • 64 Kbytes (address space from H'0080 0000 to H'0080 FFFF) • Transfers between internal peripheral I/Os, between internal RAM and internal peripheral I/O, between internal RAMs are supported
Transfer data size	16 or 8 bits
Transfer method	Single transfer DMA (control of the internal bus is relinquished for each transfer performed), dual-address transfer
Transfer mode	Single transfer mode
Direction of transfer	One of three modes can be selected for the source and destination: <ul style="list-style-type: none"> • Address fixed • Address incremental • Ring buffered
Channel priority	Channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7 > channel 8 > channel 9 (Priority is fixed)
Maximum transfer rate	13.3 Mbytes per second (with 20 MHz internal peripheral clock)
Interrupt request	Group interrupt request can be generated when each transfer count register underflows.
Transfer area	64 Kbytes from H'0080 0000 to H'0080 FFFF (Transferable in the entire internal RAM/SFR area)

Note: • Transfer operation can be cascaded between DMA channels as shown below.

- Completion of one transfer in channel 0 starts DMA transfer in channel 1
- Completion of one transfer in channel 1 starts DMA transfer in channel 2
- Completion of one transfer in channel 2 starts DMA transfer in channel 0
- Completion of one transfer in channel 3 starts DMA transfer in channel 4
- Completion of one transfer in channel 5 starts DMA transfer in channel 6
- Completion of one transfer in channel 6 starts DMA transfer in channel 7
- Completion of one transfer in channel 7 starts DMA transfer in channel 5
- Completion of one transfer in channel 8 starts DMA transfer in channel 9
- Completion of all DMA transfers in channel 0 (transfer count register underflow) starts DMA transfer in channel 5

5	TSZSL9 (Selects DMA7 transfer size)	0 : 16 bits 1 : 8 bits	○	○
6	SADSL9 (Selects DMA9 source address direction)	0 : Fixed 1 : Incremental	○	○
7	DADSL9 (Selects DMA9 destination address direction)	0 : Fixed 1 : Incremental	○	○

W = △ : Only writing a 0 is effective; when you write a 1, the previous value is retained.

The DMA Channel Control Register consists of bits to select DMA transfer mode in each channel, set DMA transfer request flag, and the bits to select the cause of DMA request, enable DMA transfer, and set the transfer size and the source/destination address directions.

(1) MDSELn (DMA_n transfer mode select) bit (D0)

This bit when in single transfer mode selects normal mode or ring buffer mode. Normal mode is selected by setting this bit to 0 or ring buffer mode is selected by setting it to 1.

In ring buffer mode, transfer begins from the transfer start address and after performing transfers 32 times, control is recycled back to the transfer start address, from which transfer operation is repeated. In this case, the Transfer Count Register counts in free-run mode during which time transfer operation is continued until the transfer enable bit is reset to 0 (to disable transfer). No interrupt is generated at completion of DMA transfer.

(2) TREQFn (DMA_n transfer request flag) bit (D1)

This flag is set to 1 when a DMA transfer request occurs. Reading this flag helps to know DMA transfer requests in each channel.

The generated DMA request is cleared by writing a 0 to this bit. If you write a 1, the value you wrote is ignored and the bit retains its previous value. If a new DMA transfer request is generated for a channel whose DMA transfer request flag has already been set to 1, the next DMA transfer request is not accepted until the transfer under way in that channel is completed.

(3) REQSLn (cause of DMA_n request select) bits (D2, D3)

These bits select the cause of DMA request in each DMA channel.

(4) TENLn (DMA_n transfer enable) bit (D4)

Transfer is enabled by setting this bit to 1, so that the channel is ready for DMA transfer. Conversely, transfer is disabled by setting this bit to 0. However, if a transfer request has already been accepted, transfer in that channel is not disabled until after the requested transfer is completed.

(5) TSZSLn (DMA_n transfer size select) bit (D5)

This bit selects the number of bits to be transferred in one DMA transfer operation (unit of one transfer). The unit of one transfer is 16 bits when TSZSL = 0 or 8 bits when TSZSL = 1.

(6) SADSLn (DMA_n source address direction select) bit (D6)

This bit selects the direction in which the source address changes as transfer proceeds. This mode can be selected from two choices: address fixed or address incremental.

(7) DADSLn (DMA_n destination address direction select) bit (D7)

This bit selects the direction in which the destination address changes as transfer proceeds. This mode can be selected from two choices: address fixed or address incremental.

9.2.2 DMA Software Request Generation Registers

- **DMA0 Software Request Generation Register (DM0SRI)** <Address: H'0080 0460>
- **DMA1 Software Request Generation Register (DM1SRI)** <Address: H'0080 0462>
- **DMA2 Software Request Generation Register (DM2SRI)** <Address: H'0080 0464>

- **DMA4 Software Request Generation Register (DM4SRI)** <Address: H'0080 0468>
- **DMA5 Software Request Generation Register (DM5SRI)** <Address: H'0080 0470>
- **DMA6 Software Request Generation Register (DM6SRI)** <Address: H'0080 0472>
- **DMA7 Software Request Generation Register (DM7SRI)** <Address: H'0080 0474>
- **DMA8 Software Request Generation Register (DM8SRI)** <Address: H'0080 0476>
- **DMA9 Software Request Generation Register (DM9SRI)** <Address: H'0080 0478>

<When reset : Indeterminate>

D	Bit Name	Function	R	W
0 - 15	DM0SRI - DM9SRI (Generates DMA software request) by writing any data	DMA transfer request is generated	?	○

Note: • This register can be accessed in either bytes or halfwords.

The DMA Software Request Generation Register is used to generate DMA transfer requests in software. A DMA transfer request can be generated by writing any data to this register when "Software start" has been selected for the cause of DMA request.

DM0SRI - DM9SRI (DMA software request generate) bit

A software DMA transfer request is generated by writing any data to this register in halfword (16 bits) or in byte (8 bits) beginning with an even or odd address when "Software" is selected as the cause of DMA transfer request (by setting the DMA Channel Control Register D2, D3 bits to "00").

9.2.3 DMA Source Address Registers

■ DMA0 Source Address Register (DM0SA)	<Address: H'0080 0412>
■ DMA1 Source Address Register (DM1SA)	<Address: H'0080 0422>
■ DMA2 Source Address Register (DM2SA)	<Address: H'0080 0432>
■ DMA3 Source Address Register (DM3SA)	<Address: H'0080 0442>
■ DMA4 Source Address Register (DM4SA)	<Address: H'0080 0452>
■ DMA5 Source Address Register (DM5SA)	<Address: H'0080 041A>
■ DMA6 Source Address Register (DM6SA)	<Address: H'0080 042A>
■ DMA7 Source Address Register (DM7SA)	<Address: H'0080 043A>
■ DMA8 Source Address Register (DM8SA)	<Address: H'0080 044A>
■ DMA9 Source Address Register (DM9SA)	<Address: H'0080 045A>

<When reset : Indeterminate>

D	Bit Name	Function	R	W
0 - 15	DM0SA - DM9SA (DMA source address)	A16-A31 of the source address (A0-A15 are fixed to H'0080)	○	○

Note: • This register must always be accessed in halfwords.

The DMA Source Address Register is used to set the source address of DMA transfer in such a way that D0 corresponds to A16, and D15 corresponds to A31. Because this register is comprised of a current register, the value you get by reading this register is always the current value.

When DMA transfer finishes (at which the Transfer Count Register underflows), the value in this register if "Address fixed" is selected, is the same source address that was set in it before DMA transfer began; if "Address incremental" is selected, the value in this register is the last transfer address + 1 (for 8-bit transfer) or the last transfer address + 2 (for 16-bit transfer).

Make sure the DMA Source Address Register is always accessed in halfwords (16 bits) beginning with an even address. If accessed in bytes, the value read from this register is indeterminate.

DM0SA-DM9SA (A16-A31 of the source address)

By setting this register, specify the source address of DMA transfer in internal I/O space ranging from H'0080 0000 to H'0080 FFFF or in the RAM space.

The 16 high-order bits of the source address (A0-A15) are always fixed to H'0080. Use this register to set the 16 low-order bits of the source address (with D0 corresponding to A16, and D15 corresponding to A31).

9.2.4 DMA Destination Address Registers

■ DMA0 Destination Address Register (DM0DA)	<Address: H'0080 0414>
■ DMA1 Destination Address Register (DM1DA)	<Address: H'0080 0424>
■ DMA2 Destination Address Register (DM2DA)	<Address: H'0080 0434>
■ DMA3 Destination Address Register (DM3DA)	<Address: H'0080 0444>
■ DMA4 Destination Address Register (DM4DA)	<Address: H'0080 0454>
■ DMA5 Destination Address Register (DM5DA)	<Address: H'0080 041C>
■ DMA6 Destination Address Register (DM6DA)	<Address: H'0080 042C>
■ DMA7 Destination Address Register (DM7DA)	<Address: H'0080 043C>
■ DMA8 Destination Address Register (DM8DA)	<Address: H'0080 044C>
■ DMA9 Destination Address Register (DM9DA)	<Address: H'0080 045C>

<When reset : Indeterminate>

D	Bit Name	Function	R	W
0 - 15	DM0DA - DM9DA (DMA destination address)	A16-A31 of the destination address (A0-A15 are fixed to H'0080)	○	○

Note: • This register must always be accessed in halfwords.

The DMA Destination Address Register is used to set the destination address of DMA transfer in such a way that D0 corresponds to A16, and D15 corresponds to A31. Because access to this register is comprised of a current register, the value you get by reading this register is always the current value.

When DMA transfer finishes (at which the Transfer Count Register underflows), the value in this register if "Address fixed" is selected, is the same destination address that was set in it before DMA transfer began; if "Address incremental" is selected, the value in this register is the last transfer address + 1 (for 8-bit transfer) or the last transfer address + 2 (for 16-bit transfer).

Make sure the DMA Destination Address Register is always accessed in halfwords (16 bits) beginning with an even address. If accessed in bytes, the value read from this register is indeterminate.

DM0DA-DM9DA (A16-A31 of the destination address)

By setting this register, specify the destination address of DMA transfer in internal I/O space ranging from H'0080 0000 to H'0080 FFFF or in the RAM space.

The 16 high-order bits of the destination address (A0-A15) are always fixed to H'0080. Use this register to set the 16 low-order bits of the destination address (with D0 corresponding to A16, and D15 corresponding to A31).

9.2.5 DMA Transfer Count Registers

■ DMA0 Transfer Count Register (DM0TCT)	<Address: H'0080 0411>
■ DMA1 Transfer Count Register (DM1TCT)	<Address: H'0080 0421>
■ DMA2 Transfer Count Register (DM2TCT)	<Address: H'0080 0431>
■ DMA3 Transfer Count Register (DM3TCT)	<Address: H'0080 0441>
■ DMA4 Transfer Count Register (DM4TCT)	<Address: H'0080 0451>
■ DMA5 Transfer Count Register (DM5TCT)	<Address: H'0080 0419>
■ DMA6 Transfer Count Register (DM6TCT)	<Address: H'0080 0429>
■ DMA7 Transfer Count Register (DM7TCT)	<Address: H'0080 0439>
■ DMA8 Transfer Count Register (DM8TCT)	<Address: H'0080 0449>
■ DMA9 Transfer Count Register (DM9TCT)	<Address: H'0080 0459>

<When reset : Indeterminate>

D	Bit Name	Function	R	W
8 - 15	DM0TCT - DM9TCT (DMA transfer count)	DMA transfer count (ignored during 32-channel ring buffer mode)	○	○

The DMA Transfer Count Register is used to set the number of times data is transferred in each channel. However, the value in this register is ignored during ring buffer mode.

The transfer count is the (value set in the transfer count register + 1). Because the DMA Transfer Count Register is comprised of a current register, the value you get by reading this register is always the current value. (However, if you read this register in a cycle immediately after transfer, the value you get is the value that was in the count register before the transfer began.) When transfer finishes, this count register underflows, so that the read value you get is H'FF.

If any cascaded channel exists, each time one DMA transfer (byte or halfword) is completed or when all transfers are completed (at which the transfer count register underflows), transfer in the cascaded channel starts.

9.2.6 DMA Interrupt Request Status Registers

■ DMA0-4 Interrupt Request Status Register (DM04ITST) <Address: H'0080 0400>

<When reset : H'00>

D	Bit Name	Function	R	W
0 - 2	No functions assigned		0	—
3	DMITST4 (DMA4 interrupt request status)	0 : No interrupt request	○	△
4	DMITST3 (DMA3 interrupt request status)	1 : Interrupt requested		
5	DMITST2 (DMA2 interrupt request status)			
6	DMITST1 (DMA1 interrupt request status)			
7	DMITST0 (DMA0 interrupt request status)			

W = △ : Only writing a 0 is effective; when you write a 1, the previous value is retained.

The DMA0-4 Interrupt Request Status Register lets you know the status of interrupt requests in channels 0-4. If the DMA n interrupt request status bit ($n = 0$ to 4) is set to 1, it means that a DMA n interrupt request in the corresponding channel has been generated.

DMITST n (DMA n interrupt request status) bit ($n = 0$ to 4)

[Setting the DMA n interrupt request status bit]

This bit can only be set in hardware, and cannot be set in software.

[Clearing the DMA n interrupt request status bit]

This bit is cleared by writing a 0 in software.

Note: • The DMA n interrupt request status bit cannot be cleared by writing a 0 to the "IREQ bit" of the DMA Interrupt Control Register(IDMA04CR) that the interrupt controller has.

When writing to the DMA0-4 Interrupt Request Status Register, be sure to set the bits you want to clear to 0 and all other bits to 1. The bits which are thus set to 1 are unaffected by writing in software, and retain the value they had before you wrote.

■ DMA5-9 Interrupt Request Status Register (DM59ITST) <Address: H'0080 0408>

<When reset : H'00>

D	Bit Name	Function	R	W
0 - 2	No functions assigned		0	—
3	DMITST9 (DMA9 interrupt request status)	0 : No interrupt request	○	△
4	DMITST8 (DMA8 interrupt request status)	1 : Interrupt requested		
5	DMITST7 (DMA7 interrupt request status)			
6	DMITST6 (DMA6 interrupt request status)			
7	DMITST5 (DMA5 interrupt request status)			

W = △ : Only writing a 0 is effective; when you write a 1, the previous value is retained.

The DMA5-9 Interrupt Request Status Register lets you know the status of interrupt requests in channels 5-9. If the DMA n interrupt request status bit ($n = 5$ to 9) is set to 1, it means that a DMA n interrupt request in the corresponding channel has been generated.

DMITST n (DMA n interrupt request status) bit ($n = 5$ to 9)

[Setting the DMA n interrupt request status bit]

This bit can only be set in hardware, and cannot be set in software.

[Clearing the DMA n interrupt request status bit]

This bit is cleared by writing a 0 in software.

Note: • The DMA n interrupt request status bit cannot be cleared by writing a 0 to the "IREQ bit" of the DMA Interrupt Control Register(IDMA59CR) that the interrupt controller has.

When writing to the DMA5-9 Interrupt Request Status Register, be sure to set the bits you want to clear to 0 and all other bits to 1. The bits which are thus set to 1 are unaffected by writing in software, and retain the value they had before you wrote.

9.2.7 DMA Interrupt Mask Registers

■ DMA0-4 Interrupt Mask Register (DM04ITMK)

<Address: H'0080 0401>

<When reset : H'00>

D	Bit Name	Function	R	W
8 - 10	No functions assigned		0	—
11	DMITMK4 (DMA4 interrupt request mask)	0 : Enables interrupt request	○	○
12	DMITMK3 (DMA3 interrupt request mask)	1 : Masks (disables) interrupt request		
13	DMITMK2 (DMA2 interrupt request mask)			
14	DMITMK1 (DMA1 interrupt request mask)			
15	DMITMK0 (DMA0 interrupt request mask)			

The DMA0-4 Interrupt Mask Register is used to mask interrupt requests in DMA channels 0-4.

DMITMK_n (DMA_n interrupt request mask) bit (n = 0 to 4)

DMA_n interrupt request is masked by setting the DMA_n interrupt request mask bit to 1. However, when an interrupt request is generated, the DMA_n interrupt request status bit is always set to 1 irrespective of the contents of this register.

■ DMA5-9 Interrupt Mask Register (DM59ITMK)

<Address: H'0080 0409>

<When reset : H'00>

D	Bit Name	Function	R	W
8 - 10	No functions assigned		0	—
11	DMITMK9 (DMA9 interrupt request mask)	0 : Enables interrupt request	○	○
12	DMITMK8 (DMA8 interrupt request mask)	1 : Masks (disables) interrupt request		
13	DMITMK7 (DMA7 interrupt request mask)			
14	DMITMK6 (DMA6 interrupt request mask)			
15	DMITMK5 (DMA5 interrupt request mask)			

The DMA5-9 Interrupt Mask Register is used to mask interrupt requests in DMA channels 5-9.

DMITMK_n (DMA_n interrupt request mask) bit (n = 5 to 9)

DMA_n interrupt request is masked by setting the DMA_n interrupt request mask bit to 1. However, when an interrupt request is generated, the DMA_n interrupt request status bit is always set to 1 irrespective of the contents of this register.

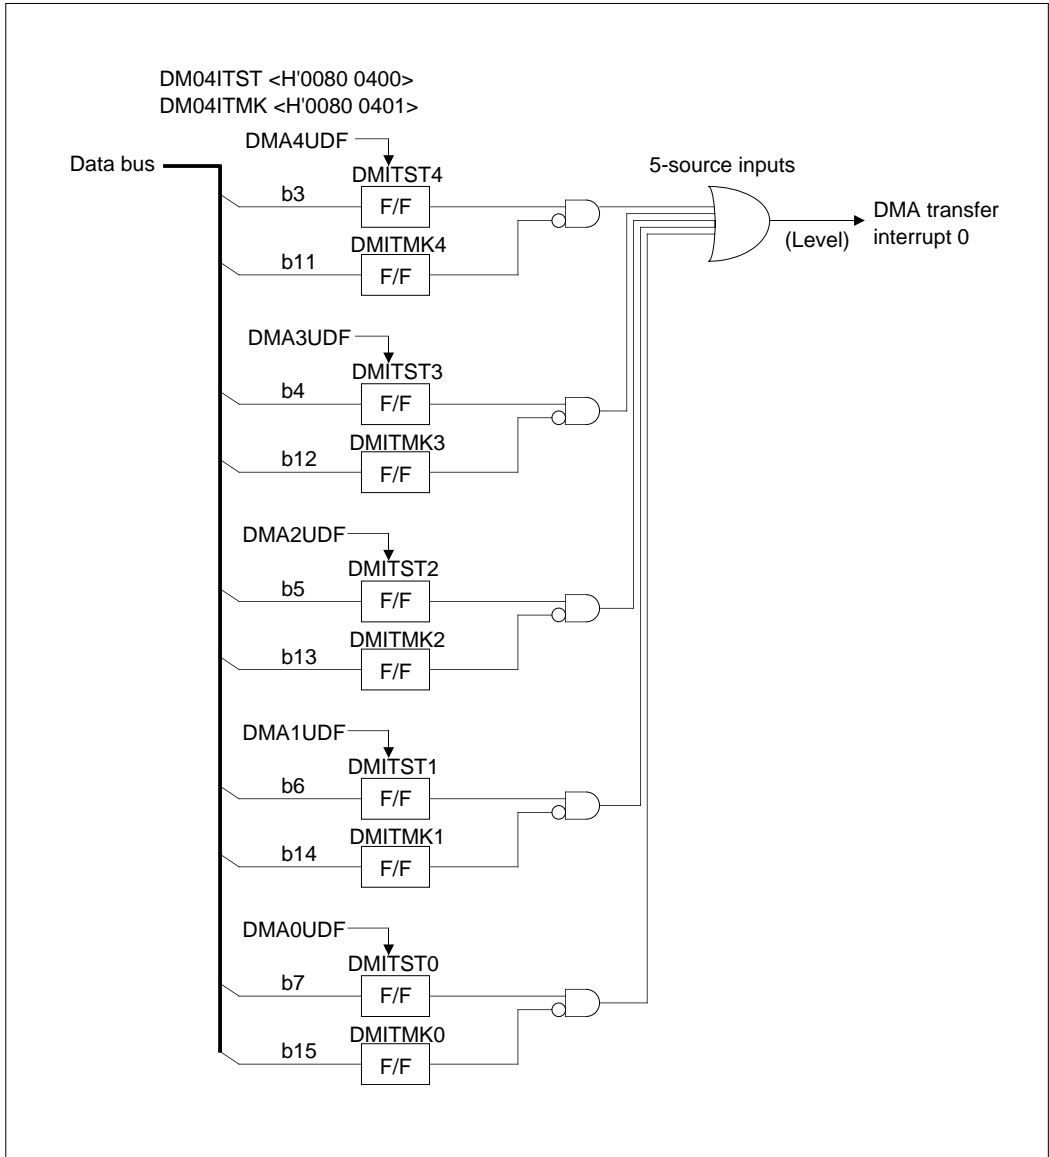

Figure 9.2.3 Block Diagram of DMA Transfer Interrupt 0

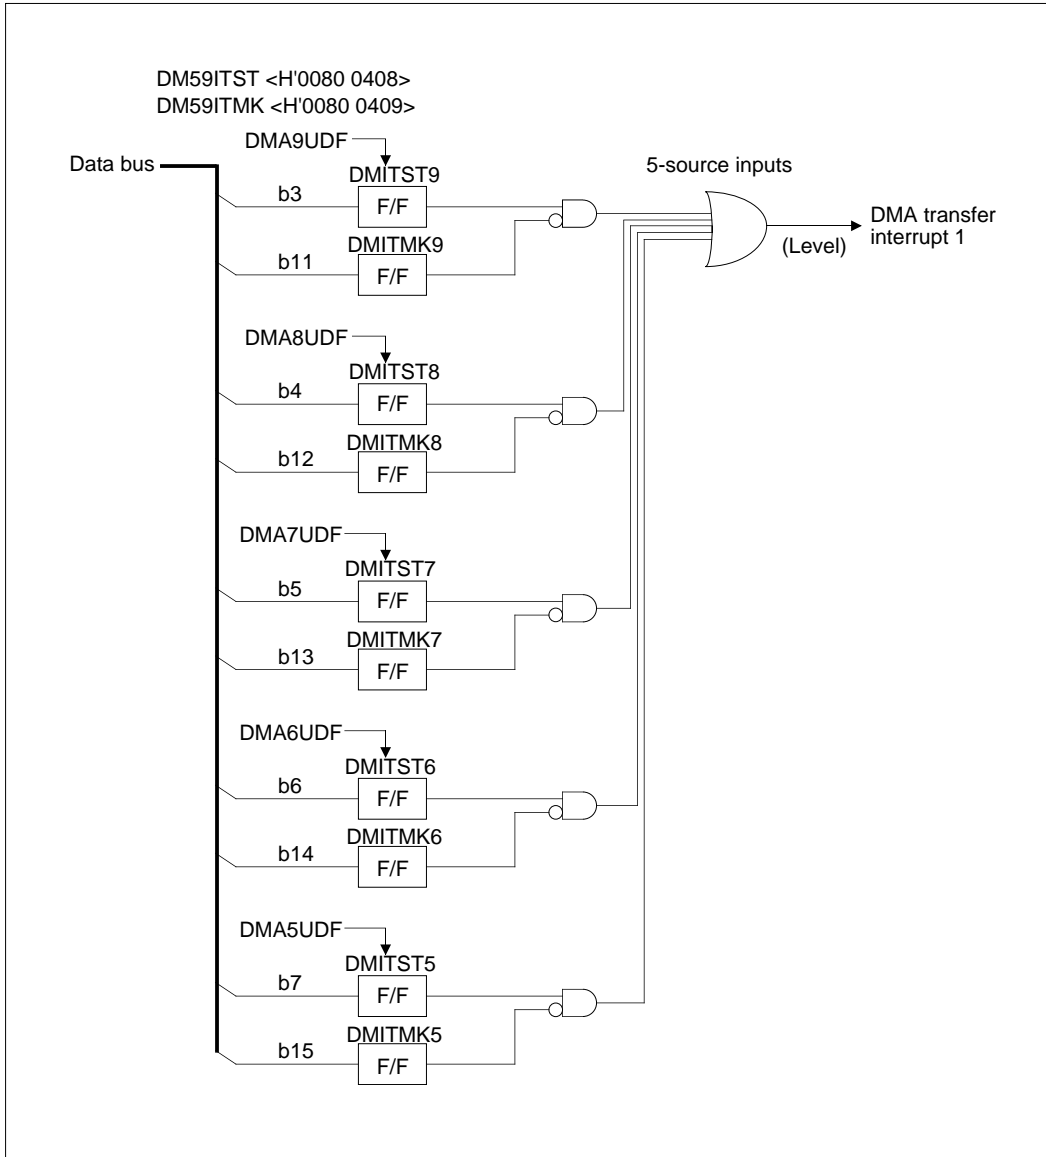

Figure 9.2.4 Block Diagram of DMA Transfer Interrupt 1

9.3 Functional Description of the DMAC

9.3.1 Cause of DMA Request

For each DMA channel (channels 0 to 9), DMA transfer can be requested from multiple sources. There are various causes of DMA transfer, so that DMA transfer can be started by a request from internal peripheral I/O, started in software by a program, or can be started upon completion of one transfer or all transfers in a DMA channel (cascade mode).

The cause of DMA request is selected using the cause of request select bit provided for each channel, REQSLn (DMA Channel Control Register bits D2, D3). The table below lists the causes of DMA requests in each channel.

Table 9.3.1 Causes of DMA Requests in DMA0 and Generation Timings

REQSL0	Cause of DMA Request	DMA Request Generation Timing
0 0	Software start or one DMA2 transfer completed	When any data is written to DMA0 Software Request Generation Register (software start) or one DMA2 transfer is completed (cascade mode)
0 1	A-D0 conversion completed	When A-D0 conversion is completed
1 0	MJT (TIO8_udf)	When MJT TIO8 underflow occurs
1 1	MJT (input event bus 2)	When MJT's input event bus 2 signal is generated

Table 9.3.2 Causes of DMA Requests in DMA1 and Generation Timings

REQSL1	Cause of DMA Request	DMA Request Generation Timing
0 0	Software start	When any data is written to DMA1 Software Request Generation Register
0 1	MJT (output event bus 0)	When MJT's output event bus 0 signal is generated
1 0	None (Use inhibited)	–
1 1	One DMA0 transfer completed	When one DMA0 transfer is completed (cascade mode)

Table 9.3.3 Causes of DMA Requests in DMA2 and Generation Timings

REQSL2	Cause of DMA Request	DMA Request Generation Timing
0 0	Software start	When any data is written to DMA2 Software Request Generation Register
0 1	MJT (output event bus 1)	When MJT's output event bus 1 signal is generated
1 0	MJT (TIN18 input signal)	When MJT's TIN18 input signal is generated
1 1	One DMA1 transfer completed	When one DMA1 transfer is completed (cascade mode)

Table 9.3.4 Causes of DMA Requests in DMA3 and Generation Timings

REQSL3	Cause of DMA Request	DMA Request Generation Timing
0 0	Software start	When any data is written to DMA3 Software Request Generation Register
0 1	Serial I/O0 (transmit buffer empty)	When serial I/O0 transmit buffer is emptied
1 0	Serial I/O1 (reception completed)	When serial I/O1 reception is completed
1 1	MJT (TIN0 input signal)	When MJT's TIN0 input signal is generated

Table 9.3.5 Causes of DMA Requests in DMA4 and Generation Timings

REQSL4	Cause of DMA Request	DMA Request Generation Timing
0 0	Software start	When any data is written to DMA4 Software Request Generation Register
0 1	One DMA3 transfer completed	When one DMA3 transfer is completed (cascade mode)
1 0	Serial I/O0 (reception completed)	When serial I/O0 reception is completed
1 1	MJT (TIN19 input signal)	When MJT's TIN19 input signal is generated

Table 9.3.6 Causes of DMA Requests in DMA5 and Generation Timings

REQSL5	Cause of DMA Request	DMA Request Generation Timing
0 0	Software start or one DMA7 transfer completed	When any data is written to DMA5 Software Request Generation Register or one DMA7 transfer is completed (cascade mode)
0 1	All DMA0 transfers completed	When all DMA0 transfers are completed (cascade mode)
1 0	Serial I/O2 (reception completed)	When serial I/O2 reception is completed
1 1	MJT (TIN20 input signal)	When MJT's TIN20 input signal is generated

Table 9.3.7 Causes of DMA Requests in DMA6 and Generation Timings

REQSL6	Cause of DMA Request	DMA Request Generation Timing
0 0	Software start	When any data is written to DMA6 Software Request Generation Register
0 1	Serial I/O1 (transmit buffer empty)	When serial I/O1 transmit buffer is emptied
1 0	None (Use inhibited)	–
1 1	One DMA5 transfer completed	When one DMA5 transfer is completed (cascade mode)

Table 9.3.8 Causes of DMA Requests in DMA7 and Generation Timings

REQSL7	Cause of DMA Request	DMA Request Generation Timing
0 0	Software start	When any data is written to DMA7 Software Request Generation Register
0 1	Serial I/O2 (transmit buffer empty)	When serial I/O2 transmit buffer is emptied
1 0	None (Use inhibited)	–
1 1	One DMA6 transfer completed	When one DMA6 transfer is completed (cascade mode)

Table 9.3.9 Causes of DMA Requests in DMA8 and Generation Timings

REQSL8	Cause of DMA Request	DMA Request Generation Timing
0 0	Software start	When any data is written to DMA8 Software Request Generation Register
0 1	MJT (input event bus 0)	When MJT's input event bus 0 signal is generated
1 0	None (Use inhibited)	–
1 1	None (Use inhibited)	–

Table 9.3.10 Causes of DMA Requests in DMA9 and Generation Timings

REQSL9	Cause of DMA Request	DMA Request Generation Timing
0 0	Software start	When any data is written to DMA9 Software Request Generation Register
0 1	None (Use inhibited)	–
1 0	None (Use inhibited)	–
1 1	One DMA8 transfer completed	When one DMA8 transfer is completed (cascade mode)

9.3.2 DMA Transfer Processing Procedure

Shown below is an example of how to control DMA transfer in cases when performing transfer in DMA channel 0.

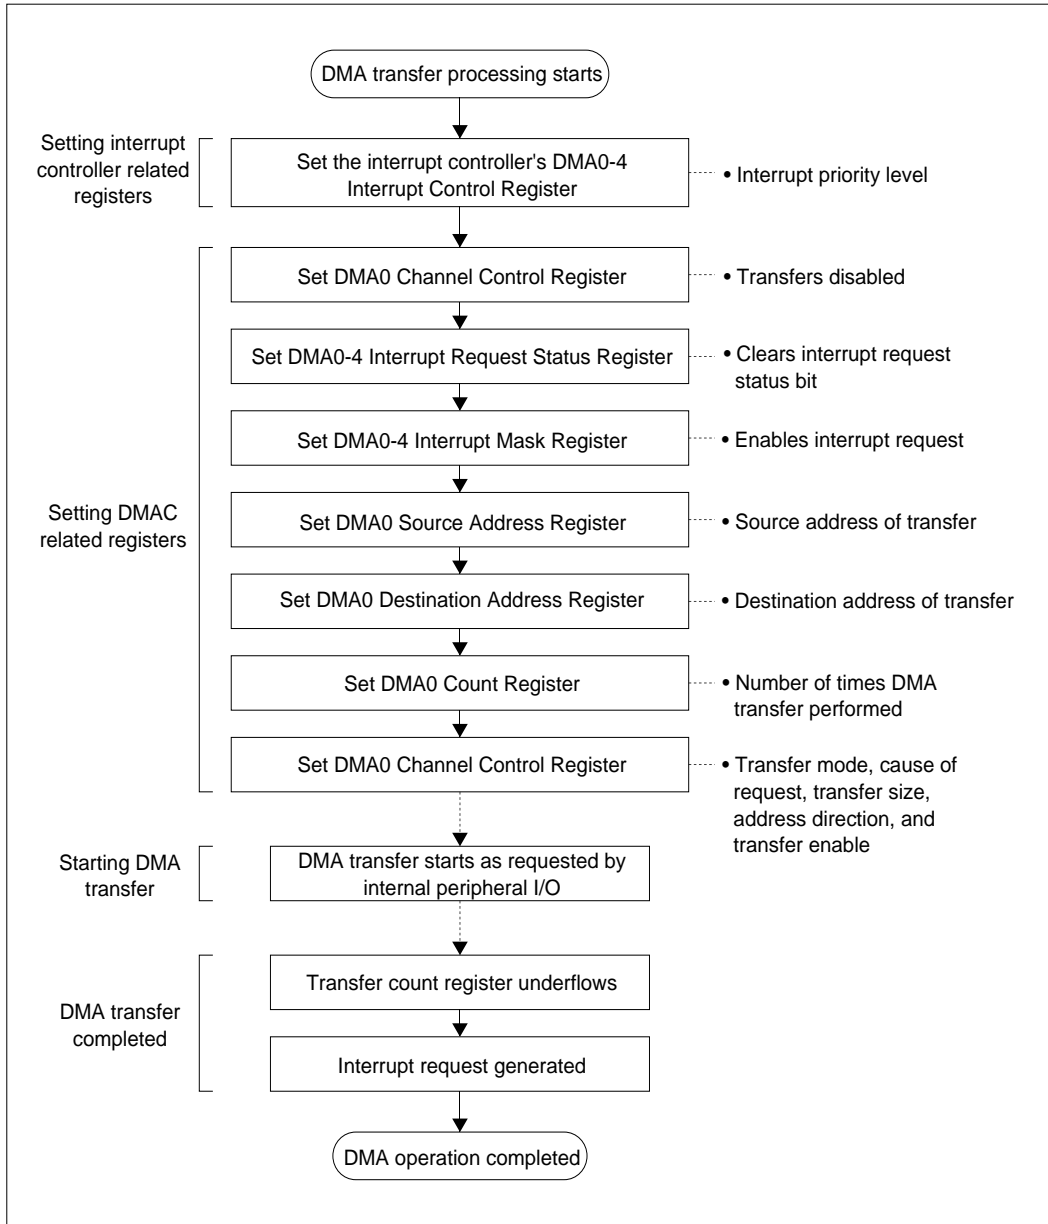

Figure 9.3.1 Example of a DMA Transfer Processing Procedure

9.3.3 Starting DMA

Use the REQSL (cause of DMA request select) bit to set the cause of DMA request. To enable DMA, set the TENL (DMA transfer enable) bit to 1. DMA transfer begins when the specified cause of DMA request becomes effective after setting the TENL (DMA transfer enable) bit to 1.

9.3.4 Channel Priority

Channel 0 has the highest priority. The priority of this and other channels is shown below.

Channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7 > channel 8 > channel 9

This order of priority is fixed and cannot be changed. Among channels for which DMA transfers are requested, the channel that has the highest priority is selected. Channel selection is made every transfer cycle (one DMA bus cycle consisting of three machine cycles).

9.3.5 Gaining and Releasing Control of the Internal Bus

For any channel, control of the internal bus is gained and released in "single transfer DMA" mode. In single transfer DMA, the DMA gains control of the internal bus when DMA transfer request is accepted and after executing one DMA transfer (consisting of one read cycle + one write cycle of internal peripheral clock), returns bus control to the CPU. The diagram below shows DMA operation in single transfer DMA.

Figure 9.3.2 Gaining and Releasing Control of the Internal Bus

9.3.6 Transfer Units

Use the TSZSL (DMA transfer size select) bit to set for each channel the number of bits (8 or 16 bits) to be transferred in one DMA transfer.

9.3.7 Transfer Counts

Use the DMA Transfer Count Register to set transfer counts for each channel. Transfer can be performed up to 256 times. The value of the DMA Transfer Count Register is decremented by one each time one transfer unit is transferred. In ring buffer mode, the DMA Transfer Count Register operates in free-run mode, with the value set in it ignored.

9.3.8 Address Space

The address space in which data can be transferred by DMA is the internal peripheral I/O or 64 Kbytes of RAM space (H'0080 0000 through H'0080 FFFF) for either source or destination. To set the source and destination addresses in each channel, use the DMA Source Address Register and DMA Destination Address Register.

9.3.9 Transfer Operation

(1) Dual-address transfer

Irrespective of the size of transfer unit, data is transferred in two bus cycles, one for source read access and one for destination write access. (The transfer data is temporarily taken into the DMA's internal temporary register.)

(2) Bus protocol and bus timing

Because the bus interface is shared with the CPU, the same applies to both bus protocol and bus timing as in peripheral module access from the CPU.

(3) Transfer rate

The maximum transfer rate is calculated using the equation below:

$$\text{Maximum transfer rate [bytes/second]} = 2 \text{ bytes} \times \frac{1}{1 / f (\text{BCLK}) \times 3 \text{ cycles}}$$

(4) Address count direction and address changes

The direction in which the source and destination addresses are counted as transfer proceeds ("Address fixed" or "Address incremental") is set for each channel using the SADSL (source address direction select) and DADSL (destination address select) bits.

When the transfer size is 16 bits, the address is incremented by two for each DMA transfer performed; when the transfer size is 8 bits, the address is incremented by one.

Table 9.3.11 Address Count Direction and Address Changes

Address Count Direction	Transfer Unit	Address Change for One DMA
Address fixed	8 bits	0
	16 bits	0
Address incremental	8 bits	+1
	16 bits	+2

(5) Transfer count value

The transfer count value is decremented by one at a time irrespective of the size of transfer unit (8 or 16 bits).

(6) Transfer byte positions

When the transfer unit = 8 bits, the LSB of the address register is effective for both source and destination. (Therefore, in addition to data transfers between even addresses or between odd addresses, data may be transferred from even address to odd address, or from odd address to even address.)

When the transfer unit = 16 bits, the LSB of the address register (D15 of the address register) is ignored, and data are always transferred in two bytes aligned to the 16-bit bus.

The diagram below shows the valid transfer byte positions.

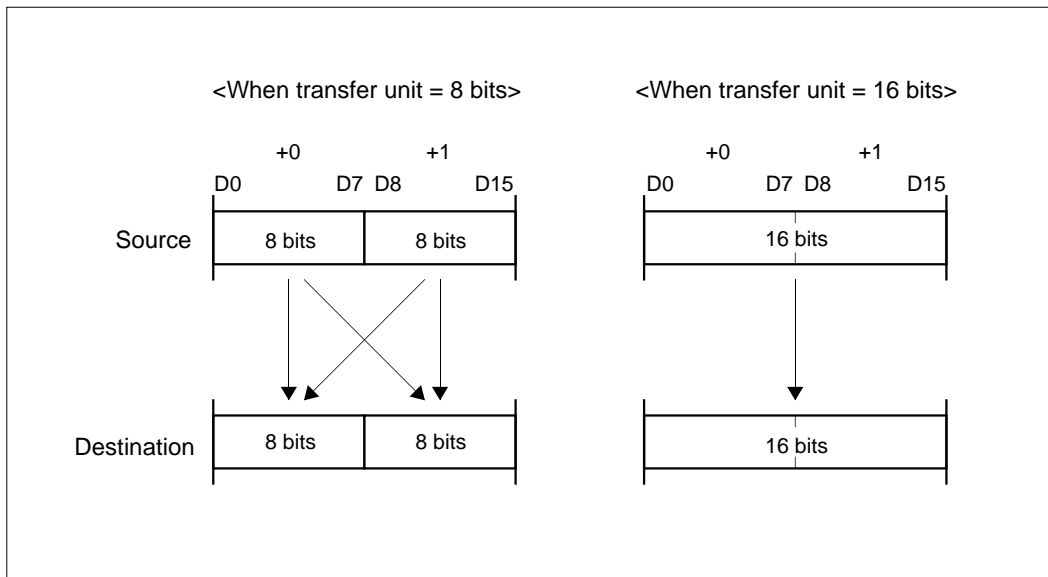

Figure 9.3.3 Transfer Byte Positions

(7) Ring buffer mode

When ring buffer mode is selected, transfer begins from the transfer start address and after performing transfers 32 times, control is recycled back to the transfer start address, from which transfer operation is repeated. In this case, however, the five low-order bits of the ring buffer start address must always be B'00000. The address increment operation in ring buffer mode is described below.

① When the transfer unit = 8 bits

The 27 high-order bits of the transfer start address are fixed, and the five low-order bits are incremented by one at a time. When as transfer proceeds the five low-order bits reach B'11111, they are recycled to B'00000 by the next increment operation, thus returning to the start address again.

② When the transfer unit = 16 bits

The 26 high-order bits of the transfer start address are fixed, and the six low-order bits are incremented by two at a time. When as transfer proceeds the six low-order bits reach B'111110, they are recycled to B'000000 by the next increment operation, thus returning to the start address again.

When the source address has been set to be incremented, it is the source address that recycles to the start address; when the destination address has been set to be incremented, it is the destination address that recycles to the start address. If both source and destination addresses have been set to be incremented, both addresses recycle to the start address. However, the start address on either side must have their five low-order bits initially being B'00000.

During ring buffer mode, the transfer count register is ignored. Also, once DMA operation starts, the counter operates in free-run mode, and the transfer continues until the transfer enable bit is cleared to (to disable transfer).

<When transfer unit = 8 bits>		<When transfer unit = 16 bits>	
Transfer count	Transfer address	Transfer count	Transfer address
1	H'0080 1000	1	H'0080 1000
2	H'0080 1001	2	H'0080 1002
3	H'0080 1002	3	H'0080 1004
31	H'0080 101E	31	H'0080 103C
32	H'0080 101F	32	H'0080 103E
↓	↓	↓	↓
1	H'0080 1000	1	H'0080 1000
2	H'0080 1001	2	H'0080 1002

Figure 9.3.4 Example of Address Increment Operation in 32-Channel Ring Buffer Mode

9.3.10 End of DMA and Interrupt

In normal mode, DMA transfer is terminated when the transfer count register underflows. When transfer finishes, the transfer enable bit is cleared to 0 and transfers are thereby disabled. Also, an interrupt request is generated at completion of transfer. However, this interrupt is not generated for channels where interrupt requests have been masked by the DMA Interrupt Mask Register.

During ring buffer mode, the transfer count register operates in free-run mode, and transfer continues until the transfer enable bit is cleared to 0 (to disable transfer). In this case, therefore, the DMA transfer-completed interrupt request is not generated. Nor is this interrupt request generated even when transfer in ring buffer mode is terminated by clearing the transfer enable bit.

9.3.11 Status of Each Register after Completion of DMA Transfer

When DMA transfer is completed, the status of the source address and destination address registers becomes as follows:

(1) Address fixed

- The value set in the address register before DMA transfer started remains intact (fixed).

(2) Address incremental

- For 8-bit transfer, the value of the address register is the last transfer address + 1.
- For 16-bit transfer, the value of the address register is the last transfer address + 2.

The transfer count register when DMA transfer completed is in an underflow state (H'FF). Therefore, to perform another DMA transfer, set the transfer count register newly again, except when you are performing transfers 256 times (H'FF).

9.4 Precautions about the DMAC

• About writing to DMAC related registers

Because DMA transfer involves exchanging data via the internal bus, basically you only can write to the DMAC related registers immediately after reset or when transfer is disabled (transfer enable bit = 0). When transfer is enabled, do not write to the DMAC related registers because write operation to those registers, except the DMA transfer enable bit, transfer request flag, and the DMA Transfer Count Register which is protected in hardware, is instable.

The table below shows the registers that can or cannot be accessed for write.

Table 9.4.1 DMAC Related Registers That Can or Cannot Be Accessed for Write

Status	Transfer enable bit	Transfer request flag	Other DMAC related registers
When transfer is enabled	○	○	×
When transfer is disabled	○	○	○

○ : Can be accessed ; × : Cannot be accessed

For even registers that can exceptionally be written to while transfer is enabled, the following requirements must be met.

① DMA Channel Control Register's transfer enable bit and transfer request flag

For all other bits of the channel control register, be sure to write the same data that those bits had before you wrote to the transfer enable bit or transfer request flag. Note that you only can write a 0 to the transfer request flag as valid data.

② DMA Transfer Count Register

When transfer is enabled, this register is protected in hardware, so that any data you write to this register is ignored.

③ Rewriting the DMA source and DMA destination addresses on different channels by DMA transfer

In this case, you are writing to the DMAC related registers while DMA is enabled, but this practically does not present any problem. However, you cannot DMA-transfer to the DMAC related registers on the local channel itself in which you are currently operating.

- **Manipulating DMAC related registers by DMA transfer**

When manipulating DMAC related registers by means of DMA transfer (e.g., reloading the DMAC related registers' initial values by DMA transfer), do not write to the DMAC related registers on the local channel itself through that channel. (If this precaution is neglected, device operation cannot be guaranteed.)

Only if residing on other channels, you can write to the DMAC related registers by means of DMA transfer. (For example, you can rewrite the DMA Source Address and DMA Destination Address Registers on channel 1 by DMA transfer through channel 0.)

- **About the DMA Interrupt Request Status Register**

When clearing the DMA Interrupt Request Status Register, be sure to write 1s to all bits but the one you want to clear. The bits to which you wrote 1s retain the previous data they had before the write.

- **About the stable operation of DMA transfer**

To ensure the stable operation of DMA transfer, never rewrite the DMAC related registers, except the DMA Channel Control Register's transfer enable bit, unless transfer is disabled. One exception is that even when transfer is enabled, you can rewrite the DMA Source Address and DMA Destination Address Registers by DMA transfer from one channel to another.

CHAPTER 10

MULTIJUNCTION TIMERS

- 10.1 Outline of Multijunction Timers
- 10.2 Common Units of Multijunction Timer
- 10.3 TOP (Output-related 16-bit Timer)
- 10.4 TIO (Input/Output-related 16-bit Timer)
- 10.5 TMS (Input-related 16-bit Timer)
- 10.6 TML (Input-related 32-bit Timer)

10.1 Outline of Multijunction Timers

The multijunction timers (abbreviated MJT) have input event and output event buses. Therefore, in addition to being used as a single unit, the timers can be internally connected to each other. This capability allows for highly flexible timer configuration, making it possible to meet various application needs. It is because the timers are connected to the internal event bus at multiple points that they are called the "multijunction" timers.

The 32171 has four types of multijunction timers as listed in the table below, providing a total of 37 channels of timers.

Table 10.1.1 Outline of Multijunction Timers

Name	Type	Number of Channels	Description
TOP (Timer Output)	Output-related 16-bit timer (down-counter)	11	One of three output modes can be selected by software. <With correction function> <ul style="list-style-type: none"> • Single-shot output mode • Delayed single-shot output mode <Without correction function> <ul style="list-style-type: none"> • Continuous output mode
TIO (Timer Input Output)	Input/output-related 16-bit timer (down-counter)	10	One of three input modes or four output modes can be selected by software. <Input modes> <ul style="list-style-type: none"> • Measure clear input mode • Measure free-run input mode • Noise processing input mode <Output mode without correction function> <ul style="list-style-type: none"> • PWM output mode • Single-shot output mode • Delayed single-shot output mode • Continuous output mode
TMS (Timer Measure Small)	Input-related 16-bit timer (up-counter)	8	16-bit input measure timer
TML (Timer Measure Large)	Input-related 32-bit timer (up-counter)	8	32-bit input measure timer

10.2 Common Units of Multijunction Timer

The common units of the multijunction timer include the following:

- Prescaler unit
- Clock bus/input-output event bus control unit
- Input processing control unit
- Output flip-flop control unit
- Interrupt control unit

10.2.1 Timer Common Register Map

The diagrams in the next pages show a map of registers in the common units of the multijunction timer.

Address	D0	+0 Address	D7	D8	+1 Address	D15
H'0080 0200				Clock Bus & Input Event Bus Control Register (CKIEBCR)

H'0080 023E	TIN Interrupt Control Register 6 (TINIR6)					
⋮						

Blank addresses are reserved.

Note: • The registers included in thick frames must always be accessed in halfwords.

Figure 10.2.1 Timer Common Register Map

10.2.2 Prescaler Unit

The prescalers PRS0-2 are an 8-bit counter, which generates clocks supplied to each timer (TOP, TIO, TMS, and TML) from the divide-by-2 frequency of the internal peripheral clock (10.0 MHz when the internal peripheral clock = 20 MHz).

The values of prescaler registers are initialized to H'00 immediately after reset. Also, when you rewrite the set value of any prescaler register, the device starts operating with the new value simultaneously when the prescaler underflows.

Values H'00 to H'FF can be set in the counter registers of prescalers. The prescalers' divide-by ratios are given by the equation below:

$$\text{Prescaler divide-by ratio} = \frac{1}{\text{Prescaler set value} + 1}$$

- Prescaler Register 0 (PRS0) <Address: H'0080 0202>
- Prescaler Register 1 (PRS1) <Address: H'0080 0203>
- Prescaler Register 2 (PRS2) <Address: H'0080 0204>

<When reset : H'00>				
D	Bit Name	Function	R	W
0 - 7	PRS0, 2	Sets the prescaler's divide-by value	○	○
8 - 15	PRS1			

Prescaler Registers 0-2 start counting after exiting reset.

10.2.3 Clock Bus/Input-Output Event Bus Control Unit

(1) Clock bus

The clock bus is provided for supplying clock to each timer, and is comprised of four lines of clock bus 0-3. Each timer can use this clock bus signal as clock input signal. The table below lists the signals that can be fed to the clock bus.

Table 10.2.1 Signals That Can Be Fed to Each Clock Bus Line

Clock Bus	Acceptable Signal
3	TCLK0 input
2	Internal prescaler (PRS2) or TCLK3 input
1	Internal prescaler (PRS1)
0	Internal prescaler (PRS0)

(2) Input event bus

The input event bus is provided for supplying a count enable signal or measure capture signal to each timer, and is comprised of four lines of input event bus 0-3. Each timer can use this input event bus signal as enable (or capture) signal input. The table below lists the signals that can be fed to the input event bus.

Table 10.2.2 Signals That Can Be Fed to Each Input Event Bus Line

Input Event Bus	Acceptable Signal
3	TIN3 input, output event bus 2 or TIO7 underflow signal
2	TIN0 input
1	TIO6 underflow signal
0	TIO5 underflow signal

(3) Output event bus

The output event bus has the underflow signal from each timer connected to it, and is comprised of four lines of output event bus 0-3. Output event bus signals are connected to output flip-flops, and can also be connected to other peripheral circuits-output event bus 3 to A-D0 converter, output event bus 0 to DMA channel 1, and output event bus 1 to DMA channel 2. Furthermore, output event bus 2 can be connected to input event bus 3.

The table below lists the signals that can be connected to the output event bus.

Table 10.2.3 Signals That Can Be Connected (Fed) to Each Output Event Bus Line

Output Event Bus	Connectable (Acceptable) Signal (Note 1)
3	TOP8, TIO3, TIO4, or TIO8 underflow signal
2	TOP9 or TIO2 underflow signal
1	TOP7 or TIO1 underflow signal
0	TOP6 or TIO0 underflow signal

Note 1: For details about the output destinations of output event bus signals, refer to Figure 10.1.1, "Block Diagram of MJT."

Timings at which signals are generated to the output event bus by each timer (and those generated to the input event bus by TIO5, 6) are shown below. (Note that they are generated at different timings than those forwarded to output flip-flops by timers.)

Table 10.2.4 Timings at Which Signals Are Generated to the Output Event Bus by Each Timer

Timer	Mode	Timings at which signals are generated to the output event bus
TOP	Single-shot output mode	When the counter underflows
	Delayed single-shot output mode	When the counter underflows
	Continuous output mode	When the counter underflows
TIO (Note 1)	Measure clear input mode	When the counter underflows
	Measure free-run input mode	When the counter underflows
	Noise processing input mode	When the counter underflows
	PWM output mode	When the counter underflows
	Single-shot output mode	When the counter underflows
	Delayed single-shot output mode	When the counter underflows
	Continuous output mode	When the counter underflows
TMS	(16-bit measure input)	No signal generation function
TML	(32-bit measure input)	No signal generation function

Note 1: TIO5, 6 output underflow signals to the input event bus.

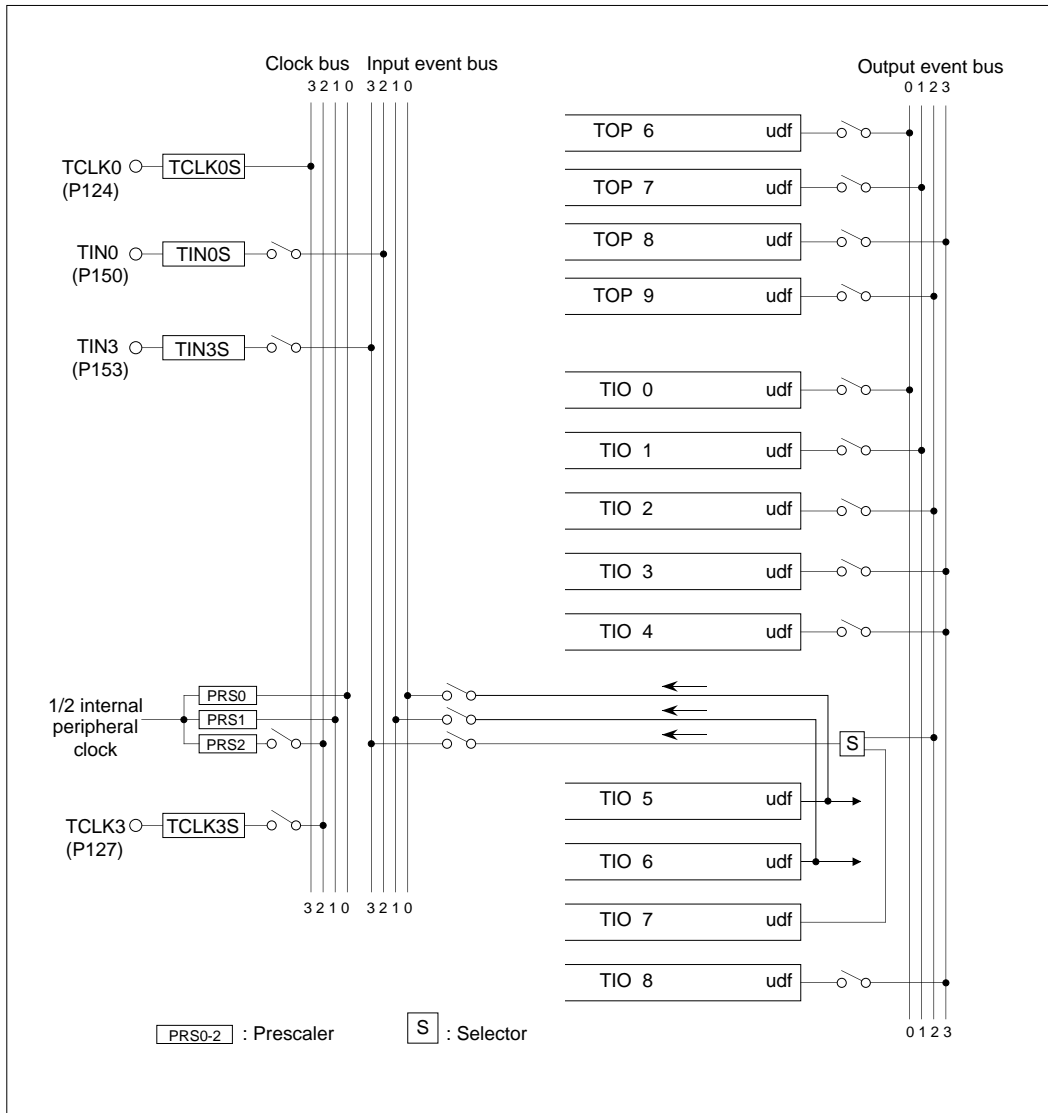

Figure 10.2.2 Conceptual Diagram of the Clock Bus and Input/Output Event Bus

The clock bus/input-output bus control unit has the following registers:

- Clock Bus & Input Event Bus Control Register (CKIEBCR)
- Output Event Bus Control Register (OEBCR)

■ Clock Bus & Input Event Bus Control Register (CKIEBCR) <Address: H'0080 0201>

<When reset : H'00>

D	Bit Name	Function	R	W
8, 9	IEB3S (input event bus 3 input selection)	0X : Selects external input 3 (TIN3) 10 : Selects output event bus 2 11 : Selects TIO7 output	○	○
10, 11	IEB2S (input event bus 2 input selection)	00 : Selects external input 0 (TIN0) 01 : No selection 1X : No selection	○	○
12	IEB1S (input event bus 1 input selection)	0 : No selection 1 : Selects TIO6 output	○	○
13	IEB0S (input event bus 0 input selection)	0 : No selection 1 : Selects TIO5 output	○	○
14	No functions assigned		0	—
15	CKB2S (Clock Bus 2 input selection)	0 : Selects prescaler 2 1 : Selects external clock 3 (TCLK3)	○	○

The register CKIEBCR is used to select the clock source (external input or prescaler) supplied to the clock bus and the count enable/capture signal (external input or output event bus) supplied to the input event bus.

■ Output Event Bus Control Register (OEBCR)

<Address: H'0080 0205>

<When reset : H'00>

D	Bit Name	Function	R	W
8, 9	OEB3S (output event bus 3 input selection)	00 : Selects TOP8 output 01 : Selects TIO3 output 10 : Selects TIO4 output 11 : Selects TIO8 output	○	○
10	No functions assigned		0	—
11	OEB2S (output event bus 2 input selection)	0 : Selects TOP9 output 1 : Selects TIO2 output	○	○
12	No functions assigned		0	—
13	OEB1S (output event bus 1 input selection)	0 : Selects TOP7 output 1 : Selects TIO1 output	○	○
14	No functions assigned		0	—
15	OEB0S (output event bus 0 input selection)	0 : Selects TOP6 output 1 : Selects TIO0 output	○	○

The register OEBCR is used to select the timer (TOP or TIO) whose underflow signal is supplied to the output event bus.

10.2.4 Input Processing Control Unit

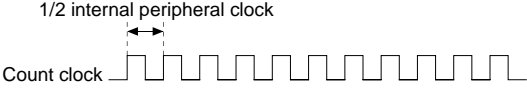

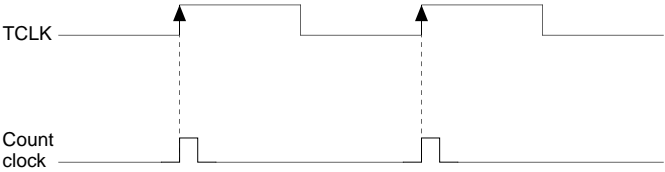

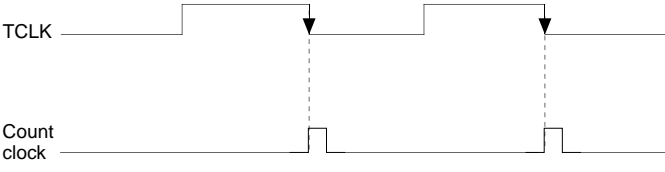

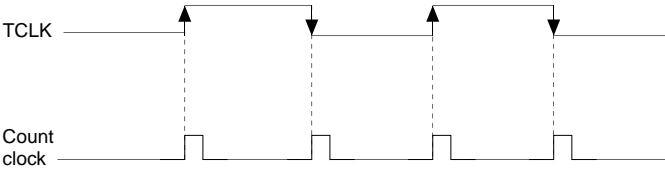

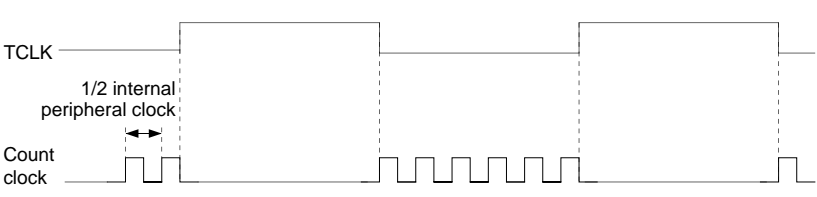

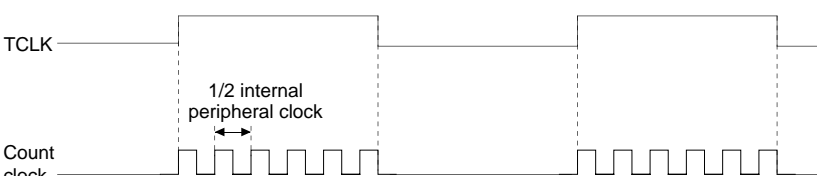

The input processing control unit processes the TCLK and TIN signals fed into the MJT. In the TCLK input processing unit, selection is made of the source of TCLK signal, or for external input, the active edge (rising or falling or both) or level (high or low) of the signal, with or at which to generate the clock signal fed to the clock bus.

In the TIN input processing unit, selection is made of the active edge (rising or falling or both) or level (high or low) of the signal at which to generate the enable, measure or count source signal for each timer or the signal fed to each event bus.

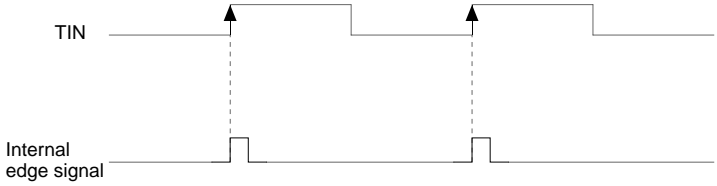

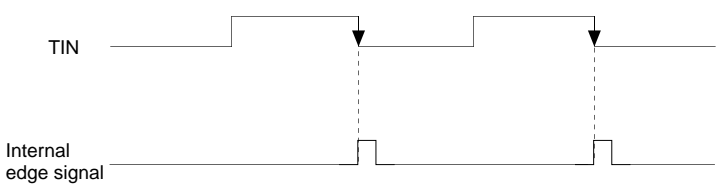

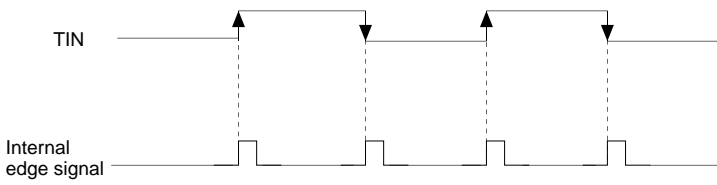

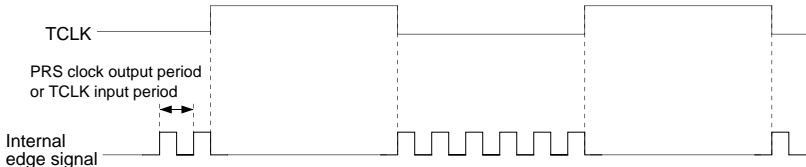

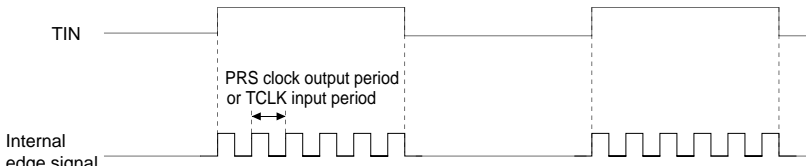

Following input processing control registers are included:

- TCLK Input Processing Control Register (TCLKCR)
- TIN Input Processing Control Register 0 (TINCR0)
- TIN Input Processing Control Register 3 (TINCR3)
- TIN Input Processing Control Register 4 (TINCR4)

(1) Functions of TCLK input processing control registers

Item	Function
1/2 internal peripheral clock	
Rising clock edge	
Falling clock edge	
Both edges	
Low level	
High level	

(2) Functions of TIN input processing control registers

Item	Function
Rising edge	 <p>TIN</p> <p>Internal edge signal</p>
Falling edge	 <p>TIN</p> <p>Internal edge signal</p>
Both edges	 <p>TIN</p> <p>Internal edge signal</p>
Low level	 <p>TCLK</p> <p>PRS clock output period or TCLK input period</p> <p>Internal edge signal</p>
High level	 <p>TIN</p> <p>PRS clock output period or TCLK input period</p> <p>Internal edge signal</p>

■ TLCK Input Processing Control Register (TCLKCR)

<Address: H'0080 0210>

<When reset : H'0000>

D	Bit Name	Function	R	W
0, 1	No functions assigned		0	—
2, 3	TCLK3S (TCLK3 input processing selection)	00 : 1/2 internal peripheral clock 01 : Rising edge 10 : Falling edge 11 : Both edges	○	○
4	No functions assigned		0	—
5 - 7	TCLK2S (TCLK2 input processing selection)	000 : Invalidates input 001 : Rising edge 010 : Falling edge 011 : Both edges 10X : Low level 11X : High level	○	○
8	No functions assigned		0	—
9 - 11	TCLK1S (TCLK1 input processing selection)	000 : Invalidates input 001 : Rising edge 010 : Falling edge 011 : Both edges 10X : Low level 11X : High level	○	○
12, 13	No functions assigned		0	—
14, 15	TCLK0S (TCLK0 input processing selection)	00 : 1/2 internal peripheral clock 01 : Rising edge 10 : Falling edge 11 : Both edges	○	○

Note: • This register must always be accessed in halfwords.

■ TIN Input Processing Control Register 0 (TINCRO)

<Address: H'0080 0212>

<When reset : H'0000>

D	Bit Name	Function	R	W
0	No functions assigned		0	—
1 - 3	TIN4S (reserved)	Set these bits to '000' (Note 1)	○	○
4	No functions assigned		0	—
5 - 7	TIN3S (TIN3 input processing selection)	000 : Invalidates input 001 : Rising edge 010 : Falling edge 011 : Both edges 10X : Low level 11X : High level	○	○
8, 9	No functions assigned		0	—
10, 11	TIN2S (reserved)	Set these bits to '00' (Note 2)	○	○
12, 13	TIN1S (reserved)	Set these bits to '00' (Note 2)	○	○
14, 15	TIN0S (TIN0 input processing selection)	00 : Invalidates input 01 : Rising edge 10 : Falling edge 11 : Both edges	○	○

Note 1: Always set the TIN4S bits to '000.'

Note 2: Always set the TIN2S bits and TIN1S bits to '00.'

Note: • This register must always be accessed in halfwords.

■ TIN Input Processing Control Register 3 (TINCR3)

<Address: H'0080 0218>

<When reset : H'0000>

D	Bit Name	Function	R	W
0, 1	TIN19S (TIN19 input processing selection)	00 : Invalidates input	<input type="radio"/>	<input type="radio"/>
2, 3	TIN18S (TIN18 input processing selection)	01 : Rising edge		
4, 5	TIN17S (TIN17 input processing selection)	10 : Falling edge		
6, 7	TIN16S (TIN16 input processing selection)	11 : Both edges		
8, 9	TIN15S (reserved)	Set these bits to '00' (Note)	<input type="radio"/>	<input type="radio"/>
10, 11	TIN14S (reserved)			
12, 13	TIN13S (reserved)			
14, 15	TIN12S (reserved)			

- Notes:
- Always set the TIN15S bits, TIN14S bits, TIN13S bits, and TIN12S bits to '00' .
 - This register must always be accessed in halfwords.

■ TIN Input Processing Control Register 4 (TINCR4)

<Address: H'0080 021A>

<When reset : H'0000>

D	Bit Name	Function	R	W
0, 1	TIN33S (reserved)	Set these bits to '00' (Note)	<input type="radio"/>	<input type="radio"/>
2, 3	TIN32S (reserved)			
4, 5	TIN31S (reserved)			
6, 7	TIN30S (reserved)			
8, 9	TIN23S (TIN23 input processing selection)	00 : Invalidates input	<input type="radio"/>	<input type="radio"/>
10, 11	TIN22S (TIN22 input processing selection)	01 : Rising edge		
12, 13	TIN21S (TIN21 input processing selection)	10 : Falling edge		
14, 15	TIN20S (TIN20 input processing selection)	11 : Both edges		

- Notes:
- Always set the TIN33S bits, TIN32S bits, TIN31S bits, and TIN30S bits to '00' .
 - This register must always be accessed in halfwords.

10.2.5 Output Flip-Flop Control Unit

The output flip-flop control unit controls the flip-flop (F/F) provided for each timer output. Following flip-flop control registers are included:

- F/F Source Select Register 0 (FFS0)
- F/F Source Select Register 1 (FFS1)
- F/F Protect Register 0 (FFP0)
- F/F Protect Register 1 (FFP1)
- F/F Data Register 0 (FFD0)
- F/F Data Register 1 (FFD1)

Timings at which signals are generated to the output flip-flop by each timer are shown in Table 10.2.5 below. (Note that signals are generated at different timings than those fed to the output event bus.)

Table 10.2.5 Timings at Which Signals Are Generated to the Output Flip-Flop by Each Timer

Timer	Mode	Timings at which signals are generated to the output flip-flop
TOP	Single-shot output mode	When counter is enabled and when underflows
	Delayed single-shot output mode	When counter underflows
	Continuous output mode	When counter is enabled and when underflows
TIO	Measure clear input mode	When counter underflows
	Measure free-run input mode	When counter underflows
	Noise processing input mode	When counter underflows
	PWM output mode	When counter is enabled and when underflows
	Single-shot output mode	When counter is enabled and when underflows
	Delayed single-shot output mode	When counter underflows
	Continuous output mode	When counter is enabled and when underflows
TMS	(16-bit measure input)	No signal generation function
TML	(32-bit measure input)	No signal generation function

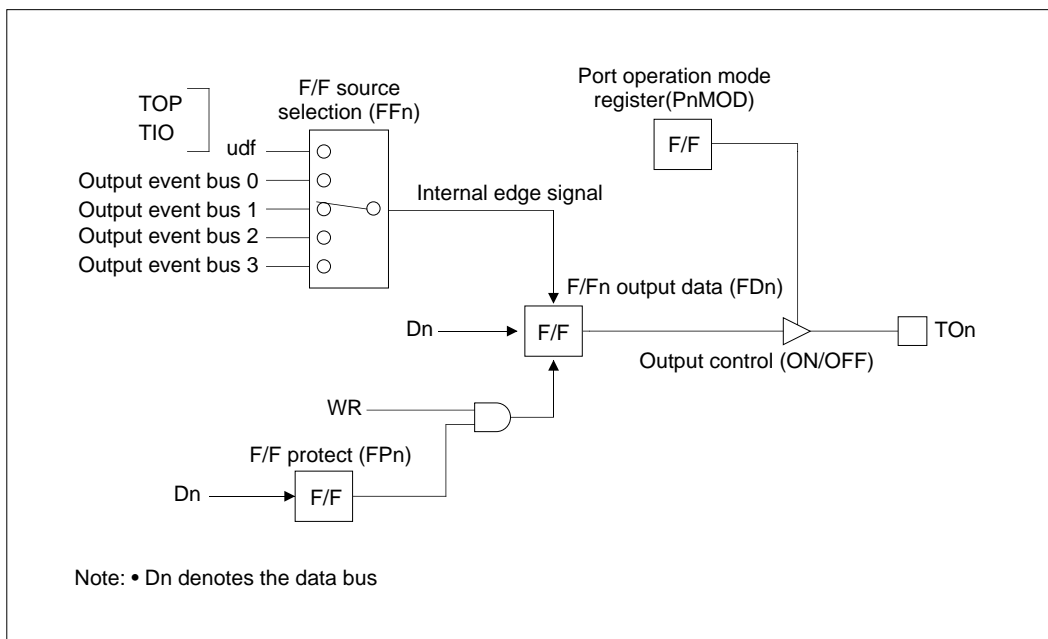

Figure 10.2.3 Configuration of the F/F Output Circuit

■ F/F Source Select Register 0 (FFS0)

<Address: H'0080 0220>

<When reset : H'0000>

D	Bit Name	Function	R	W
0 - 2	No functions assigned		0	—
3	FF15 (F/F15 source selection)	0 : TIO4 output 1 : Output event bus 0	○	○
4	FF14 (F/F14 source selection)	0 : TIO3 output 1 : Output event bus 0	○	○
5	FF13 (F/F13 source selection)	0 : TIO2 output 1 : Output event bus 3	○	○
6	FF12 (F/F12 source selection)	0 : TIO1 output 1 : Output event bus 2	○	○
7	FF11 (F/F11 source selection)	0 : TIO0 output 1 : Output event bus 1	○	○
8, 9	FF10 (F/F10 source selection)	0X : TOP10 output 10 : Output event bus 0 11 : Output event bus 1	○	○
10, 11	FF9 (F/F9 source selection)	0X : TOP9 output 10 : Output event bus 0 11 : Output event bus 1	○	○
12, 13	FF8 (F/F8 source selection)	00 : TOP8 output 01 : Output event bus 0 10 : Output event bus 1 11 : Output event bus 2	○	○
14	FF7 (F/F7 source selection)	0 : TOP7 output 1 : Output event bus 0	○	○
15	FF6 (F/F6 source selection)	0 : TOP6 output 1 : Output event bus 1	○	○

Note: • This register must always be accessed in halfwords.

■ F/F Source Select Register 1 (FFS1)

<Address: H'0080 0223>

<When reset : H'00>

D	Bit Name	Function	R	W
8, 9	FF19 (F/F19 source selection)	0X : TIO8 output 10 : Output event bus 0 11 : Output event bus 1	○	○
10, 11	FF18 (F/F18 source selection)	0X : TIO7 output 10 : Output event bus 0 11 : Output event bus 1	○	○
12, 13	FF17 (F/F17 source selection)	0X : TIO6 output 10 : Output event bus 0 11 : Output event bus 1	○	○
14, 15	FF16 (F/F16 source selection)	00 : TIO5 output 01 : Output event bus 0 10 : Output event bus 1 11 : Output event bus 3	○	○

The registers FFS0 and FFS1 are used to select the signal sources fed to each output F/F (flip-flop). For these signal sources, you can choose signals from the internal output bus or underflow output from each timer.

■ F/F Protect Register 0 (FFP0)

<Address: H'0080 0224>

<When reset : H'0000>

D	Bit Name	Function	R	W
0	FP15 (F/F15 protect)	0 : Enables write to F/F output bit	○	○
1	FP14 (F/F14 protect)	1 : Disables write to F/F output bit		
2	FP13 (F/F13 protect)			
3	FP12 (F/F12 protect)			
4	FP11 (F/F11 protect)			
5	FP10 (F/F10 protect)			
6	FP9 (F/F9 protect)			
7	FP8 (F/F8 protect)			
8	FP7 (F/F7 protect)			
9	FP6 (F/F6 protect)			
10	FP5 (F/F5 protect)			
11	FP4 (F/F4 protect)			
12	FP3 (F/F3 protect)			
13	FP2 (F/F2 protect)			
14	FP1 (F/F1 protect)			
15	FP0 (F/F0 protect)			

Note: • This register must always be accessed in halfwords.

This register controls write to each output F/F (flip-flop) by enabling or disabling it. When this register is set to disable write to any output F/F, writing to the F/F Data Register has no effect.

■ F/F Protect Register 1 (FFP1)

<Address: H'0080 0229>

<When reset : H'00>

D	Bit Name	Function	R	W
8 - 10	No functions assigned		0	—
11	FP20 (F/F20 protect)	0 : Enables write to F/F output bit	○	○
12	FP19 (F/F19 protect)	1 : Disables write to F/F output bit		
13	FP18 (F/F18 protect)			
14	FP17 (F/F17 protect)			
15	FP16 (F/F16 protect)			

This register controls write to each output F/F (flip-flop) by enabling or disabling it. When this register is set to disable write to any output F/F, writing to the F/F Data Register has no effect.

■ F/F Data Register 0 (FFD0)

<Address: H'0080 0226>

<When reset : H'0000>

D	Bit Name	Function	R	W
0	FD15 (F/F15 output data)	0 : F/F output data = 0	○	○
1	FD14 (F/F14 output data)	1 : F/F output data = 1		
2	FD13 (F/F13 output data)			
3	FD12 (F/F12 output data)			
4	FD11 (F/F11 output data)			
5	FD10 (F/F10 output data)			
6	FD9 (F/F9 output data)			
7	FD8 (F/F8 output data)			
8	FD7 (F/F7 output data)			
9	FD6 (F/F6 output data)			
10	FD5 (F/F5 output data)			
11	FD4 (F/F4 output data)			
12	FD3 (F/F3 output data)			
13	FD2 (F/F2 output data)			
14	FD1 (F/F1 output data)			
15	FD0 (F/F0 output data)			

Note: • This register must always be accessed in halfwords.

This register is used to set data in each output F/F (flip-flop). Normally, the data output from F/F changes with timer output, but by setting data 0 or 1 in this register you can produce the desired output from any F/F. The F/F Data Register can only be accessed for write when the F/F Protect Register described above is enabled for write.

■ F/F Data Register 1 (FFD1)

<Address: H'0080 022B>

<When reset : H'00>

D	Bit Name	Function	R	W
8 - 10	No functions assigned		0	—
11	FD20 (F/F20 output data)	0 : F/F output data = 0	○	○
12	FD19 (F/F19 output data)	1 : F/F output data = 1		
13	FD18 (F/F18 output data)			
14	FD17 (F/F17 output data)			
15	FD16 (F/F16 output data)			

This register is used to set data in each output F/F (flip-flop). Normally, the data output from F/F changes with timer output, but by setting data 0 or 1 in this register you can produce the desired output from any F/F. The F/F Data Register can only be accessed for write when the F/F Protect Register described above is enabled for write.

10.2.6 Interrupt Control Unit

The interrupt control unit controls the interrupt signals sent to the interrupt controller by each timer. Following timer interrupt control registers are provided for each timer.

- TOP Interrupt Control Register 0 (TOPIR0)
- TOP Interrupt Control Register 1 (TOPIR1)
- TOP Interrupt Control Register 2 (TOPIR2)
- TOP Interrupt Control Register 3 (TOPIR3)
- TIO Interrupt Control Register 0 (TIOIR0)
- TIO Interrupt Control Register 1 (TIOIR1)
- TIO Interrupt Control Register 2 (TIOIR2)

- TMS Interrupt Control Register (TMSIR)

- TIN Interrupt Control Register 0 (TINIR0)
- TIN Interrupt Control Register 1 (TINIR1)
- TIN Interrupt Control Register 4 (TINIR4)
- TIN Interrupt Control Register 5 (TINIR5)
- TIN Interrupt Control Register 6 (TINIR6)

For interrupts which have only one source of interrupt in one interrupt table, no interrupt control registers are provided in the timer, and the interrupt status flags are automatically managed within the interrupt controller. For details, refer to Chapter 5, "Interrupt Controller."

- TOP10 MJT Output Interrupt 5 (IRQ5)

For interrupts which have two or more sources of interrupt in one interrupt table, interrupt control registers are provided, with which to control interrupt requests and determine interrupt input. Therefore, the status flags in the interrupt controller function only as a bit to show whether an interrupt-enabled interrupt request occurred and cannot be written to.

(1) Interrupt request status bit

This status bit shows whether an interrupt request occurred. When an interrupt request is generated, this bit is set in hardware (but cannot be set in software). The status bit is cleared by writing a 0, but not affected by writing a 1, in which case the bit holds the status intact. Because the status bit is unaffected by interrupt mask bits, it can also be used to check the operation of peripheral function. In interrupt processing, make sure that among grouped interrupt flags, only the flag for the serviced interrupt is cleared. Clearing flags for unserviced interrupts results in the pending interrupt requests also being cleared.

(2) Interrupt mask bit

This bit is used to disable unnecessary interrupts among grouped interrupt requests. Set this bit to 0 to enable interrupts or 1 to disable interrupts.

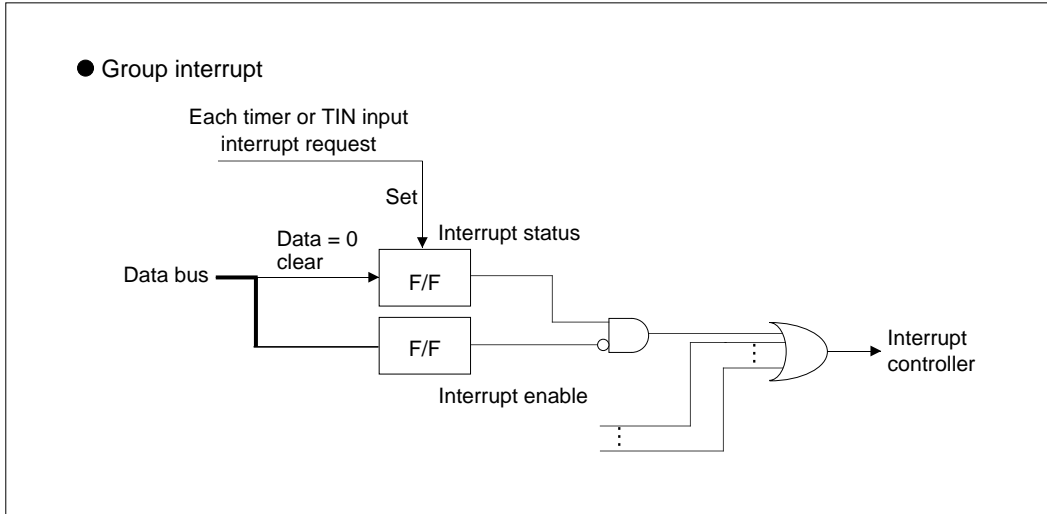

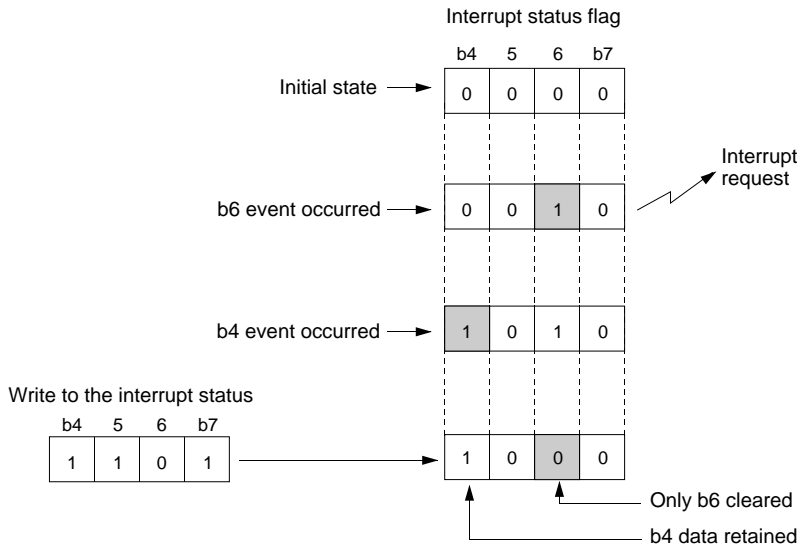

Figure 10.2.4 Interrupt Status Register and Mask Register

● Example for clearing the interrupt status

● Example program

When clearing the TOP Interrupt Control Register 0 (TOPIR0)'s TOP1 interrupt status (TOPIS1)

○ `*TOPIR0 = 0xfd;` /* Clears only TOPIS1 (0x02 bit) */

To clear an interrupt status flag, be sure to write "1"s for all other status flags. At this time, if a logical operation like the one shown below is used, because this operation involves three steps (TOPIR0 read, logical operation, and write), an unintended status may be inadvertently cleared should another interrupt request occur during a read-to-write interval time.

✗ `*TOPIR0 &= 0xfd;` /* Clears only TOPIS1 (0x02 bit) */

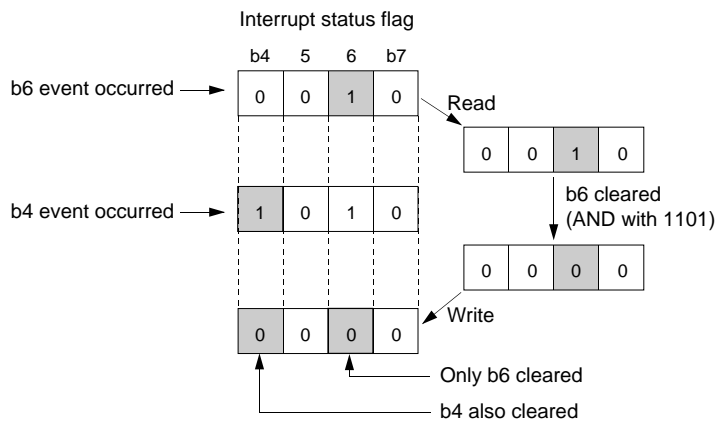

Figure 10.2.5 Example for Clearing the Interrupt Status

The table below shows the relationship between the interrupt signals generated by multijunction timers and the interrupt sources input to the interrupt controller.

Table 10.2.6 Interrupt Signals Generated by MJT

Signal Name	Source of Interrupt Generated	Interrupt Sources Input to ICU (Note 1)	Number of Input Sources
IRQ0	TIO0, TIO1, TIO2, TIO3	MJT output interrupt 0	4
IRQ1	TOP6, TOP7	MJT output interrupt 1	2
IRQ2	TOP0, TOP1, TOP2, TOP3, TOP4, TOP5	MJT output interrupt 2	6
IRQ3	TIO8, TIO9	MJT output interrupt 3	2
IRQ4	TIO4, TIO5, TIO6, TIO7	MJT output interrupt 4	4
IRQ6	TOP8, TOP9	MJT output interrupt 6	2
IRQ7	TMS0, TMS1	MJT output interrupt 7	2
IRQ9	TIN0	MJT input interrupt 1	1
IRQ10	TIN16, TIN17, TIN18, TIN19	MJT input interrupt 2	4
IRQ11	TIN20, TIN21, TIN22, TIN23	MJT input interrupt 3	4
IRQ12	TIN3	MJT input interrupt 4	1

Note 1: Refer to Chapter 5, "Interrupt Controller (ICU)."

Note: • For TOP10, there are no interrupt status and mask bits in MJT interrupt control register because it only has one source of interrupt in the group. (It is controlled directly by the interrupt controller.)

■ TOP Interrupt Control Register 0 (TOPIR0)

<Address: H'0080 0230>

<When reset : H'00>

D	Bit Name	Function	R	W
0, 1	No functions assigned		0	—
2	TOPIS5 (TOP5 interrupt status)	0 : No interrupt request	○	△
3	TOPIS4 (TOP4 interrupt status)	1 : Interrupt request generated		
4	TOPIS3 (TOP3 interrupt status)			
5	TOPIS2 (TOP2 interrupt status)			
6	TOPIS1 (TOP1 interrupt status)			
7	TOPIS0 (TOP0 interrupt status)			

W = △ : Only writing a 0 is effective; when you write a 1, the previous value is retained.

■ TOP Interrupt Control Register 1 (TOPIR1)

<Address: H'0080 0231>

<When reset : H'00>

D	Bit Name	Function	R	W
8, 9	No functions assigned.		0	—
10	TOPIM5 (TOP5 interrupt mask)	0 : Enables interrupt request	○	○
11	TOPIM4 (TOP4 interrupt mask)	1 : Masks (disables) interrupt request		
12	TOPIM3 (TOP3 interrupt mask)			
13	TOPIM2 (TOP2 interrupt mask)			
14	TOPIM1 (TOP1 interrupt mask)			
15	TOPIM0 (TOP0 interrupt mask)			

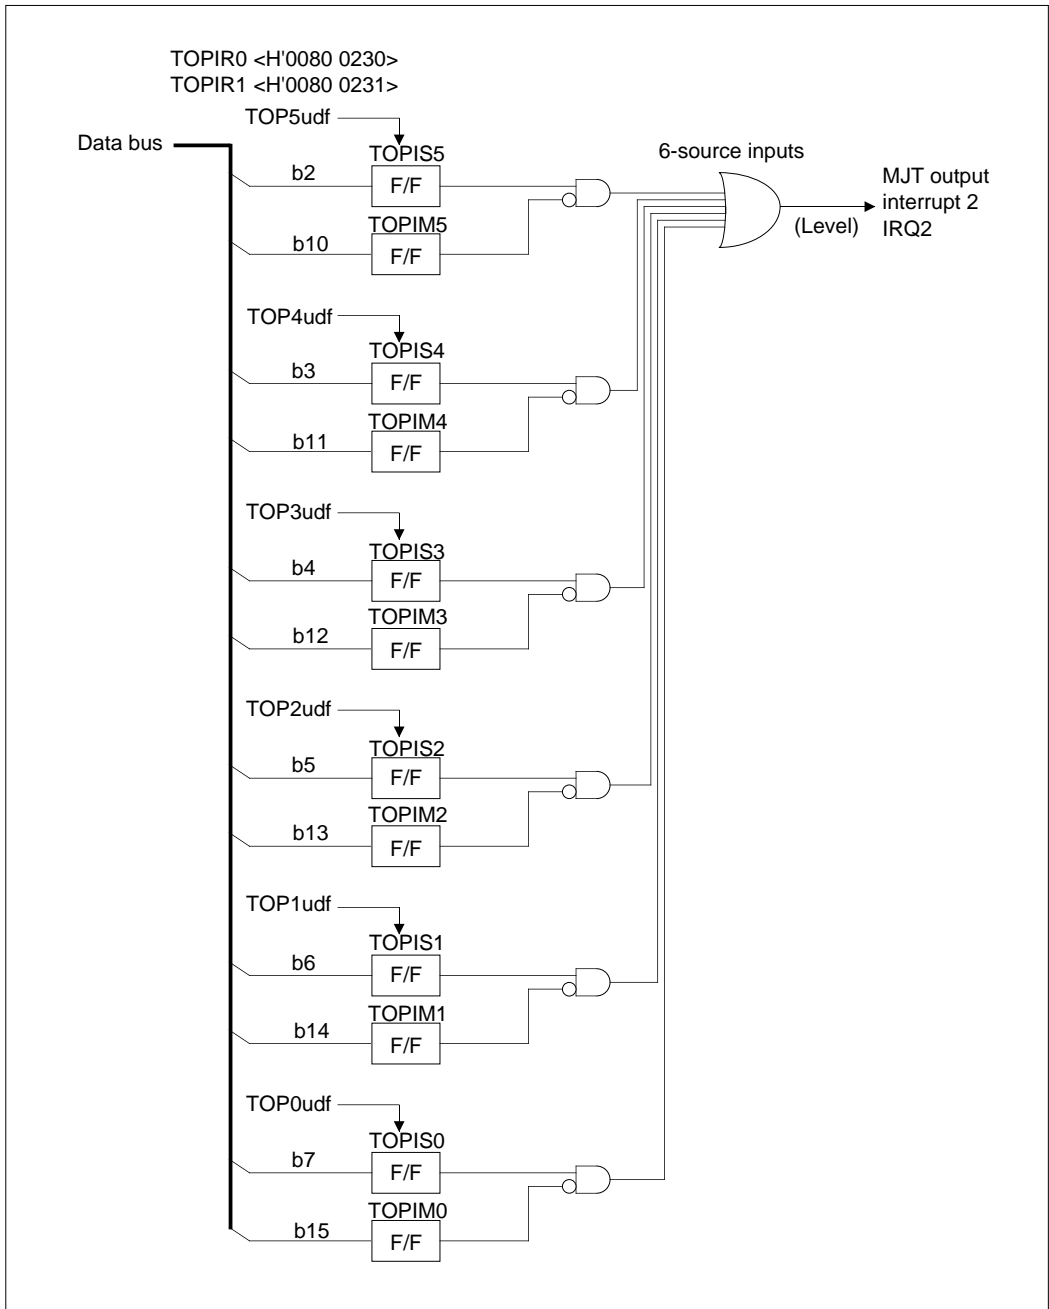

Figure 10.2.6 Block Diagram of MJT Output Interrupt 2

■ TOP Interrupt Control Register 2 (TOPIR2)

10.3 TOP (Output-related 16-bit Timer)

10.3.1 Outline of TOP

TOP (Timer Output) is an output-related 16-bit timer, whose operation mode can be selected from the following by mode switching in software:

- Single-shot output mode
- Delayed single-shot output mode
- Continuous output mode

The table below shows specifications of TOP. The diagram in the next page shows a block diagram of TOP.

Table 10.3.1 Specifications of TOP (Output-related 16-bit Timer)

Item	Specification
Number of channels	11 channels
Counter	16-bit down-counter
Reload register	16-bit reload register
Correction register	16-bit correction register
Timer startup	Started by writing to enable bit in software or by enabling with external input (rising or falling edge or both)
Mode selection	<With correction function> <ul style="list-style-type: none"> • Single-shot output mode • Delayed single-shot output mode <Without correction function> <ul style="list-style-type: none"> • Continuous output mode
Interrupt generation	Can be generated by a counter underflow

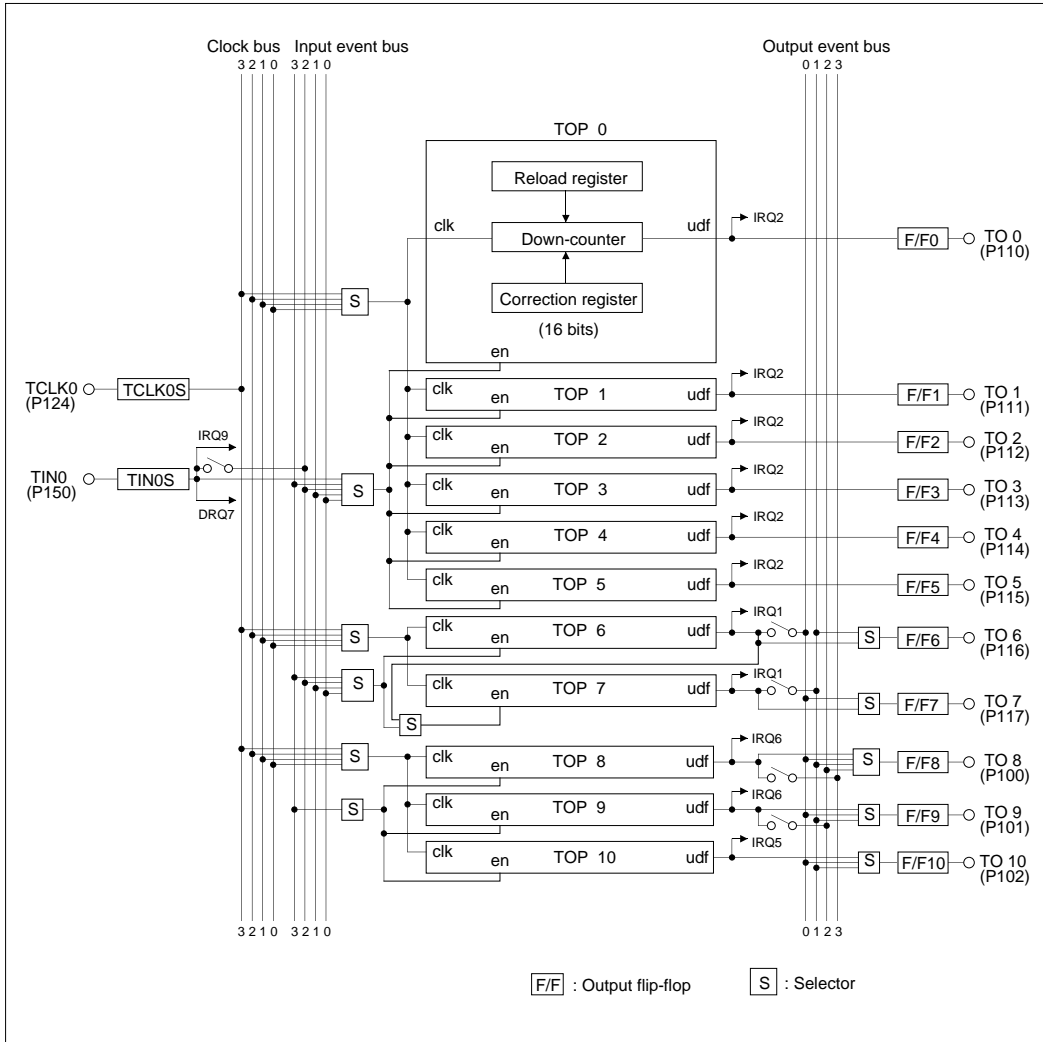

Figure 10.3.1 Block Diagram of TOP (Output-related 16-bit Timer)

10.3.2 Outline of Each Mode of TOP

Each mode of TOP is outlined below. For each TOP channel, only one of the following modes can be selected.

(1) Single-shot output mode

In single-shot output mode, the timer generates a pulse in width of (reload register set value + 1) only once and then stops.

When after setting the reload register, the timer is enabled (by writing to the enable bit in software or by external input), the content of the reload register is loaded into the counter synchronously with the count clock, letting the counter start counting. The counter counts down clock pulses and stops when it underflows after reaching the minimum count.

The F/F output waveform in single-shot output mode is inverted at startup and upon underflow, generating a single-shot pulse waveform in width of (reload register set value + 1) only once. Also, an interrupt can be generated when the counter underflows.

(2) Delayed single-shot output mode

In delayed single-shot output mode, the timer generates a pulse in width of (reload register set value + 1) only once, with the output delayed by an amount of time equal to (counter set value + 1) and then stops.

When after setting the counter and reload register, the timer is enabled (by writing to the enable bit in software or by external input), it starts counting down from the counter's set value synchronously with the count clock. The first time the counter underflows, the reload register value is loaded into the counter causing it to continue counting down, and the counter stops when it underflows next time.

The F/F output waveform in delayed single-shot output mode is inverted when the counter underflows first time and next, generating a single-shot pulse waveform in width of (reload register set value + 1) only once, with the output delayed by an amount of time equal to (first set value of counter + 1). Also, an interrupt can be generated when the counter underflows first time and next.

(3) Continuous output mode

In continuous output mode, the timer counts down clock pulses starting from the set value of the counter and when the counter underflows, reloads it with the reload register value. Thereafter, this operation is repeated each time the counter underflows, thus generating consecutive pulses whose waveform is inverted in width of (reload register set value + 1).

When after setting the counter and reload register, the timer is enabled (by writing to the enable bit in software or by external input), it starts counting down from the counter's set value synchronously with the count clock and when the minimum count is reached, generates an underflow. This underflow causes the counter to be reloaded with the content of the reload register and start counting over again. Thereafter, this operation is repeated each time an underflow occurs. To stop the counter, disable count by writing to the enable bit in software.

The F/F output waveform in continuous output mode is inverted at startup and upon underflow, generating consecutive pulses until the timer stops counting. Also, an interrupt can be generated each time the counter underflows.

<Count clock-dependent delay>

- Because the timer operates synchronously with the count clock, there is a count clock-dependent delay from when the timer is enabled till it actually starts operating. In operation mode where the F/F output is inverted when the timer is enabled, the F/F output is inverted synchronously with the count clock.

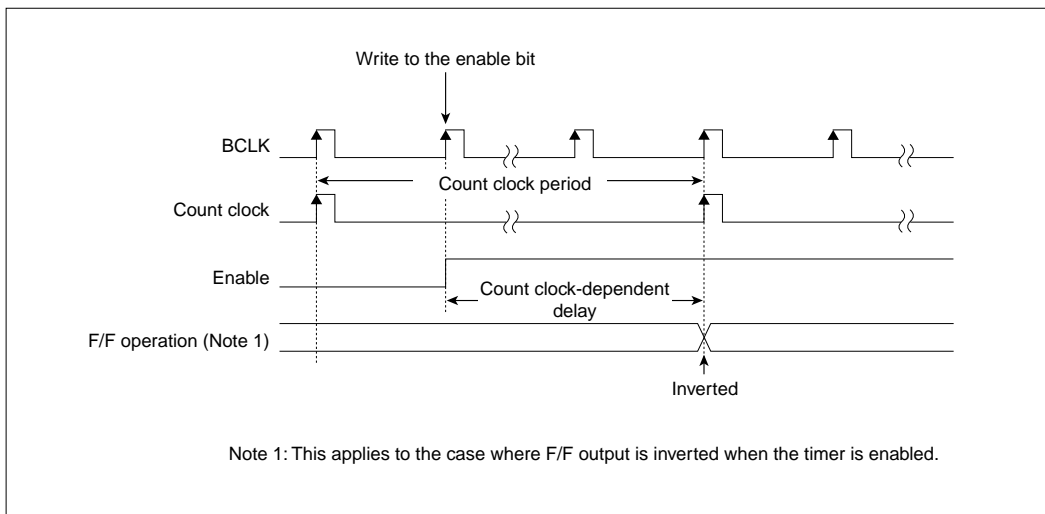

Figure 10.3.2 Count clock Dependent Delay

10.3.3 TOP Related Register Map

The diagram below shows a TOP-related register map.

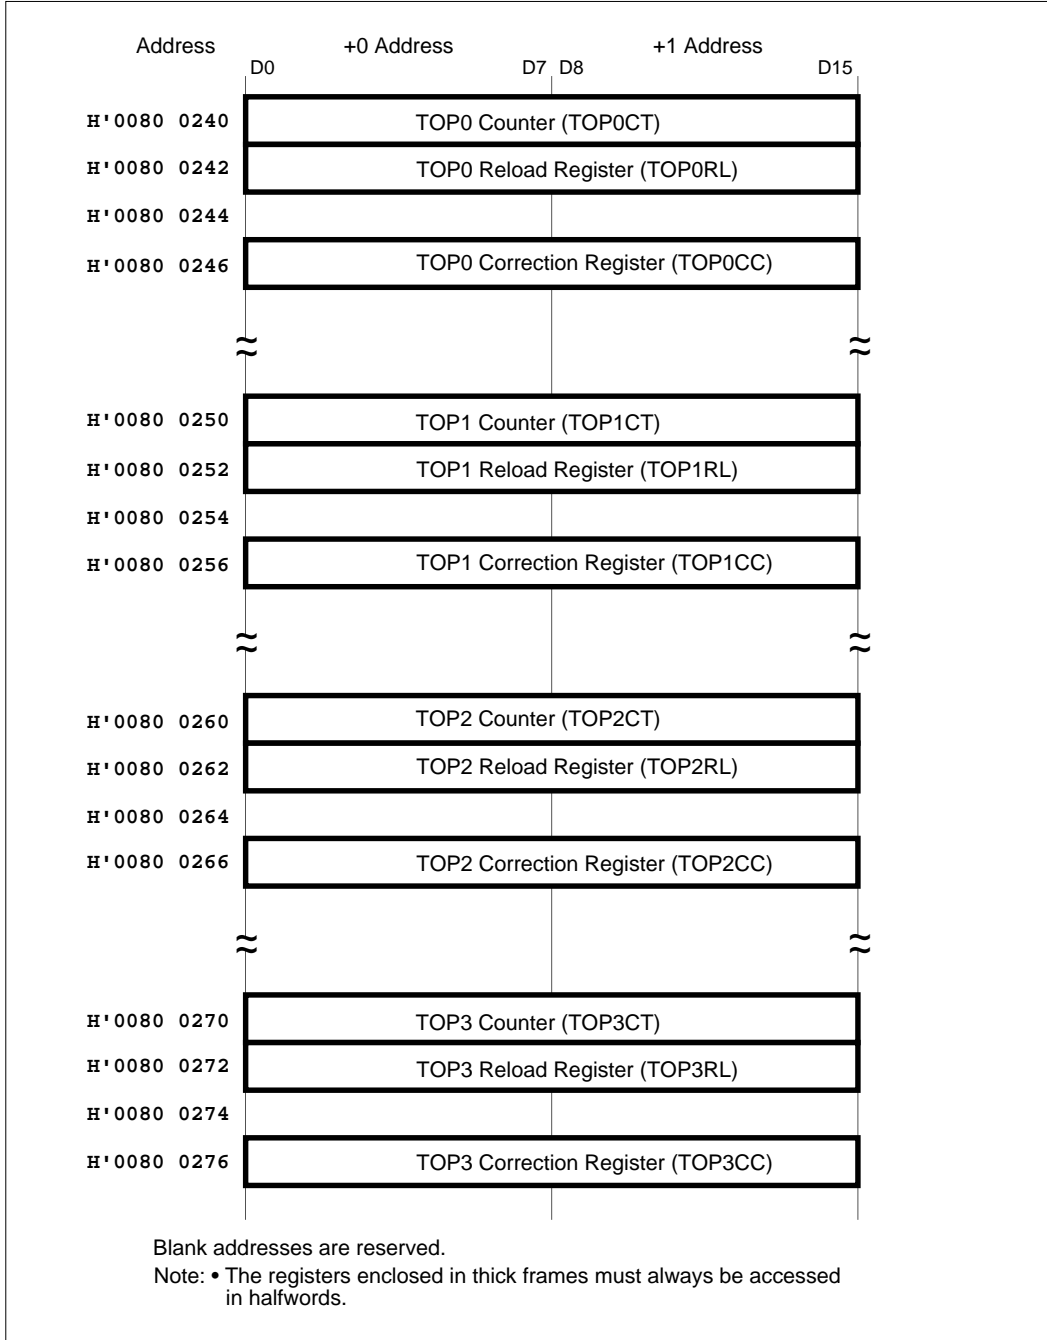

Figure 10.3.3 TOP Related Register Map (1/3)

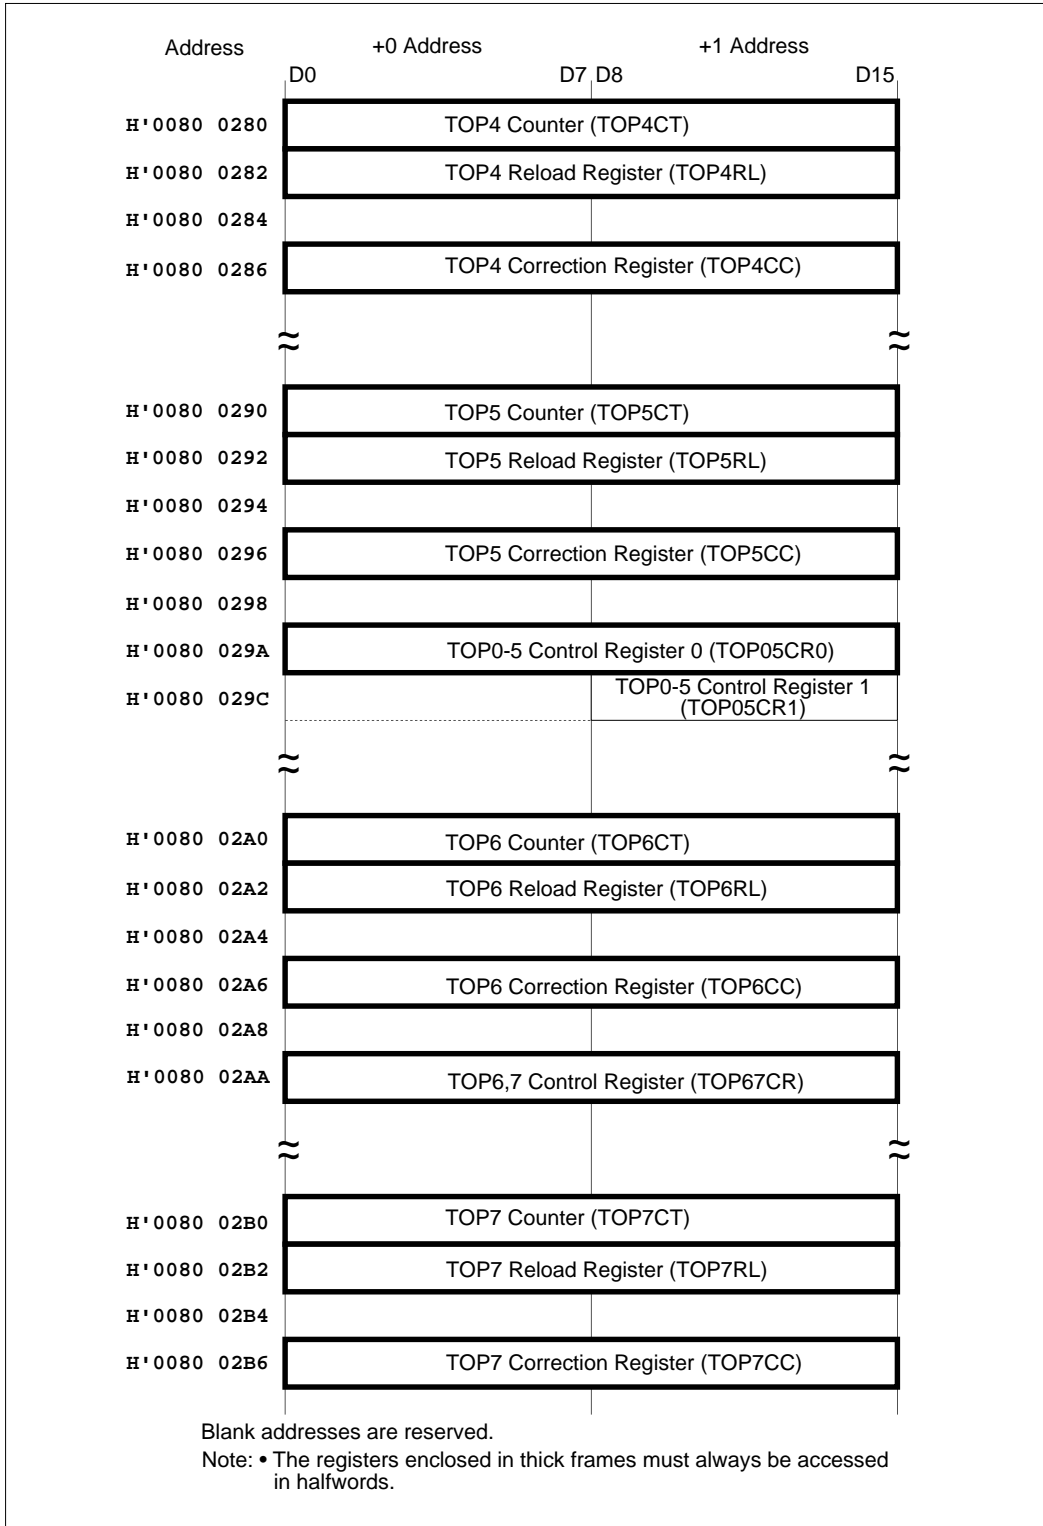

Figure 10.3.4 TOP Related Register Map (2/3)

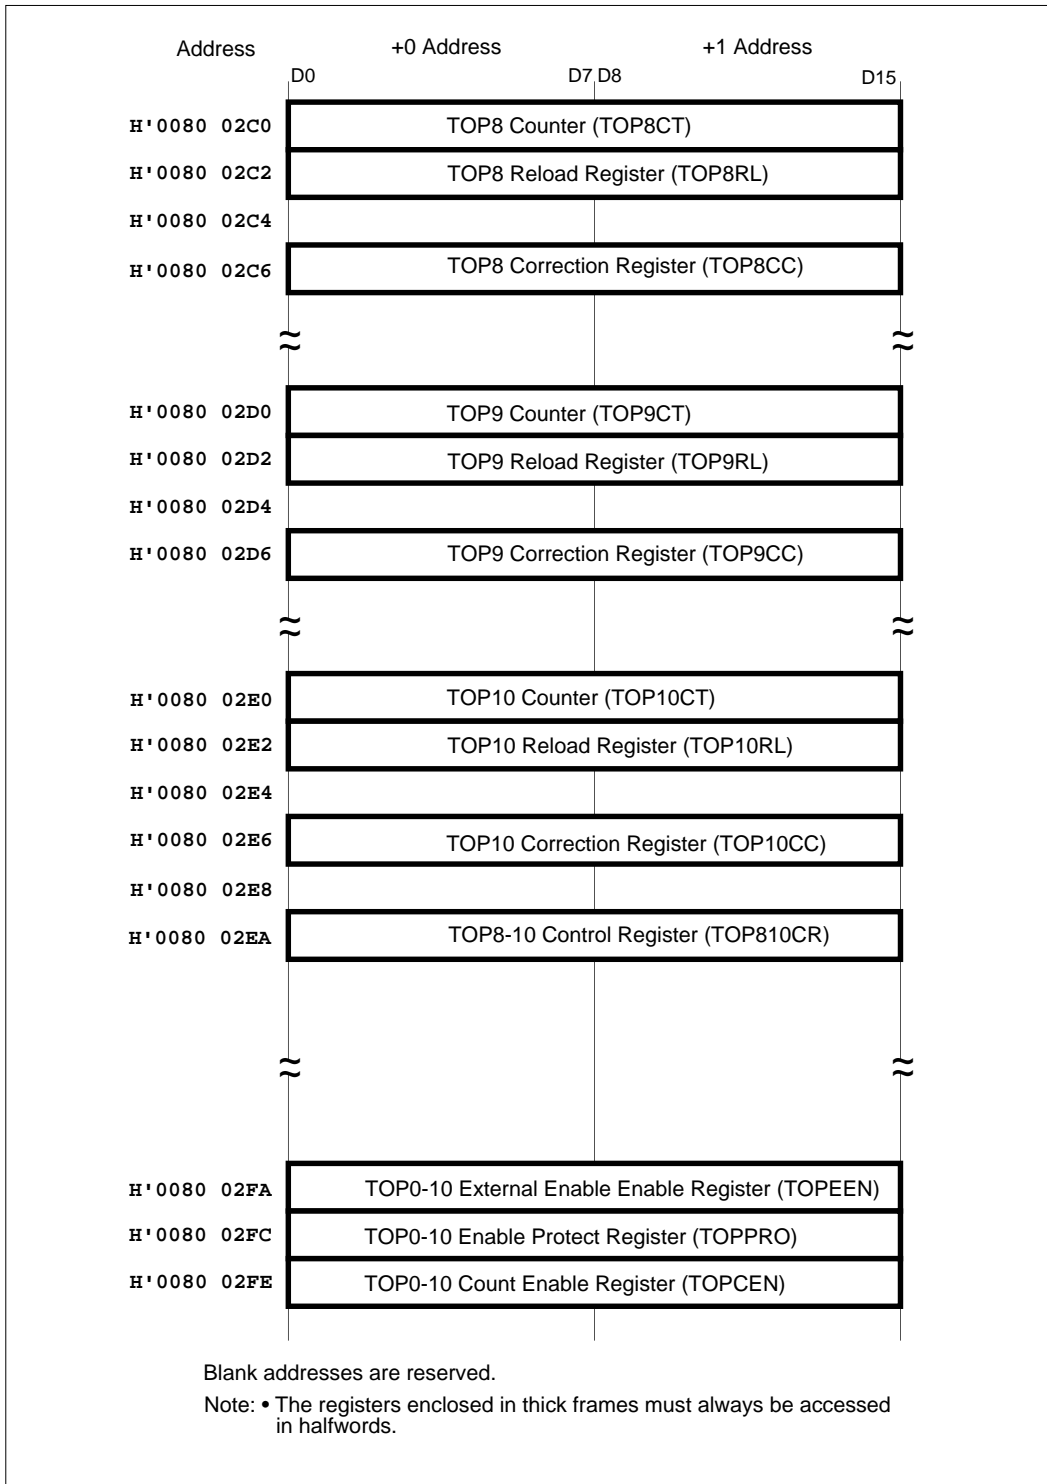

Figure 10.3.5 TOP Related Register Map (3/3)

10.3.4 TOP Control Registers

The TOP control registers are used to select operation modes of TOP0-10 (single-shot, delayed single-shot, or continuous mode), as well as select the counter enable and counter clock sources. Following four TOP control registers are provided for each timer group.

- TOP0-5 Control Register 0 (TOP05CR0)
- TOP0-5 Control Register 1 (TOP05CR1)
- TOP6, 7 Control Register (TOP67CR)
- TOP8-10 Control Register (TOP810CR)

■ TOP0-5 Control Register 0 (TOP05CR0)

<Address:H'0080 029A>

<When reset:H'0000>

D	Bit Name	Function	R	W
0,1	TOP3M (TOP3 operation mode selection)	00: Single-shot output mode	○	○

14,15	TOP67CKS (TOP6, TOP7 clock source selection)	00: Clock bus 0 01: Clock bus 1 10: Clock bus 2 11: Clock bus 3	○	○

Notes: • This register must always be accessed in halfwords.

- Always make sure the counter has stopped and is idle before setting or changing operation modes.

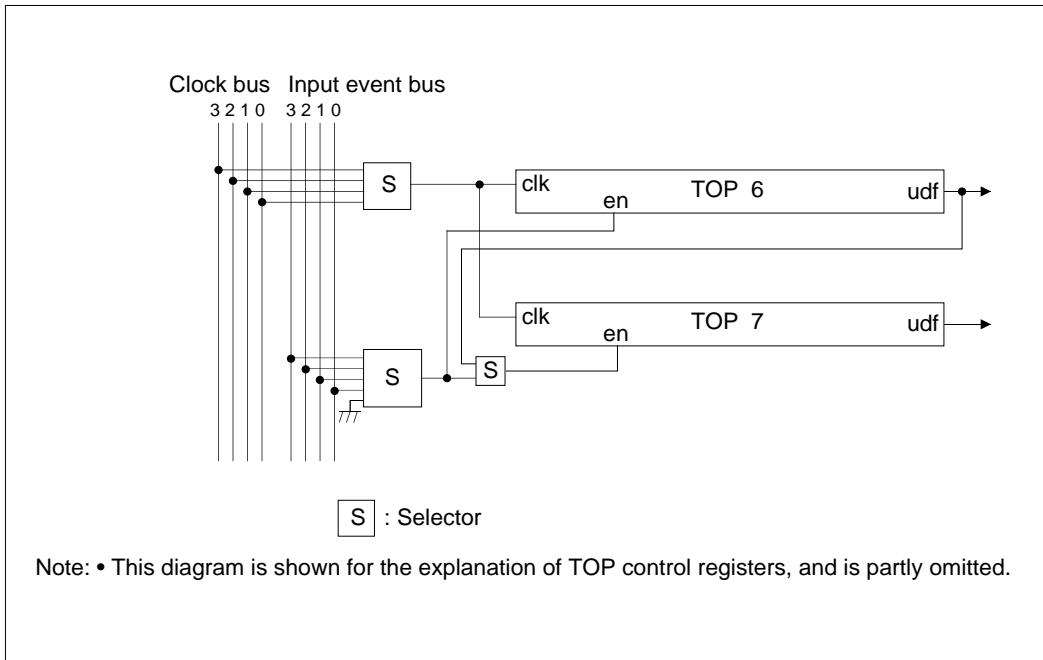

Figure 10.3.7 Outline Diagram of TOP6, TOP7 Clock/Enable Inputs

■ TOP8-10 Control Register (TOP810CR)

<Address:H'0080 02EA>

<When reset:H'0000>

D	Bit Name	Function	R	W
0,1	No functions assigned		0	–
2,3	TOP10M (TOP10 operation mode selection)	00: Single-shot output mode	○	○
4,5	TOP9M (TOP9 operation mode selection)	01: Delayed single-shot output mode		
6,7	TOP8M (TOP8 operation mode selection)	1X: Continuous output mode		
8-10	No functions assigned		0	–
11	TOP810ENS (TOP8-10 enable source selection)	0: No selection 1: Input event bus 3	○	○
12,13	No functions assigned		0	–
14,15	TOP810CKS (TOP8-10 clock source selection)	00: Clock bus 0 01: Clock bus 1 10: Clock bus 2 01: Clock bus 3	○	○

Notes: • This register must always be accessed in halfwords.

- Always make sure the counter has stopped and is idle before setting or changing operation modes.

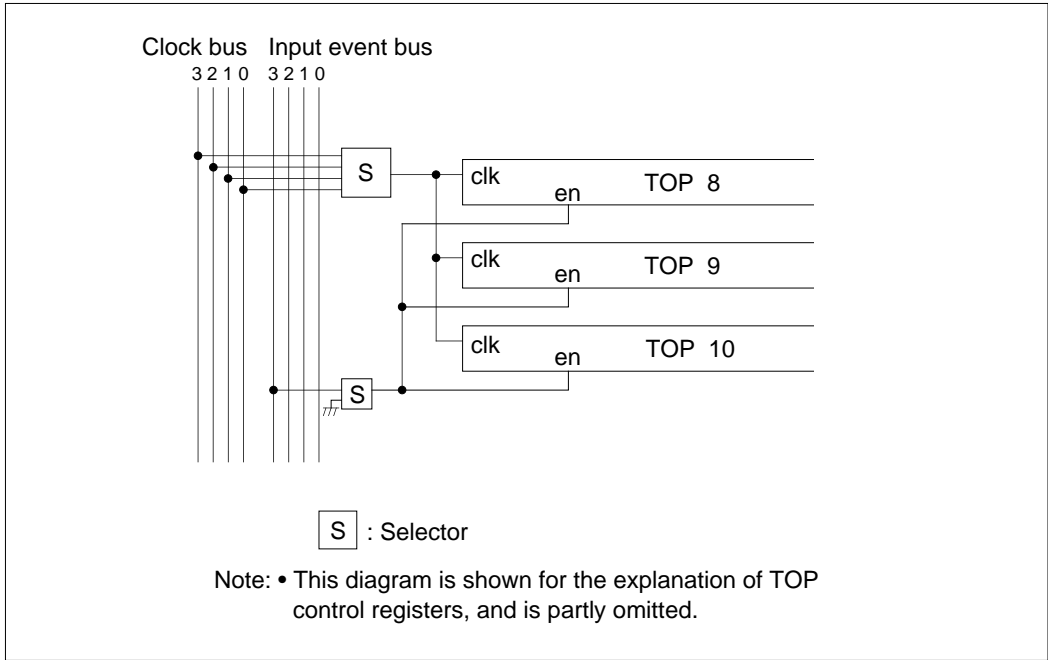

Figure 10.3.8 Outline Diagram of TOP8-10 Clock/Enable Inputs

10.3.5 TOP Counters (TOP0CT-TOP10CT)

- TOP0 Counter (TOP0CT) <Address:H'0080 0240>
- TOP1 Counter (TOP1CT) <Address:H'0080 0250>
- TOP2 Counter (TOP2CT) <Address:H'0080 0260>
- TOP3 Counter (TOP3CT) <Address:H'0080 0270>
- TOP4 Counter (TOP4CT) <Address:H'0080 0280>
- TOP5 Counter (TOP5CT) <Address:H'0080 0290>
- TOP6 Counter (TOP6CT) <Address:H'0080 02A0>
- TOP7 Counter (TOP7CT) <Address:H'0080 02B0>
- TOP8 Counter (TOP8CT) <Address:H'0080 02C0>
- TOP9 Counter (TOP9CT) <Address:H'0080 02D0>
- TOP10 Counter (TOP10CT) <Address:H'0080 02E0>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0-15	TOP0CT-TOP10CT	16-bit counter value	○	○

Note: • This register must always be accessed in halfwords.

The TOP counters are a 16-bit down-counter. After the timer is enabled (by writing to the enable bit in software or by external input), the counter starts counting synchronously with the count clock.

10.3.6 TOP Reload Registers (TOP0RL-TOP10RL)

■ TOP0 Reload Register (TOP0RL)	<Address:H'0080 0242>
■ TOP1 Reload Register (TOP1RL)	<Address:H'0080 0252>
■ TOP2 Reload Register (TOP2RL)	<Address:H'0080 0262>
■ TOP3 Reload Register (TOP3RL)	<Address:H'0080 0272>
■ TOP4 Reload Register (TOP4RL)	<Address:H'0080 0282>
■ TOP5 Reload Register (TOP5RL)	<Address:H'0080 0292>
■ TOP6 Reload Register (TOP6RL)	<Address:H'0080 02A2>
■ TOP7 Reload Register (TOP7RL)	<Address:H'0080 02B2>
■ TOP8 Reload Register (TOP8RL)	<Address:H'0080 02C2>
■ TOP9 Reload Register (TOP9RL)	<Address:H'0080 02D2>
■ TOP10 Reload Register (TOP10RL)	<Address:H'0080 02E2>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0-15	TOP0RL-TOP10RL	16-bit reload register value	○	○

Note: • This register must always be accessed in halfwords.

The TOP reload registers are used to load data into the TOP counter registers (TOP0CT-TOP10CT). It is in the following cases that the content of the reload register is loaded in the counter:

- When the counter is enabled in single-shot mode
- When the counter underflowed in delayed single-shot or continuous mode

Writing data to the reload register does not mean that the data is loaded into the counter simultaneously.

Note that data reloading after an underflow is performed synchronously with the clock period in which the counter underflowed.

10.3.7 TOP Correction Registers (TOP0CC-TOP10CC)

- TOP0 Correction Register (TOP0CC) <Address:H'0080 0246>
- TOP1 Correction Register (TOP1CC) <Address:H'0080 0256>
- TOP2 Correction Register (TOP2CC) <Address:H'0080 0266>
- TOP3 Correction Register (TOP3CC) <Address:H'0080 0276>
- TOP4 Correction Register (TOP4CC) <Address:H'0080 0286>
- TOP5 Correction Register (TOP5CC) <Address:H'0080 0296>
- TOP6 Correction Register (TOP6CC) <Address:H'0080 02A6>
- TOP7 Correction Register (TOP7CC) <Address:H'0080 02B6>
- TOP8 Correction Register (TOP8CC) <Address:H'0080 02C6>
- TOP9 Correction Register (TOP9CC) <Address:H'0080 02D6>
- TOP10 Correction Register (TOP10CC) <Address:H'0080 02E6>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0-15	TOP0CC-TOP10CC	16-bit correction register value	○	○

Note: • This register must always be accessed in halfwords.

The TOP correction registers are used to correct the TOP counter value by adding or subtracting it in the middle of operation. To increase or reduce the counter value, write a value to this correction register, the value by which you want to be increased or reduced from the initial count set in the counter. To add, write the value you want to add to the correction register directly as is; to subtract, write the two's complement of the value you want to subtract to the correction register.

Correction of the counter is performed synchronously with a clock period next to the one in which the correction value was written to the TOP correction register. In this case, one down-count in the clock period during which the correction was performed is canceled. Therefore, note that the counter value actually is corrected by (correction register value + 1). For example, if the initial counter value is 10 and you write a value 3 to the correction register when the counter has counted down to 5, then the counter underflows after a total of 15 counts.

10.3.8 TOP Enable Control Register

■ TOP0-10 External Enable Permit Register (TOPEEN) <Address:H'0080 02FA>

<When reset: H'0000>

D	Bit Name	Function	R	W
0-4	No functions assigned		0	-
5	TOP10EEN (TOP10 external enable permit)	0: Disables external enable	○	○
6	TOP9EEN (TOP9 external enable permit)	1: Enables external enable		
7	TOP8EEN (TOP8 external enable permit)			
8	TOP7EEN (TOP7 external enable permit)			
9	TOP6EEN (TOP6 external enable permit)			
10	TOP5EEN (TOP5 external enable permit)			
11	TOP4EEN (TOP4 external enable permit)			
12	TOP3EEN (TOP3 external enable permit)			
13	TOP2EEN (TOP2 external enable permit)			
14	TOP1EEN (TOP1 external enable permit)			
15	TOP0EEN (TOP0 external enable permit)			

Note: • This register must always be accessed in halfwords.

The TOP0-10 External Enable Permit Register controls enable operation from sources external to the TOP counter by enabling or disabling it.

■ TOP0-10 Enable Protect Register (TOPPRO)

<Address:H'0080 02FC>

<When reset:H'0000>

D	Bit Name	Function	R	W
0-4	No functions assigned		0	-
5	TOP10PRO (TOP10 enable protect)	0: Enables rewrite	○	○
6	TOP9PRO (TOP9 enable protect)	1: Disables rewrite		
7	TOP8PRO (TOP8 enable protect)			
8	TOP7PRO (TOP7 enable protect)			
9	TOP6PRO (TOP6 enable protect)			
10	TOP5PRO (TOP5 enable protect)			
11	TOP4PRO (TOP4 enable protect)			
12	TOP3PRO (TOP3 enable protect)			
13	TOP2PRO (TOP2 enable protect)			
14	TOP1PRO (TOP1 enable protect)			
15	TOP0PRO (TOP0 enable protect)			

Note: • This register must always be accessed in halfwords.

The TOP0-10 Enable Protect Register controls rewriting of the TOP0-10 count enable bits shown in the next page by enabling or disabling rewrite.

■ TOP0-10 Count Enable Register (TOPCEN)

<Address:H'0080 02FE>

<When reset:H'0000>

D	Bit Name	Function	R	W
0-4	No functions assigned		0	-
5	TOP10CEN (TOP10 count enable)	0: Stops count	○	○
6	TOP9CEN (TOP9 count enable)	1: Enables count		
7	TOP8CEN (TOP8 count enable)			
8	TOP7CEN (TOP7 count enable)			
9	TOP6CEN (TOP6 count enable)			
10	TOP5CEN (TOP5 count enable)			
11	TOP4CEN (TOP4 count enable)			
12	TOP3CEN (TOP3 count enable)			
13	TOP2CEN (TOP2 count enable)			
14	TOP1CEN (TOP1 count enable)			
15	TOP0CEN (TOP0 count enable)			

Note: • This register must always be accessed in halfwords.

The TOP0-10 Count Enable Register controls the operation of TOP counter. To enable the counter in software, enable the relevant TOP0-10 Enable Protect Register for write and set the count enable bit by writing a 1. To stop the counter, enable the TOP0-10 Enable Protect Register for write and reset the count enable bit by writing a 0.

In all but continuous mode, when the counter stops due to an occurrence of underflow, the count enable bit is automatically reset to 0. Therefore, what you get by reading the TOP0-10 Count Enable Register is the status that indicates the counter's operating status (active or idle).

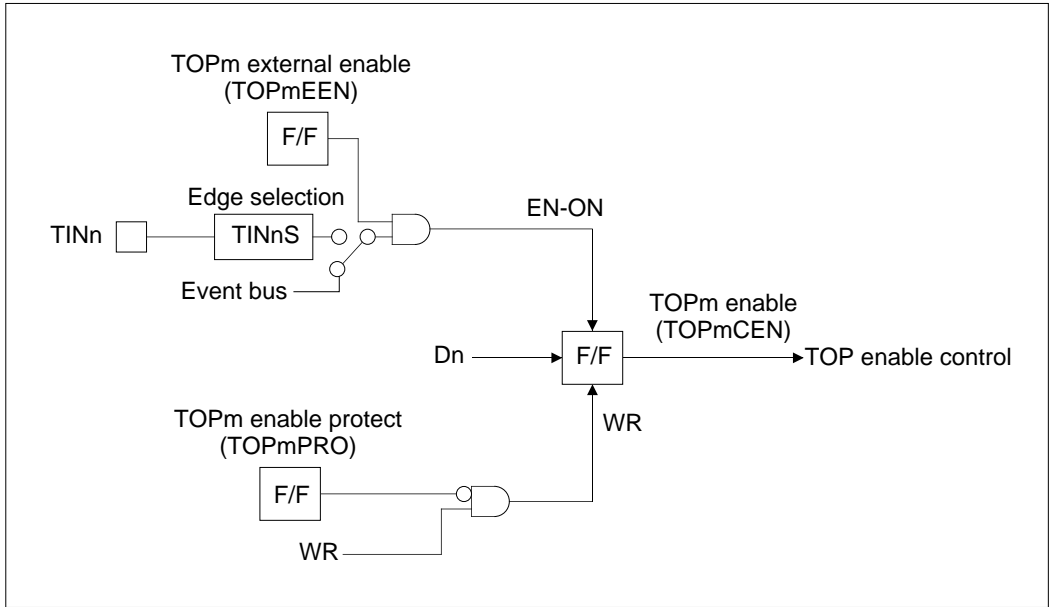

Figure 10.3.9 Configuration of the TOP Enable Circuit

10.3.9 Operation in TOP Single-shot Output Mode (with Correction Function)

(1) Outline of TOP single-shot output mode

In single-shot output mode, the timer generates a pulse in width of (reload register value + 1) only once and stops.

When after setting the reload register, the timer is enabled (by writing to the enable bit in software or by external input), it loads the content of the reload register into the counter synchronously with the count clock, letting the counter start counting. The counter counts down clock pulses and stops when it underflows after reaching the minimum count.

The F/F output waveform in single-shot output mode is inverted (F/F output levels change from low to high, or vice versa) at startup and upon underflow, generating a single-shot pulse waveform in width of (reload register set value + 1) only once. Also, an interrupt can be generated when the counter underflows.

The count value is (reload register set value + 1). In the case shown below, for example, if the reload register value = 7, then the count value = 8.

Because all internal circuits operate synchronously with the count clock, a finite time equal to a prescaler delay is included before F/F output changes state after the timer is enabled.

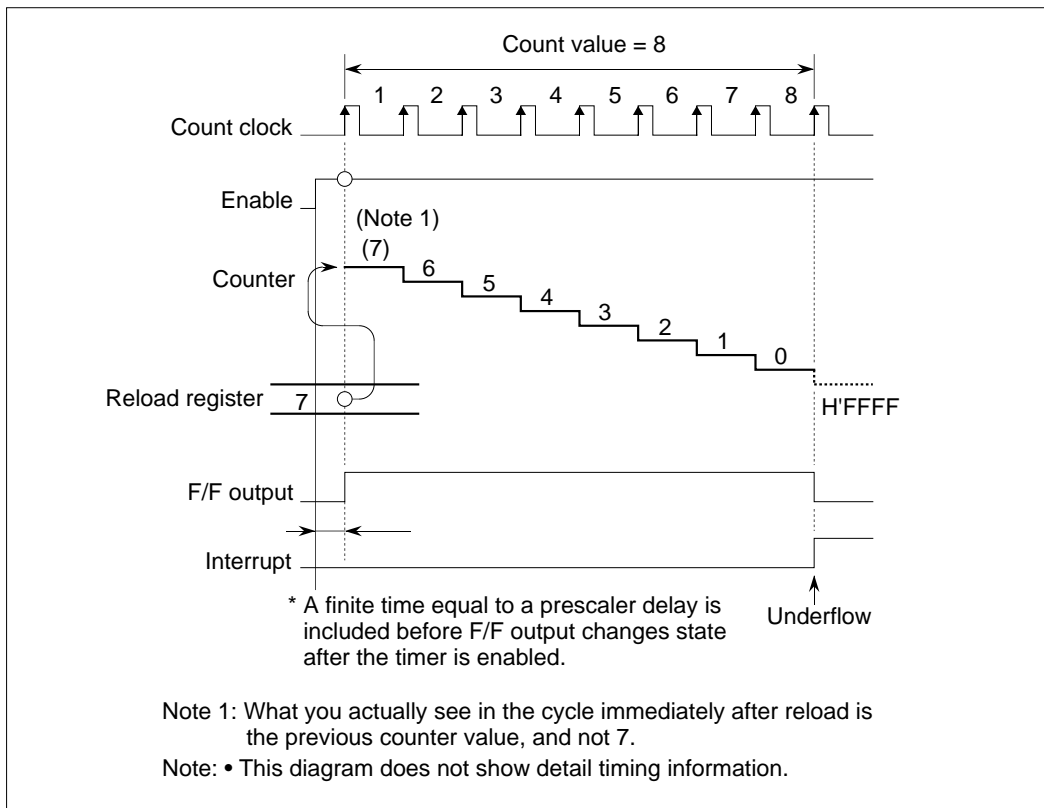

Figure 10.3.10 Example of Counting in TOP Single-shot Output Mode

In the example below, the reload register has the initial value H'A000 set in it. (The initial value of the counter can be indeterminate, and does not have to be specific.) When the timer starts, the reload register value is loaded into the counter causing it to start counting. Thereafter, it continues counting down clock pulses until it underflows after reaching the minimum count.

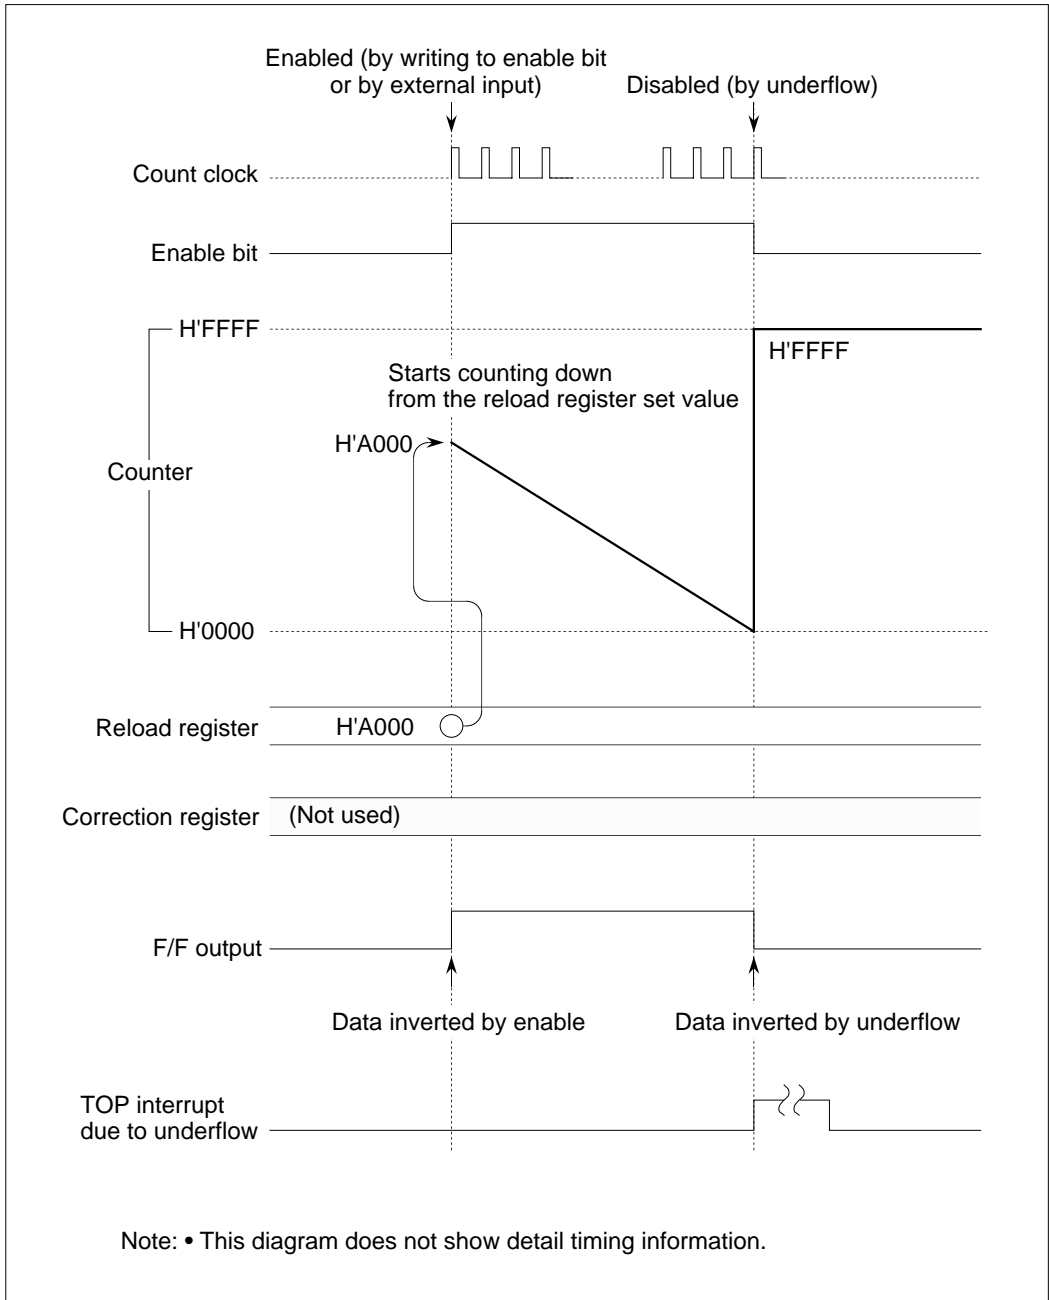

Figure 10.3.11 Typical Operation in TOP Single-shot Output Mode

(2) Correction function of TOP single-shot output mode

If you want to change the counter value during operation, write a value to the TOP correction register, the value by which you want to be increased or reduced from the initial count set in the counter. To add, write the value you want to add to the correction register directly as is; to subtract, write the two's complement of the value you want to subtract to the correction register.

Correction of the counter is performed synchronously with a clock period next to the one in which the correction value was written to the TOP correction register. In this case, one down-count in the clock period during which the correction was performed is canceled. Therefore, note that the counter value actually is corrected by (correction register value + 1).

For example, if the initial counter value is 7 and you write a value 3 to the correction register when the counter has counted down to 3, then the counter underflows after a total of 12 counts.

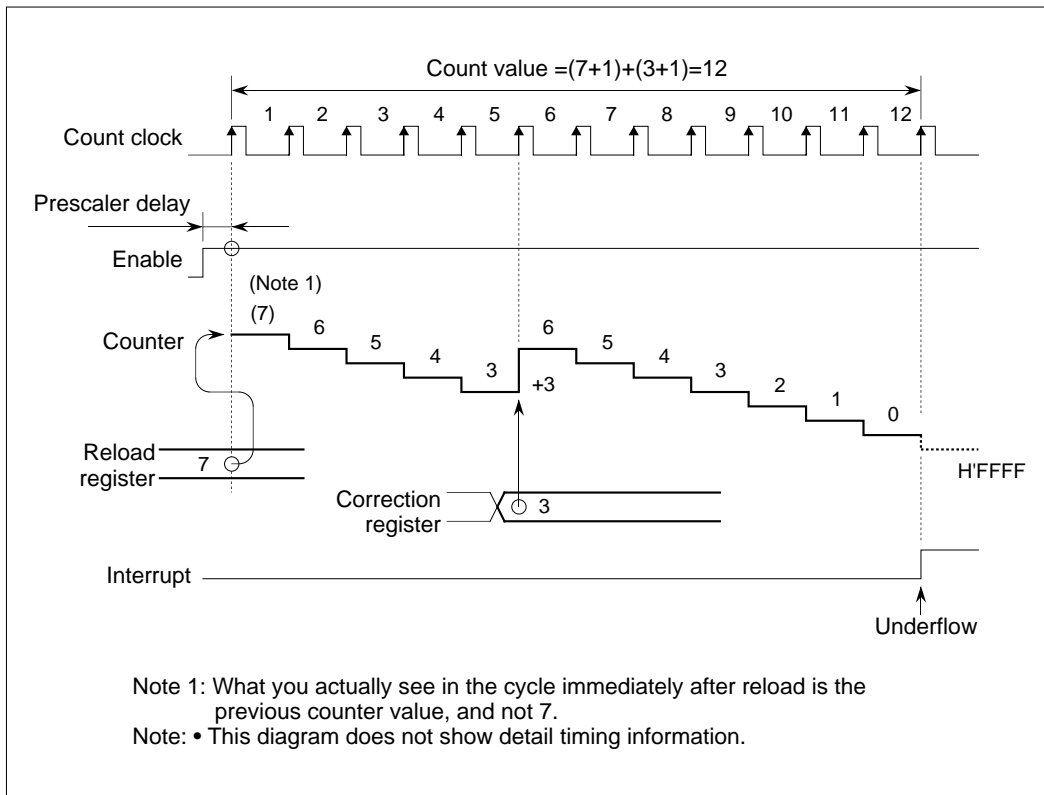

Figure 10.3.12 Example of Counting in TOP Single-shot Output Mode When Count is Corrected

When writing to the correction register, be careful not to cause the counter to overflow. Even when the counter overflows due to correction of counts, no interrupt is generated for the occurrence of overflow.

In the example next page, the reload register has the initial value H'8000 set in it. When the timer starts, the reload register value is loaded into the counter causing it to start counting down. In the example diagram here, H'4000 is written to the correction register when the counter has counted down to H'5000. As a result of this correction, the count has been increased to H'9000, so that the counter stops after counting a total of $(H'8000 + 1 + H'4000 + 1)$ counts.

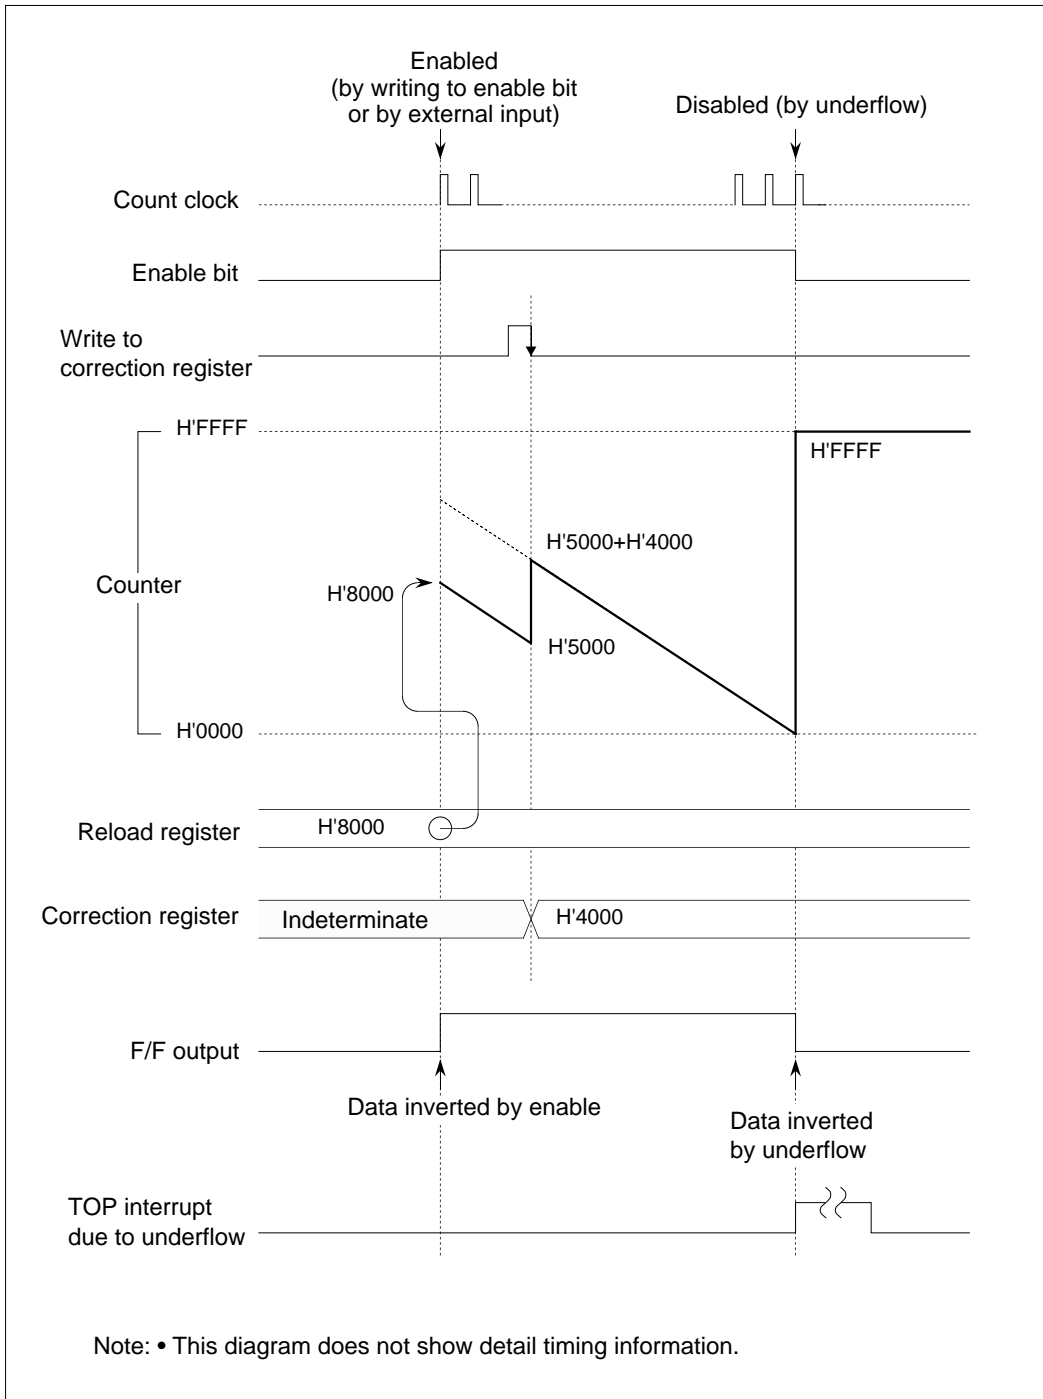

Figure 10.3.13 Example of Counting in TOP Single-shot Output Mode When Count is Corrected

(3) Precautions to be observed when using TOP single-shot output mode

The following describes precautions to be observed when using TOP single-shot output mode.

- If the counter stops due to underflow in the same clock period as the timer is enabled by external input, the former has priority (so that the counter stops).
- If the counter stops due to underflow in the same clock period as count is enabled by writing to the enable bit, the latter has priority (so that count is enabled).
- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority (so that count is disabled).
- Because the internal circuit operation is synchronized to the count clock (prescaler output), a finite time equal to a prescaler delay is included before F/F starts operating after the timer is enabled.
- When writing to the correction register, be careful not to cause the counter to overflow. Even when the counter overflows due to correction of counts, no interrupt is generated for the occurrence of overflow. When the counter underflows in the subsequent down-count after overflow, a false underflow interrupt is generated due to overcounting.

In the example below, the reload register has the initial value H'FFF8 set in it. When the timer starts, the reload register value is loaded into the counter causing it to start counting down. In the example diagram here, H'0014 is written to the correction register when the counter has counted down to H'FFF0. As a result of this correction, the count overflows to H'0004 and fails to count correctly. Also, an interrupt is generated for an erroneous overcount.

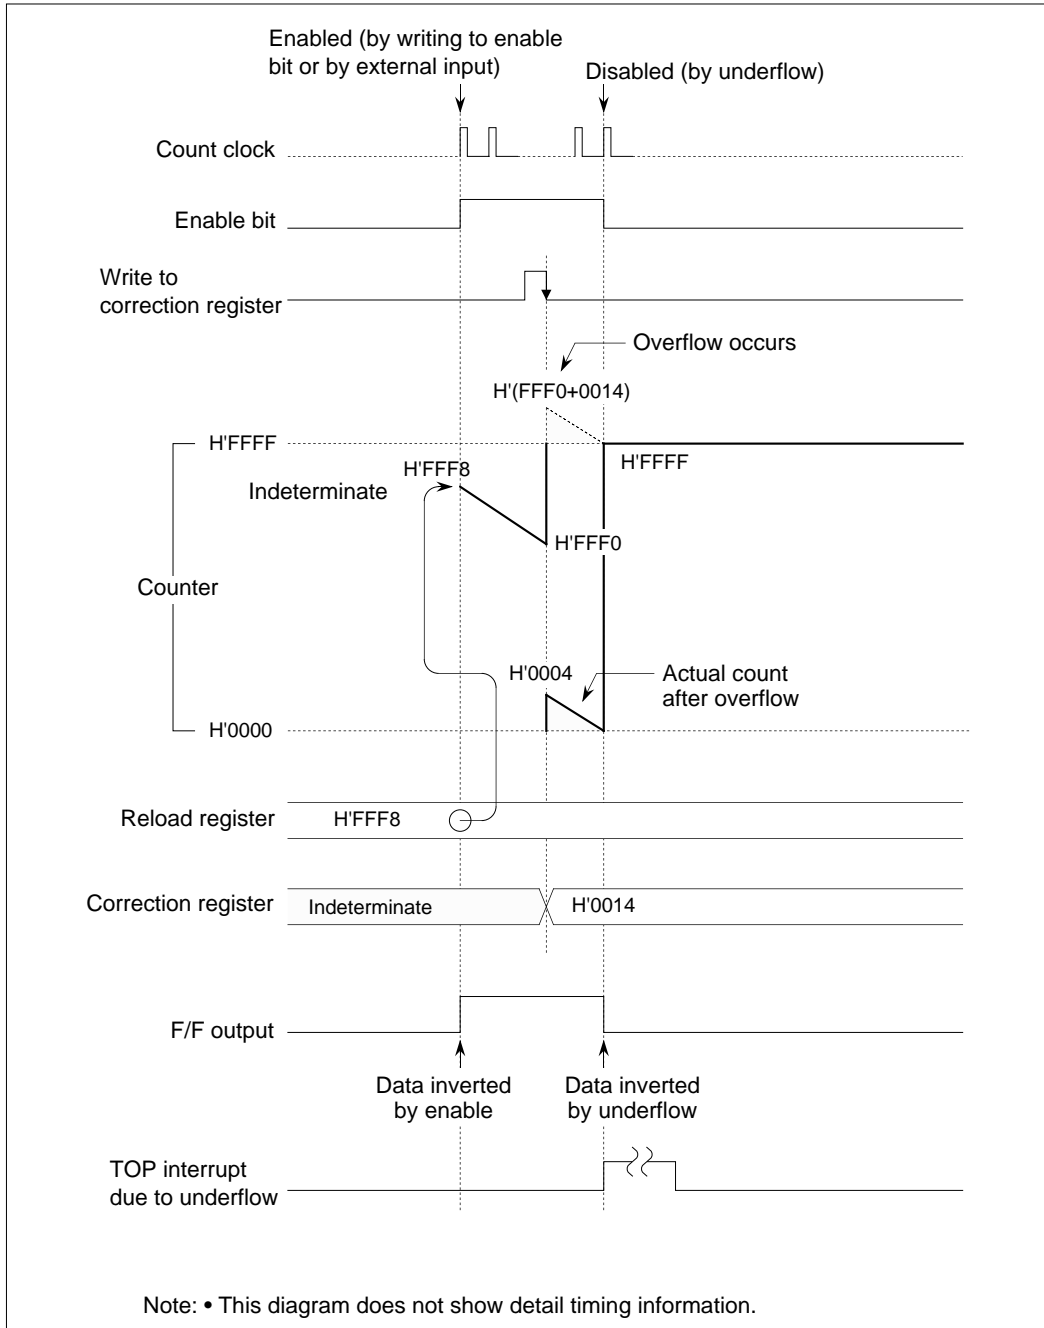

Figure 10.3.14 Example of Operation in TOP Single-shot Output Mode Where Count Overflows due to Correction

10.3.10 Operation in TOP Delayed Single-shot Output Mode (With Correction Function)

(1) Outline of TOP delayed single-shot output mode

In delayed single-shot output mode, the timer generates a pulse in width of (reload register set value + 1) only once, with the output delayed by an amount of time equal to (counter set value + 1) and then stops.

When after setting the counter and reload register, the timer is enabled (by writing to the enable bit in software or by external input), it starts counting down from the counter's set value synchronously with the count clock. The first time the counter underflows, the reload register value is loaded into the counter causing it to continue counting down, and the counter stops when it underflows next time.

The F/F output waveform in delayed single-shot output mode is inverted (F/F output levels change from low to high, or vice versa) when the counter underflows first time and next, generating a single-shot pulse waveform in width of (reload register set value + 1) only once, with the output delayed by an amount of time equal to (first set value of counter + 1). Also, an interrupt can be generated when the counter underflows first time and next.

The valid count values are the (counter set value + 1) and (reload register set value + 1). The diagram below shows timer operation as an example when the initial counter value = 4 and the initial reload register value = 5.

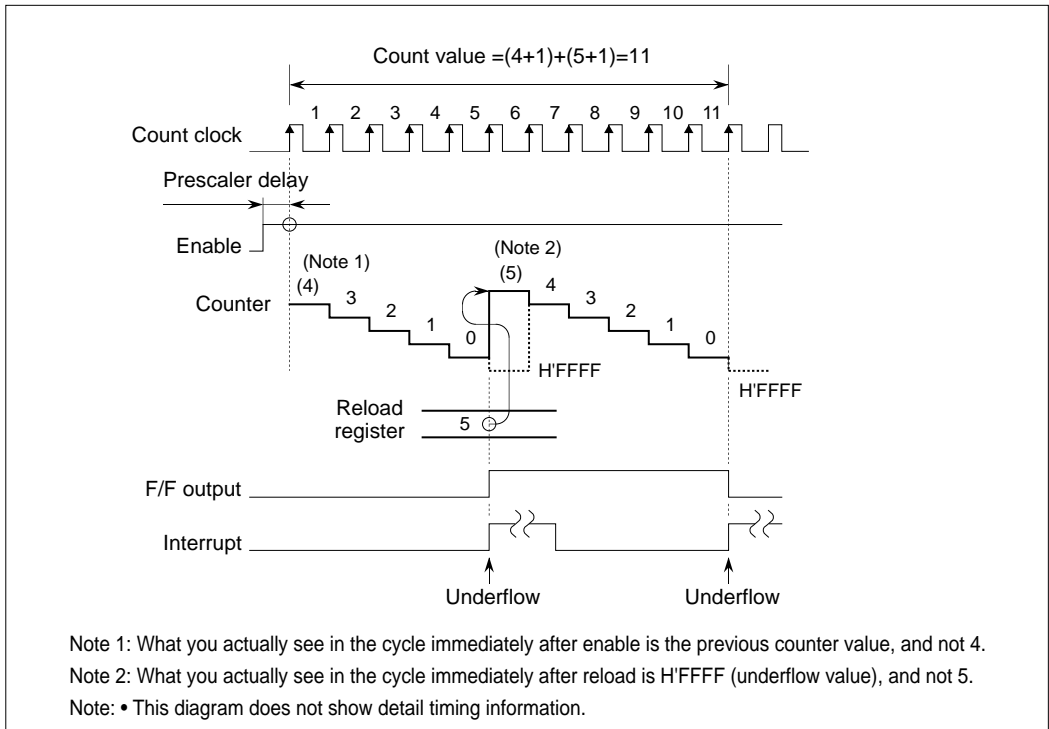

Figure 10.3.15 Example of Counting in TOP Delayed Single-shot Output Mode

In the example below, the counter has the initial value H'A000 set in it and the reload register has the initial value H'F000 set in it. When the timer starts, the counter starts counting down clock pulses and when it underflows after reaching the minimum count, the counter is reloaded with the content of the reload register. Then when the counter underflows next time while continuing down-count, it stops.

Figure 10.3.16 Typical Operation in TOP Delayed Single-shot Output

(2) Correction function of TOP delayed single-shot output mode

If you want to change the counter value during operation, write a value to the TOP correction register, the value by which you want to be increased or reduced from the initial count set in the counter. To add, write the value you want to add to the correction register directly as is; to subtract, write the two's complement of the value you want to subtract to the correction register.

Correction of the counter is performed synchronously with a clock period next to the one in which the correction value was written to the TOP correction register. In this case, one down-count in the clock period during which the correction was performed is canceled. Therefore, note that the counter value actually is corrected by (correction register value + 1).

For example, if the initial counter value is 7 and you write a value 3 to the correction register when the counter has counted down to 3, then the counter underflows after a total of 12 counts after reload.

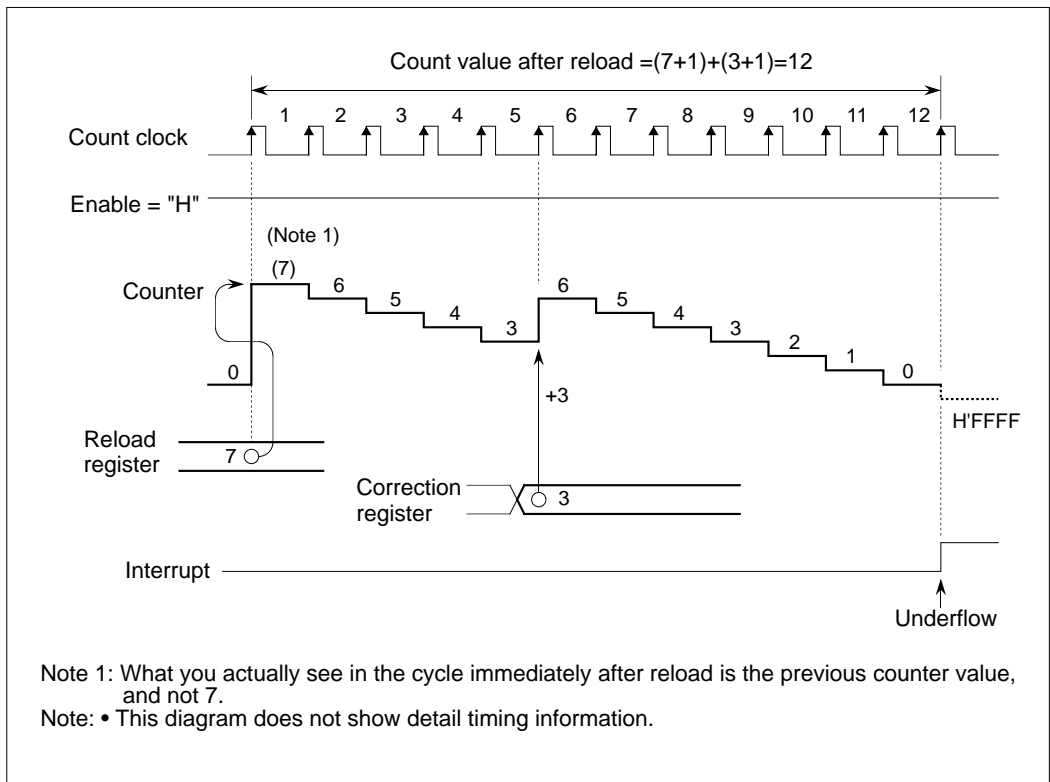

Figure 10.3.17 Example of Counting in TOP Delayed Single-shot Output Mode When Count is Corrected

When writing to the correction register, be careful not to cause the counter to overflow. Even when the counter overflows due to correction of counts, no interrupt is generated for the occurrence of overflow.

In the example below, the counter and the reload register are initially set to H'A000 and H'F000, respectively. When the timer is enabled, the counter starts counting down and when it underflows first time after reaching the minimum count, the counter is loaded with the content of the reload register and continues counting down. In the diagram below, the value H'0008 is written to the correction register when the counter has counted down to H'9000. As a result of this correction, the counter has its count value increased to H'9008 and counts (H'F000 + 1 + H'0008 + 1) after the first underflow before it stops.

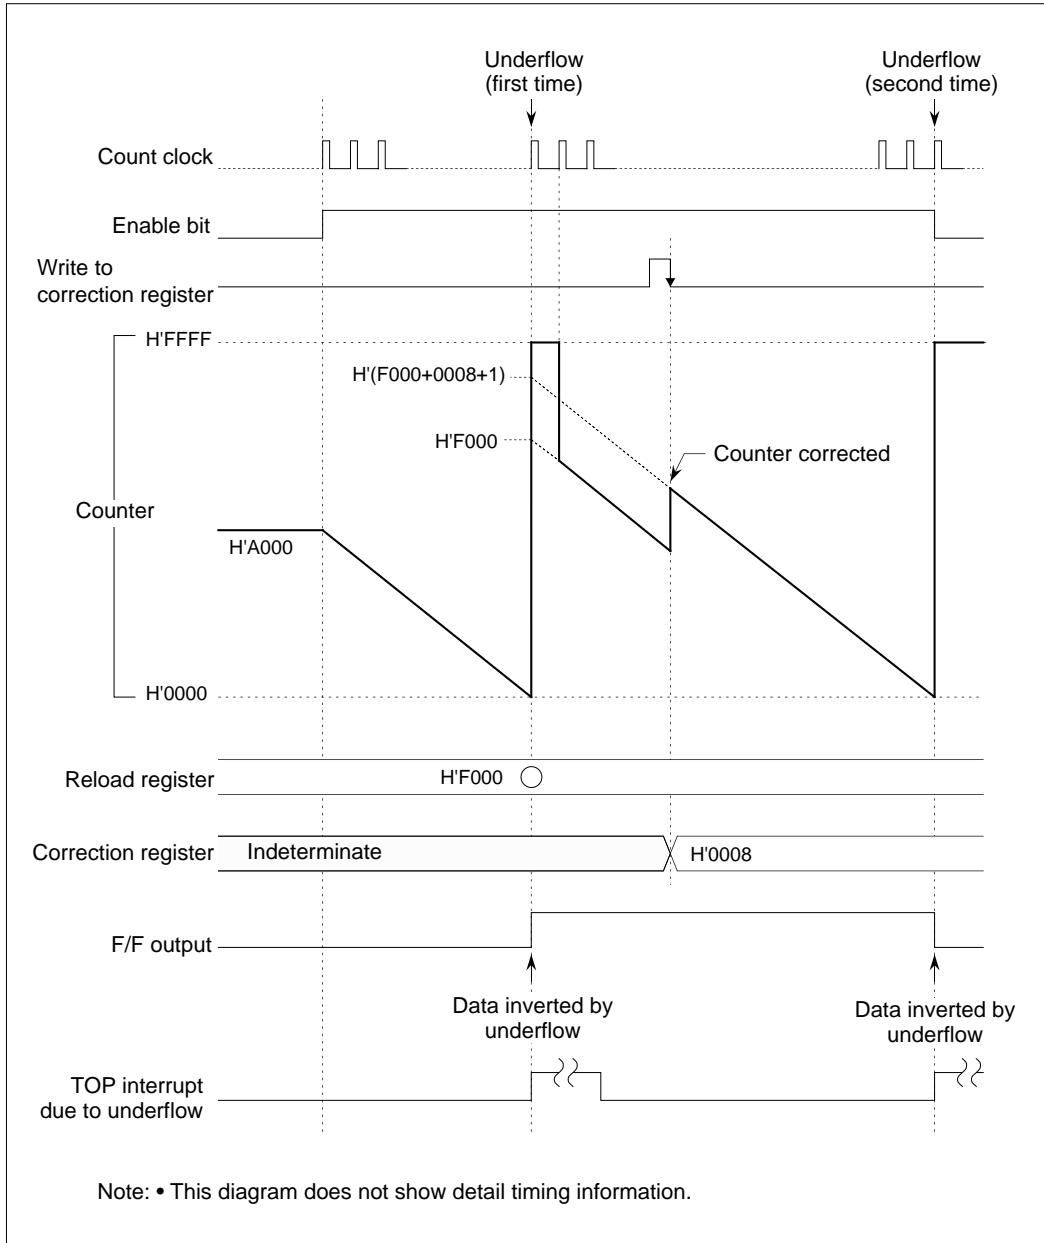

Figure 10.3.18 Typical Operation in TOP Delayed Single-shot Output Mode when Correction Applied

(3) Precautions to be observed when using TOP delayed single-shot output mode

The following describes precautions to be observed when using TOP delayed single-shot output mode.

- If the counter stops due to underflow in the same clock period as the timer is enabled by external input, the former has priority (so that the counter stops).
- If the counter stops due to underflow in the same clock period as count is enabled by writing to the enable bit, the latter has priority (so that count is enabled).
- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority (so that count is disabled).
- Even when the counter overflows due to correction of counts, no interrupt is generated for the occurrence of overflow. When the counter underflows in the subsequent down-count after overflow, a false underflow interrupt is generated due to overcounting.
- When you read the counter immediately after reloading it pursuant to underflow, the value you get is temporarily H'FFFF. But this counter value immediately changes to (reload value - 1) at the next clock edge.

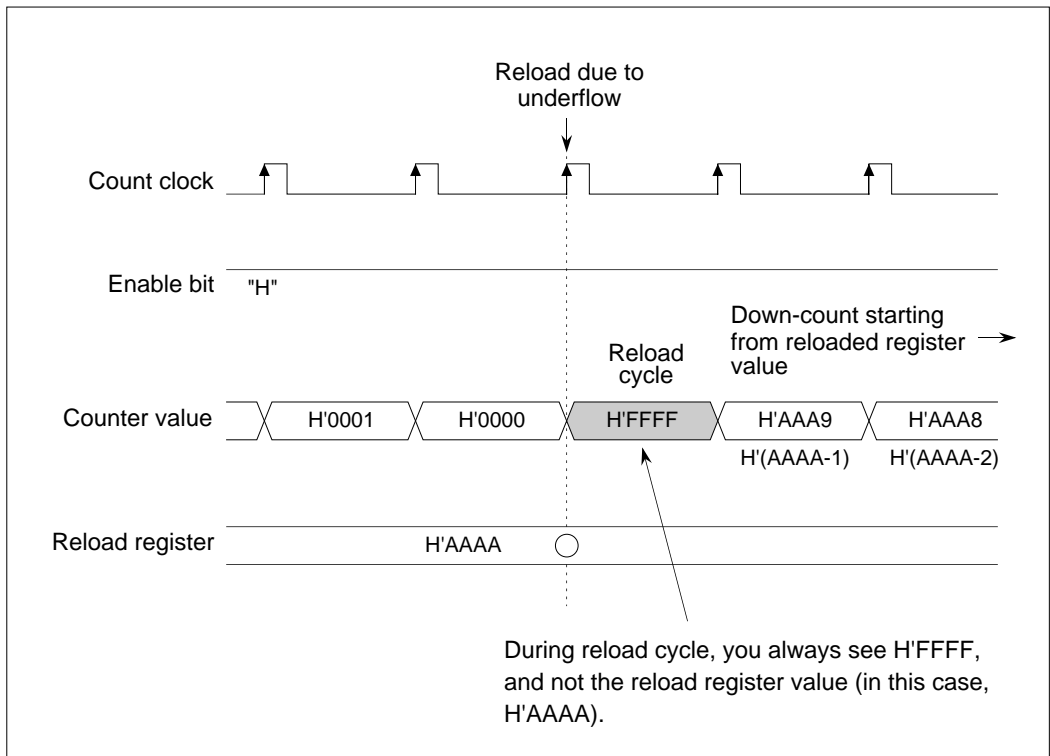

Figure 10.3.19 Counter Value Immediately after Underflow

10.3.11 Operation in TOP Continuous Output Mode (Without Correction Function)

(1) Outline of TOP continuous output mode

In continuous output mode, the timer counts down clock pulses starting from the set value of the counter and when the counter underflows, reloads it with the reload register value. Thereafter, this operation is repeated each time the counter underflows, thus generating consecutive pulses whose waveform is inverted in width of (reload register set value + 1).

When after setting the counter and reload register, the timer is enabled (by writing to the enable bit in software or by external input), it starts counting down from the counter's set value synchronously with the count clock and when the minimum count is reached, generates an underflow. This underflow causes the counter to be reloaded with the content of the reload register and start counting over again. Thereafter, this operation is repeated each time an underflow occurs. To stop the counter, disable count by writing to the enable bit in software.

The F/F output waveform in continuous output mode is inverted (F/F output levels change from low to high, or vice versa) at startup and upon underflow, generating consecutive pulses until the timer stops counting. Also, an interrupt can be generated each time the counter underflows.

The valid count values are the (counter set value + 1) and (reload register set value + 1). The diagram below shows timer operation as an example when the initial counter value = 4 and the initial reload register value = 5.

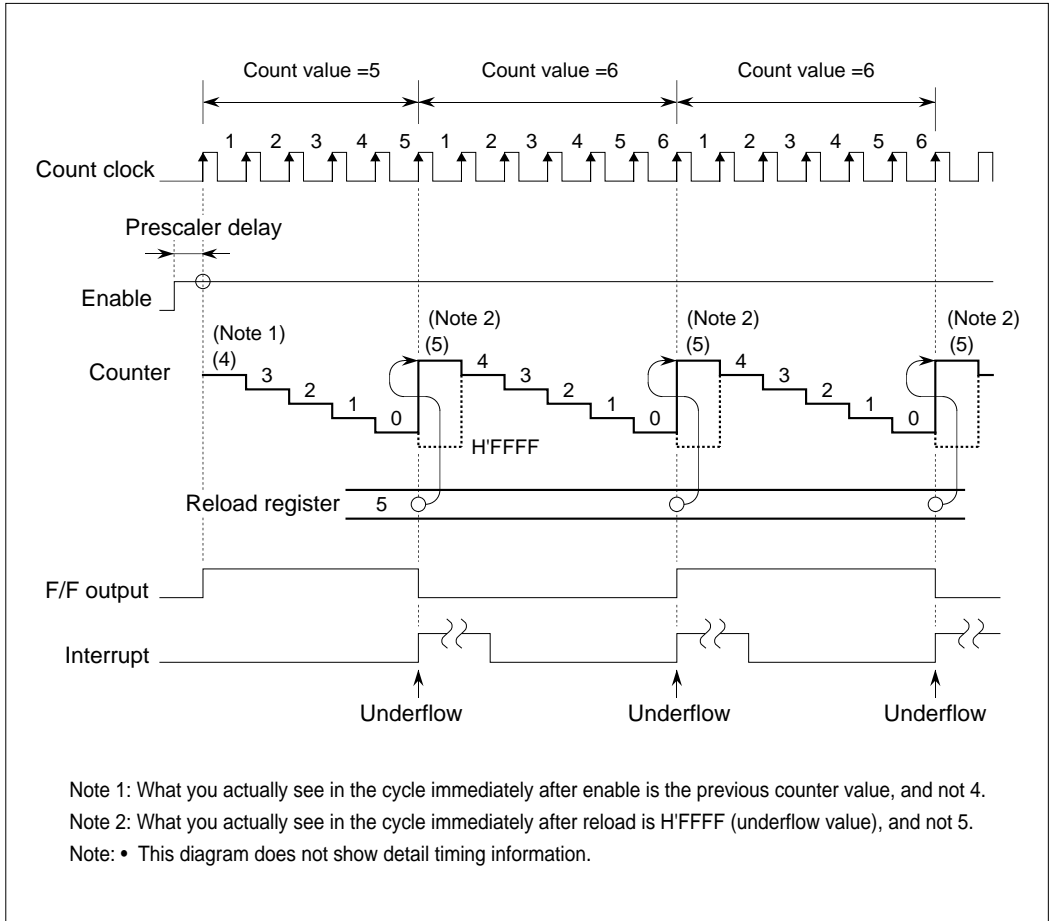

Figure 10.3.20 Example of Counting in TOP Continuous Output Mode

In the example below, the counter has the initial value H'A000 set in it and the reload register has the initial value H'E000 set in it. When the timer starts, the counter starts counting down clock pulses and when it underflows after reaching the minimum count, the counter is reloaded with the content of the reload register and continues counting down.

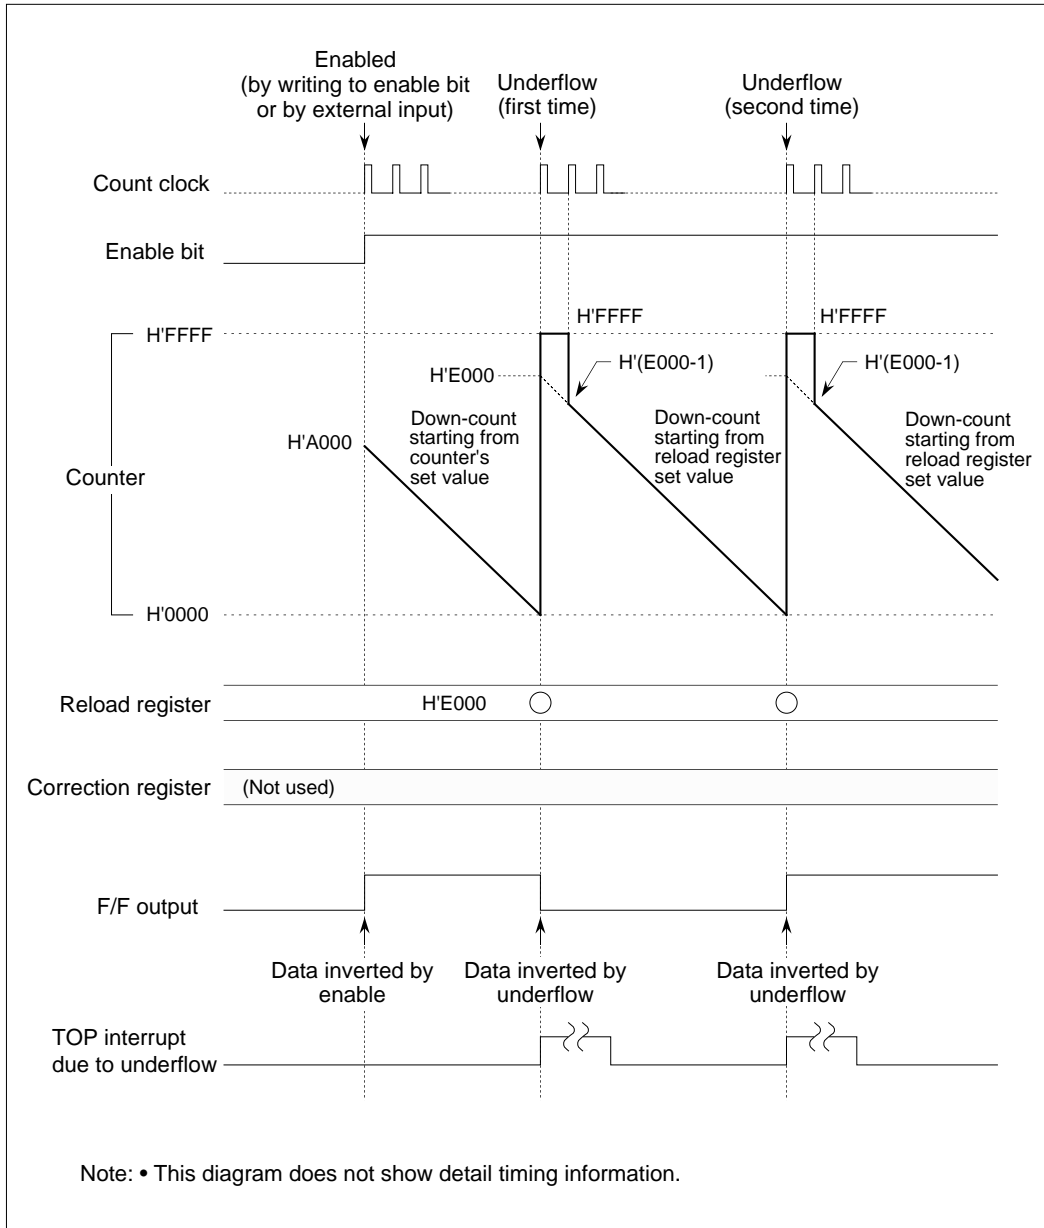

Figure 10.3.21 Typical Operation in TOP Continuous Output Mode

(2) Precautions to be observed when using TOP continuous output mode

The following describes precautions to be observed when using TOP continuous output mode.

- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority (so that count is disabled).
- When you read the counter immediately after reloading it pursuant to underflow, the value you get is temporarily H'FFFF. But this counter value immediately changes to (reload value - 1) at the next clock edge.
- Because the internal circuit operation is synchronized to the count clock (prescaler output), a finite time equal to a prescaler delay is included before F/F starts operating after the timer is enabled.

10.4 TIO (Input/Output-related 16-bit Timer)

10.4.1 Outline of TIO

TIO (Timer Input/Output) is an input/output-related 16-bit timer, whose operation mode can be selected from the following by mode switching in software:

<Input mode>

- Measure clear input mode
- Measure free-run input mode
- Noise processing input mode

<Output mode without correction function>

- PWM output mode
- Single-shot output mode
- Delayed single-shot output mode
- Continuous output mode

The following shows TIO specifications. Figure 10.4.1 shows a TIO block diagram.

Table 10.4.1 Specifications of TIO (Input/Output-related 16-bit Timer)

Item	Specification
Number of channels	10 channels
Counter	16-bit down-counter
Reload register	16-bit reload register
Measure register	16-bit capture register
Timer startup	Started by writing to enable bit in software or by enabling with external input (rising/falling edge or both or high/low level)
Mode selection	<p><Input mode></p> <ul style="list-style-type: none"> • Measure clear input mode • Measure free-run input mode • Noise processing input mode <p><Output mode without correction function></p> <ul style="list-style-type: none"> • PWM output mode • Single-shot output mode • Delayed single-shot output mode • Continuous output mode
Interrupt generation	Can be generated by a counter underflow
DMA transfer request generation	Can be generated by a counter underflow (for only the TIO8)

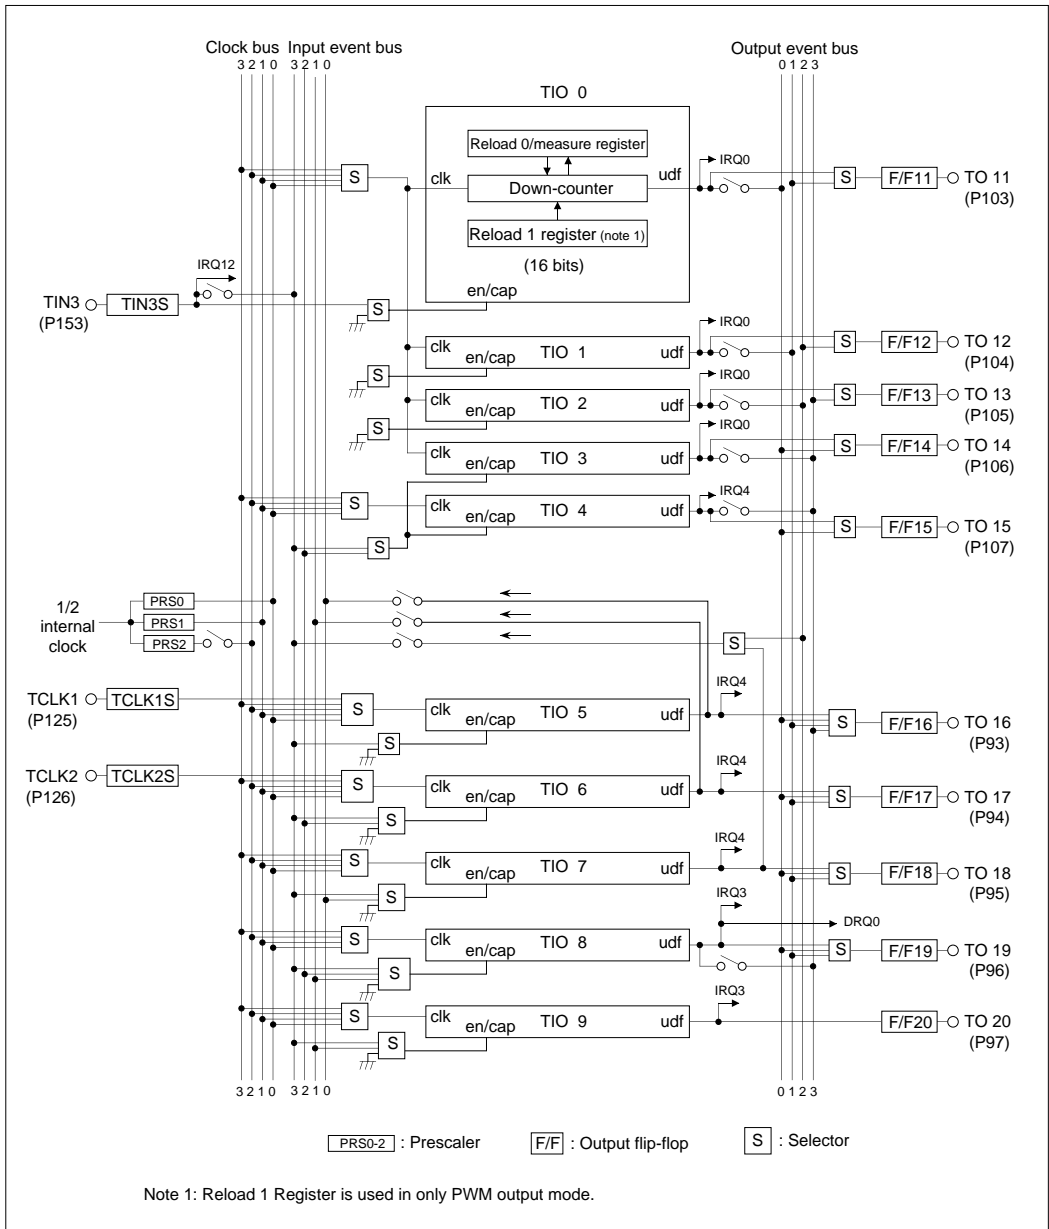

Figure 10.4.1 Block Diagram of TIO (Input/Output-related 16-bit Timer)

10.4.2 Outline of Each Mode of TIO

Each mode of TIO is outlined below. For each TIO channel, only one of the following modes can be selected.

(1) Measure clear/free-run input modes

In measure clear/free-run input modes, the timer measures a duration of time from when it starts counting till when an external capture signal is entered.

After the timer is enabled (by writing to the enable bit in software), the counter starts counting down synchronously with the count clock. When a capture signal is entered from an external device, the counter value at that point in time is written to a register called the "measure register."

Especially in measure clear input mode, the counter value is initialized to H'FFFF upon capture, from which the counter starts counting down again. In measure free-run mode, the counter continues counting down even after capture and upon underflow, recycles to H'FFFF, from which it starts counting down again.

To stop the counter, disable count by writing to the enable bit in software. An interrupt can be generated by a counter underflow or execution of measure operation. Also, a DMA transfer request (for only the TIO8) can be generated when the counter underflows.

(2) Noise processing input mode

In noise processing input mode, the timer detects the status of an input signal that it remained in the same state for over a predetermined time.

In noise processing input mode, the counter is started by entering a high or low-level signal from an external device and if the signal remains in the same state for over a predetermined time before the counter underflows, the counter stops after generating an interrupt. If the valid-level signal being applied turns to an invalid level before the counter underflows, the counter temporarily stops counting and when a valid-level signal is entered again, it is reloaded with the initial count and restarts counting.

The timer stops at the same time the counter underflows or count is disabled by writing to the enable bit. An interrupt as well as a DMA transfer request (for only the TIO8) can be generated by a counter underflow.

(3) PWM output mode (without correction function)

In PWM output mode, the timer uses two reload registers to generate a waveform with a given duty cycle.

When after setting the initial values in reload 0 and reload 1 registers, the timer is enabled (by writing to the enable bit in software or by external input), it loads the reload 0 register value into the counter synchronously with the count clock letting the counter start counting down. The first time the counter underflows, the reload 1 register value is loaded into the counter letting it continue counting. Thereafter, the counter is reloaded with the reload 0 and reload 1 register values alternately each time an underflow occurs.

The F/F output waveform in PWM output mode is inverted at count startup and upon each underflow. The timer stops at the same time count is disabled by writing to the enable bit (and not in synchronism with PWM output period). An interrupt can be generated when the counter underflows every even time (second time, fourth time, and so on) after being enabled. Also, a DMA transfer request (for only the TIO8) can be generated every time the counter underflows.

(4) Single-shot output mode (without correction function)

In single-shot output mode, the timer generates a pulse in width of (reload 0 register set value + 1) only once and stops.

When after setting the reload 0 register, the timer is enabled (by writing to the enable bit in software or by external input), it loads the content of reload 0 register into the counter synchronously with the count clock, letting the counter start counting. The counter counts down clock pulses and stops when it underflows after reaching the minimum count.

The F/F output waveform in single-shot output mode is inverted at startup and upon underflow, generating a single-shot pulse waveform in width of (reload 0 register set value + 1) only once. Also, an interrupt as well as a DMA transfer request (for only the TIO8) can be generated when the counter underflows.

(5) Delayed single-shot output mode (without correction function)

In delayed single-shot output mode, the timer generates a pulse in width of (reload 0 register set value + 1) only once, with the output delayed by an amount of time equal to (counter set value + 1) and then stops.

When after setting the counter and reload 0 register, the timer is enabled (by writing to the enable bit in software or by external input), it starts counting down from the counter's set value synchronously with the count clock. The first time the counter underflows, the reload 0 register value is loaded into the counter causing it to continue counting down, and the counter stops when it underflows next time.

The F/F output waveform in delayed single-shot output mode is inverted when the counter underflows first time and next, generating a single-shot pulse waveform in width of (reload 0 register set value + 1) only once, with the output delayed by an amount of time equal to (first set value of counter + 1). Also, an interrupt and a DMA transfer request (for only the TIO8) can be generated when the counter underflows first time and next.

(6) Continuous output mode (without correction function)

In continuous output mode, the timer counts down clock pulses starting from the set value of the counter and when the counter underflows, reloads it with the reload 0 register value. Thereafter, this operation is repeated each time the counter underflows, thus generating consecutive pulses in width of (reload 0 register set value + 1).

When after setting the counter and reload 0 register, the timer is enabled (by writing to the enable bit in software or by external input), it starts counting down from the counter's set value synchronously with the count clock and when the minimum count is reached, generates an underflow. This underflow causes the counter to be reloaded with the content of reload 0 register and start counting over again. Thereafter, this operation is repeated each time an underflow occurs. To stop the counter, disable count by writing to the enable bit in software.

The F/F output waveform in continuous output mode is inverted at startup and upon underflow, generating consecutive pulses until the timer stops counting. Also, an interrupt as well as a DMA transfer request (for only the TIO8) can be generated each time the counter underflows.

<Count clock-dependent delay>

- Because the timer operates synchronously with the count clock, there is a count clock-dependent delay from when the timer is enabled till it actually starts operating. In operation mode where the F/F output is inverted when the timer is enabled, the F/F output is inverted synchronously with the count clock.

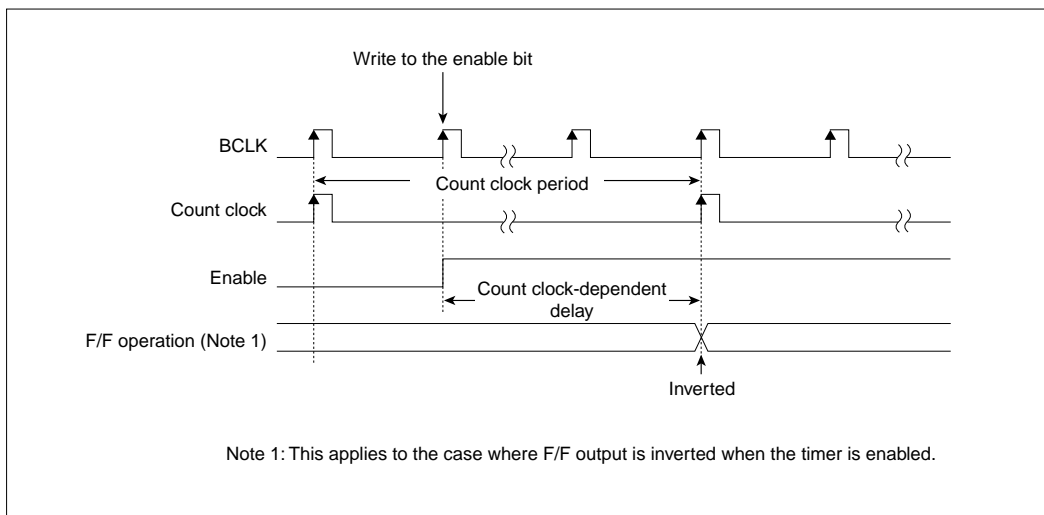

Figure 10.4.2 Count Clock Dependent Delay

10.4.3 TIO Related Register Map

The diagram below shows a TIO related register map.

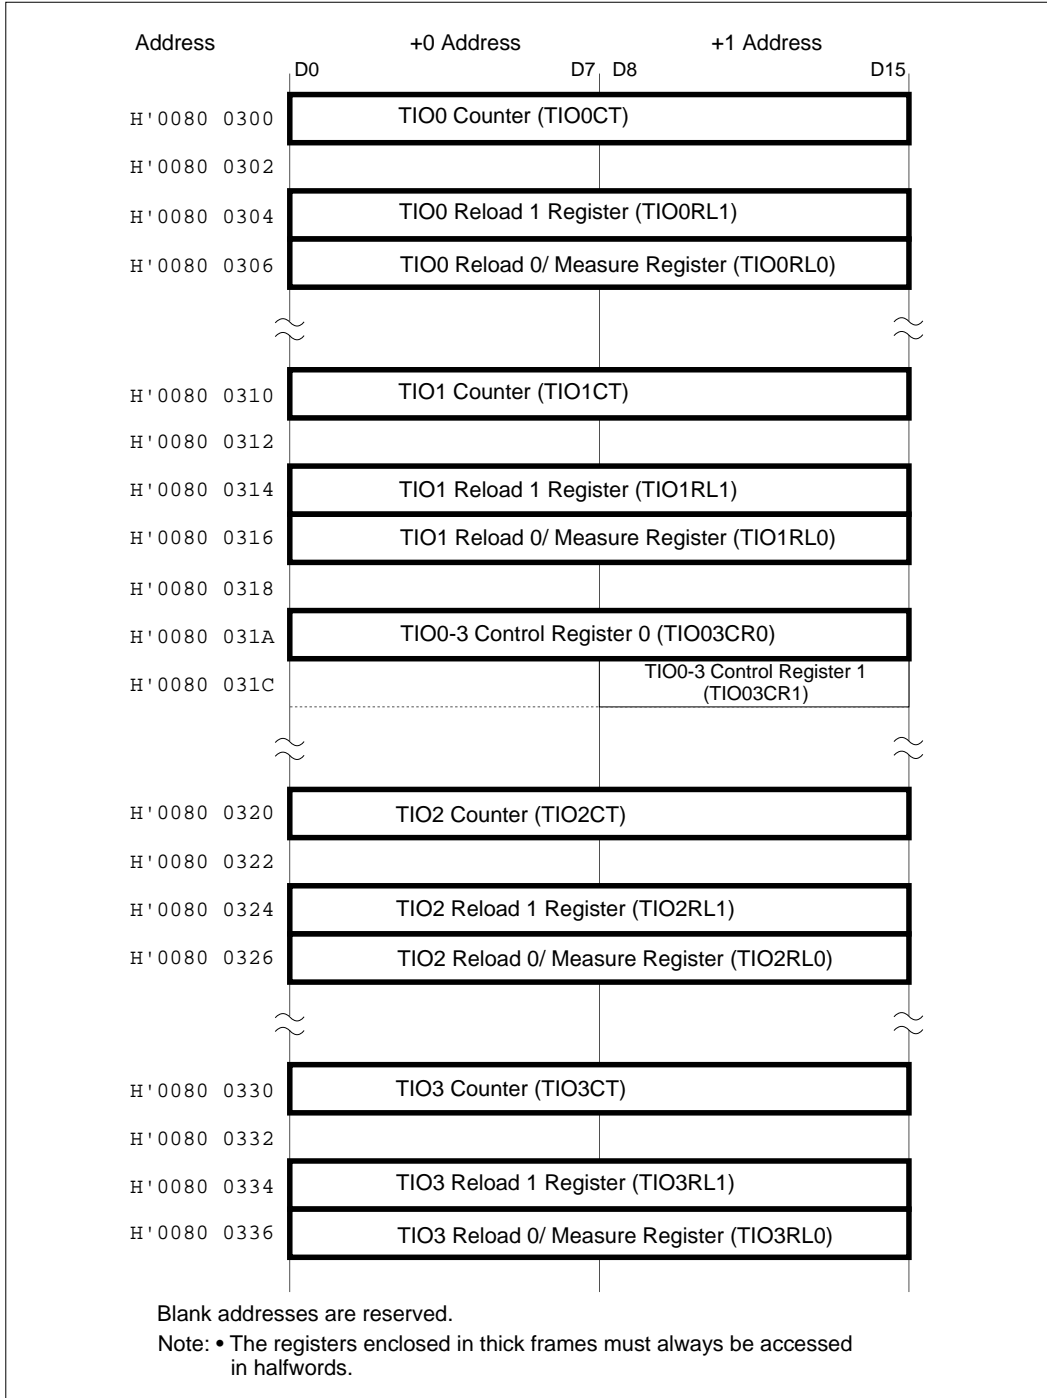

Figure 10.4.3 TIO Related Register Map (1/3)

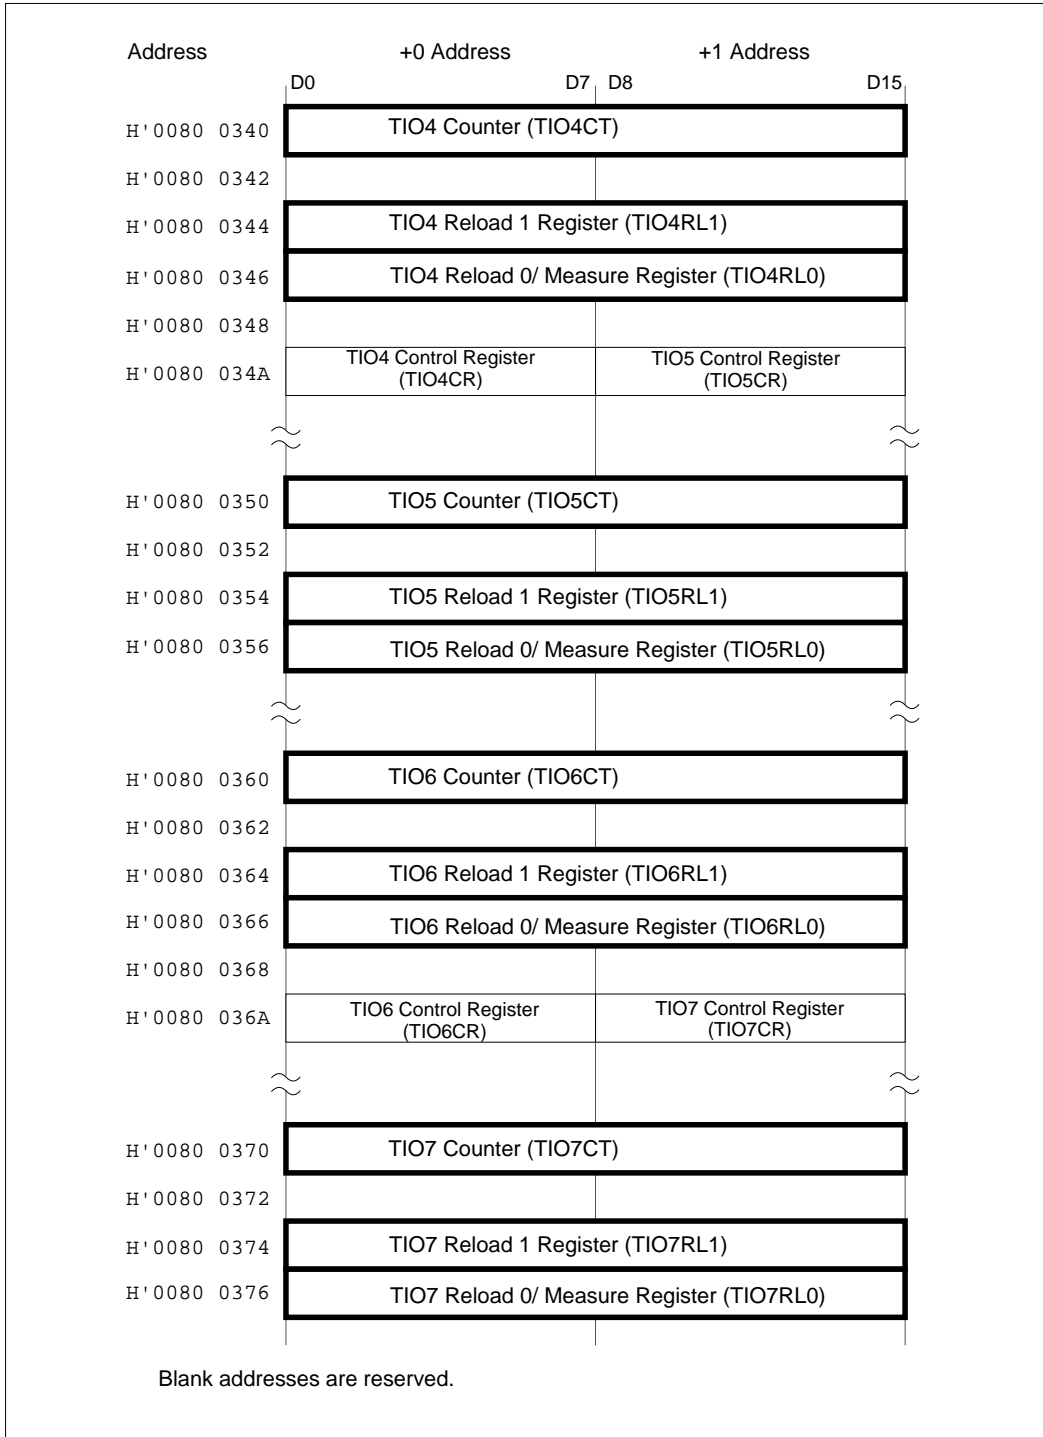

Figure 10.4.4 TIO Related Register Map (2/3)

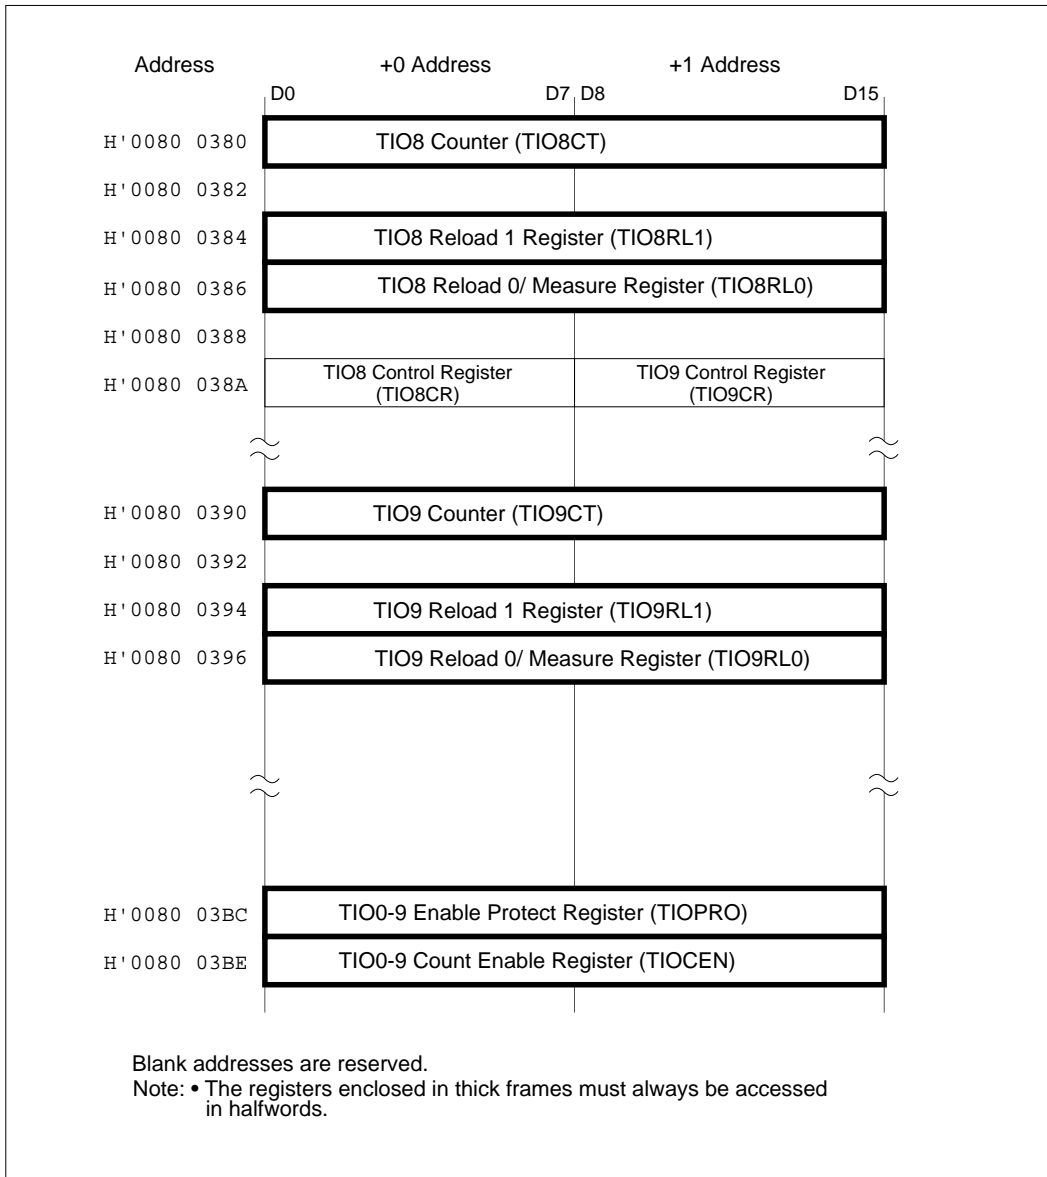

Figure 10.4.5 TIO Related Register Map (3/3)

10.4.4 TIO Control Registers

The TIO control registers are used to select TIO0-9 operation modes (measure input, noise processing input, PWM output, single-shot output, delayed single-shot output, or continuous output mode), as well as select the counter enable and counter clock sources. Following eight TIO control registers are provided for each timer group.

- TIO0-3 Control Register 0 (TIO03CR0)
- TIO0-3 Control Register 1 (TIO03CR1)
- TIO4 Control Register (TIO4CR)

- TIO5 Control Register (TIO5CR)
- TIO6 Control Register (TIO6CR)
- TIO7 Control Register (TIO7CR)
- TIO8 Control Register (TIO8CR)
- TIO9 Control Register (TIO9CR)

■ TIO0-3 Control Register 0 (TIO3CR0)

<Address:H'0080 031A>

<When reset:H'0000>

D	Bit Name	Function	R	W
0	TIO3EEN (TIO3 external input enable) (Note 1)	0: Disables external input 1: Enables external input	<input type="radio"/>	<input type="radio"/>
1-3	TIO3M (TIO3 operation mode selection)	000: Single-shot output mode 001: Delayed single-shot output mode 010: Continuous output mode 011: PWM output mode 100: Measure clear input mode 101: Measure free-run input mode 11X: Noise processing input mode	<input type="radio"/>	<input type="radio"/>
4	TIO2ENS (reserved)	Setting this bit has no effect	<input type="radio"/>	<input type="radio"/>
5-7	TIO2M (TIO2 operation mode selection) (Note 2)	000: Single-shot output mode 001: Delayed single-shot output mode 010: Continuous output mode 011: PWM output mode 100: Measure clear input mode 101: Measure free-run input mode 11X: Use inhibited	<input type="radio"/>	<input type="radio"/>
8	TIO1ENS (reserved)	Setting this bit has no effect	<input type="radio"/>	<input type="radio"/>

(Continues to the next page)

Note 1: To select TIO3 enable/measurement input source, use the TIO4 Control Register TIO34ENS (TIO3,4 enable/measurement input source select) bits.

Note 2: Even when this bit is 0 (external input disabled) during measurement (free-run/clear) input mode, if a capture signal is entered from an external device, the counter value at that point in time is written to the measurement register. However, because if this bit is 0 (external input disabled) during measurement clear input mode, the counter value may not be initialized (H'FFFF) upon capturing, make sure this bit = 1 (external input enabled) before using the measurement clear function.

- Notes:
- During measurement (free-run/clear) input mode, the TIO1 and TIO2 timers do not have the capture function.
 - This register must always be accessed in half word.
 - Always make sure the counter has stopped and is idle before setting or changing operation modes.

(Continued from the preceding page)

D	Bit Name	Function	R	W
9-11	TIO1M (TIO1 operation mode selection)	000: Single-shot output mode 001: Delayed single-shot output mode 010: Continuous output mode 011: PWM output mode 100: Measure clear input mode 101: Measure free-run input mode 11X: Use inhibited	○	○
12	TIO0ENS (TIO0 enable/ measure input source selection)	0: No selection 1: External input TIN3	○	○
13-15	TIO0M (TIO0 operation mode selection)	000: Single-shot output mode 001: Delayed single-shot output mode 010: Continuous output mode 011: PWM output mode 100: Measure clear input mode 101: Measure free-run input mode 11X: Noise processing input mode	○	○

Notes: • This register must always be accessed in halfwords.

- Always make sure the counter has stopped and is idle before setting or changing operation modes.

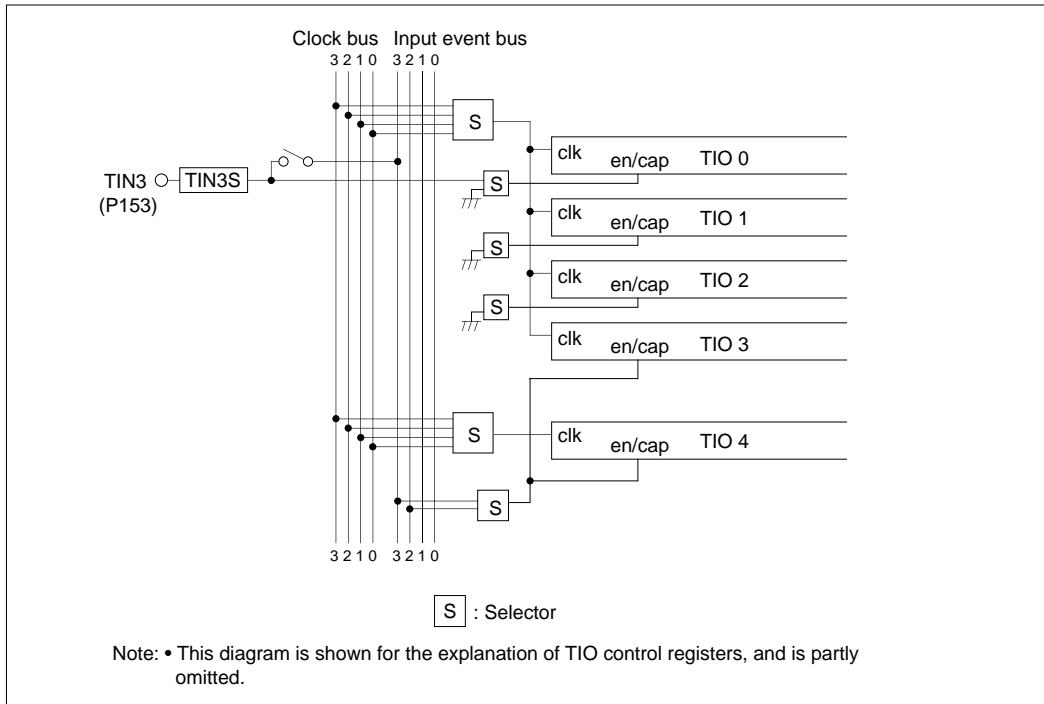

Figure 10.4.6 Outline Diagram of TIO0-4 Clock/Enable Inputs

■ TIO0-3 Control Register 1 (TIO03CR1)

<Address:H'0080 031D>

<When reset:H'00>

10.4.5 TIO Counter (TIO0CT-TIO9CT)

- TIO0 Counter (TIO0CT) <Address:H'0080 0300>
- TIO1 Counter (TIO1CT) <Address:H'0080 0310>
- TIO2 Counter (TIO2CT) <Address:H'0080 0320>
- TIO3 Counter (TIO3CT) <Address:H'0080 0330>
- TIO4 Counter (TIO4CT) <Address:H'0080 0340>
- TIO5 Counter (TIO5CT) <Address:H'0080 0350>
- TIO6 Counter (TIO6CT) <Address:H'0080 0360>
- TIO7 Counter (TIO7CT) <Address:H'0080 0370>
- TIO8 Counter (TIO8CT) <Address:H'0080 0380>
- TIO9 Counter (TIO9CT) <Address:H'0080 0390>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0-15	TIO0CT-TIO9CT	16-bit counter value	○	△

W=△ : Write to this register is not accepted in PWM output mode.

Note: • This register must always be accessed in halfwords.

The TIO Counters are a 16-bit down-counter. After the timer is enabled (by writing to the enable bit in software or by external input), the counter starts counting synchronously with the count clock.

The counter cannot be written to during PWM output mode.

10.4.6 TIO Reload 0/ Measure Register (TIO0RL0-TIO9RL0)

■ TIO0 Reload 0/ Measure Register (TIO0RL0)	<Address:H'0080 0306>
■ TIO1 Reload 0/ Measure Register (TIO1RL0)	<Address:H'0080 0316>
■ TIO2 Reload 0/ Measure Register (TIO2RL0)	<Address:H'0080 0326>
■ TIO3 Reload 0/ Measure Register (TIO3RL0)	<Address:H'0080 0336>
■ TIO4 Reload 0/ Measure Register (TIO4RL0)	<Address:H'0080 0346>
■ TIO5 Reload 0/ Measure Register (TIO5RL0)	<Address:H'0080 0356>
■ TIO6 Reload 0/ Measure Register (TIO6RL0)	<Address:H'0080 0366>
■ TIO7 Reload 0/ Measure Register (TIO7RL0)	<Address:H'0080 0376>
■ TIO8 Reload 0/ Measure Register (TIO8RL0)	<Address:H'0080 0386>
■ TIO9 Reload 0/ Measure Register (TIO9RL0)	<Address:H'0080 0396>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0-15	TIO0RL0-TIO9RL0	16-bit reload register value	○	△

W=△ : Write to this register is not accepted in measure input mode.

Note: • This register must always be accessed in halfwords.

The TIO Reload 0/ Measure Registers serve dual purposes as a register for reloading TIO Count Registers (TIO0CT-TIO9CT) with data, and as a measure register during measure input mode. These registers are disabled against write during measure input mode.

It is in the following cases that the content of reload 0 register is loaded into the counter:

- When after the counter started counting in noise processing input mode, the input signal is inverted and a valid-level signal is entered again before the counter underflows
- When the counter is enabled in single-shot mode
- When the counter underflowed in delayed single-shot or continuous mode
- When the counter is enabled in PWM mode and when the counter value set by reload 1 register underflowed

Writing data to the reload 0 register does not mean that the data is loaded into the counter simultaneously.

When used as a measure register, the counter value is latched into the measure register by an event input.

10.4.7 TIO Reload 1 Registers (TIO0RL1-TIO9RL1)

■ TIO0 Reload 1 Register (TIO0RL1)	<Address:H'0080 0304>
■ TIO1 Reload 1 Register (TIO1RL1)	<Address:H'0080 0314>
■ TIO2 Reload 1 Register (TIO2RL1)	<Address:H'0080 0324>
■ TIO3 Reload 1 Register (TIO3RL1)	<Address:H'0080 0334>
■ TIO4 Reload 1 Register (TIO4RL1)	<Address:H'0080 0344>
■ TIO5 Reload 1 Register (TIO5RL1)	<Address:H'0080 0354>
■ TIO6 Reload 1 Register (TIO6RL1)	<Address:H'0080 0364>
■ TIO7 Reload 1 Register (TIO7RL1)	<Address:H'0080 0374>
■ TIO8 Reload 1 Register (TIO8RL1)	<Address:H'0080 0384>
■ TIO9 Reload 1 Register (TIO9RL1)	<Address:H'0080 0394>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0-15	TIO0RL1-TIO9RL1	16-bit reload register value	○	○

Note: • This register must always be accessed in halfwords.

The TIO Reload 1 Registers are used to reload data into the TIO Counter Registers (TIO0CT-TIO9CT).

The content of reload 1 register is loaded into the counter in the following cases:

- When the count value set by reload 0 register underflowed in PWM output mode

Writing data to the reload 1 register does not mean that the data is loaded into the counter simultaneously.

10.4.8 TIO Enable Control Registers

■ TIO0-9 Enable Protect Register (TIOPRO)

<Address:H'0080 03BC>

<When reset:H'0000>

D	Bit Name	Function	R	W
0-5	No functions assigned		0	-
6	TIO9PRO (TIO9 Enable Protect)	0: Enables rewrite	○	○
7	TIO8PRO (TIO8 Enable Protect)	1: Disables rewrite		
8	TIO7PRO (TIO7 Enable Protect)			
9	TIO6PRO (TIO6 Enable Protect)			
10	TIO5PRO (TIO5 Enable Protect)			
11	TIO4PRO (TIO4 Enable Protect)			
12	TIO3PRO (TIO3 Enable Protect)			
13	TIO2PRO (TIO2 Enable Protect)			
14	TIO1PRO (TIO1 Enable Protect)			
15	TIO0PRO (TIO0 Enable Protect)			

Note: • This register must always be accessed in halfwords.

The TIO0-9 Enable Protect Register controls rewriting of the TIO count enable bit described in the next page by enabling or disabling rewrite.

■ TIO0-9 Count Enable Register (TIOCEN)

<Address:H'0080 03BE>

<When reset:H'0000>

D	Bit Name	Function	R	W
0-5	No functions assigned		0	-
6	TIO9CEN (TIO9 count enable)	0: Stops count	○	○
7	TIO8CEN (TIO8 count enable)	1: Enables count		
8	TIO7CEN (TIO7 count enable)			
9	TIO6CEN (TIO6 count enable)			
10	TIO5CEN (TIO5 count enable)			
11	TIO4CEN (TIO4 count enable)			
12	TIO3CEN (TIO3 count enable)			
13	TIO2CEN (TIO2 count enable)			
14	TIO1CEN (TIO1 count enable)			
15	TIO0CEN (TIO0 count enable)			

Note: • This register must always be accessed in halfwords.

The TIO0-9 Count Enable Register controls operation of TIO counters. To enable the counter in software, enable the relevant TIO0-9 Enable Protect Register for write and set the count enable bit by writing a 1. To stop the counter, enable the TIO0-9 Enable Protect Register for write and reset the count enable bit by writing a 0.

In all but continuous mode, when the counter stops due to an occurrence of underflow, the count enable bit is automatically reset to 0. Therefore, what you get by reading the TIO0-9 Count Enable Register is the status that indicates the counter's operating status (active or idle).

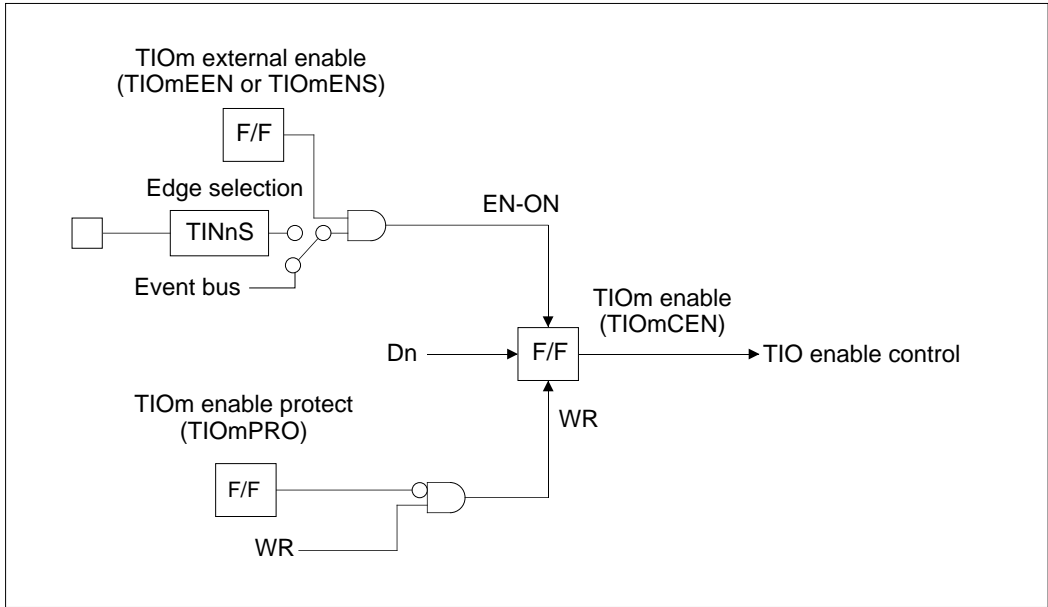

Figure 10.4.8 Configuration of the TIO Enable Circuit

10.4.9 Operation in TIO Measure Free-run/Clear Input Modes

(1) Outline of TIO measure free-run/clear input modes

In TIO measure free-run/clear input modes, the timer measures a duration of time from when it starts counting till when an external capture signal is entered. An interrupt can be generated by a counter underflow or execution of measure operation. Also, a DMA transfer request (for only the TIO8) can be generated when the counter underflows.

After the timer is enabled (by writing to the enable bit in software), the counter starts counting down synchronously with the count clock. When a capture signal is entered from an external device, the counter value at that point in time is written to the measure register.

Especially in measure clear input mode, the counter value is initialized to H'FFFF upon capture, from which the counter starts counting down again. When the counter underflows after reaching the minimum count, it starts counting down from H'FFFF again. In measure free-run input mode, the counter continues counting down even after capture and upon underflow, recycles to H'FFFF, from which it starts counting down again.

To stop the counter, disable count by writing to the enable bit in software.

Figure 10.4.9 Typical Operation in Measure Free-run Input Mode

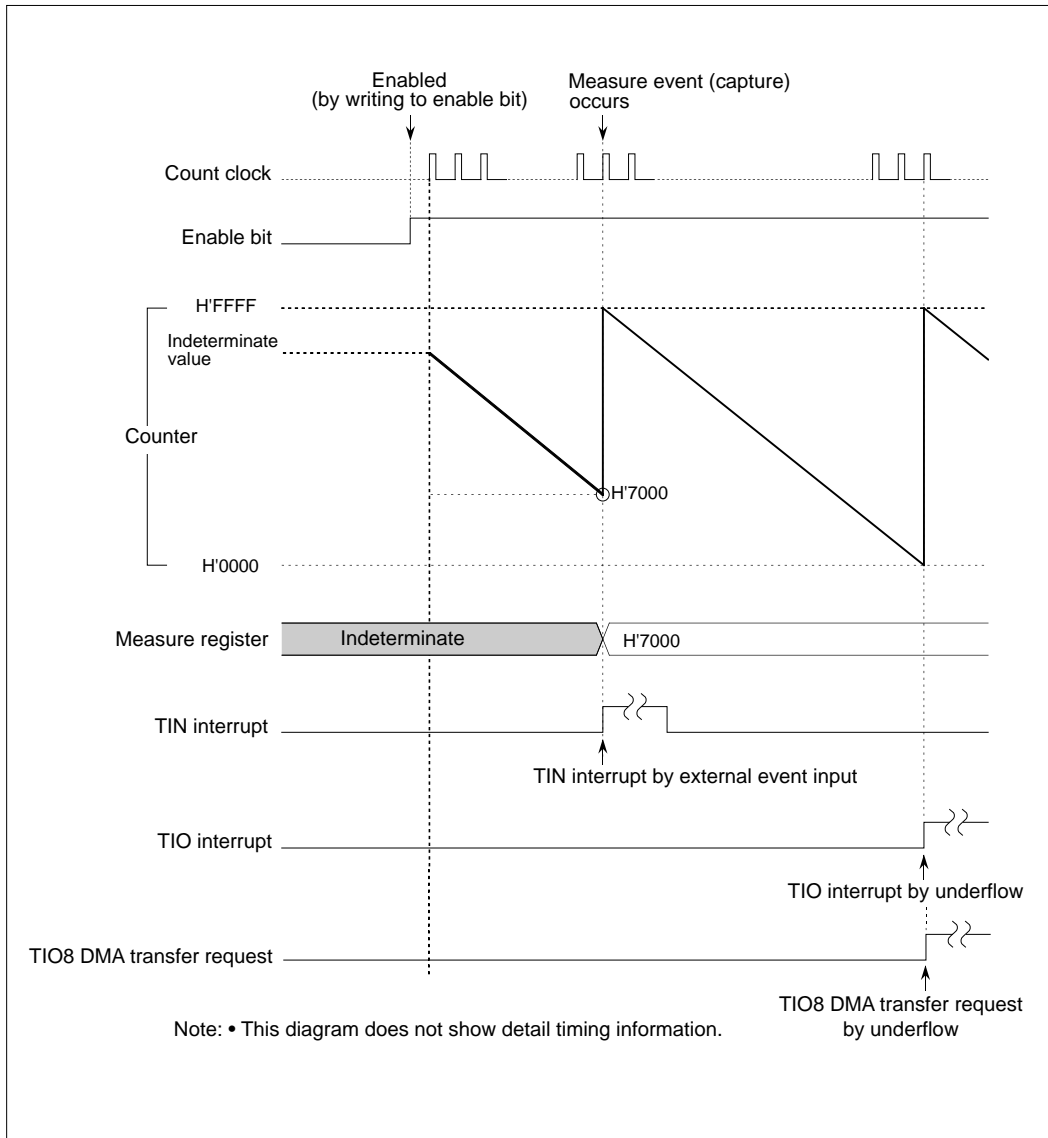

Figure 10.4.10 Typical Operation in Measure Clear Input Mode

(2) Precautions to be observed when using TIO measure free-run/clear input modes

The following describes precautions to be observed when using TIO measure free-run/clear input modes.

- If measure event input and write to the counter occur simultaneously in the same clock period, the write value is set in the counter while at the same time latched into the measure register.

10.4.10 Operation in TIO Noise Processing Input Mode

In noise processing input mode, the timer detects the status of an input signal that it remained in the same state for over a predetermined time.

In noise processing input mode, the counter is started by entering a high or low-level signal from an external device and if the signal remains in the same state for over a predetermined time before the counter underflows, the counter stops after generating an interrupt. If the valid-level signal being applied turns to an invalid level before the counter underflows, the counter temporarily stops counting and when a valid-level signal is entered again, it is reloaded with the initial count and restarts counting. The valid count value is (reload 0 register set value + 1).

The timer stops at the same time the counter underflows or count is disabled by writing to the enable bit.

Also, an interrupt as well as a DMA transfer request (for only the TIO8) can be generated by a counter underflow.

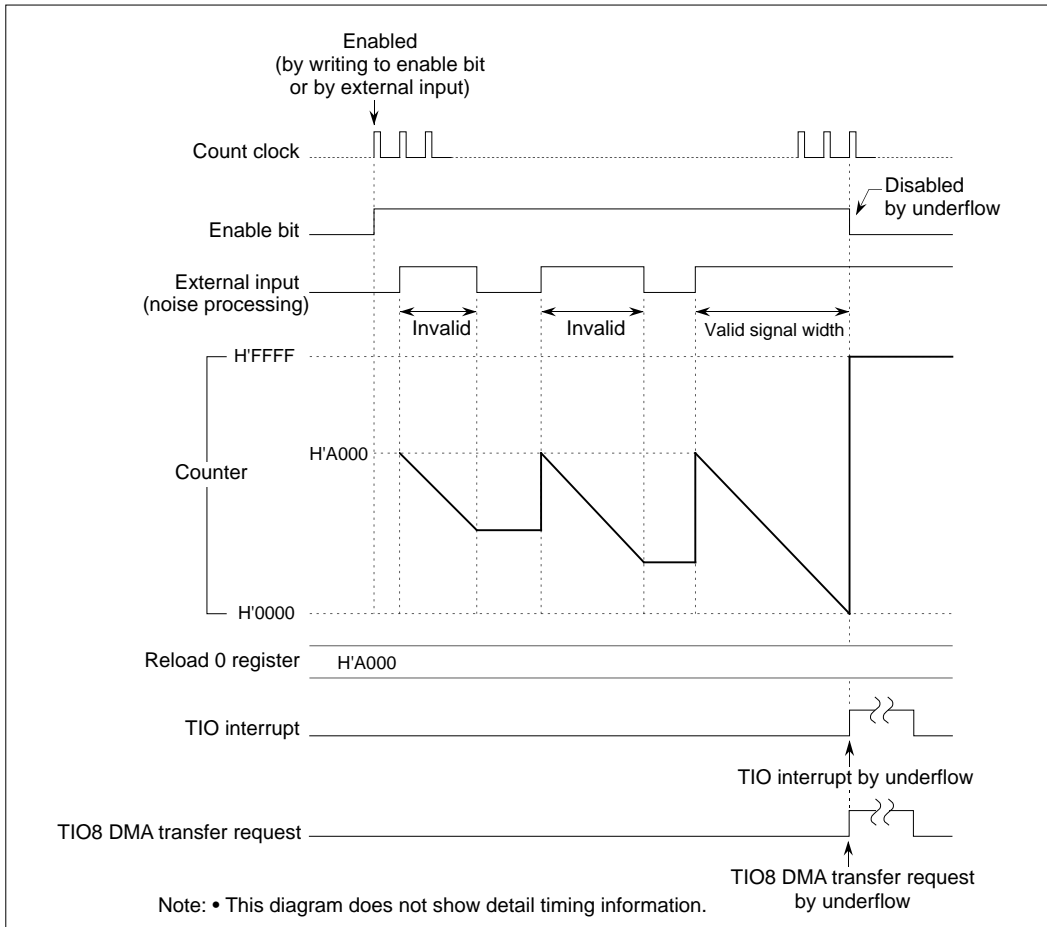

Figure 10.4.11 Typical Operation in Noise Processing Input Mode

10.4.11 Operation in TIO PWM Output Mode

(1) Outline of TIO PWM output mode

In PWM output mode, the timer uses two reload registers to generate a waveform with a given duty cycle.

When after setting the initial values in reload 0 and reload 1 registers, the timer is enabled (by writing to the enable bit in software or by external input), it loads the reload 0 register value into the counter synchronously with the count clock letting the counter start counting down. The first time the counter underflows, the reload 1 register value is loaded into the counter letting it continue counting. Thereafter, the counter is reloaded with the reload 0 and reload 1 register values alternately each time an underflow occurs. The valid count values are (reload 0 register set value + 1) and (reload 1 register set value + 1). The timer stops at the same time count is disabled by writing to the enable bit (and not in synchronism with PWM output period).

The F/F output waveform in PWM output mode is inverted (F/F output levels change from low to high, or vice versa) at count startup and upon each underflow. An interrupt can be generated when the counter underflows every even time (second time, fourth time, and so on) after being enabled. Also, a DMA transfer request (for only the TIO8) can be generated every time the counter underflows.

Note that TIO's PWM output mode does not have the correction function.

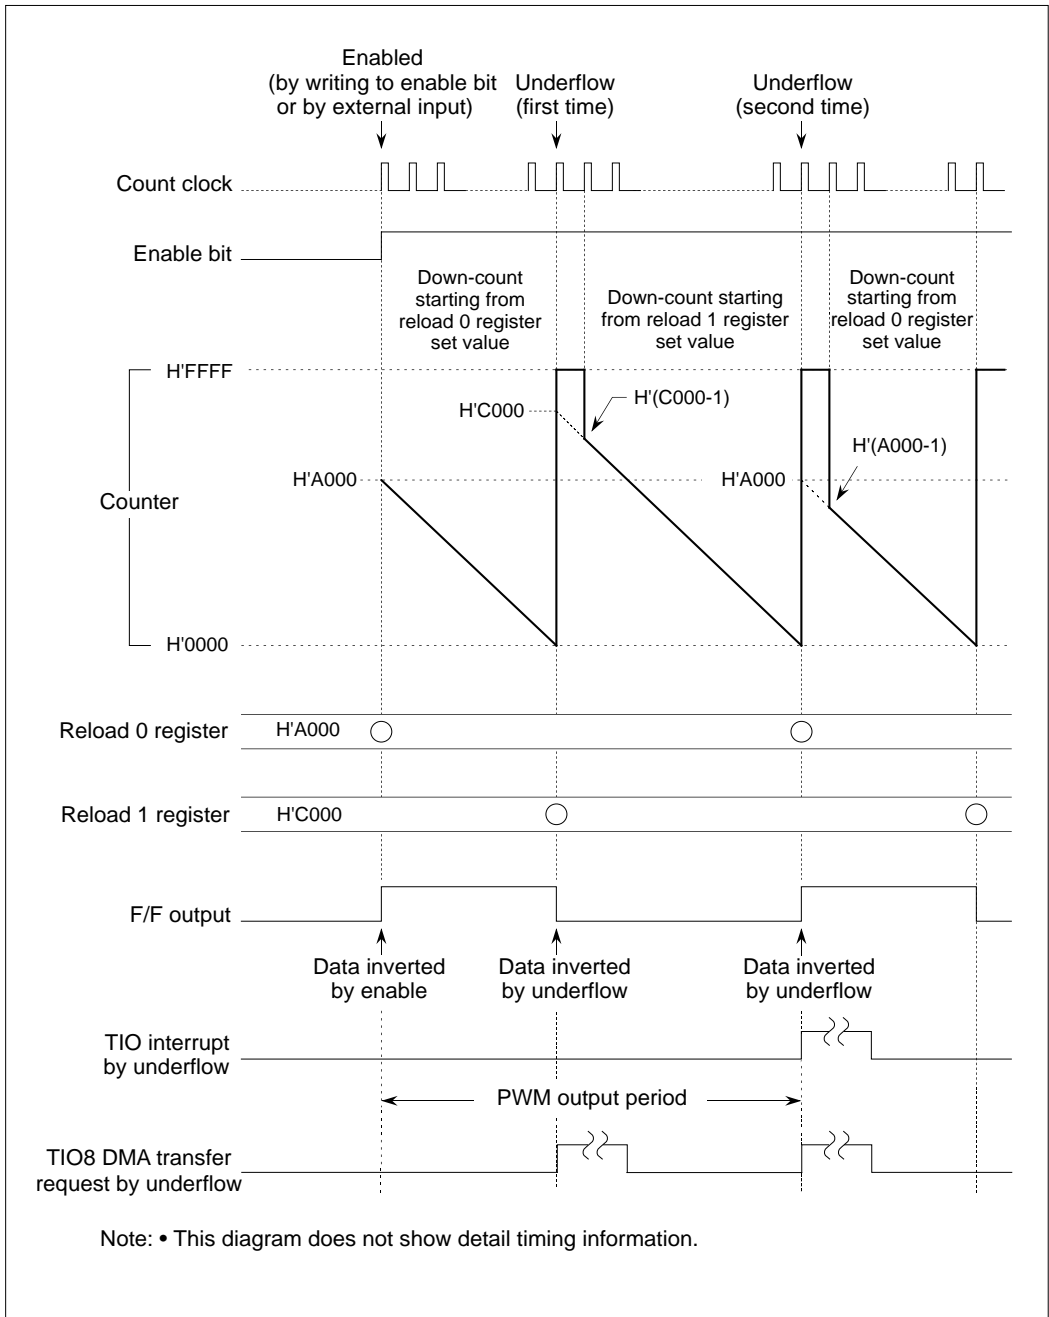

Figure 10.4.12 Typical Operation in PWM Output Mode

(2) Reload register updates in TIO PWM output mode

In PWM output mode, when the timer remains idle, reload 0 and reload 1 registers are updated at the same time data are written to the registers. But when the timer is active, reload 1 register is updated by updating reload 0 register. However, when you read reload 0 and reload 1 registers, the values you get are always the data written to the registers.

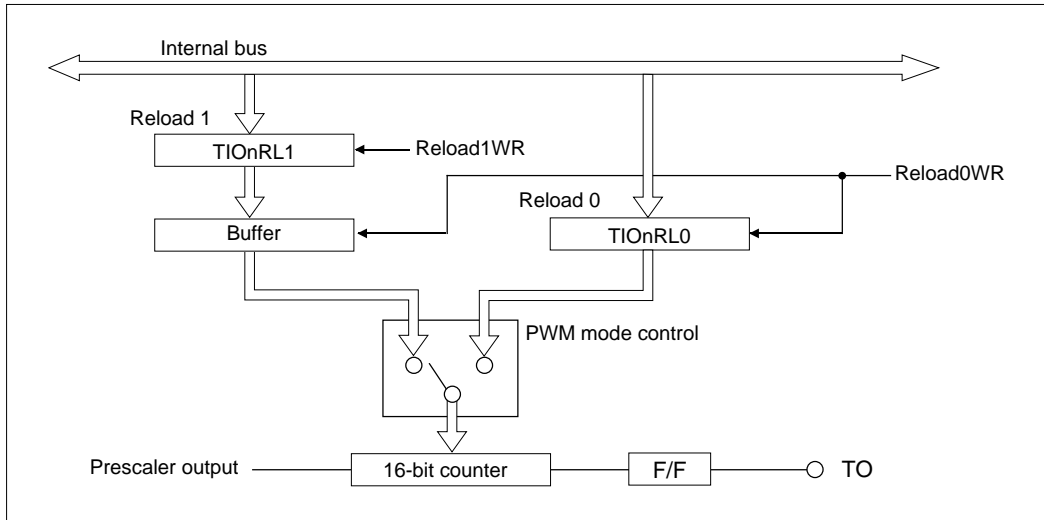

Figure 10.4.13 PWM Circuit Diagram

If you want to rewrite reload 0 and reload 1 registers while the timer is operating, rewrite reload 1 register first and then reload 0 register. In this way, reload 0 and reload 1 registers both are updated synchronously with PWM periods, from which the timer starts operating again. This operation can normally be performed collectively by accessing register addresses wordwise (in 32 bits) beginning with that of reload 1 register. (Data are automatically written to reload 1 and then reload 0 registers in succession.)

If you update the reload registers in reverse by updating reload 0 register first and then reload 1 register, only reload 0 register is updated. when you read reload 0 and reload 1 registers, the values you get are always the data written to the registers, and not the reload values being actually used.

Note that when updating the PWM period, if the PWM period is terminated before you finished writing to reload 0, the PWM period is not updated in the current period and what you've set is reflected in the next period.

(3) Precautions on using TIO PWM output mode

The following describes precautions to be observed when using TIO PWM output mode.

- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority so that count is disabled.
- If the counter is accessed for read immediately after being reloaded pursuant to an underflow, the counter value temporarily reads as H'FFFF but immediately changes to (reload value – 1) at the next clock edge.
- Because the timer operates synchronously with the count clock, a count clock-dependent delay is included before F/F output is inverted after the timer is enabled.

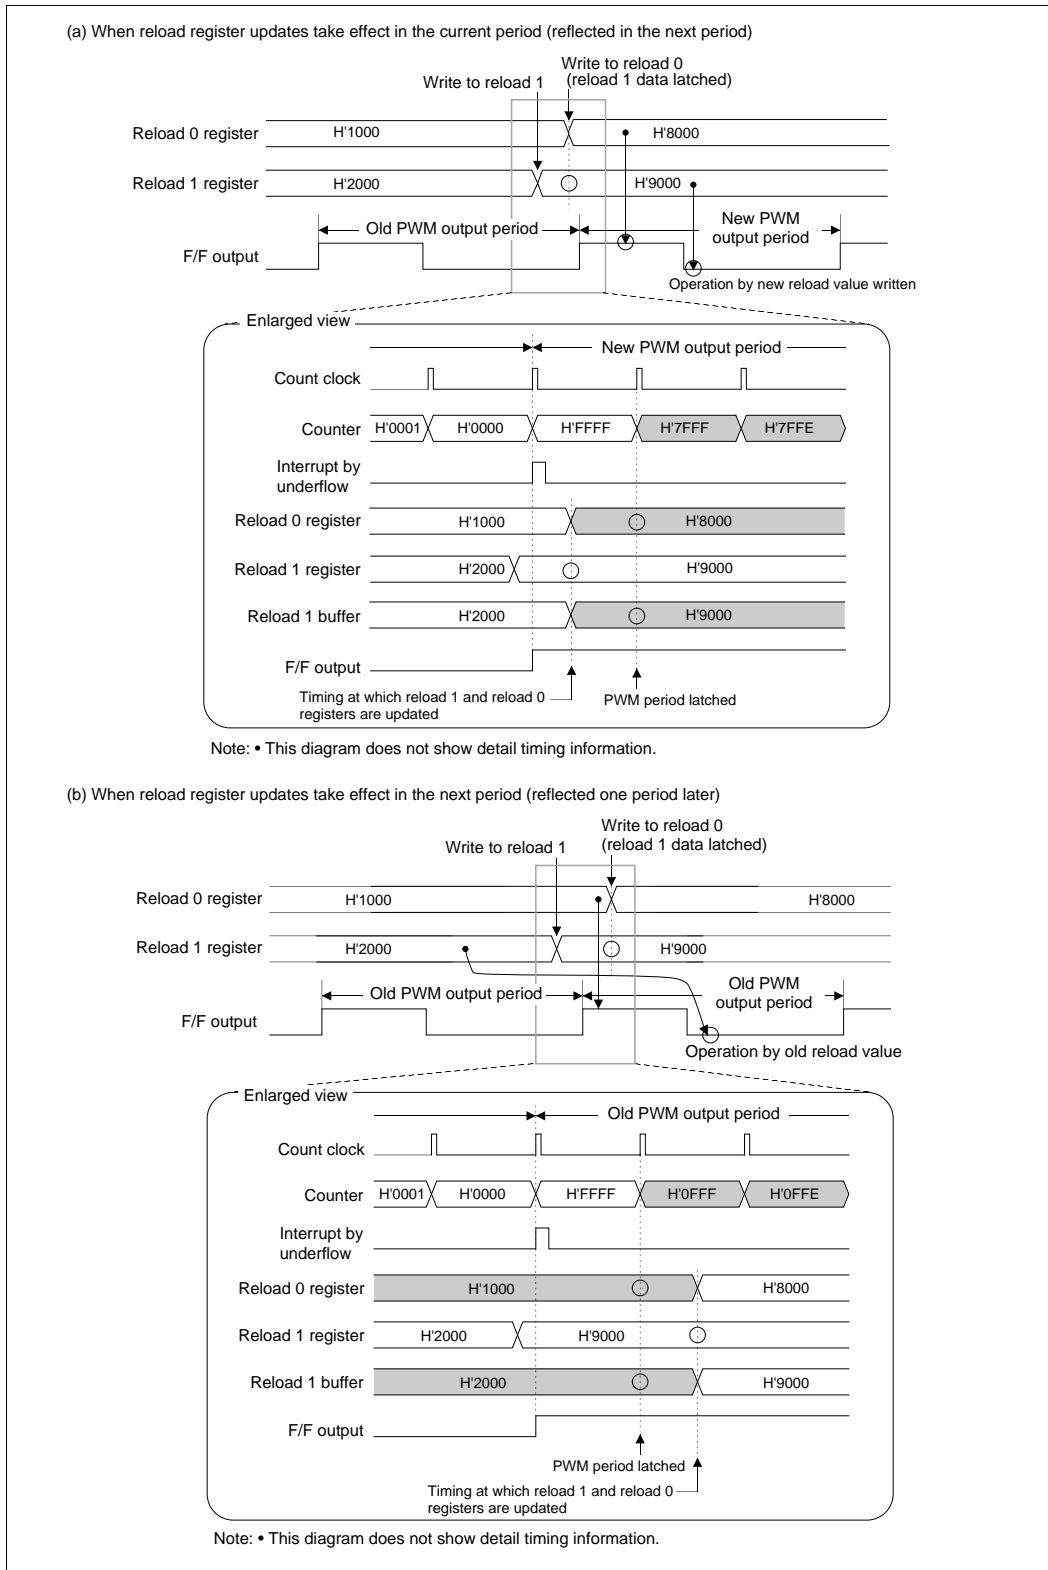

Figure 10.4.14 Reload 0 and Reload 1 Register Updates in PWM Output Mode

10.4.12 Operation in TIO Single-shot Output Mode (without Correction Function)

(1) Outline of TIO single-shot output mode

In single-shot output mode, the timer generates a pulse in width of (reload 0 register set value + 1) only once and stops.

When after setting the reload 0 register, the timer is enabled (by writing to the enable bit in software or by external input), it loads the content of reload 0 register into the counter synchronously with the count clock, letting the counter start counting. The counter counts down clock pulses and stops when it underflows after reaching the minimum count.

The F/F output waveform in single-shot output mode is inverted (F/F output levels change from low to high, or vice versa) at startup and upon underflow, generating a single-shot pulse waveform in width of (reload 0 register set value + 1) only once. Also, an interrupt as well as a DMA transfer request (for only the TIO8) can be generated when the counter underflows.

The count value is (reload 0 register set value + 1). For details about count operation, also refer to Section 10.3.9, "Operation in TOP Single-shot Output Mode (with Correction Function)."

(2) Precautions to be observed when using TIO single-shot output mode

The following describes precautions to be observed when using TIO single-shot output mode.

- If the counter stops due to underflow in the same clock period as the timer is enabled by external input, the former has priority (so that the counter stops).
- If the counter stops due to underflow in the same clock period as count is enabled by writing to the enable bit, the latter has priority (so that count is enabled).
- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority (so that count is disabled).
- Because the internal circuit operation is synchronized to the count clock (prescaler output), a finite time equal to a prescaler delay is included before F/F starts operating after the timer is enabled.

Figure 10.4.15 Typical Operation in TIO Single-shot Output Mode (without Correction Function)

10.4.13 Operation in TIO Delayed Single-shot Output Mode (without Correction Function)

(1) Outline of TIO delayed single-shot output mode

In delayed single-shot output mode, the timer generates a pulse in width of (reload 0 register set value + 1) only once, with the output delayed by an amount of time equal to (counter set value + 1) and then stops without performing any operation.

When after setting the counter and reload 0 register, the timer is enabled (by writing to the enable bit in software or by external input), it starts counting down from the counter's set value synchronously with the count clock. The first time the counter underflows, the reload 0 register value is loaded into the counter causing it to continue counting down, and the counter stops when it underflows next time.

The F/F output waveform in delayed single-shot output mode is inverted (F/F output levels change from low to high, or vice versa) when the counter underflows first time and next, generating a single-shot pulse waveform in width of (reload 0 register set value + 1) only once, with the output delayed by an amount of time equal to (first set value of counter + 1). Also, an interrupt and a DMA transfer request (for only the TIO8) can be generated when the counter underflows first time and next .

The valid count values are the (counter set value + 1) and (reload 0 register set value + 1). For details about count operation, also see Section 10.3.10, "Operation in TOP Delayed Single-shot Output Mode."

(2) Precautions to be observed when using TIO delayed single-shot output mode

The following describes precautions to be observed when using TIO delayed single-shot output mode.

- If the counter stops due to underflow in the same clock period as the timer is enabled by external input, the former has priority (so that the counter stops).
- If the counter stops due to underflow in the same clock period as count is enabled by writing to the enable bit, the latter has priority (so that count is enabled).
- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority (so that count is disabled).
- When you read the counter immediately after reloading it pursuant to underflow, the value you get is temporarily H'FFFF. But this counter value immediately changes to (reload value - 1) at the next clock edge.
- Because the internal circuit operation is synchronized to the count clock (prescaler output), a finite time equal to a prescaler delay is included before F/F starts operating after the timer is enabled.

Figure 10.4.16 Typical Operation in TIO Delayed Single-shot Output Mode (without Correction Function)

10.4.14 Operation in TIO Continuous Output Mode (Without Correction Function)

(1) Outline of TIO continuous output mode

In continuous output mode, the timer counts down clock pulses starting from the set value of the counter and when the counter underflows, reloads it with reload 0 register value. Thereafter, this operation is repeated each time the counter underflows, thus generating consecutive pulses whose waveform is inverted in width of (reload 0 register set value + 1).

When after setting the counter and reload 0 register, the timer is enabled (by writing to the enable bit in software or by external input), it starts counting down from the counter's set value synchronously with the count clock and when the minimum count is reached, generates an underflow. This underflow causes the counter to be reloaded with the content of reload 0 register and start counting over again. Thereafter, this operation is repeated each time an underflow occurs. To stop the counter, disable count by writing to the enable bit in software.

The F/F output waveform in continuous output mode is inverted (F/F output levels change from low to high, or vice versa) at startup and upon underflow, generating consecutive pulses until the timer stops counting. Also, an interrupt as well as a DMA transfer request (for only the TIO8) can be generated each time the counter underflows.

The valid count values are the (counter set value + 1) and (reload 0 register set value + 1). For details about count operation, also see Section 10.3.11, "Operation in TOP Continuous Output Mode (Without Correction Function) ."

(2) Precautions to be observed when using TIO continuous output mode

The following describes precautions to be observed when using TIO continuous output mode.

- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority (so that count is disabled).
- When you read the counter immediately after reloading it pursuant to underflow, the value you get is temporarily H'FFFF. But this counter value immediately changes to (reload value - 1) at the next clock edge.
- Because the internal circuit operation is synchronized to the count clock (prescaler output), a finite time equal to a prescaler delay is included before F/F starts operating after the timer is enabled.

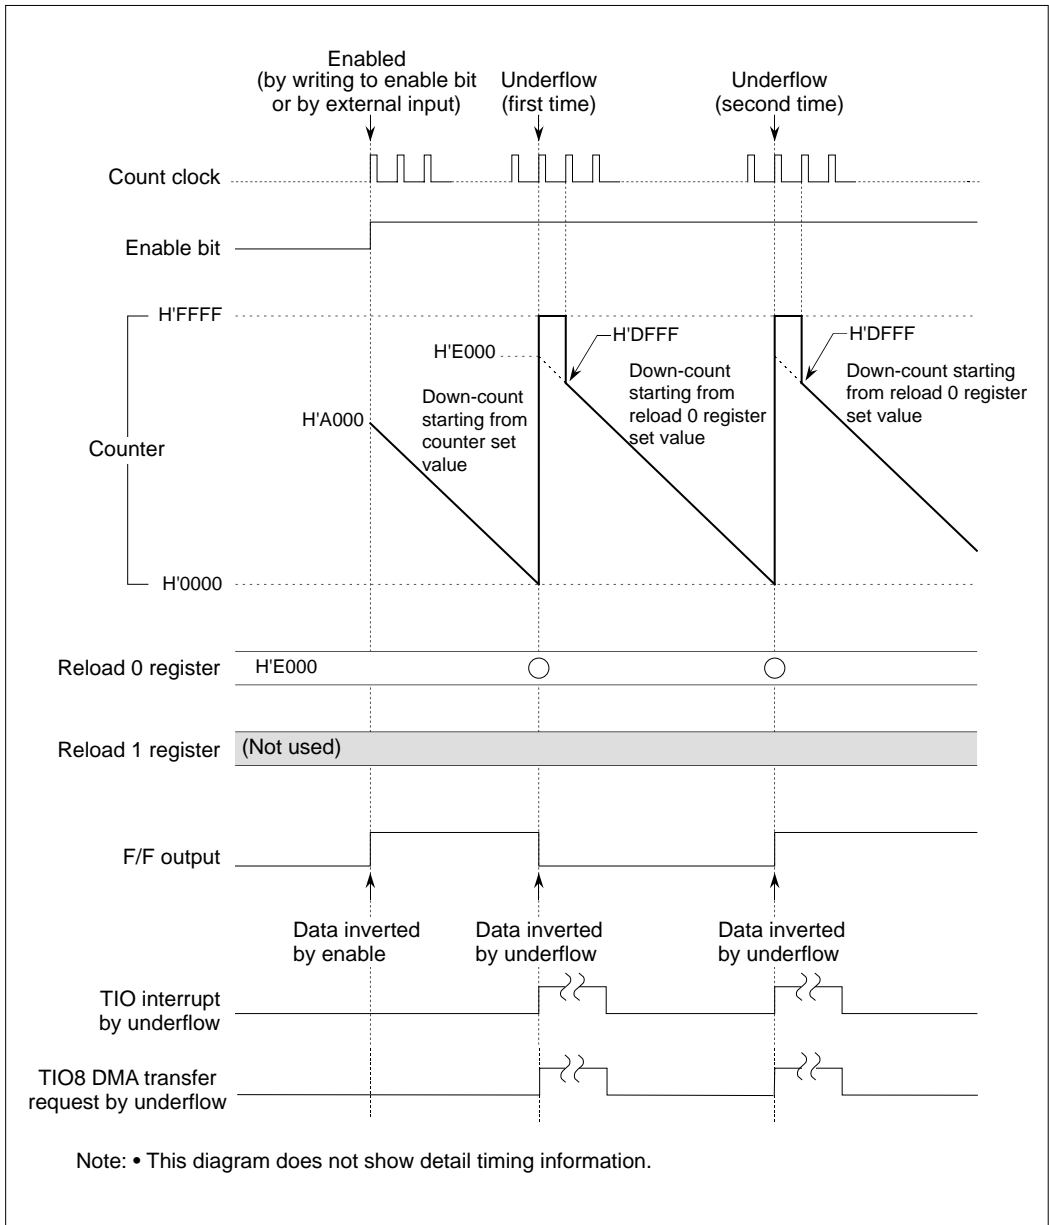

Figure 10.4.17 Typical Operation in TIO Continuous Output Mode (without Correction Function)

10.5 TMS (Input-related 16-bit Timer)

10.5.1 Outline of TMS

TMS (Timer Measure Small) is an input-related 16-bit timer capable of measuring input pulses in two circuit blocks comprising a total eight channels.

The table below shows specifications of TMS. The diagram in the next page shows a block diagram of TMS.

Table 10.5.1 Specifications of TMS (Input-related 16-bit Timer)

Item	Specification
Number of channels	8 channels (2 circuit blocks consisting of 4 channels each, 8 channels in total)
Counter	16-bit up-counter x 2
Measure register	16-bit measure register x 8
Timer startup	Started by writing to enable bit in software
Interrupt generation	Can be generated by a counter overflow

10.5.2 Outline of TMS Operation

In TMS, when the timer is started by writing to the enable bit in software, the counter starts operating. The counter is a 16-bit up-counter, where when a measure signal is entered from an external device, the counter value is latched into each measure register.

The counter stops counting at the same time count is disabled by writing to the enable bit in software.

TIN interrupts can be generated by entering an external measurement signal (no TIN interrupts available for TMS0), and TMS interrupts can be generated by an overflow signal from the counter.

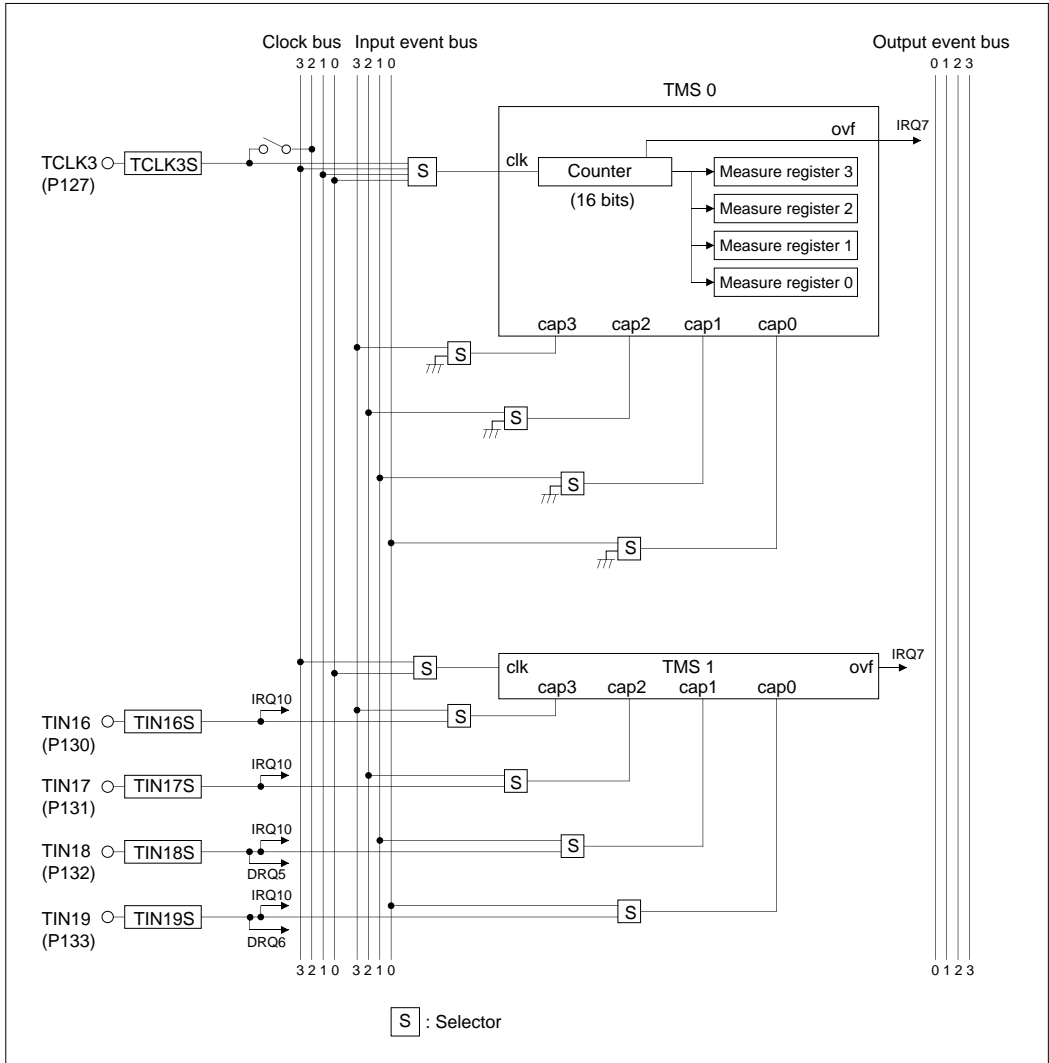

Figure 10.5.1 Block Diagram of TMS (Input-related 16-bit Timer)

<Count clock-dependent delay>

- Because the timer operates synchronously with the count clock, there is a count clock-dependent delay from when the timer is enabled till it actually starts operating.

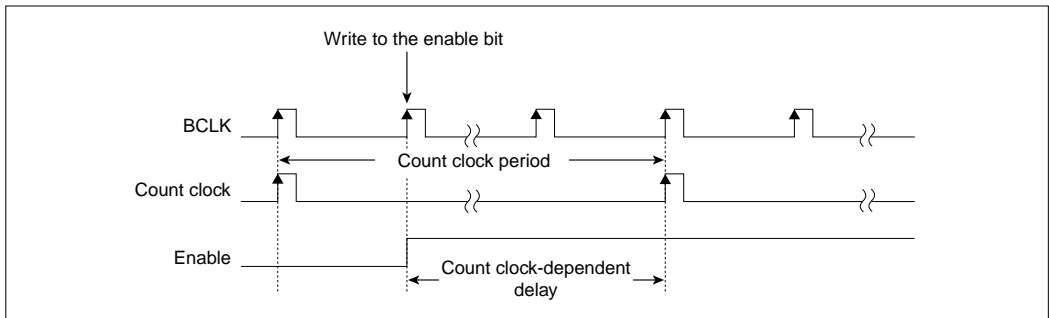

Figure 10.5.2 Count Clock-Dependent Delay

10.5.3 TMS Related Register Map

The diagram below shows a TMS related register map.

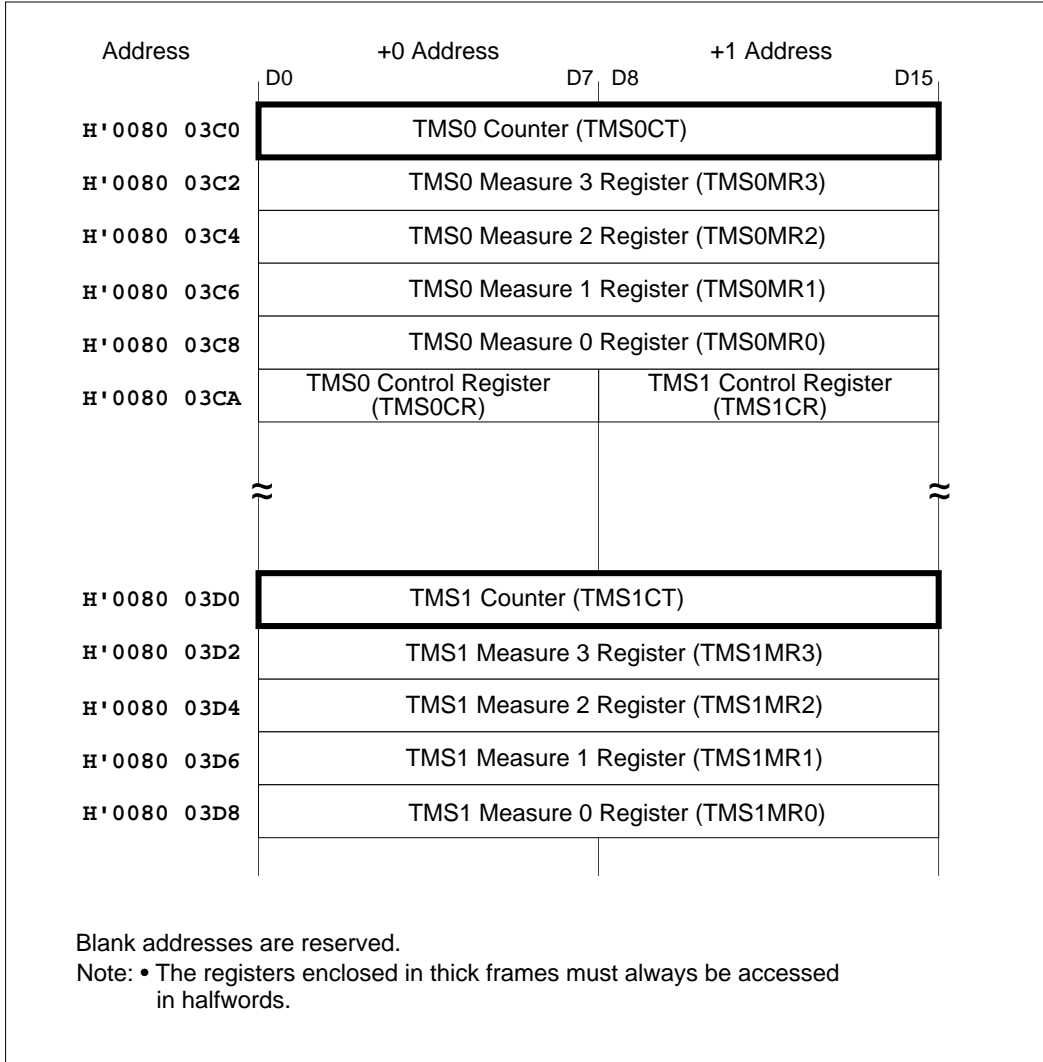

Figure 10.5.3 TMS Related Register Map

10.5.4 TMS Control Registers

The TMS control registers are used to select TMS0/1 input events and the counter clock source, as well as control counter startup. Following two TMS control registers are included:

- TMS0 Control Register (TMS0CR)
- TMS1 Control Register (TMS1CR)

■ TMS0 Control Register (TMS0CR)

<Address: H'0080 03CA>

<When reset:H'00>

D	Bit Name	Function	R	W
0	TMS0SS0 (TMS0 measure 0 source selection)	0: No selection 1: Input event bus 0	<input type="radio"/>	<input type="radio"/>

2	TMS0SS2 (TMS0 measure 2 source selection)	0: No selection 1: Input event bus 2	<input type="radio"/>	<input type="radio"/>
3	TMS0SS3 (TMS0 measure 3 source selection)	0: No selection 1: Input event bus 3	<input type="radio"/>	<input type="radio"/>
4,5	TMS0CKS (TMS0 clock source selection)	00: External input TCLK3 01: Clock bus 0 10: Clock bus 1 11: Clock bus 3	<input type="radio"/>	<input type="radio"/>
6	No functions assigned		0	-
7	TMS0CEN (TMS0 count enable)	0: Count stops 1: Count starts	<input type="radio"/>	<input type="radio"/>

■ TMS1 Control Register (TMS1CR)

<Address: H'0080 03CB>

D8	9	10	11	12	13	14	D15
TMS1 SS0	TMS1 SS1	TMS1 SS2	TMS1 SS3		TMS1CKS		TMS1CEN

<When reset:H'00>

D	Bit Name	Function	R	W
8	TMS1SS0 (TMS1 measure 0 source selection)	0: External input TIN19 1: Input event bus 0	○	○
9	TMS1SS1 (TMS1 measure 1 source selection)	0: External input TIN18 1: Input event bus 1	○	○
10	TMS1SS2 (TMS1 measure 2 source selection)	0: External input TIN17 1: Input event bus 2	○	○
11	TMS1SS3 (TMS1 measure 3 source selection)	0: External input TIN16 1: Input event bus 3	○	○
12	No functions assigned		0	-
13	TMS1CKS (TMS1 clock source selection)	0: Clock bus 0 1: Clock bus 3	○	○
14	No functions assigned		0	-
15	TMS1CEN (TMS1 count enable)	0: Count stops 1: Count starts	○	○

10.5.5 TMS Counter (TMS0CT, TMS1CT)

■ TMS0 Counter (TMS0CT)

<Address: H'0080 03C0>

■ TMS1 Counter (TMS1CT)

<Address: H'0080 03D0>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0-15	TMS0CT, TMS1CT	16-bit counter value	○	○

Note: • This register must always be accessed in halfwords.

The TMS counters are a 16-bit up-counter, which starts counting when the timer is enabled (by writing to the enable bit in software). The counter can be read during operation.

10.5.6 TMS Measure Registers (TMS0MR3-0, TMS1MR3-0)

- **TMS0 Measure 3 Register (TMS0MR3)** <Address: H'0080 03C2>
- **TMS0 Measure 2 Register (TMS0MR2)** <Address: H'0080 03C4>
- **TMS0 Measure 1 Register (TMS0MR1)** <Address: H'0080 03C6>
- **TMS0 Measure 0 Register (TMS0MR0)** <Address: H'0080 03C8>

- **TMS1 Measure 3 Register (TMS1MR3)** <Address: H'0080 03D2>
- **TMS1 Measure 2 Register (TMS1MR2)** <Address: H'0080 03D4>
- **TMS1 Measure 1 Register (TMS1MR1)** <Address: H'0080 03D6>
- **TMS1 Measure 0 Register (TMS1MR0)** <Address: H'0080 03D8>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0-15	TMS0MR3-TMS0MR0 TMS1MR3-TMS1MR0	16-bit counter value	○	-

- Notes:
- This register is a read-only register.
 - This register can be accessed in either byte or halfword.

The TMS measure registers are used to latch counter contents upon event input. The TMS measure registers are a read-only register.

10.5.7 Operation of TMS Measure Input

(1) Outline of TMS measure input

In TMS measure input, the counter starts counting up clock pulses when the timer is actuated by writing to the enable bit in software. When event input is entered to TMS while the timer is operating, the counter value is latched into measure registers 0-3. The timer stops at the same time count is disabled by writing to the enable bit.

A TIN interrupt can be generated by entering a measure signal from an external device (for TMS1 only; no TIN interrupts available for TMS0). Also, when the counter overflows, a TMS interrupt can be generated.

Figure 10.5.4 Typical Operation in TMS Measure Input

(2) Precautions to be observed when using TMS measure input

The following describes precautions to be observed when using TMS measure input.

- If measure event input and write to the counter occur simultaneously in the same clock period, the write value is set in the counter while at the same time latched to the measure register.

10.6 TML (Input-related 32-bit Timer)

10.6.1 Outline of TML

TML (Timer Measure Large) is an input-related 32-bit timer capable of measuring input pulses in two circuit blocks comprising a total of eight channels.

The table below shows specifications of TML. The diagram in the next page shows a block diagram of TML.

Table 10.6.1 Specifications of TML (Input-related 32-bit Timer)

Item	Specification
Number of channels	8 channels (2 circuit blocks consisting of 4 channels each, 8 channels in total)
Input clock	Divided-by-2 frequency of the internal peripheral operating clock (e.g., 10.0 MHz when using 20 MHz internal peripheral operating clock) or clock bus 1 input
Counter	32-bit up-counter × 2
Measure register	32-bit measure register × 8
Timer startup	Starts counting after exiting reset

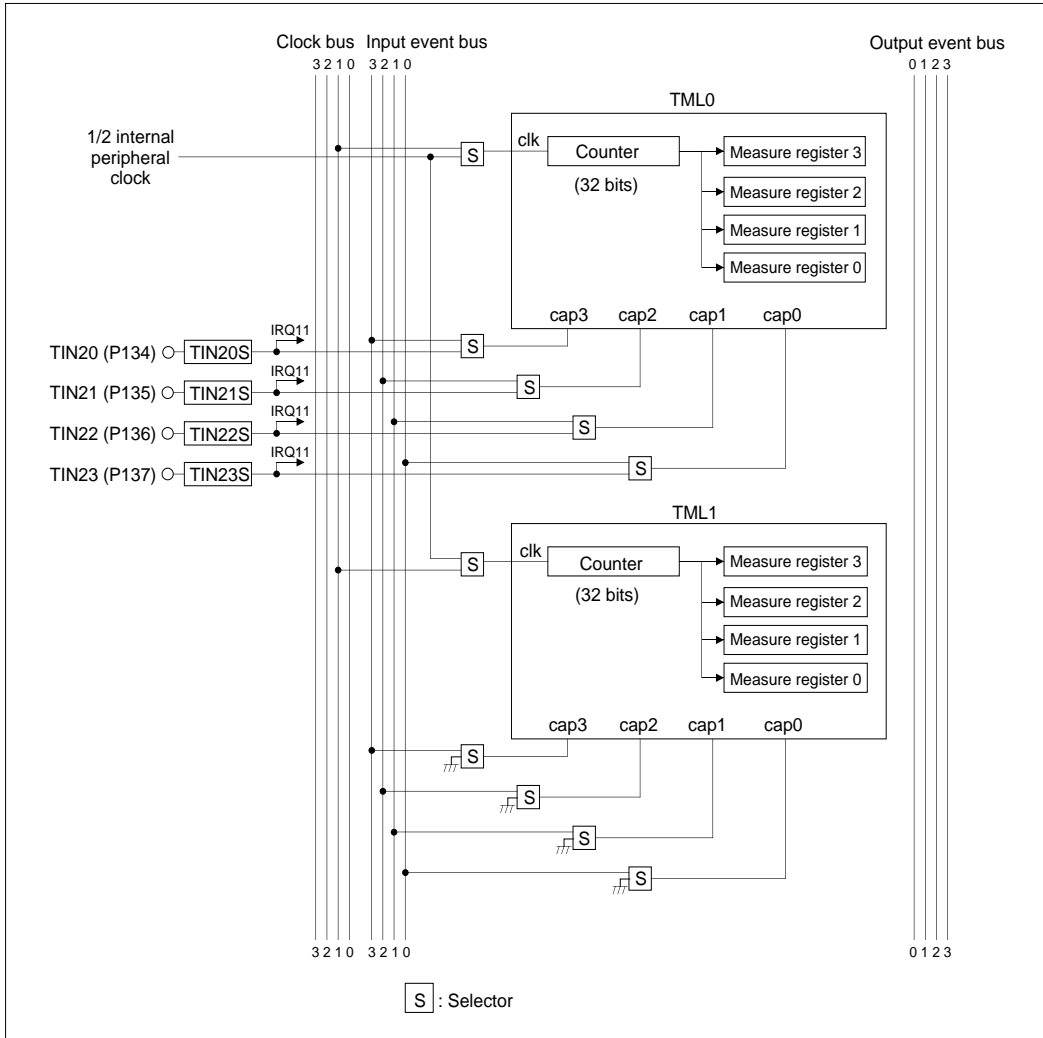

Figure 10.6.1 Block Diagram of TML (Input-related 32-bit Timer)

10.6.2 Outline of TML Operation

In TML, the counter starts counting upon deassertion of the reset input signal. The counter is a 32-bit up-counter, where when a measure event signal is entered from an external device, the counter value at that point in time is stored in each 32-bit measure register.

When the reset input signal is deasserted, the counter starts operating with a divided-by-2 frequency of the internal peripheral clock, and cannot be stopped once it has started. The counter is idle only when the device remains reset.

TIN interrupts can be generated by entering an external measurement signal (for TML0 only; no TIN interrupts available for TML1). However, the TML does not have counter overflow interrupts.

10.6.3 TML Related Register Map

The diagram below shows a TML related register map.

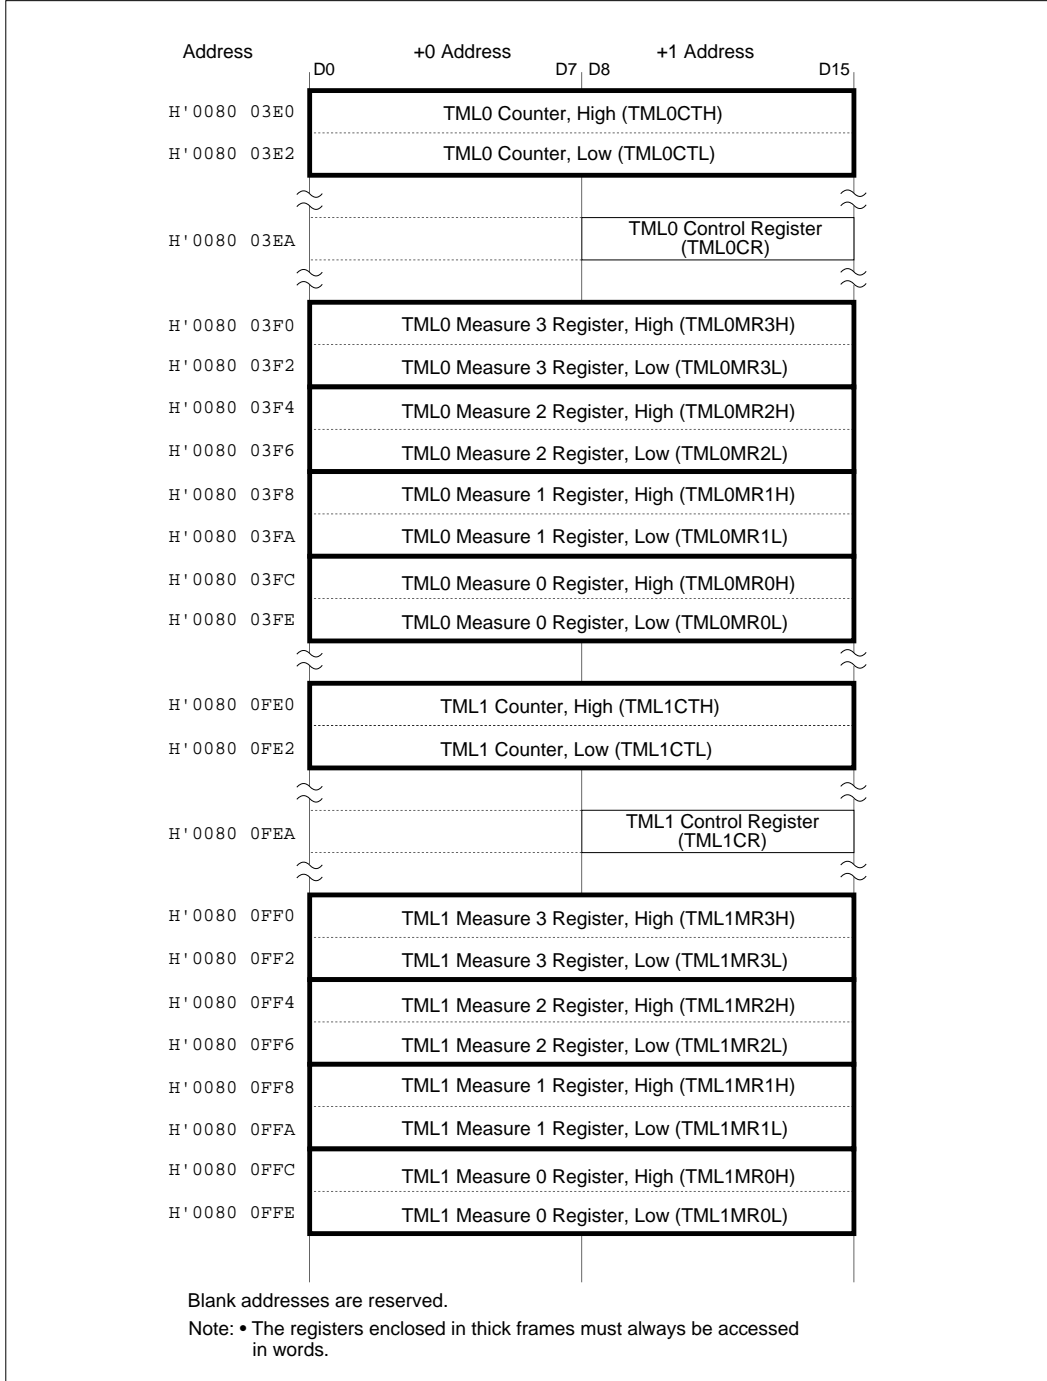

Figure 10.6.2 TML Related Register Map

10.6.4 TML Control Registers

■ TML0 Control Register (TML0CR)

<Address: H'0080 03EB>

<When reset:H'00>				
D	Bit Name	Function	R	W
8	TML0SS0 (TML0 measure 0 source selection)	0: External input TIN23 1: Input event bus 0	<input type="radio"/>	<input type="radio"/>
9	TML0SS1 (TML0 measure 1 source selection)	0: External input TIN22 1: Input event bus 1	<input type="radio"/>	<input type="radio"/>
10	TML0SS2 (TML0 measure 2 source selection)	0: External input TIN21 1: Input event bus 2	<input type="radio"/>	<input type="radio"/>
11	TML0SS3 (TML0 measure 3 source selection)	0: External input TIN20 1: Input event bus 3	<input type="radio"/>	<input type="radio"/>
12-14	No functions assigned		0	-
15	TML0CKS (TML0 clock source selection)	0: 1/2 internal peripheral clock 1: Clock bus 1	<input type="radio"/>	<input type="radio"/>

The TML0 Control Register is used to select TML0 input event and the counter clock source.

Note: • The counter can be written normally only when the selected clock source is a 1/2 internal peripheral clock. When using any other clock source, you cannot write to the counter normally. Under this condition, do not write to the counter.

■ TML1 Control Register (TML1CR)

<Address: H'0080 0FEB>

D8	9	10	11	12	13	14	D15
TML1SS0	TML1SS1	TML1SS2	TML1SS3				TML1CKS

<When reset:H'00>

D	Bit Name	Function	R	W
8	TML1SS0 (TML1 measure 0 source selection)	0: No selection 1: Input event bus 0	<input type="radio"/>	<input type="radio"/>
9	TML1SS1 (TML1 measure 1 source selection)	0: No selection 1: Input event bus 1	<input type="radio"/>	<input type="radio"/>
10	TML1SS2 (TML1 measure 2 source selection)	0: No selection 1: Input event bus 2	<input type="radio"/>	<input type="radio"/>
11	TML1SS3 (TML1 measure 3 source selection)	0: No selection 1: Input event bus 3	<input type="radio"/>	<input type="radio"/>
12-14	No functions assigned		0	-
15	TML1CKS (TML1 clock source selection)	0: 1/2 internal peripheral clock 1: Clock bus 1	<input type="radio"/>	<input type="radio"/>

The TML1 Control Register is used to select TML1 input event and the counter clock source.

Note: • The counter can be written normally only when the selected clock source is a 1/2 internal peripheral clock. When using any other clock source, you cannot write to the counter normally. Under this condition, do not write to the counter.

10.6.5 TML Counters

■ **TML0 Counter, High (TML0CTH)**

<Address: H'0080 03E0>

■ **TML0 Counter, Low (TML0CTL)**

<Address: H'0080 03E2>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0-15	TML0CTH	32-bit counter value (16 high-order bits)	○	○
	TML0CTL	32-bit counter value (16 low-order bits)		

Note: • This register must always be accessed in words (32 bits) beginning with the address of TML0CTH.

The TML0 Counter is a 32-bit up-counter, which starts counting upon deassertion of the reset input signal. The TML0CTH register accommodates the 16 high-order bits, and the TML0CTL register accommodates the 16 low-order bits of the 32-bit counter.

The counter can be read during operation.

■ **TML1 Counter, High (TML1CTH)**

<Address: H'0080 0FE0>

■ **TML1 Counter, Low (TML1CTL)**

<Address: H'0080 0FE2>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0-15	TML1CTH	32-bit counter value (16 high-order bits)	○	○
	TML1CTL	32-bit counter value (16 low-order bits)		

Note: • This register must always be accessed in words (32 bits) beginning with the address of TML1CTH.

The TML1 Counter is a 32-bit up-counter, which starts counting upon deassertion of the reset input signal. The TML1CTH register accommodates the 16 high-order bits, and the TML1CTL register accommodates the 16 low-order bits of the 32-bit counter.

The counter can be read during operation.

10.6.6 TML Measure Registers

- **TML0 Measure 3 Register (TML0MR3H)** <Address: H'0080 03F0>
- **TML0 Measure 3 Register (TML0MR3L)** <Address: H'0080 03F2>
- **TML0 Measure 2 Register (TML0MR2H)** <Address: H'0080 03F4>
- **TML0 Measure 2 Register (TML0MR2L)** <Address: H'0080 03F6>
- **TML0 Measure 1 Register (TML0MR1H)** <Address: H'0080 03F8>
- **TML0 Measure 1 Register (TML0MR1L)** <Address: H'0080 03FA>
- **TML0 Measure 0 Register (TML0MR0H)** <Address: H'0080 03FC>
- **TML0 Measure 0 Register (TML0MR0L)** <Address: H'0080 03FE>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0-15	TML0MR3H-0H	32-bit counter value (16 high-order bits)	○	-
	TML0MR3L-0L	32-bit counter value (16 low-order bits)		

- Notes:
- These registers are a read-only register.
 - These registers must always be accessed in words (32 bits) beginning with a word boundary.

The TML0 Measure Registers are used to latch counter contents upon event input. The TML0 Measure Registers are configured with 32 bits, the TML0MR3H-0H accommodating the 16 high-order bits, and the TML0MR3L-0L accommodating the 16 low-order bits. The TML0 Measure Registers are a read-only register. These registers must always be accessed in words (32 bits) beginning with a word boundary.

- **TML1 Measure 3 Register (TML1MR3H)** <Address: H'0080 0FF0>
- **TML1 Measure 3 Register (TML1MR3L)** <Address: H'0080 0FF2>

- **TML1 Measure 2 Register (TML1MR2H)** <Address: H'0080 0FF4>
- **TML1 Measure 2 Register (TML1MR2L)** <Address: H'0080 0FF6>

- **TML1 Measure 1 Register (TML1MR1H)** <Address: H'0080 0FF8>
- **TML1 Measure 1 Register (TML1MR1L)** <Address: H'0080 0FFA>

- **TML1 Measure 0 Register (TML1MR0H)** <Address: H'0080 0FFC>
- **TML1 Measure 0 Register (TML1MR0L)** <Address: H'0080 0FFE>

<When reset: Indeterminate>

D	Bit Name	Function	R	W
0-15	TML1MR3H-0H	32-bit counter value (16 high-order bits)	○	-
	TML1MR3L-0L	32-bit counter value (16 low-order bits)		

- Notes:
- These registers are a read-only register.
 - These registers must always be accessed in words (32 bits) beginning with a word boundary.

The TML1 Measure Registers are used to latch counter contents upon event input. The TML1 Measure Registers are configured with 32 bits, the TML1MR3H-0H accommodating the 16 high-order bits, and the TML1MR3L-0L accommodating the 16 low-order bits. The TML1 Measure Registers are a read-only register. These registers must always be accessed in words (32 bits) beginning with a word boundary.

10.6.7 Operation of TML Measure Input

(1) Outline of TML measure input

In TML measure input, the counter starts counting up clock pulses upon deassertion of the reset input signal. When event input is entered to measure registers 0-3, the counter value is latched into the measure registers.

A TIN interrupt can be generated by entering an external measure signal. (For TML0 only; No TIN interrupts are available for TML1.) However, no counter overflow interrupts are available.

Figure 10.6.3 Typical Operation in TML Measure Input

(2) Precautions to be observed when using TML measure input

The following describes precautions to be observed when using TML measure input.

- If measure event input and write to the counter occur simultaneously in the same clock period, the write value is set in the counter, whereas the up-count value (before being rewritten) is latched to the measure register.
- If the timer operates with any clock other than the 1/2 internal peripheral clock while clock bus 1 is selected for the count clock, the counter cannot be written normally. Therefore, when operating with any clock other than the 1/2 internal peripheral clock, do not write to the counter.
- If the timer operates with any clock other than the 1/2 internal peripheral clock while clock bus 1 is selected for the count clock, the captured value is one that leads the actual counter value by one clock period. However, during the 1/2 internal peripheral clock interval from the count clock, this problem does not occur and the counter value is captured at exact timing.

The diagram below shows the relationship between counter operation and the valid data that can be captured.

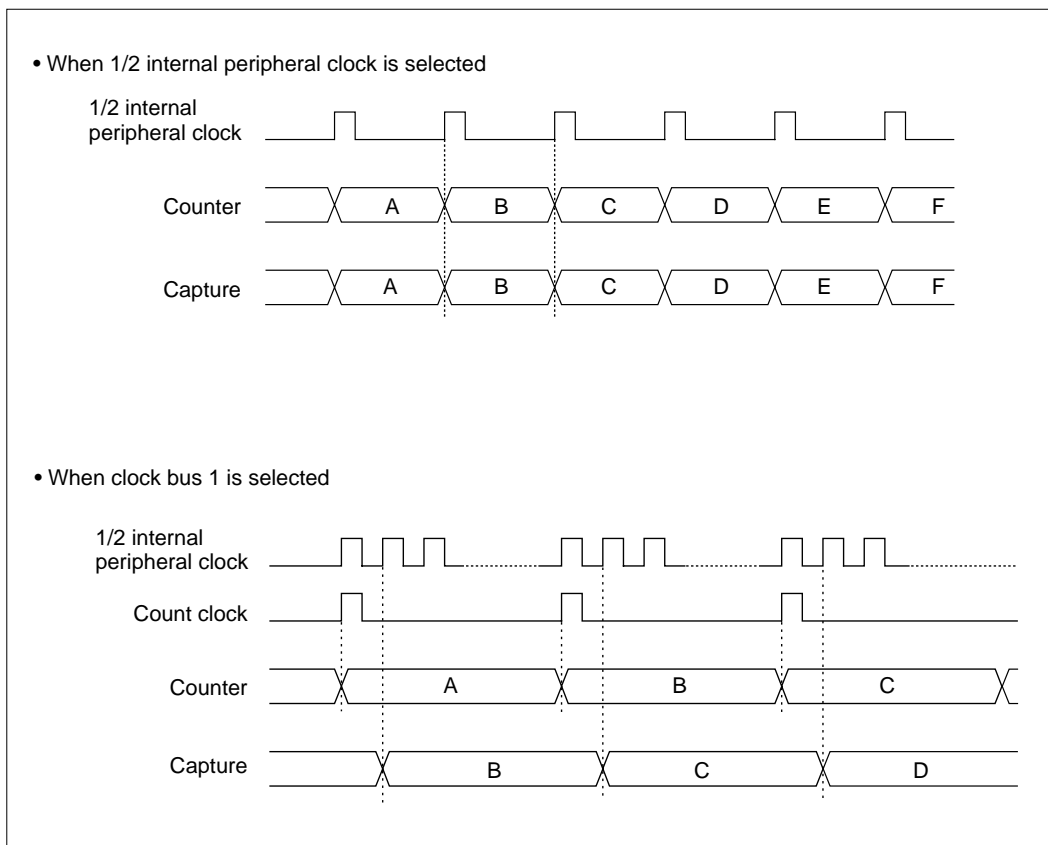

Figure 10.6.4 Mistimed Counter Value and Captured Value

CHAPTER 11

A-D CONVERTER

- 11.1 Outline of A-D Converter
- 11.2 A-D Converter Related Registers
- 11.3 Functional Description of A-D Converter
- 11.4 Precautions on Using A-D Converter

11.1 Outline of A-D Converter

The 32171 contains a 10-bit resolution A-D converter based on successive approximation method. A total of 16 analog input pins (channels) from AD0IN0 to AD0IN15 are available. The A-D conversion results can be read out in either 8 bits or 10 bits.

For A-D conversion, there are following conversion modes and operation modes:

(1) Conversion mode

- A-D conversion mode: Ordinary mode in which analog input voltages are converted into digital quantities.
- Comparator mode (Note 1): A mode in which analog input voltage is compared with a preset comparison voltage to only find the relative magnitude of two quantities. (Single mode only)

(2) Operation mode

- Single mode: Analog input voltage in one channel is A-D converted once or compared (Note 1) with a given quantity.
- Scan mode: Analog input voltages in multiple selected channels (4, 8, or 16 channels) are sequentially A-D converted.

(3) Types of scan modes

- Single-shot scan mode: Scan operation is performed for one machine cycle.
- Continuous scan mode: Scan operation is performed repeatedly until stopped.

(4) Special operation mode

- Forcible single mode execution during scan mode: Conversion is forcibly executed in single mode during scan operation.
- Scan mode start after single mode execution: Scan operation is started subsequently after executing conversion in single mode.
- Conversion restart: A-D conversion being executed in single or scan mode is restarted.

The A-D conversion and compare rates can be selected between normal and double rate. An A-D conversion interrupt request or a DMA transfer request can be generated at completion of A-D conversion, compare operation, single-shot scan operation, or one cycle of continuous scan operation.

Note 1: To discriminate between the comparison operation performed internally by the successive approximation-type A-D converter and the operation in comparator mode performed using the A-D converter as a comparator, the comparison operation in comparator mode in this manual is referred to as "compare."

Table 11.1.1 outlines the A-D converter. Figure 11.1.1 shows a block diagram of the A-D converter.

Table 11.1.1 Outline of A-D Converter

Item	Content	
Analog input	16 channels	
A-D conversion method	Successive approximation method	
Resolution	10 bits (Conversion results can be read out in either 8 bits or 10 bits)	
Absolute accuracy (Note1)	Normal mode	±2LSB
(Conditions : Ta = -40 to 125°C, AVCC0=VREF0=5.12V)	Double speed mode	±2LSB
Conversion mode	A-D conversion mode, comparator mode	
Operation mode	Single mode, scan mode	
Scan mode	Single-shot scan mode, continuous scan mode	
Conversion start trigger	Software start	Started by setting A-D converter start bit to 1
	Hardware start	Starts A-D0 converter by MJT output event bus 3. (Note 2)
Conversion rate f(BCLK):	During single mode (shortest time)	Normal rate 299 × 1/f(BCLK) (Note 3)
		Double rate 173 × 1/f(BCLK)
Internal peripheral clock operating frequency (Note 3)	During comparator mode (shortest time)	Normal rate 47 × 1/f(BCLK)
		Double rate 29 × 1/f(BCLK)
Interrupt request generation function	Generated at completion of A-D conversion, compare operation, single-shot scan operation, or one cycle of continuous scan operation	
DMA transfer request generation function	Generated at completion of A-D conversion, compare operation, single-shot scan operation, or one cycle of continuous scan operation	

Note 1: The rated value (accuracy) is that of the microcomputer alone, premised on an assumption that power supply wiring on the board where the microcomputer is mounted is stable and unaffected by noise.

Note 2: Refer to Chapter 10, "Multijunction Timers."

Note 3: Note 3: f(BCLK) = 20 MHz when the input clock (XIN) = 10 MHz.

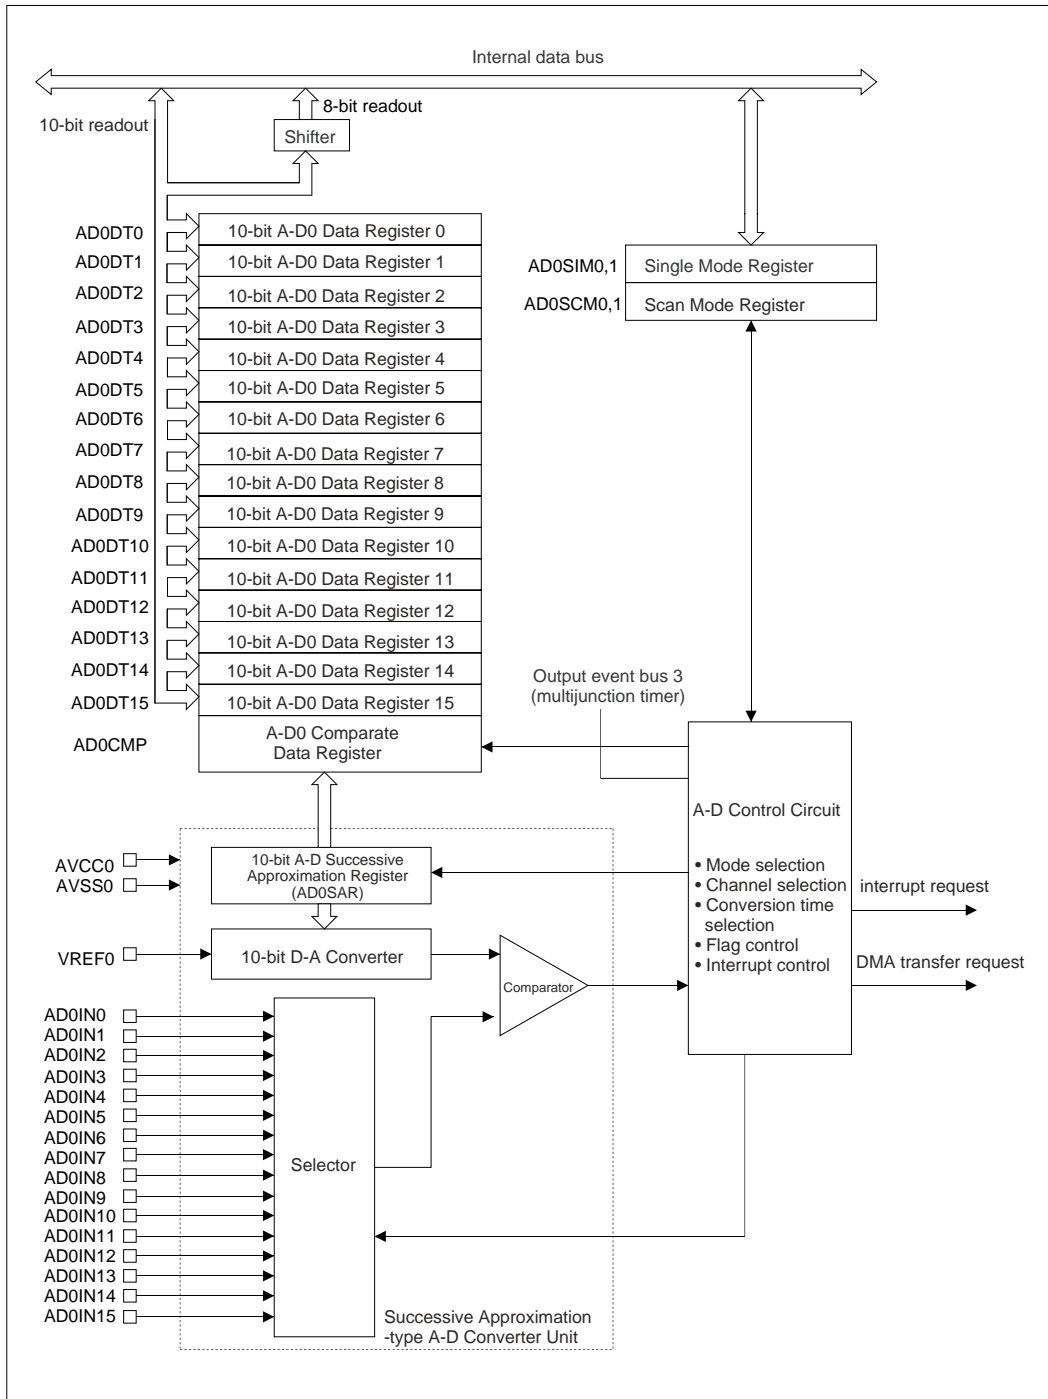

Figure 11.1.1 Block Diagram of A-D0 Converter

11.1.1 Conversion Modes

The A-D converter has two conversion modes: "A-D conversion mode" and "Comparator mode."

(1) A-D conversion mode

In A-D conversion mode, the analog input voltage in a specified channel is converted into digital quantity.

In single mode, A-D conversion is performed on a channel selected by the Single Mode Register 1 analog input pin select bit. In scan mode, A-D conversion is performed on channels selected by Scan Mode Register 1 according to settings of Scan Mode Register 0. The conversion result is stored in each channel's corresponding 10-bit A-D Data Register. Also, 8-bit A-D conversion results can be read from each 8-bit A-D Data Register.

An A-D conversion interrupt request or a DMA transfer request can be generated at completion of A-D conversion when in single mode, or when operating in scan mode, at completion of one cycle of scan loop.

(2) Comparator mode

In comparator mode, the analog input voltage in a specified channel is "compared" (compared) with the Successive Approximation Register value, and the result (relative magnitude of two values) is returned to a flag.

The channel to be compared is selected using the Single Mode Register 1 analog input pin select bit. The result of compare operation is flagged (1 or 0) by setting the A-D Compare Data Register bit that corresponds to the selected channel.

An A-D conversion interrupt request or a DMA transfer request can be generated at completion of compare operation.

11.1.2 Operation Modes

The A-D converter operates in two modes: "Single mode" and "Scan mode." When comparator mode is selected as A-D conversion mode, only single mode can be used.

(1) Single mode

In single mode, the analog input voltage in one selected channel is A-D converted once or compared with a given quantity. An A-D conversion interrupt request or a DMA transfer request can be generated at completion of A-D conversion.

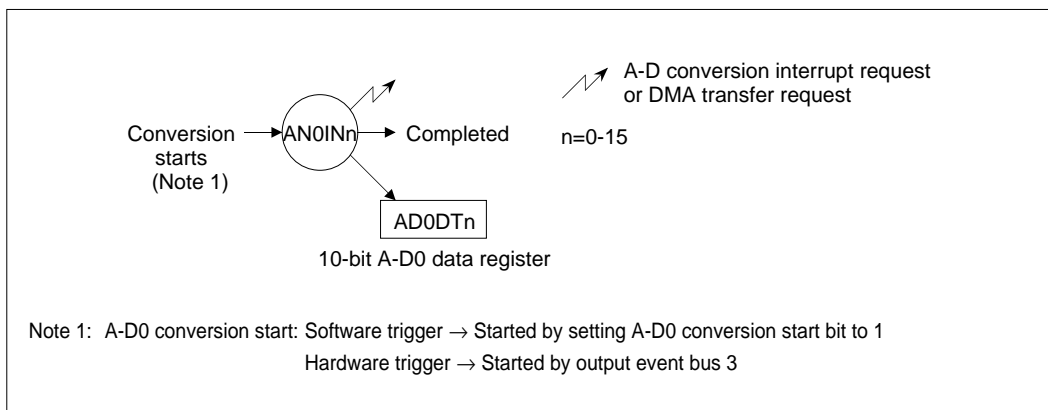

Figure 11.1.2 Operation in Single Mode (A-D Conversion)

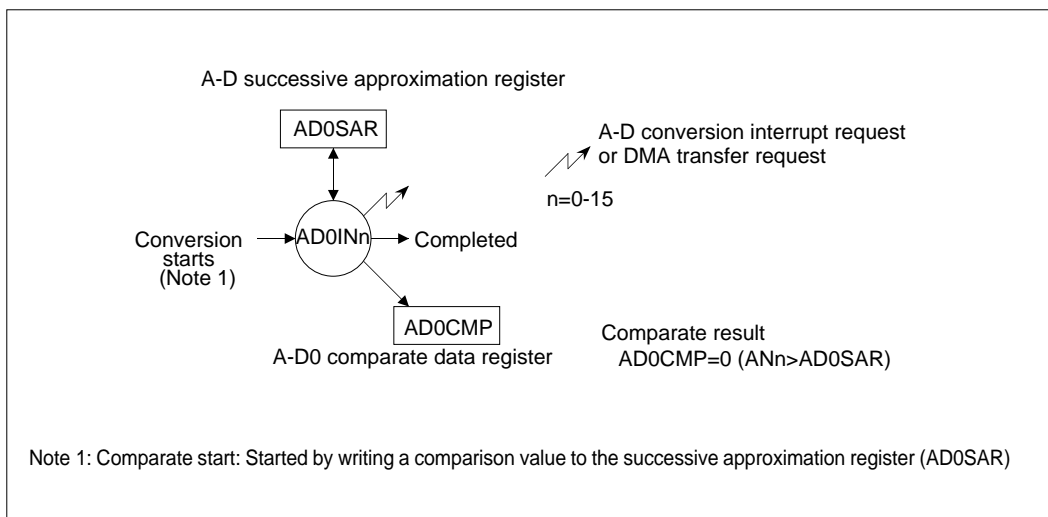

Figure 11.1.3 Operation in Single Mode (Compare)

(2) Scan mode

In scan mode, analog input voltages in multiple selected channels (4, 8, or 16 channels) are sequentially A-D converted.

There are two types of scan modes: "Single-shot scan mode" in which A-D conversion is completed by performing one cycle of scan operation, and "Continuous scan mode" in which scan operation is continued until halted by setting the Scan Mode Register A-D conversion stop bit to 1.

These types of scan modes are selected using Scan Mode Register 0. The channels to be scanned are selected using Scan Mode Register 1. The number of channels and the sequence to be scanned can be selected from three combinations available: 4, 8, or 16 channels. Channels AD0IN0 to AD0IN3 are used for 4-channel scan. Similarly, channels AD0IN0 to AD0IN7 and channels AD0IN0 to AD0IN15 are used for 8-channel scan and 16-channel scan, respectively.

An A-D conversion interrupt request or a DMA transfer request can be generated at completion of one cycle of scan operation.

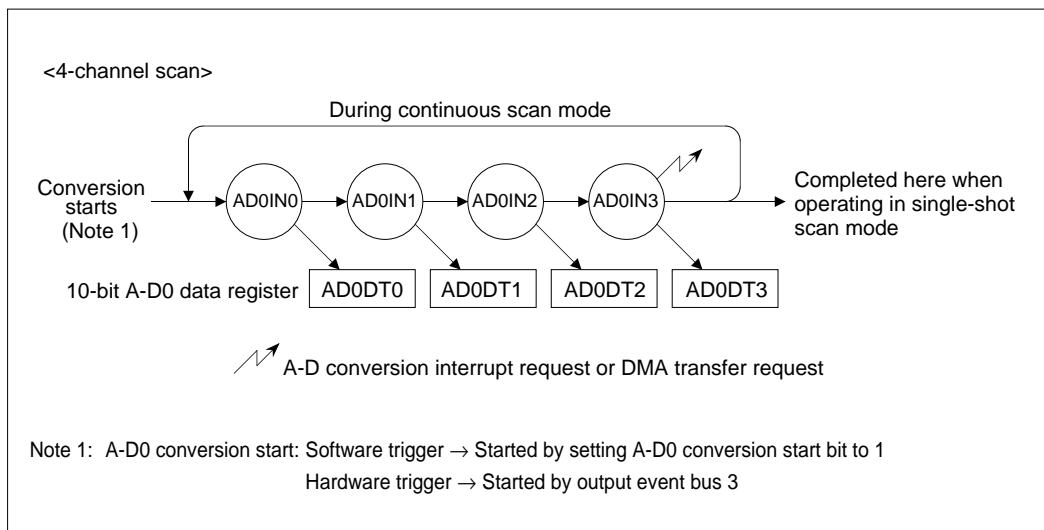

Figure 11.1.4 Operation of A-D Conversion in Scan Mode (for 4-channel Scan)

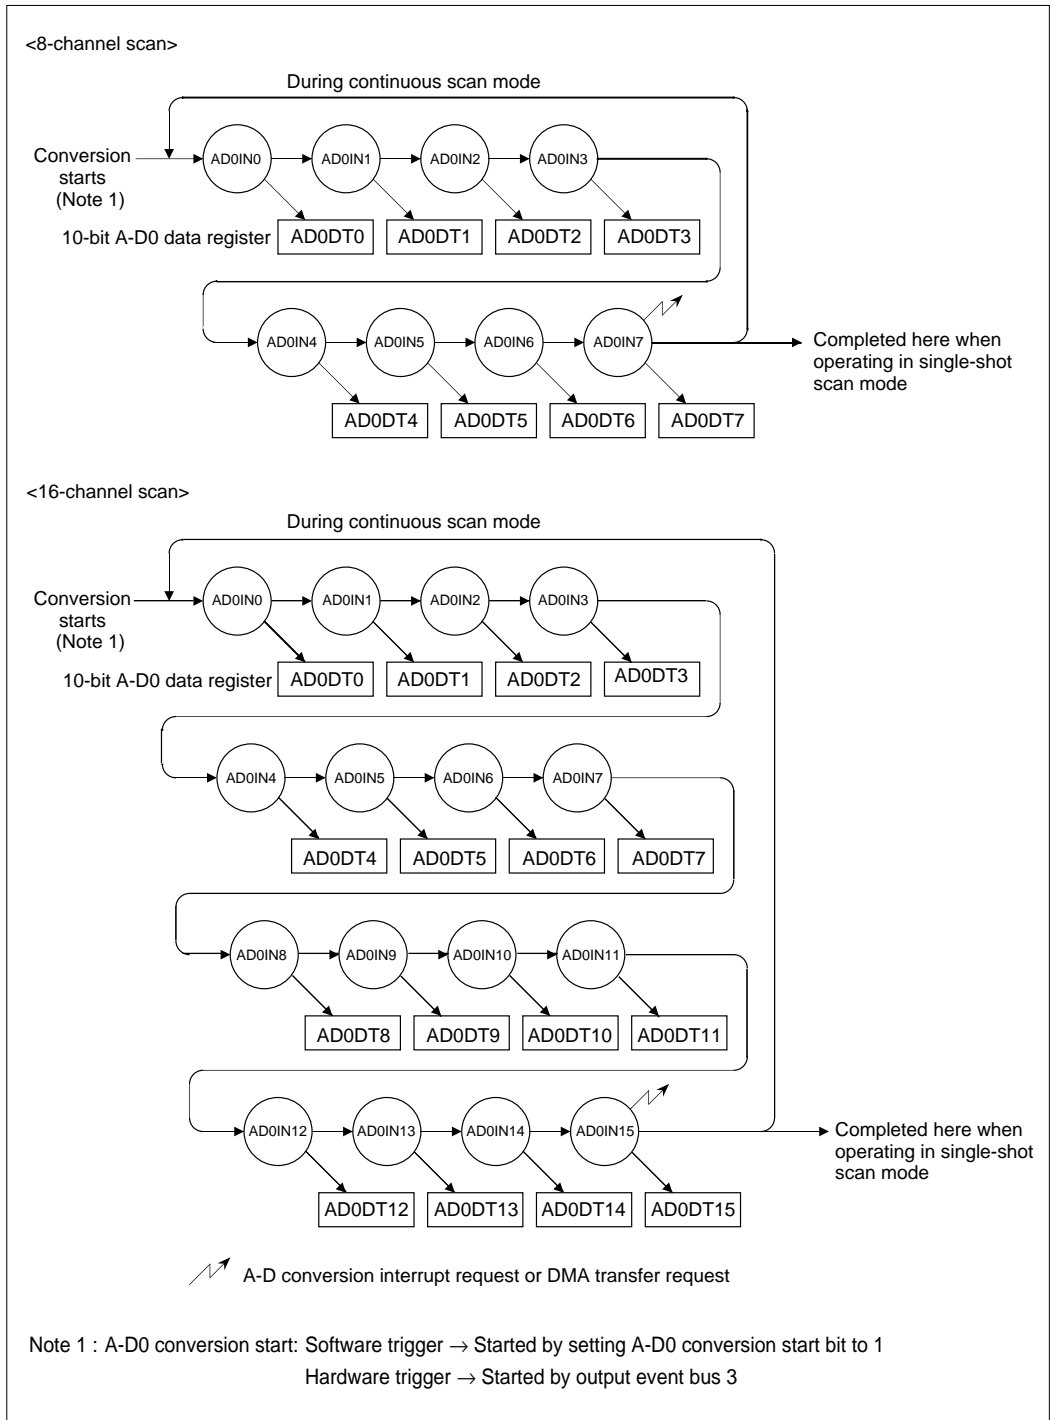

Figure 11.1.5 Operation of A-D Conversion in Scan Mode (for 8-channel/16-channel Scan)

Table 11.1.2 Registers in Which Scan Mode A-D Conversion Results Are Stored

Scan loop selection	Selected channels for single-shot scan	Selected channels for continue scan	A-D Conversion result storage Register
4-channel scan	AD0IN0	AD0IN0	10-bit A-D0 Data Register 0
	AD0IN1	AD0IN1	10-bit A-D0 Data Register 1
	AD0IN2	AD0IN2	10-bit A-D0 Data Register 2

	AD0IN14	AD0IN14	10-bit A-D0 Data Register 14
	AD0IN15	AD0IN15	10-bit A-D0 Data Register 15
	Completed	AD0IN0	10-bit A-D Data Register 0
	⋮ (Repeated until forcibly halted)	⋮	

11.1.3 Special Operation Modes

(1) Forcible single mode execution during scan mode

This special operation mode forcibly executes single mode conversion (A-D conversion or compare) in a specified channel during scan mode operation. For A-D conversion mode, the conversion result is stored in the 10-bit A-D Data Register corresponding to the specified channel. For compare mode, the conversion result is stored in the 10-bit A-D Compare Data Register. When the A-D conversion or compare operation in the specified channel is completed, scan mode A-D conversion is restarted from where it was canceled during scan operation.

To start single mode conversion during scan mode operation in software, select software trigger using the Single Mode Register 0's A-D conversion start trigger select bit and for A-D conversion, set the said register's A-D conversion start bit to 1. For compare mode, write the value to be compared into the A-D Successive Approximation Register (AD0SAR) during scan mode operation.

To start single mode conversion during scan mode operation in hardware, select hardware trigger using Single Mode Register 0's A-D conversion start trigger select bit and enter the hardware trigger (output event bus 3) specified by the said register.

An A-D conversion interrupt request or a DMA transfer request can be generated at completion of conversion in the specified channel, or at completion of one cycle of scan operation.

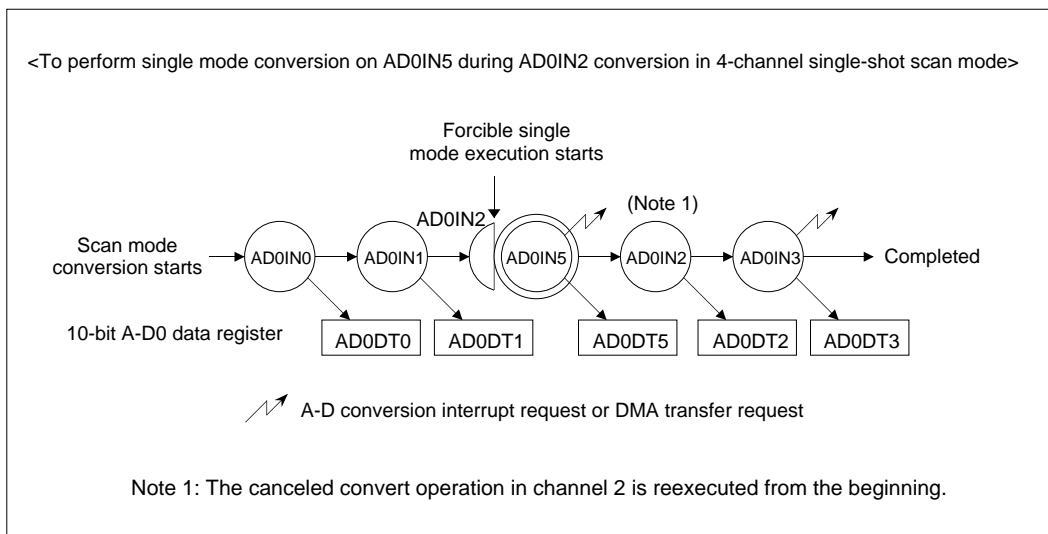

Figure 11.1.6 Forcible Single Mode Execution during Scan Mode

(2) Scan mode start after single mode execution

This special operation mode starts scan operation subsequently after executing conversion in single mode (A-D conversion or compare).

To start this mode in software, choose a software trigger using the Scan Mode Register 0 A-D conversion start trigger select bit. Then set the said register's A-D conversion start bit to 1 during single mode conversion operation.

To start in hardware, select hardware trigger using the Scan Mode Register 0's A-D conversion start trigger select bit and enter the hardware trigger (output event bus 3) specified by the said register while single mode conversion is in operation.

When a hardware trigger (output event bus 3) is entered after selecting hardware trigger with the A-D conversion start trigger select bits of both Single Mode Register 0 and Scan Mode Register 0, conversion is first performed in single mode and then after execution of it, conversion is performed in scan mode.

An A-D conversion interrupt request or a DMA transfer request can be generated at completion of single mode conversion in the specified channel, or at completion of one cycle of scan operation.

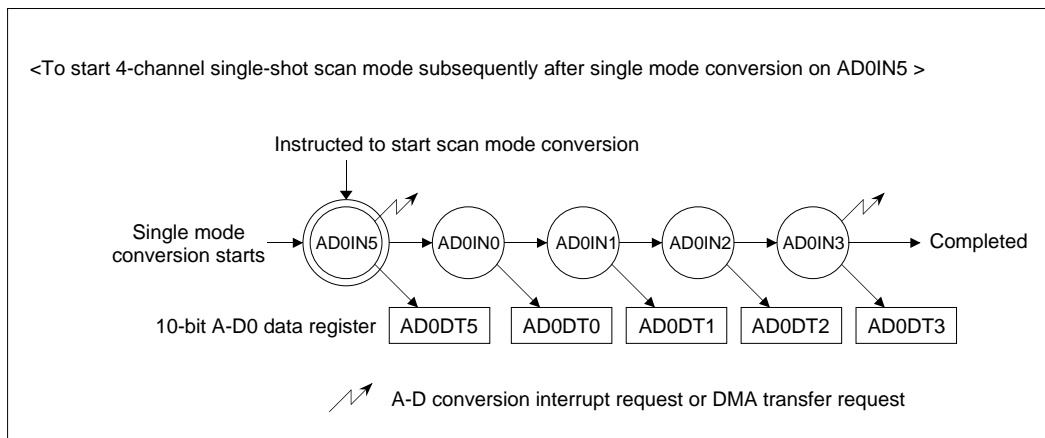

Figure 11.1.7 Scan Mode Start after Single Mode Execution

(3) Conversion restart

This special operation mode stops operation being executed in single mode or scan mode and reexecutes the operation from the beginning.

In the case of single mode, the operation being executed is redone by setting Single Mode Register 0's A-D conversion start bit to 1 again during A-D conversion or compare operation or by entering a hardware trigger (output event bus 3).

For scan mode, the channel being converted is canceled and A-D conversion is restarted from channel 0 by setting Scan Mode Register 0's A-D conversion start bit to 1 again during scan operation or by entering a hardware trigger (output event bus 3).

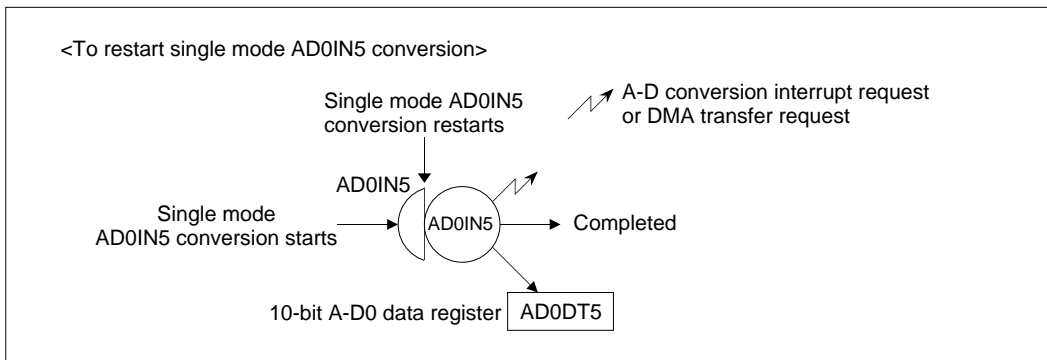

Figure 11.1.8 Restarting Conversion during Single Mode Operation

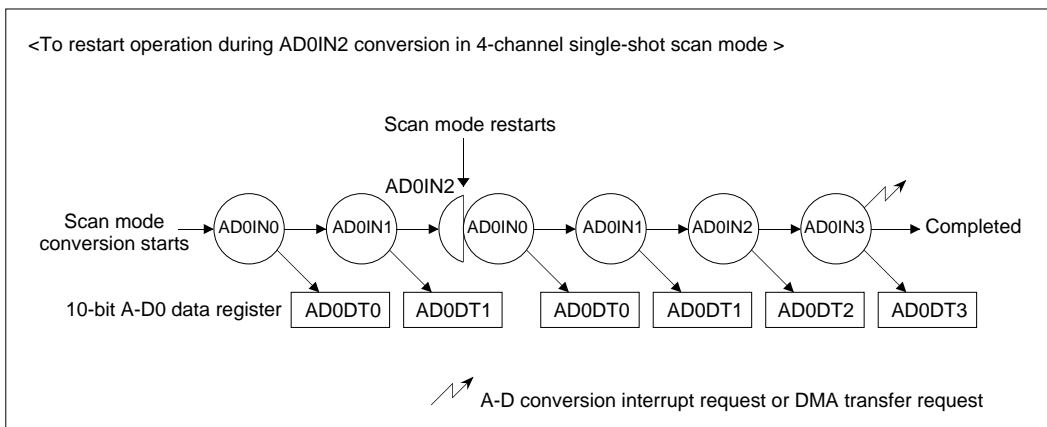

Figure 11.1.9 Restarting Conversion during Scan Operation

11.1.4 A-D Converter Interrupt and DMA Transfer Requests

The A-D converter can generate an A-D conversion interrupt request or DMA transfer request at completion of A-D conversion, compare operation, or one-shot scan or when each cycle of continuous scan mode is completed.

To select between A-D conversion interrupt or DMA transfer requests to generate, use Single Mode Register 0 and Scan Mode Register 0.

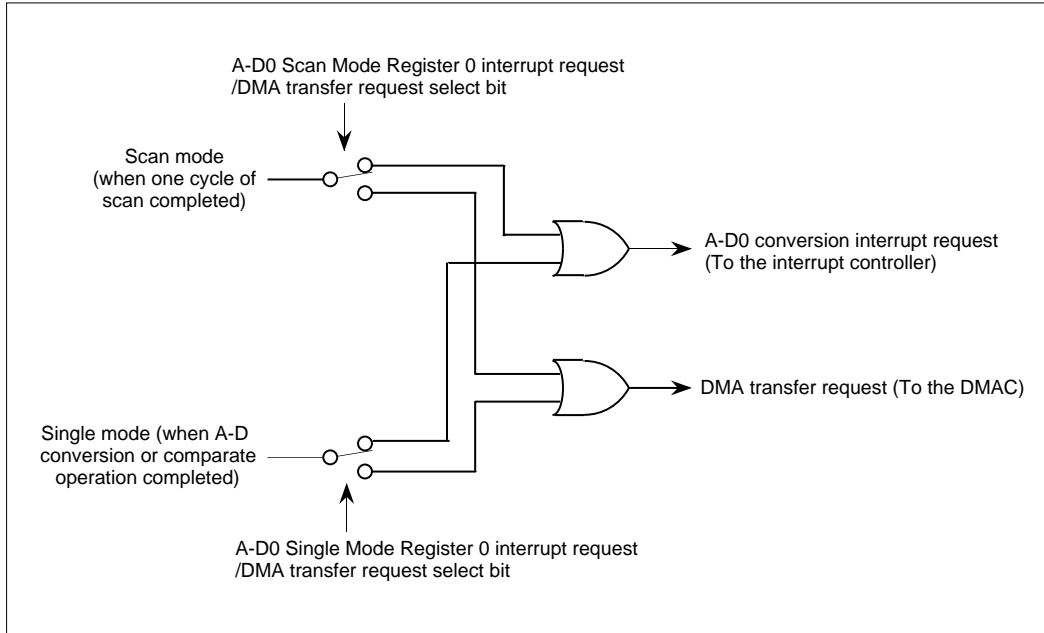

Figure 11.1.10 Selecting between Interrupt Request and DMA Transfer Request

11.2.1 A-D Single Mode Register 0

■ A-D0 Single Mode Register 0 (AD0SIM0)

<Address: H'0080 0080>

<When reset:H'04>

D	Bit Name	Function	R	W
0,1	No functions assigned		0	-
2	AD0STRG (A-D0 hardware trigger selection)	0: Use inhibited 1: Output event bus 3	○	○
3	AD0SSEL (A-D0 conversion start trigger selection)	0: Software trigger 1: Hardware trigger (Note 1)	○	○
4	AD0SREQ (Interrupt request/DMA transfer request selection)	0: A-D0 interrupt request 1: DMA transfer request	○	○
5	AD0SCMP (A-D0 conversion/comparate completed)	0: A-D0 conversion/comparate in progress 1: A-D0 conversion/comparate completed	○	-
6	AD0SSTP (A-D0 conversion stop)	0: Performs no operation 1: Stops A-D0 conversion	0	○
7	AD0SSTT (A-D0 conversion start)	0: Performs no operation 1: Starts A-D0 conversion	0	○

Note 1: During comparator mode, hardware triggers, if any selected, are ignored and operation is started by a software trigger.

A-D0 Single Mode Register 0 is used to control operation of the A-D0 converter during single mode (including special mode "Forcible single mode execution during scan mode").

(1) AD0STRG (A-D0 hardware trigger select) bit (D2)

When starting A-D conversion of the A-D0 converter in hardware, this bit specifies the conversion to be started by MJT output (output event bus 3). If software trigger is selected with the AD0SSEL (A-D0 conversion start trigger select) bit, the content of this bit is ignored.

(2) AD0SSEL (A-D0 conversion start trigger select) bit (D3)

This bit selects whether to apply the A-D0 conversion start trigger in software or in hardware during single mode. When software trigger is selected, A-D conversion is started by setting the AD0SSTT (A-D0 conversion start) bit to 1. When hardware trigger is selected, set the AD0STRG (hardware trigger select) bit to 1 and specify conversion to be started by MJT output.

(3) AD0SREQ (A-D0 interrupt request/DMA transfer request select) bit (D4)

This bit selects whether to generate an A-D0 conversion interrupt request or a DMA transfer request at completion of single mode (A-D conversion or compare).

(4) AD0SCMP (A-D0 conversion/compare complete) bit (D5)

This is a read-only bit, and is 1 when reset. This bit is 0 when the A-D0 converter in single mode (A-D conversion or compare) is operating and set to 1 when the operation is completed. It also is set to 1 when A-D conversion or compare operation is forcibly terminated by setting the AD0SSTT (A-D0 conversion stop) bit to 1 during A-D conversion or compare operation.

(5) AD0SSTP (A-D0 conversion stop) bit (D6)

The A-D0 converter in single mode (A-D conversion or compare) can be stopped by setting this bit to 1 while the converter is operating. Manipulation of this bit is ignored while the converter in single mode remains idle or is operating in scan mode. Operation is stopped immediately after writing to this bit and the content of the A-D0 Successive Approximation Register when read after being stopped shows an intermediate value that was in the middle of conversion. (No transfers to the A-D0 Data Register are performed.)

If the A-D0 conversion start and A-D0 conversion stop bits are set to 1 simultaneously, the A-D0 conversion stop bit is effective.

If this bit is set to 1 while single mode operation of special mode is under way (forcible execution of single mode during scan mode operation), only single mode conversion stops and scan mode operation restarts.

(6) AD0SSTT (A-D0 conversion start) bit (D7)

A-D conversion of the A-D0 converter is started by setting this bit to 1 while software trigger has been selected with the AD0SSEL (A-D0 conversion start trigger select) bit.

If the A-D0 conversion start and A-D0 conversion stop bits are set to 1 simultaneously, the A-D0 conversion stop bit is effective.

When this bit is set to 1 during single mode conversion, special operation mode "Conversion restart" is assumed, so that conversion in single mode restarts.

When this bit is set to 1 during A-D conversion in scan mode, special operation mode "Forcible execution of single mode during scan mode operation" is assumed, so that the channel being converted in scan mode is canceled and single mode conversion is performed. When single mode conversion finishes, A-D conversion in scan mode restarts from the canceled channel.

11.2.2 A-D Single Mode Register 1

■ A-D0 Single Mode Register 1 (AD0SIM1)

<Address: H'0080 0081>

<When reset:H'00>

D	Bit Name	Function	R	W
8	AD0SMSL (A-D0 conversion mode selection)	0: A-D0 conversion mode 1: Comparator mode	○	○
9	AD0SSPD (A-D0 conversion rate selection)	0: Normal rate 1: Double rate	○	○
10,11	No functions assigned		0	△
12-15	AN0SEL (Analog input pin selection)	0000: Selects AD0IN0 0001: Selects AD0IN1 0010: Selects AD0IN2 0011: Selects AD0IN3 0100: Selects AD0IN4 0101: Selects AD0IN5 0110: Selects AD0IN6 0111: Selects AD0IN7 1000: Selects AD0IN8 1001: Selects AD0IN9 1010: Selects AD0IN10 1011: Selects AD0IN11 1100: Selects AD0IN12 1101: Selects AD0IN13 1110: Selects AD0IN14 1111: Selects AD0IN15	○	○

W=△ : Only writing a 0 is effective; when you write a 1, device operation cannot be guaranteed.

A-D0 Single Mode Register 1 is used to control operation of the A-D0 converter during single mode (including special mode "Forcible single mode execution during scan mode").

(1) AD0SMSL (A-D0 conversion mode selection) bit (D8)

This bit selects A-D conversion mode for the A-D0 converter during single mode. Setting this bit to 0 selects A-D conversion mode, and setting this bit to 1 selects comparator mode.

(2) AD0SSPD (A-D0 conversion rate selection) bit (D9)

This bit selects an A-D conversion rate for the A-D0 converter during single mode. Setting this bit to 0 selects a normal speed, and setting this bit to 1 selects a x2 speed.

(3) AN0SEL (analog input pin selection) bits (D12-D15)

These bits select analog input pins for the A-D0 converter during single mode. It is the channels selected by these bits that are operated on for A-D conversion or compare operation. When you read these bits, they show the values written to them.

11.2.3 A-D Scan Mode Register 0

■ A-D0 Scan Mode Register 0 (AD0SCM0)

<Address: H'0080 0084>

<When reset:H'04>

D	Bit Name	Function	R	W
0	No functions assigned		0	-
1	AD0CMSL (A-D0 scan mode selection)	0: Single-shot mode 1: Continuous mode	○	○
2	AD0CTRG (A-D0 hardware trigger selection)	0: Use inhibited 1: Output event bus 3	○	○
3	AD0CSEL (A-D0 conversion start trigger selection)	0: Software trigger 1: Hardware trigger	○	○
4	AD0CREQ (Interrupt request/DMA request selection)	0: Requests A-D0 interrupt 1: Requests DMA transfer	○	○
5	AD0CCMP (A-D0 conversion completed)	0: A-D0 conversion in progress 1: A-D0 conversion completed	○	-
6	AD0CSTP (A-D0 conversion stop)	0: Performs no operation 1: Stops A-D0 conversion	0	○
7	AD0CSTT (A-D0 conversion start)	0: Performs no operation 1: Starts A-D0 conversion	0	○

A-D0 Scan Mode Register 0 is used to control operation of the A-D0 converter during scan mode.

(1) AD0CMSL (A-D0 scan mode select) bit (D1)

This bit selects the A-D0 converter scan mode between one-shot scan and continuous scan modes.

Setting this bit to 0 selects one-shot scan mode, so that A-D conversion of channels selected with the AN0SCAN (scan loop select) bit are performed sequentially. When A-D conversion on all selected channels is completed, the convert operation stops.

Setting this bit to 1 selects continuous scan mode, so that when operation in one-shot mode finishes, A-D conversion is performed from the first channel again. This is repeated until stopped by setting the AD0CSTP (A-D0 conversion stop) bit to 1.

(2) AD0CTRG (A-D0 hardware trigger select) bit (D2)

When starting A-D conversion of the A-D0 converter in hardware, this bit specifies the conversion to be started by MJT output (output event bus 3). If software trigger is selected with the AD0CSEL (A-D conversion start trigger select) bit, the content of this bit is ignored.

(3) AD0CSEL (A-D0 conversion start trigger select) bit (D3)

This bit selects whether to apply the A-D conversion start trigger in software or in hardware during scan mode of the A-D0 converter. When software trigger is selected, A-D conversion is started by setting the AD0CSTT (A-D0 conversion start) bit to 1. When hardware trigger is selected, set the AD0CTRG (hardware trigger select) bit to 1 and specify conversion to be started by MJT output.

(4) AD0CREQ (A-D0 interrupt/DMA transfer request select) bit (D4)

This bit selects whether to generate an A-D0 conversion interrupt request or a DMA transfer request at completion of one cycle of scan mode operation.

(5) AD0CCMP (A-D0 conversion complete) bit (D5)

This is a read-only bit, and is 1 when reset. This bit is 0 when scan mode conversion of the A-D0 converter is in progress and set to 1 when one-shot scan mode operation is completed or when continuous scan mode is stopped by setting the AD0CSTT (A-D0 conversion stop) bit to 1.

(6) AD0CSTP (A-D0 conversion stop) bit (D6)

Scan mode operation of the A-D0 converter can be stopped by setting this bit to 1 while scan mode A-D conversion is under way. This bit is effective for only scan mode operation, and does not affect single mode operation when both single and scan modes of special operation mode are active.

Operation is stopped immediately after writing to this bit and A-D conversion on the channel which is in the middle of conversion is aborted, with no data transferred to the A-D Data Register.

If the A-D0 conversion start and A-D0 conversion stop bits are set to 1 simultaneously, the A-D0 conversion stop bit is effective.

(7) AD0CSTT (A-D0 conversion start) bit (D7)

This bit is used to start scan mode operation of the A-D0 converter in software. Only when software trigger has been selected with the AD0CSEL (A-D0 conversion start trigger select) bit, A-D conversion can be started by setting this bit to 1.

If the A-D0 conversion start and A-D0 conversion stop bits are set to 1 simultaneously, the A-D0 conversion stop bit is effective.

When this bit is set to 1 during scan mode conversion again, special operation mode "Conversion restart" is assumed, so that scan operation restarts according to the contents set by Scan Mode Register 0 and Scan Mode Register 1.

When this bit is set to 1 during A-D conversion in single mode, special operation mode "Start scan mode after executing single mode" is assumed, so that scan mode operation starts on successive channels after single mode finishes.

11.2.4 A-D Scan Mode Register 1

■ A-D0 Scan Mode Register 1 (AD0SCM1)

<Address: H'0080 0085>

<When reset:H'00>

D	Bit Name	Function	R	W
8	No functions assigned		0	–
9	AD0CSPD (A-D0 conversion rate selection)	0: Normal rate 1: Double rate	○	○
10,11	No functions assigned		0	–
12-15	AN0SCAN (A-D0 scan loop selection)	<For write> 01XX: 4-channel scan 10XX: 8-channel scan 11XX: 16-channel scan 00XX: 16-channel scan <For read during conversion> 0000: Converting AD0IN0 0001: Converting AD0IN1 0010: Converting AD0IN2 0011: Converting AD0IN3 0100: Converting AD0IN4 0101: Converting AD0IN5 0110: Converting AD0IN6 0111: Converting AD0IN7 1000: Converting AD0IN8 1001: Converting AD0IN9 1010: Converting AD0IN10 1011: Converting AD0IN11 1100: Converting AD0IN12 1101: Converting AD0IN13 1110: Converting AD0IN14 1111: Converting AD0IN15	○	○

A-D0 Scan Mode Register 1 is used to control operation of the A-D0 converter during scan mode.

(1) AD0CSPD (A-D0 conversion rate selection) bit (D9)

This bit selects an A-D conversion rate for the A-D0 converter during scan mode. Setting this bit to 0 selects a normal speed, and setting this bit to 1 selects a x2 speed.

(2) AN0SCAN (A-D0 scan loop selection) bits (D12-D15)

The AN0SCAN (A-D0 scan loop selection) bits set the channels to be scanned during scan mode of the A-D0 converter. In this case, writes to D14 and D15 have no effect.

The AN0SCAN (A-D0 scan loop selection) bits when read during scan operation show the status of the A-D0 converter, indicating the channel it is converting.

The value read from these bits during single mode are always "B'0000." If A-D conversion is halted by setting Scan Mode Register 0 AD0CSTP (A-D0 conversion stop) bit to 1 during scan mode execution, the bits when read at this time show the value of the channel in which the A-D conversion has been canceled. Also, if halted during single mode conversion in special operation mode "Forcible single mode execution during scan mode," the bits when read at this time show the value of the channel in which the A-D conversion has been canceled in the middle of scan.

11.2.5 A-D Successive Approximation Register

■ A-D0 Successive Approximation Register (AD0SAR) <Address: H'0080 0088>

<When reset:Indeterminate>

D	Bit Name	Function	R	W
0-5	No functions assigned		0	–
6-15	AD0SAR (A-D0 successive approximation value/comparison value)	<ul style="list-style-type: none"> • A-D successive approximation value (A-D conversion mode) • Comparison value (comparator mode) 	○	○

Note: • This register must always be accessed in halfwords.

The A-D0 Successive Approximation Register (AD0SAR), when in A-D conversion mode, is used to read out the conversion result of the A-D0 converter, and when in comparator mode, it is used to write a comparison value.

In A-D conversion mode, the successive approximation method is used to perform A-D conversion. With this method, the reference voltage VREF0 and analog input voltages are sequentially compared bitwise beginning with the high-order side, and the comparison result is set in the A-D0 Successive Approximation Register (AD0SAR) bits (D6-D15). After the A-D conversion is completed, the value of this register is transferred to the 10-bit A-D0 Data Register (AD0DTn) corresponding to the converted channel. When you read this register in the middle of A-D conversion, you see the result in the middle of conversion.

In comparator mode, write a comparison value (the value to be compared in compare operation) to this register. Simultaneously with a write to this register, compare operation with the analog input pin that has been set by Single Mode Register 1 starts. After compare operation, the result is stored in the A-D0 Compare Data Register (AD0CMP).

Use the calculation formula shown below to find the comparison value to be written to the A-D0 Successive Approximation Register (AD0SAR) during comparator mode.

$$\text{Comparison value} = \text{H'3FF} \times \frac{\text{Compare comparison voltage [V]}}{\text{VREF0 input voltage [V]}}$$

11.2.6 A-D Compare Data Register

■ A-D0 Compare Data Register (AD0CMP)

<Address: H'0080 008C>

D0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	D15
AD0 CMP0	AD0 CMP1	AD0 CMP2	AD0 CMP3	AD0 CMP4	AD0 CMP5	AD0 CMP6	AD0 CMP7	AD0 CMP8	AD0 CMP9	AD0 CMP10	AD0 CMP11	AD0 CMP12	AD0 CMP13	AD0 CMP14	AD0 CMP15

<When reset:Indeterminate>

D	Bit Name	Function	R	W
0-15	AD0CMP0-AD0CMP15 (Note 2) (A-D0 compare result flag)	0: Analog input voltage > comparison voltage 1: Analog input voltage < comparison voltage	○	–

Notes : • This register must always be accessed in halfwords.

- During comparator mode, each bit corresponds to channels 0 through 15.

When comparator mode is selected by setting the A-D0 Single Mode Register 1 AD0SMSL (A-D0 conversion mode selection) bit, the selected analog input value is compared with the value written to the A-D0 Successive Approximation Register, with the result stored in the corresponding bit of this compare data register.

The bit is 0 when the analog input voltage > comparison voltage, and is 1 when the analog input voltage < comparison voltage.

- 10-bit A-D0 Data Register 0 (AD0DT0) <Address: H'0080 0090>
- 10-bit A-D0 Data Register 1 (AD0DT1) <Address: H'0080 0092>
- 10-bit A-D0 Data Register 2 (AD0DT2) <Address: H'0080 0094>
- 10-bit A-D0 Data Register 3 (AD0DT3) <Address: H'0080 0096>
- 10-bit A-D0 Data Register 4 (AD0DT4) <Address: H'0080 0098>
- 10-bit A-D0 Data Register 5 (AD0DT5) <Address: H'0080 009A>
- 10-bit A-D0 Data Register 6 (AD0DT6) <Address: H'0080 009C>
- 10-bit A-D0 Data Register 7 (AD0DT7) <Address: H'0080 009E>
- 10-bit A-D0 Data Register 8 (AD0DT8) <Address: H'0080 00A0>
- 10-bit A-D0 Data Register 9 (AD0DT9) <Address: H'0080 00A2>
- 10-bit A-D0 Data Register 10 (AD0DT10) <Address: H'0080 00A4>
- 10-bit A-D0 Data Register 11 (AD0DT11) <Address: H'0080 00A6>
- 10-bit A-D0 Data Register 12 (AD0DT12) <Address: H'0080 00A8>
- 10-bit A-D0 Data Register 13 (AD0DT13) <Address: H'0080 00AA>
- 10-bit A-D0 Data Register 14 (AD0DT14) <Address: H'0080 00AC>
- 10-bit A-D0 Data Register 15 (AD0DT15) <Address: H'0080 00AE>

<When reset:Indeterminate>

D	Bit Name	Function	R	W
0-5	No functions assigned		0	-
6-15	AD0DT0-AD0DT15 (10-bit A-D0 data)	A-D conversion result	○	-

Note: • This register must always be accessed in halfwords.

In single mode of the A-D0 converter, the result of A-D conversion is stored in the 10-bit A-D0 Data Register for each corresponding channel. In single-shot and continuous scan modes, the content of the A-D0 Successive Approximation Register is transferred to the 10-bit A-D Data Register for the corresponding channel every time the A-D conversion in each channel is completed. Each 10-bit A-D Data Register retains the last conversion result until they receive the next conversion result transferred, allowing the content to be read out at any time.

11.2.8 8-bit A-D Data Registers

- 8-bit A-D0 Data Register 0 (AD08DT0) <Address: H'0080 00D1>
- 8-bit A-D0 Data Register 1 (AD08DT1) <Address: H'0080 00D3>

- 8-bit A-D0 Data Register 3 (AD08DT3) <Address: H'0080 00D7>
- 8-bit A-D0 Data Register 4 (AD08DT4) <Address: H'0080 00D9>
- 8-bit A-D0 Data Register 5 (AD08DT5) <Address: H'0080 00DB>
- 8-bit A-D0 Data Register 6 (AD08DT6) <Address: H'0080 00DD>
- 8-bit A-D0 Data Register 7 (AD08DT7) <Address: H'0080 00DF>
- 8-bit A-D0 Data Register 8 (AD08DT8) <Address: H'0080 00E1>
- 8-bit A-D0 Data Register 9 (AD08DT9) <Address: H'0080 00E3>
- 8-bit A-D0 Data Register 10 (AD08DT10) <Address: H'0080 00E5>
- 8-bit A-D0 Data Register 11 (AD08DT11) <Address: H'0080 00E7>
- 8-bit A-D0 Data Register 12 (AD08DT12) <Address: H'0080 00E9>
- 8-bit A-D0 Data Register 13 (AD08DT13) <Address: H'0080 00EB>
- 8-bit A-D0 Data Register 14 (AD08DT14) <Address: H'0080 00ED>
- 8-bit A-D0 Data Register 15 (AD08DT15) <Address: H'0080 00EF>

<When reset:Indeterminate>

D	Bit Name	Function	R	W
8-15	AD08DT0-AD08DT15 (8-bit A-D0 data)	8-bit A-D conversion result	○	–

This A-D data register stores the 8-bit conversion data from the A-D0 converter.

In single mode of the A-D0 converter, the result of A-D conversion is stored in the 8-bit A-D0 Data Register for each corresponding channel. In single-shot and continuous scan modes, the content of the A-D0 Successive Approximation Register is transferred to the 8-bit A-D Data Register for the corresponding channel every time the A-D conversion in each channel is completed. Each 8-bit A-D Data Register retains the last conversion result until they receive the next conversion result transferred, allowing the content to be read out at any time.

11.3 Functional Description of A-D Converter

11.3.1 How to Find Analog Input Voltages

The A-D converter uses a 10-bit successive approximation method, and finds the actual analog input voltage from the value (digital quantity) obtained through execution of A-D conversion by performing the following calculation.

$$\text{Analog input voltage [V]} = \frac{\text{A-D conversion result} \times \text{VREF0 input voltage [V]}}{1024}$$

The A-D converter is a 10-bit converter, providing a resolution of 1,024 discrete voltage levels. Because the reference voltage for the A-D converter is the voltage applied to the VREF0 pin, make sure an exact and stable constant-voltage power supply is connected to VREF0. Also, make sure the analog circuit power supply and ground (AVCC0, AVSS0) are separated from those of the digital circuit, with sufficient noise prevention measures incorporated.

For details about the conversion accuracy, refer to Section 11.3.5, "Accuracy of A-D Conversion."

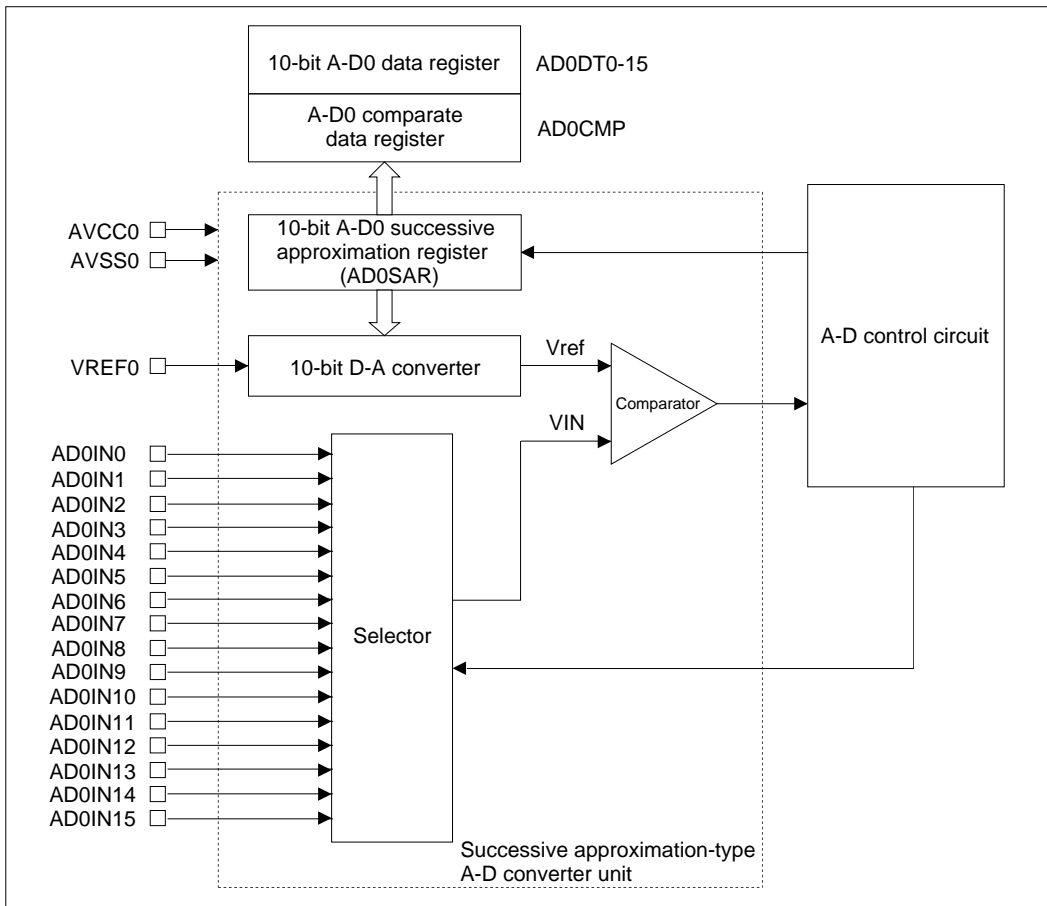

Figure 11.3.1 Outline Block Diagram of the Successive Approximation-type A-D Converter Unit

11.3.2 A-D Conversion by Successive Approximation Method

The A-D converter has A-D convert operation started by an A-D conversion start trigger (in software or hardware). Once A-D conversion begins, the following operation is automatically executed.

1. During single mode, Single Mode Register 0's A-D conversion/compare completion bit is cleared to 0. During scan mode, Scan Mode Register 0's A-D conversion completion bit is cleared to 0.
2. The content of the A-D Successive Approximation Register is cleared to "H'0000."
3. The A-D Successive Approximation Register's most significant bit (D6) is set to 1.
4. The comparison voltage, Vref (Note 1), is fed from the D-A converter into the comparator.
5. The comparison voltage, Vref, and the analog input voltage, VIN, are compared, with the comparison result stored in D6.
 - If $V_{ref} < V_{IN}$, then $D6 = 1$
 - If $V_{ref} > V_{IN}$, then $D6 = 0$
6. Operations in steps 3 through 5 above are executed for all other bits from D7 to D15.
7. The value stored in the A-D Successive Approximation Register at completion of the comparison of D15 is the final A-D conversion result.

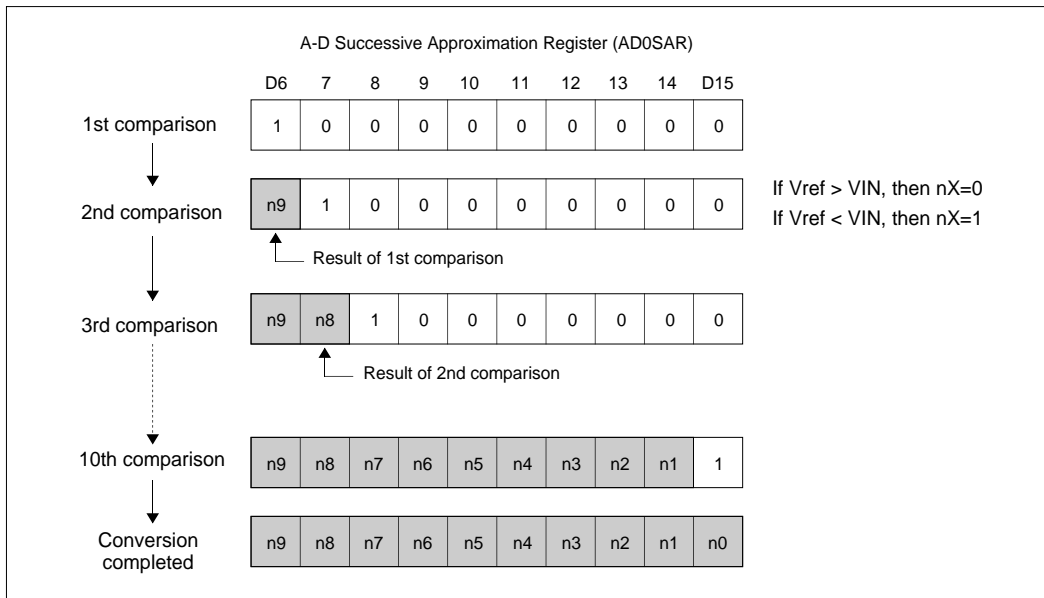

Figure 11.3.2 Changes of the A-D Successive Approximation Register during A-D Convert Operation

Note 1: The comparison voltage, Vref (the voltage fed from the D-A converter into the comparator), is determined according to changes of the content of the A-D Successive Approximation Register. Shown below are the equations used to calculate the comparison voltage, Vref.

- When the content of the A-D Successive Approximation Register = 0
 $V_{ref} [V] = 0$
- When the content of the A-D Successive Approximation Register = 1 to 1,023
 $V_{ref} [V] = (\text{reference voltage } V_{REF0} / 1,024) \times (\text{content of the A-D Successive Approximation Register} - 0.5)$

The comparison result is stored in the 10-bit A-D Data Register (AD0DTn) corresponding to each converted channel. Also, the 8 high-order bits of the 10-bit A-D conversion result can be read out from the 8-bit A-D Data Register (AD08DTn).

The following shows the procedure for A-D conversion by successive approximation in each operation mode.

(1) Single mode

The convert operation stops when comparison of the A-D Successive Approximation Register's D15 bit is completed. The content (A-D conversion result) of the A-D Successive Approximation Register is transferred to the 10-bit A-D Data Registers 0-15 for the converted channel.

(2) Single-shot scan mode

When comparison of the A-D Successive Approximation Register's D15 bit in a specified channel is completed, the content of the A-D Successive Approximation Register is transferred to the corresponding 10-bit A-D Data Registers 0-15, and convert operations in steps 2 to 7 above are reexecuted for the next channel to be converted.

In single-shot scan mode, the convert operation stops when A-D conversion for one specified scan loop is completed.

(3) Continuous scan mode

When comparison of the A-D Successive Approximation Register's D15 bit in a specified channel is completed, the content of the A-D Successive Approximation Register is transferred to the corresponding 10-bit A-D Data Registers 0-15, and convert operations in steps 2 to 7 above are reexecuted for the next channel to be converted.

During continuous scan mode, the convert operation is executed continuously until scan operation is forcibly halted by setting the A-D conversion stop bit (Scan Mode Register 0's D6 bit) to 1.

11.3.3 Comparator Operation

When comparator mode (single mode only) is selected, the A-D converter functions as a comparator which compares analog input voltages with the comparison voltage that is set by software.

When a comparison value is written to the successive approximation register, the A-D converter starts 'comparing' the analog input voltage selected by the Single Mode Register 1 analog input selection bit with the value written to the successive approximation register. Once compare begins, the following operation is automatically executed.

1. The Single Mode Register 0 or Scan Mode Register 0's A-D conversion/compare completion flag is cleared to 0.
2. The comparison voltage, V_{ref} (Note 1), is fed from the D-A converter into the comparator.
3. The comparison voltage, V_{ref} , and the analog input voltage, V_{IN} , are compared, with the comparison result stored in the compare result flag (A-D Compare Data Register's D15).
If $V_{ref} < V_{IN}$, then the compare result flag = 0
If $V_{ref} > V_{IN}$, then the compare result flag = 1
4. The compare operation stops after storing the comparison result.

The comparison result is stored in the A-D Compare Data Register (AD0CMP)'s corresponding bit.

Note 1: The comparison voltage, V_{ref} (the voltage fed from the D-A converter into the comparator), is determined according to changes of the content of the A-D Successive Approximation Register. Shown below are the equations used to calculate the comparison voltage, V_{ref} .

- When the content of the A-D Successive Approximation Register = 0
 $V_{ref} [V] = 0$
- When the content of the A-D Successive Approximation Register = 1 to 1,023
 $V_{ref} [V] = (\text{reference voltage } V_{REF0} / 1,024) \times (\text{content of the A-D Successive Approximation Register} - 0.5)$

11.3.4 Calculation of the A-D Conversion Time

The A-D conversion time is expressed by the sum of dummy cycle time and the actual execution cycle time. The following shows each time factor necessary to calculate the conversion time.

1. Start dummy time

A time from when the CPU executed the A-D conversion start instruction to when the A-D converter starts A-D conversion

2. A-D conversion execution cycle time

3. Compare execution cycle time

4. End dummy time

A time from when the A-D converter finished A-D conversion to when the CPU can stably read out this conversion result from the A-D data register

5. Scan to scan dummy time

A time during single-shot or continuous scan mode from when the A-D converter finished A-D conversion in a channel to when it starts A-D conversion in the next channel

The equation to calculate the A-D conversion time is as follows:

$$\begin{aligned}
 \text{A-D conversion time} &= \text{Start dummy time} + \text{Execution cycle time} \\
 &\quad (+ \text{Scan to scan dummy time} + \text{Execution cycle time} \\
 &\quad + \text{Scan to scan dummy time} + \text{Execution cycle time} \\
 &\quad + \text{Scan to scan dummy time} \dots + \text{Execution cycle time}) \\
 &\quad + \text{End dummy time}
 \end{aligned}$$

Note: • Shown in () are the conversion time required for the second and subsequent channels to be converted in scan mode.

(1) Calculating the conversion time during A-D conversion mode

The following shows how to calculate the conversion time during A-D conversion mode.

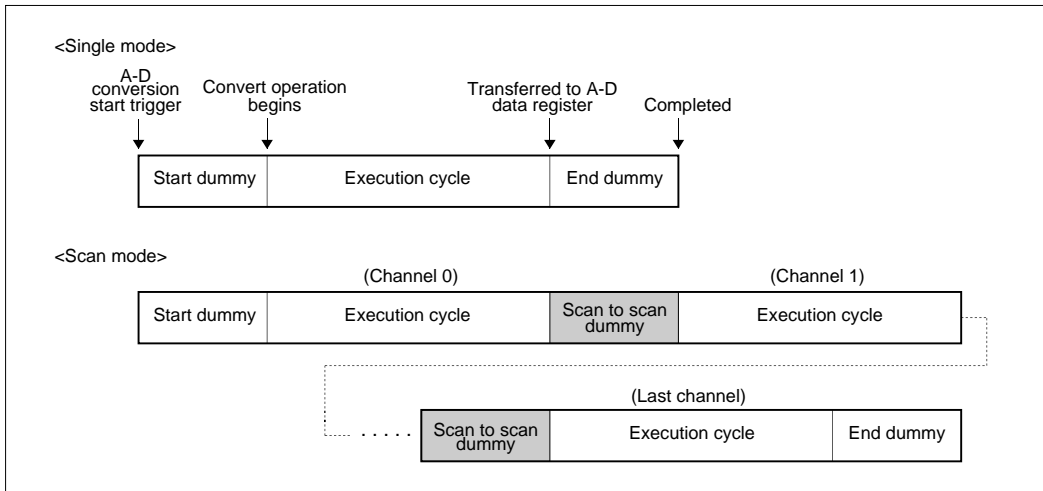

Figure 11.3.3 Conceptual Diagram of Conversion Time in A-D Conversion mode

Table 11.3.1 Conversion Clock Cycles in A-D Conversion Mode

Unit: BCLK

Conversion rate	Start dummy	A-D conversion execution cycle	End dummy	Scan to scan dummy (Note 1)
Normal rate	4	294	1	4
Double rate	4	168	1	4

Note 1: This applies to only scan mode, and is added to the execution time for each channel.

(2) Calculating the conversion time during compare mode

The following shows how to calculate the conversion time during compare mode.

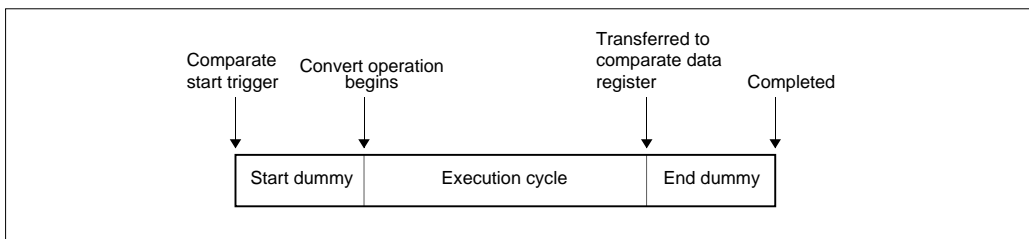

Figure 11.3.4 Conceptual Diagram of Conversion Time in Compare mode

Table 11.3.2 Conversion Clock Cycles in Compare Mode

Unit: BCLK

Conversion rate	Start dummy	Compare execution cycle	End dummy
Normal rate	4	42	1
Double rate	4	24	1

(2) A-D conversion time

The table below lists A-D conversion times.

Table 11.3.3 Total A-D Conversion Time

Conversion started by	Conversion rate	Conversion mode (Note 1)	Conversion time [BCLK]		
Software trigger (Note 2)	Normal rate	Single mode	299		
		/Continuous	Single-shot scan	4-channel scan	1193
				8-channel scan	2385
				16-channel scan	4769
		Comparator mode	47		
	Double rate	Single mode	173		
		/Continuous	Single-shot scan	4-channel scan	689
				8-channel scan	1377
				16-channel scan	2753
		Comparator mode	29		
Hardware trigger (Note 3)	Normal	Single mode	299		
		/Continuous	Single-shot scan	4-channel scan	1193
				8-channel scan	2385
				16-channel scan	4769
		Comparator mode	47		
	Double speed	Single mode	173		
		/Continuous	Single-shot scan	4-channel scan	689
				8-channel scan	1377
				16-channel scan	2753
		Comparator mode	29		

Note 1: For single and comparator modes, this shows the time for A-D conversion in one channel or for compare operation. For single-shot and continuous scan modes, this shows the time for A-D conversion in one scan loop.

Note 2: This shows the time from when a write-to-register cycle is completed to when an A-D conversion interrupt request is generated.

Note 3: This shows the time from when output event bus 3 is actuated to when an A-D conversion interrupt request is generated.

11.3.5 Definition of the A-D Conversion Accuracy

The accuracy of the A-D Converter is expressed by absolute accuracy. Absolute accuracy refers to the difference, expressed in terms of LSB, between the output code actually obtained by converting analog input voltages into digital quantities and the output code that can be expected from an A-D converter with ideal characteristics.

The analog input voltages used during accuracy measurement are chosen to be the midpoint values of voltage width at which an A-D converter with ideal characteristics will produce the same output code. For example, when $VREF0 = 5.12\text{ V}$, the width of 1 LSB of a 10-bit A-D converter is 5 mV, so that the middle points of analog input voltages are chosen to be 0 mV, 5 mV, 10 mV, 15 mV, 20 mV, 25 mV, and so on.

If the absolute accuracy of an A-D converter is said to be $\pm 2\text{ LSB}$, it means that if the input voltage is 25 mV, for example, then the actual A-D conversion result is in the range of H'003 to H'007, whereas the output code that can be expected from an ideal A-D converter is H'005. Note that absolute accuracy includes a zero error and full-scale error.

Although when actually using the A-D Converter, the analog input voltages are in the range of $AVSS0$ to $VREF0$, excessively lowering the $VREF0$ voltage requires caution because resolution may be degraded. Note also that output codes for analog input voltages from $VREF0$ to $AVCC0$ are always H'3FF.

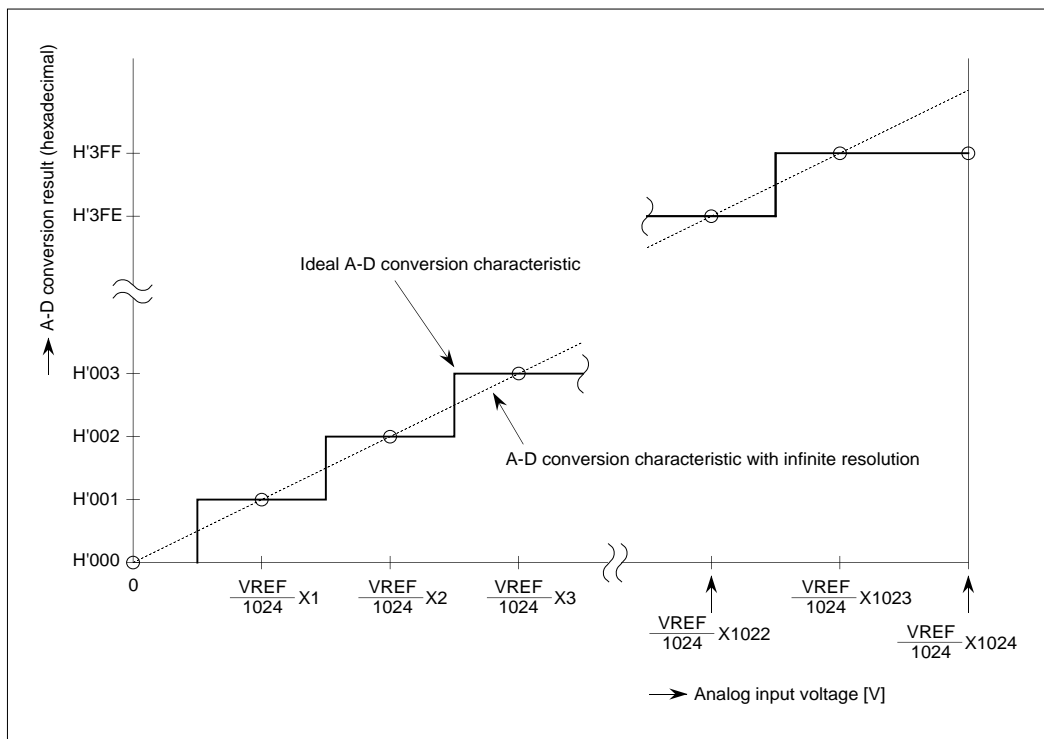

Figure 11.3.5 Ideal A-D Conversion Characteristics Relative to the 10-bit A-D Converter's Analog Input Voltages

Figure 11.3.6 Absolute Accuracy of an A-D Converter

11.4 Precautions on Using A-D Converter

- **Forcible termination during scan operation**

If A-D conversion is forcibly terminated by setting the A-D conversion stop bit (AD0CSTP) to 1 during scan mode operation and you read the content of the A-D data register for the channel in which conversion was in progress, it shows the last conversion result that had been transferred to the A-D data register before the conversion was forcibly terminated.

- **Modification of A-D converter related registers**

If you want to change the contents of the A-D Conversion Interrupt Control Register, each Single and Scan Mode Register, or A-D Successive Approximation Register, except for the A-D conversion stop bit, do your change while A-D conversion is inactive, or be sure to restart A-D conversion after you changed the register contents. If the contents of these registers are changed in the middle of A-D conversion, the conversion results cannot be guaranteed.

- **Handling of analog input signals**

The A-D converter included in the 32171 does not have a sample-and-hold circuit. Therefore, make sure the analog input levels are fixed during A-D conversion.

- **A-D conversion completion bit readout timing**

If you want to read the A-D conversion completion bit (Single Mode Register 0's D5 bit or Scan Mode Register 0's D5 bit) immediately after A-D conversion has started, be sure to adjust the timing one clock cycle by, for example, inserting a NOP instruction before you read.

- **Rated value of absolute accuracy**

The rated value of absolute accuracy is that of the microcomputer alone, premised on an assumption that power supply wiring on the board where the microcomputer is mounted is stable and unaffected by noise. When designing the board, pay careful attention to its layout by, for example, separating AVCC0, AVSS0, and VREF0 from other digital power supplies or protecting the analog input pins against noise from other digital signals.

- Regarding the analog input pins

Figure 11.4.1 shows an internal equivalent circuit of the analog input unit. To obtain exact A-D conversion results, it is necessary that the A-D conversion circuit finishes charging its internal capacitor C2 within a designated time (sampling time). To meet this sampling time requirement, we recommend connecting a stabilizing capacitor, C1, external to the chip.

The following shows the analog output device's output impedance and how to determine the value of the external stabilizing capacitor to meet this timing requirement. Also shown below is the case where the analog output device's output impedance is low and the external stabilizing capacitor C1 is unnecessary.

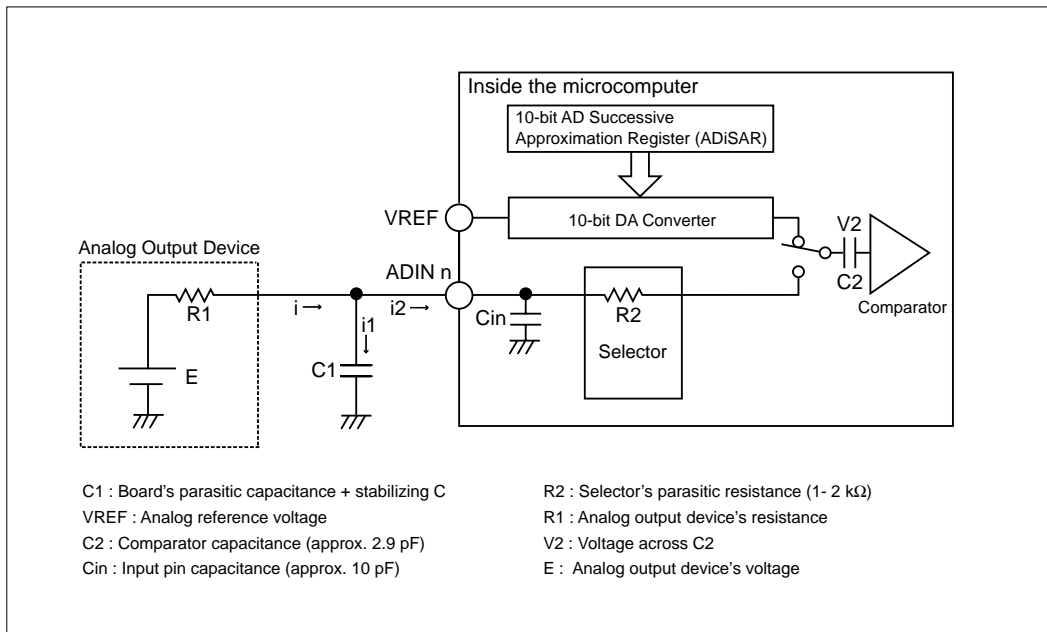

Figure 11.4.1 Internal Equivalent Circuit of the Analog Input Unit

(a) Example for calculating the value of an external stabilizing capacitor C1 (recommended)

In Figure 11.4.1, as we calculate the capacitance of C1, we assume R1 is infinitely large, that the current needed to charge the internal capacitor C2 is sourced from C1, and that the voltage fluctuation due to C1 and C2 capacitance divisions, V_p , is 0.1 LSB or less. For the 10-bit A-D converter where VREF is 5.12 V, the 1 LSB determination voltage = $5.12 \text{ V} / 1024 = 5 \text{ mV}$. With up to 0.1 LSB voltage fluctuations considered, this equals 0.5 mV fluctuation.

The relationship between C1 and C2 capacitance divisions and Vp is obtained by the equation:

$$V_p = \frac{C_2}{C_1 + C_2} \times (E - V_2) \text{ ----- Eq. (A-1)}$$

Also, Vp is obtained by the equation:

$$V_p = V_{p1} \times \sum_{i=0}^{x-1} \frac{1}{2^i} < \frac{V_{REF}}{10 \times 2^x} \text{ ----- Eq. (A-2)}$$

- Notes: • Where Vp1 = voltage fluctuation in first A-D conversion.
 • The exponent x is 10 because of a 10-bit resolution A-D converter.

When Eqs. (A-1) and (A-2) are solved,

$$C_1 = C_2 \left\{ \frac{E - V_2}{V_{p1}} - 1 \right\} \text{ ----- Eq. (A-3)}$$

$$\therefore C_1 > C_2 \left\{ 10 \times 2^x \times \sum_{i=0}^{x-1} \frac{1}{2^i} - 1 \right\} \text{ ----- Eq. (A-4)}$$

Thus, for 10-bit resolution A-D converter where C2 = 2.9 pF, C1 is 0.06 μF or greater.

Use this for reference when determining the value of C1.

(b) Maximum value of the output impedance R1 when not adding C1

In Figure 11.4.1, if the external capacitor C1 is not used, examination must be made of whether C2 can be fully charged. First, the following shows the equation to find i2 when C1 is nonexistent in Figure 11.4.1.

$$i_2 = \frac{C_2(E - V_2)}{C_{in} \times R_1 + C_2(R_1 + R_2)} \times \exp \left\{ \frac{-t}{C_{in} \times R_1 + C_2(R_1 + R_2)} \right\} \text{ Eq. (B-1)}$$

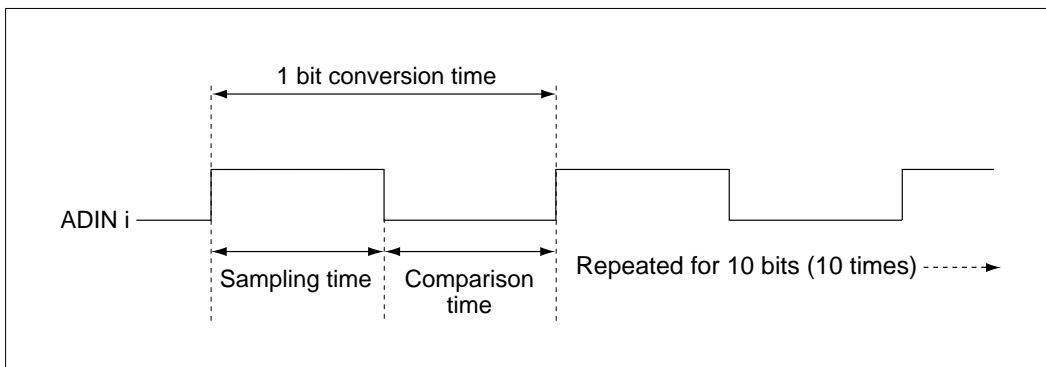

Figure 11.4.2 A-D Conversion Timing Diagram

The time needed for charging C2 must be within the sampling time (in Figure 11.4.2, A-D Conversion Timing Diagram) divided by 2.

Assuming $t = T$ (time needed for charging C2)

$$T = \frac{\text{Sampling time}}{2} = \frac{\text{A-D conversion time}}{10 \times 4}$$

Therefore, from Eq. (B-1), the time needed for charging C2 is

$$T = (\text{time needed for charging C2}) > C_{in} \times R1 + C2(R1 + R2) \dots\dots\dots \text{Eq. (B-2)}$$

Thus, the maximum value of R1 as an approximate guide can be obtained by the equation:

$$R1 < \frac{\frac{\text{A-D conversion time}}{10 \times 4} - C2 \times R2}{C_{in} + C2} \dots\dots\dots \text{Eq. (B-3)}$$

The table below shows an example of how to calculate the maximum value of R1 during A-D conversion mode when $X_{in} = 10$ and 8 MHz.

Xin	BCLK period	Conversion mode	Speed mode	Conversion cycles	T (C2 charging time) in ns	Maximum value of R1 (Ω)
10MHz	50ns	A-D conversion mode/Single	Normal	294	367	28,225
			Double speed	168	210	16,054
8MHz	62.5ns	A-D conversion mode/Single	Normal	294	459	35,357
			Double speed	168	262	20,085

Note: • The above conversion cycles do not include dummy cycles at the start and end of conversion.

In compare mode, because sampling and comparison each are performed only once, the maximum value of R1 can be derived from the equation

$$R1 < \frac{\frac{\text{A-D conversion time}}{4} - C2 \times R2}{C_{in} + C2} \dots\dots\dots \text{Eq. (B-4)}$$

The table below shows an example of how to calculate the maximum value of R1 during compare mode when $X_{in} = 10$ and 8 MHz.

Xin	BCLK period	Conversion mode	Speed mode	Conversion cycles	T (C2 charging time) in ns	Maximum value of R1 (Ω)
10MHz	50ns	compare mode /Single	Normal	42	525	40,473
			Double speed	24	300	23,031
8MHz	62.5ns	compare mode /Single	Normal	42	656	50,628
			Double speed	24	375	28,845

Note: • The above conversion cycles do not include dummy cycles at the start and end of conversion.

CHAPTER 12

SERIAL I/O

- 12.1 Outline of Serial I/O
- 12.2 Serial I/O Related Registers
- 12.3 Transmit Operation in CSIO Mode
- 12.4 Receive Operation in CSIO Mode
- 12.5 Precautions on Using CSIO Mode
- 12.6 Transmit Operation in UART Mode
- 12.7 Receive Operation in UART Mode
- 12.8 Fixed Period Clock Output Function
- 12.9 Precautions on Using UART Mode

12.1 Outline of Serial I/O

The 32171 contains a total of three serial I/O channels: SIO0, SIO1, and SIO2. Serial channels SIO0 and SIO1 can be selected between CSIO mode (clock-synchronous serial I/O) and UART mode (asynchronous serial I/O). SIO2 is UART mode only.

- **CSIO mode (clock-synchronous serial I/O)**

Communication is performed synchronously with transfer clock, using the same clock on both transmit and receive sides. The transfer data is 8 bits long (fixed).

- **UART mode (asynchronous serial I/O)**

Communication is performed asynchronously. The transfer data length can be selected from 7 bits, 8 bits, and 9 bits.

Serial I/Os 0-2 each have transmit DMA and receive DMA transfer requests. Through a combined use with the internal DMAC, they allow for fast serial communication, and help to reduce the data communication load on the CPU.

Serial I/O is outlined in the pages to follow.

Table 12.1.1 Outline of Serial I/O

Item	Content
Number of channels	CSIO/UART : 2 channels (SIO0, SIO1) UART only : 1 channels (SIO2)
Clock	During CSIO mode : Internal clock or external clock as selected (Note 1) During UART mode : Internal clock only
Transfer mode	Transmit half-duplex, receive half-duplex, transmit/receive full-duplex
BRG count source	f(BCLK), f(BCLK)/8, f(BCLK)/32, f(BCLK)/256 (when internal peripheral clock selected) (Note 2) f(BCLK) : Internal peripheral clock operating frequency
Data format	CSIO mode : Data length = 8 bits (fixed) Order of transfer = LSB first (fixed) UART mode : Start bit = 1 bit Character length = 7, 8, or 9 bits Parity bit = Added or not added (when added, selectable between odd and even parity) Stop bit = 1 or 2 bits Order of transfer = LSB first (fixed)
Baud rate	CSIO mode : 152 bits/sec to 2M bits/sec (at f(BCLK) = 20 MHz) UART mode : 19 bits/sec to 1.25M bits/sec (at f(BCLK) = 20 MHz)
Error detection	CSIO mode : Overrun error only UART mode : Overrun error, parity error, framing error (Occurrence of any of these errors is indicated by an error sum bit)
Fixed period clock function	When using SIO0 and SIO1 as UART, this function outputs a divided-by-2 BRG clock from the SCLK pin.

Note 1 : The maximum input frequency of external clock during CSIO mode is 1/16 of f(BCLK).

Note 2 : When f(BCLK) is selected as the BRG count source, the BRG set value is subject to limitations.

Table 12.1.2 Serial I/O Interrupt Request Generation Function

Serial I/O Interrupt Request	ICU Interrupt Cause
SIO0 transmit buffer empty interrupt	SIO0 transmit interrupt
SIO0 receive-finished or receive error interrupt (selectable)	SIO0 receive interrupt
SIO1 transmit buffer empty interrupt	SIO1 transmit interrupt
SIO1 receive-finished or receive error interrupt (selectable)	SIO1 receive interrupt
SIO2 transmit buffer empty interrupt	SIO2 transmit/receive interrupt (group interrupt)
SIO2 receive-finished or receive error interrupt (selectable)	SIO2 transmit/receive interrupt (group interrupt)

Table 12.1.3 Serial I/O DMA Transfer Request Generation Function

Serial I/O DMA Transfer Request	DMAC Input Channel
SIO0 transmit buffer empty	Channel 3
SIO0 receive-finished	Channel 4
SIO1 transmit buffer empty	Channel 6
SIO1 receive-finished	Channel 3
SIO2 transmit buffer empty	Channel 7
SIO2 receive-finished	Channel 5

Figure 12.2.1 Serial I/O Related Register Map

12.2.1 SIO Interrupt Related Registers

(1) Selecting the cause of interrupt

Interrupt signals sent from each SIO to the ICU (Interrupt Controller) are broadly classified into transmit interrupts and receive interrupts. Transmit interrupts are generated when the transmit buffer is empty. Receive interrupts are either receive-finished interrupts or receive error interrupts as selected by the Cause of Receive Interrupt Select Register (SI03SEL).

Note: • No interrupt signals are generated unless interrupts are enabled by the SIO Interrupt Mask Register after enabling the TEN (transmit enable) bit or REN (receive enable) bit for the corresponding SIO.

(2) Precautions on using transmit interrupts

Transmit interrupts are generated when the corresponding TEN (transmit enable) bit is enabled while the SIO Interrupt Mask Register is set to enable interrupts.

(3) About DMA transfer requests from SIO

Each SIO can generate a transmit DMA transfer and a receive-finished DMA transfer request. These DMA transfer requests can be generated by enabling each SIO's corresponding TEN (transmit enable) bit or REN (receive enable) bit. When using DMA transfers to communicate with external devices, be sure to set the DMAC before enabling the TEN or REN bits. When a receive error occurs, no receive-finished DMA transfer requests are generated.

- Transmit DMA transfer request

Generated when the transmit buffer is empty and the TEN bit is enabled.

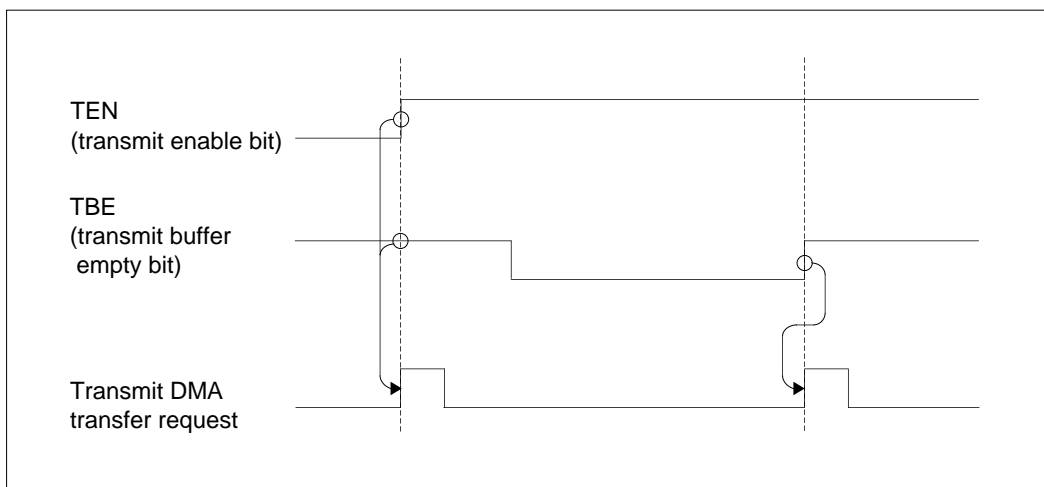

Figure 12.2.2 Transmit DMA Transfer Request

- Receive-finished DMA transfer request

DMA transfer request is generated when the receive buffer is filled.

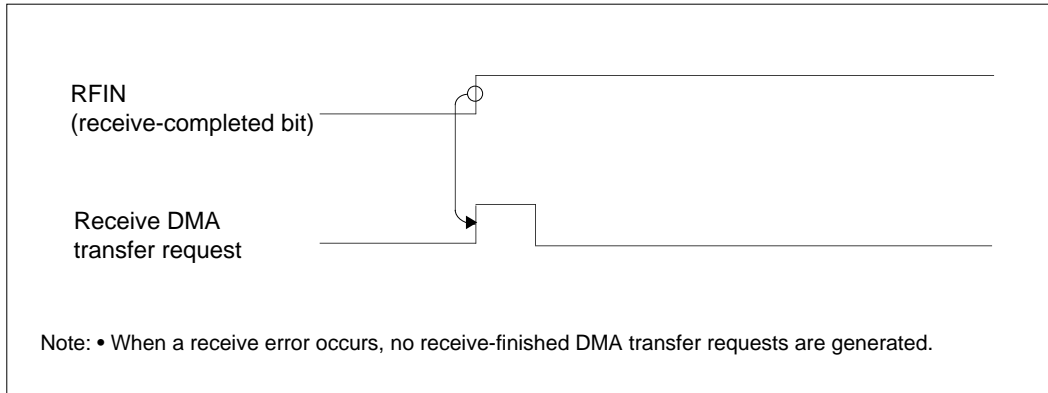

Figure 12.2.3 Receive-finished DMA Transfer Request

12.2.2 SIO Interrupt Control Registers

■ SIO23 Interrupt Status Register (SI23STAT)

<Address: H'0080 0100>

<When reset : H'00>

D	Bit Name	Function	R	W
0 - 3	No functions assigned		0	—
4	IRQT2 (SIO2 transmit-finished interrupt request status bit)	0 : Interrupt not requested 1 : Interrupt requested	○	△
5	IRQR2 (SIO2 receive interrupt request status bit)	0 : Interrupt not requested 1 : Interrupt requested	○	△
6 - 7	These bits have no functions assigned.		0	—

W = △ : Only writing a 0 is effective; when you write a 1, the previous value is retained.

Transmit/receive interrupt requests from SIO2 are described below.

[Setting the interrupt request status bit]

This bit can only be set in hardware, and cannot be set in software.

[Clearing the interrupt request status bit]

This bit is cleared by writing a 0 in software.

Note: • If the status bit is set in hardware at the same time it is cleared in software, the former has priority and the status bit is set.

When writing to the SIO Interrupt Status Register, make sure the bits you want to clear are set to 0 and all other bits are set to 1. The bits which are thus set to 1 are unaffected by writing in software and retain the value they had before you write.

■ SIO03 Interrupt Mask Register (SI03MASK)

<Address: H'0080 0101>

D8	9	10	11	12	13	14	D15
T0MASK	R0MASK	T1MASK	R1MASK	T2MASK	R2MASK		

<When reset : H'00>

D	Bit Name	Function	R	W
8	T0MASK (SIO0 transmit interrupt mask bit)	0 : Masks (disables) interrupt request 1 : Enables interrupt request	○	○
9	R0MASK (SIO0 receive interrupt mask bit)	0 : Masks (disables) interrupt request 1 : Enables interrupt request	○	○
10	T1MASK (SIO1 transmit interrupt mask bit)	0 : Masks (disables) interrupt request 1 : Enables interrupt request	○	○
11	R1MASK (SIO1 receive interrupt mask bit)	0 : Masks (disables) interrupt request 1 : Enables interrupt request	○	○
12	T2MASK (SIO2 transmit interrupt mask bit)	0 : Masks (disables) interrupt request 1 : Enables interrupt request	○	○
13	R2MASK (SIO2 receive interrupt mask bit)	0 : Masks (disables) interrupt request 1 : Enables interrupt request	○	○
14 - 15	No functions assigned.		0	—

This register enables or disables interrupt requests generated by each SIO. Interrupt requests from an SIO are enabled by setting its corresponding interrupt mask bit to 1.

■ SIO03 Cause of Receive Interrupt Select Register (SI03SEL) <Address: H'0080 0102>

<When reset : H'00>

D	Bit Name	Function	R	W
0 - 3	No functions assigned		0	—
4	ISR0 (SIO0 receive interrupt cause select bit)	0 : Receive-finished interrupt 1 : Receive error interrupt	○	○
5	ISR1 (SIO1 receive interrupt cause select bit)	0 : Receive-finished interrupt 1 : Receive error interrupt	○	○
6	ISR2 (SIO2 receive interrupt cause select bit)	0 : Receive-finished interrupt 1 : Receive error interrupt	○	○
7	No functions assigned.		0	—

This register selects the cause of an interrupt generated at completion of receive operation.

[When set to 0]

Receive-finished interrupt (receive buffer full) is selected. Receive-finished interrupts occur for receive errors (except an overrun error), as well as for completion of receive operation.

[When set to 1]

Receive error interrupt is selected. The following lists the types of errors detected for reception errors.

- CSIO mode : Overrun error
- UART mode : Overrun error, parity error, and framing error

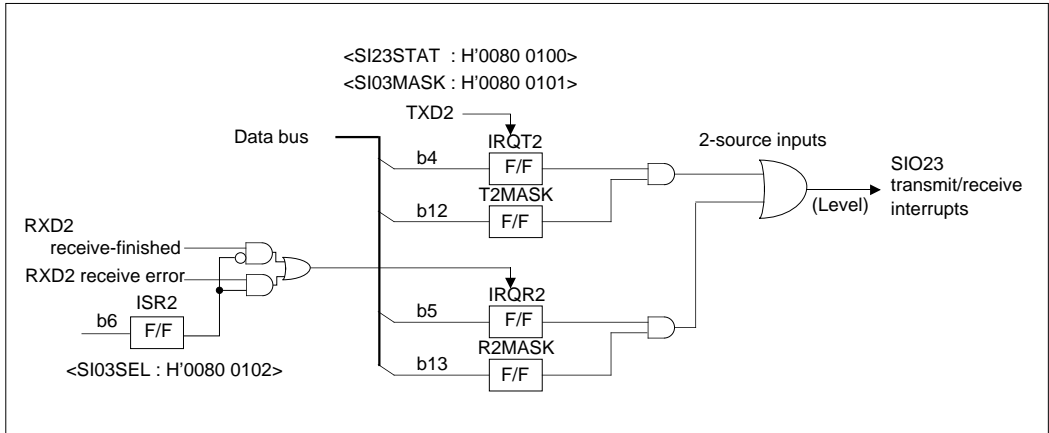

Figure 12.2.4 Block Diagram of SIO23 Transmit Interrupts

12.2.3 SIO Transmit Control Registers

- SIO0 Transmit Control Register (S0TCNT) <Address: H'0080 0110>
- SIO1 Transmit Control Register (S1TCNT) <Address: H'0080 0120>
- SIO2 Transmit Control Register (S2TCNT) <Address: H'0080 0130>

<When reset : H'12>

D	Bit Name	Function	R	W
0 , 1	No functions assigned		0	—
2 , 3	CDIV (BRG count source select bit)	00 : Selects f(BCLK) 01 : Selects divided-by-8 f(BCLK) 10 : Selects divided-by-32 f(BCLK) 11 : Selects divided-by-256 f(BCLK)	○	○
4	No functions assigned		0	—
5	TSTAT (Transmit status bit)	0 : Transmit halted & no data in transmit buffer register 1 : Transmit in progress or data exists in transmit buffer register	○	—
6	TBE (Transmit buffer empty bit)	0 : Data exists in transmit buffer register 1 : No data in transmit buffer register	○	—
7	TEN (Transmit enable bit)	0 : Disables transmit 1 : Enables transmit	○	○

(1) CDIV (baud rate generator count source select) bits (D2, D3)

These bits select the count source for the baud rate generator (BRG).

Note : • If f(BCLK) is selected as the count source for the BRG, make sure when you set BRG that the baud rate will not exceed the maximum transfer rate. For details, refer to the section of this manual where the SIO baud rate register is described.

(2) TSTAT (transmit status) bit (D5)

[Set condition]

This bit is set to 1 by a write to the Transmit Buffer Register when transmit is enabled.

[Clear condition]

This bit is cleared to 0 when transmit is idle (no data in the Transmit Shift Register) and no data exists in the Transmit Buffer Register. This bit also is cleared by clearing the transmit enable bit.

(3) TBE (transmit buffer empty) bit (D6)

[Set condition]

This bit is set to 1 when data is transferred from the Transmit Buffer Register to the Transmit Shift Register and the Transmit Buffer Register becomes empty. This bit also is set by clearing the transmit enable bit.

[Clear condition]

This bit is cleared to 0 by writing data to the lower byte of the Transmit Buffer Register when transmit is enabled (TEN = 1).

(4) TEN (transmit enable) bit (D7)

Transmit is enabled by setting this bit to 1 and disabled by clearing this bit to 0. If this bit is cleared to 0 while transmitting data, the transmit operation stops.

12.2.4 SIO Transmit/Receive Mode Registers

- SIO0 Mode Register (S0MOD) <Address: H'0080 0111>
- SIO1 Mode Register (S1MOD) <Address: H'0080 0121>
- SIO2 Mode Register (S2MOD) <Address: H'0080 0131>

<When reset : 00>

D	Bit Name	Function	R	W
8 - 10	SMOD (Serial I/O mode select bit) (Note 1)	000 : 7-bit UART 001 : 8-bit UART 01X : 9-bit UART 1XX : 8-bit clock-synchronized serial I/O	○	○
11	CKS (Internal/external clock select bit)	0 : Internal clock 1 : External clock	○	○ (Note 2)
12	STB (Stop bit length select bit, UART mode only)	0 : One stop bit 1 : Two stop bits	○	○ (Note 3)
13	PSEL (Parity odd/even select bit, UART mode only)	0 : Odd parity 1 : Even parity	○	○ (Note 3)
14	PEN (Parity enable bit, UART mode only)	0 : Disables parity 1 : Enables parity	○	○ (Note 3)
15	SEN (Sleep select bit, UART mode only)	0 : Disables sleep function 1 : Enables sleep function	○	○ (Note 3)

Note 1 : For SIO2, the D8 bit is fixed to 0 in hardware. You cannot set the D8 bit to 1 (to choose clock-synchronous serial I/O).

Note 2 : Has no effect when UART mode is selected.

Note 3 : D12 to D15 have no effect during clock-synchronous mode.

The SIO Mode Register consists of bits to set the serial I/O operation mode, data format, and the functions used during communication.

The SIO Transmit/Receive Mode Register must always be set before serial I/O starts operating. If you want to change settings of this register after the serial I/O started transmitting or receiving data, be sure to confirm that transmit and receive operations have been completed and disable transmit/receive operations (by clearing the SIO Transmit Control Register transmit enable bit and SIO Receive Control Register receive enable bit to 0) before you change.

(1) SMOD (serial I/O mode select) bits (D8 to D10)

These bits select the operation mode of serial I/O.

(2) CKS (internal/external clock select) bit (D11)

This bit is effective when CSIO mode is selected. Setting this bit has no effect when UART mode is selected, in which case the serial I/O is clocked by an internal clock.

(3) STB (stop bit length select) bit (D12)

This bit is effective when UART mode is selected. Use this bit to select the stop bit length that indicates the end of data to transmit. Setting this bit to 0 selects one stop bit, and setting this bit to 1 selects two stop bits. During clock-synchronous mode, the content of this bit has no effect.

(4) PSEL (parity odd/even select) bit (D13)

This bit is effective during UART mode. When parity is enabled (D14 = 1), use this bit to select the parity attribute (whether odd or even). Setting this bit to 0 selects an odd parity, and setting this bit to 1 selects an even parity. When parity is disabled (D14 = 0) and during clock-synchronous mode, the content of this bit has no effect.

(5) PEN (parity enable) bit (D14)

This bit is effective during UART mode. When this bit is set to 1, a parity bit is added immediately after the data bits of transmit data, and for receive data, the parity in it is checked. The parity bit added to the transmit data is automatically determined to be a 1 or a 0 in such a way that the attribute (odd/even) of the sum of the number of 1's in data bits and the content of the parity bit agrees with one selected by the parity odd/even select bit (D13). Figure 12.2.5 shows an example of data format when parity is enabled.

(6) SEN (sleep select) bit (D15)

This bit is effective during UART mode. If the sleep function is enabled by setting this bit to 1, data is latched into the UART Receive Buffer Register only when the most significant bit (MSB) of the received data is 1.

12.2.5 SIO Transmit Buffer Registers

- **SIO0 Transmit Buffer Register (S0TXB)** <Address: H'0080 0112>
- **SIO1 Transmit Buffer Register (S1TXB)** <Address: H'0080 0122>
- **SIO2 Transmit Buffer Register (S2TXB)** <Address: H'0080 0132>

<When reset : Indeterminate>

D	Bit Name	Function	R	W
0 - 6	No functions assigned		?	○
7 - 15	TDATA (Transmit data)	Sets transmit data.	?	○

R = ? : Indeterminate when read

The SIO Transmit Buffer Register is used to set transmit data. This register is a write-only register, so you cannot read out the content of this register. Set data LSB-aligned, and write transmit data to bits D9-D15 for 7-bit data (UART mode only), D8-D15 for 8-bit data, or D7-D15 for 9-bit data (UART mode only).

Before you set data in this register, enable the Transmit Control Register TEN (transmit enable) bit by setting it to 1. Writing data to this register while the TEN bit is disabled (cleared to 0) has no effect. When data is written to the Transmit Buffer Register while transmit is enabled, the data is transferred from the SIO Transmit Buffer Register to the SIO Transmit Shift Register, upon which the serial I/O starts transmitting the data.

Note: • For 7-bit and 8-bit data, the register can be accessed byte-wise.

12.2.6 SIO Receive Buffer Registers

- SIO0 Receive Buffer Register (S0RXB) <Address: H'0080 0114>
- SIO1 Receive Buffer Register (S1RXB) <Address: H'0080 0124>
- SIO2 Receive Buffer Register (S2RXB) <Address: H'0080 0134>

<When reset : Indeterminate>

D	Bit Name	Function	R	W
0 - 6	No functions assigned		0	—
8 - 15	RDATA (Receive data)	Stores receive data.	○	—

The SIO_n Receive Buffer Register is used to store the receive data. When the serial I/O finishes receiving data, the content of the SIO Receive Shift Register is transferred to the SIO Receive Buffer Register. This register is a read-only register.

For 7-bit data (UART mode only), data is set in bits D9-D15, with D8 and D7 always set to 0. For 8-bit data, data is set in bits D8-D15, with D7 always set to 0.

After reception is completed, you may read out the content of the SIO Receive Buffer Register, but if the serial I/O finishes receiving the next data before you read the previous data, an overrun error occurs. In this case, the data received thereafter is not transferred to the Receive Buffer Register. To restart reception normally, clear the Receive Control Register's REN (receive enable) bit to 0.

Note: • For 7-bit and 8-bit data, the register can be accessed byte-wise.

12.2.7 SIO Receive Control Registers

- **SIO0 Receive Control Register (S0RCNT)** <Address: H'0080 0116>
- **SIO1 Receive Control Register (S1RCNT)** <Address: H'0080 0126>
- **SIO2 Receive Control Register (S2RCNT)** <Address: H'0080 0136>

<When reset : H'00>

D	Bit Name	Function	R	W
0	No functions assigned		0	—
1	RSTAT (Receive status bit)	0 : Reception stopped 1 : Reception in progress	○	—
2	RFIN (Receive completed bit)	0 : No data in receive buffer register 1 : Data exists in receive buffer register	○	—
3	REN (Receive enable bit)	0 : Disables reception 1 : Enables reception	○	○
4	OVR (Overflow error bit)	0 : No overrun error 1 : Overflow error occurred	○	—
5	PTY (Parity error bit, UART mode only)	0 : No parity error 1 : Parity error occurred	○	—
6	FLM (Framing error bit, UART mode only)	0 : No framing error 1 : Framing error occurred	○	—
7	ERS (Error sum bit)	0 : No error 1 : Error occurred	○	—

(1) RSTAT (receive status) bit (D1)

[Set condition]

This bit is set to 1 by a start of receive operation. When this bit = 1, it means that the serial I/O is receiving data.

[Clear condition]

This bit is cleared to 0 upon completion of receive operation or by clearing the REN (receive enable) bit.

(2) RFIN (receive completed) bit (D2)

[Set condition]

This bit is set to 1 when all data bits have been received in the Receive Shift Register and whose content is transferred to the Receive Buffer Register.

[Clear condition]

This bit is cleared to 0 by reading the lower byte from the Receive Buffer Register or by clearing the REN (receive enable) bit. However, if an overrun error occurs, this bit cannot be cleared by reading the lower byte from the Receive Buffer Register. In this case, clear the REN (receive enable) bit.

(3) REN (receive enable) bit (D3)

Receive is enabled by setting this bit to 1, and is disabled by clearing this bit to 0, at which time the receive unit is initialized. Accordingly, the receive status flag, receive-completed flag bit, overrun error flag, framing error flag, parity error flag, and error sum flag all are cleared. The receive operation stops when the receive enable bit is cleared to 0 while receiving data.

(4) OVR (overrun error) bit (D4)

[Set condition]

This bit is set to 1 when all bits of the next receive data have been received in the Receive Shift Register while the Receive Buffer Register still contains the previous receive data. In this case, the receive data is not stored in the Receive Buffer Register. Although receive operation is continued when the overrun error flag = 1, the receive data is not stored in the Receive Buffer Register. To start reception normally, you need to clear this bit.

[Clear condition]

This bit is cleared by clearing the REN (receive enable) bit to 0.

(5) PTY (parity error) bit (D5)

This bit is effective in only UART mode. During CSIO mode, this bit is fixed to 0.

[Set condition]

The PTY (parity error) bit is set to 1 when the SIO Transmit/Receive Mode Register's PEN (parity enable/disable) bit is enabled and the parity (even/odd) of the receive data does not agree with the value that has been set by the said register's PSEL bit (parity select) bit.

[Clear condition]

The PTY bit is cleared by reading the lower byte from the SIO Receive Buffer Register or by clearing the SIO Receive Control Register's REN (receive enable) bit. However, if an overrun error occurs, this bit cannot be cleared by reading the lower byte from the Receive Buffer Register. In this case, clear the REN (receive enable) bit.

(6) FLM (framing error) bit (D6)

This bit is effective in only UART mode. During CSIO mode, this bit is fixed to 0.

[Set condition]

The FLM (framing error) bit is set to 1 when the number of received bits does not agree with one that has been selected by the SIO Transmit/Receive Mode Register.

[Clear condition]

The FLM bit is cleared by reading the lower byte from the SIO Receive Buffer Register or by clearing the SIO Receive Control Register's REN (receive enable) bit. However, if an overrun error occurs, this bit cannot be cleared by reading the lower byte from the Receive Buffer Register. In this case, clear the REN (receive enable) bit.

(7) ERS (Error sum) bit (D7)**[Set condition]**

This flag is set to 1 when any one of overrun, framing, or parity errors is detected at completion of reception.

[Clear condition]

If an overrun has occurred, this flag is cleared by clearing the REN (receive enable) bit. Otherwise, this flag is cleared by reading the lower byte from the Receive Buffer Register or clearing the SIO Receive Control Register's REN (receive enable) bit.

12.2.8 SIO Baud Rate Registers

- SIO0 Baud Rate Register (S0BAUR) <Address: H'0080 0117>
- SIO1 Baud Rate Register (S1BAUR) <Address: H'0080 0127>
- SIO2 Baud Rate Register (S2BAUR) <Address: H'0080 0137>

<When reset : Indeterminate>

D	Bit Name	Function	R	W
8 - 15	BRG (Baud rate divide value)	Divides the baud rate count source selected by SIO Mode Register by (n + 1) according to the BRG set value 'n.'	<input type="radio"/>	<input type="radio"/>

BRG (baud rate divide value) (D8-D15)

The SIO Baud Rate Register divides the baud rate count source selected by SIO Mode Register by (BRG set value + 1) according to the BRG set value.

In the initial state, the BRG value is indeterminate, so be sure to set the divide value before serial I/O starts operating. The value written to the BRG during transmit/receive operation takes effect in the next cycle after the BRG counter finished counting.

When using the internal clock (to output the SCLKO signal) in CSIO mode, the serial I/O divides the internal BCLK using the clock divider. Next, it divides the resulting clock by (BRG set value + 1) according to the BRG set value and then by 2, which results in generating a transmit/receive shift clock.

When using an external clock in CSIO mode, the serial I/O does not use the BRG. (Transmit/receive operations are synchronized to the externally supplied clock.)

In UART mode, the serial I/O divides the internal BCLK using the clock divider. Next, it divides the resulting clock by (BRG set value + 1) according to the BRG set value and then by 16, which results in generating a transmit/receive shift clock.

When using SIO0 or SIO1 in UART mode, you can choose the relevant port (P84 or P87) to function as the SCLKO pin, so that a divided-by-2 BRG output clock can be output from the SCLKO pin.

When using the internal clock (internally clocked CSIO), with f(BCLK) selected as the BRG count source, make sure that during CSIO mode, the transfer rate does not exceed 2 Mbits per second.

12.3 Transmit Operation in CSIO Mode

12.3.1 Setting the CSIO Baud Rate

The baud rate (data transfer rate) in CSIO mode is determined by a transmit/receive shift clock. The clock source from which to generate the transmit/receive shift clock is selected from the internal clock f(BCLK) or external clock. The CKS (internal/external clock select) bit (SIO Transmit/Receive Mode Register D11 bit) is used to select the clock source. The equation by which to calculate the transmit/receive baud rate values differs with the selected clock source, whether internal or external.

(1) When internal clock is selected in CSIO mode

When the internal clock is selected, f(BCLK) is divided by the clock divider before being fed into the baud rate generator (BRG).

The clock divider's divide-by value is selected from 1, 8, 32, or 256 by using the CDIV (baud rate generator count source select) bits (Transmit Control Register D2, D3 bits). The baud rate generator divides the clock divider output by (baud rate register set value + 1) and then by 2, which results in generating a transmit/receive shift clock.

When the internal clock is selected in CSIO mode, the baud rate is calculated using the equation below.

$$\text{Baud rate [bps]} = \frac{f(\text{BCLK})}{\text{Clock divider's divide-by value} \times (\text{baud rate register set value} + 1) \times 2}$$

f(BCLK): Internal peripheral clock operating frequency

Baud rate register set value = H'00 to H'FF (Note 1)

Clock divider's divide-by value = 1, 8, 32, or 256

Note 1: If the divide-by value selected for the baud rate generator count source is "1" (i.e., f(BCLK) itself), make sure the baud rate register value you set does not exceed 2 Mbps.

(2) When external clock is selected in CSIO mode

In this case, the baud rate generator is not used; instead, the input clock from the SCLKI pin serves directly as CSIO transmit/receive shift clock.

The maximum frequency of the SCLKI pin input clock is 1/16 of f(BCLK).

$$\text{Baud rate [bps]} = \text{SCLKI pin input clock}$$

12.3.2 Initial Settings for CSIO Transmission

To transmit data in CSIO mode, initialize the serial I/O following the procedure described below.

(1) Setting SIO Transmit/Receive Mode Register

- Set the register to CSIO mode
- Select the internal or an external clock

(2) Setting SIO Transmit Control Register

- Select the clock divider's divide-by ratio (when internal clock selected)

(3) Setting SIO Baud Rate Register

When the internal clock is selected, set a baud rate generator value. (Refer to Section 12.3.1, "Setting the CSIO Baud Rate.")

(4) Setting SIO Interrupt Mask Register

- Enable or disable the transmit buffer empty interrupt (SIO Interrupt Mask Register)

(5) Setting the Interrupt Controller (SIO Transmit Interrupt Control Register)

When you use a transmit buffer empty interrupt during transmission, set its priority level.

(6) Setting DMAC

When you issue DMA transfer requests to the internal DMAC when the transmit buffer is empty, set the DMAC. (Refer to Chapter 9, "DMAC.")

(7) Selecting pin functions

Because the serial I/O related pins serve dual purposes (shared with input/output ports), set pin functions. (Refer to Chapter 8, "Input/Output Ports and Pin Functions.")

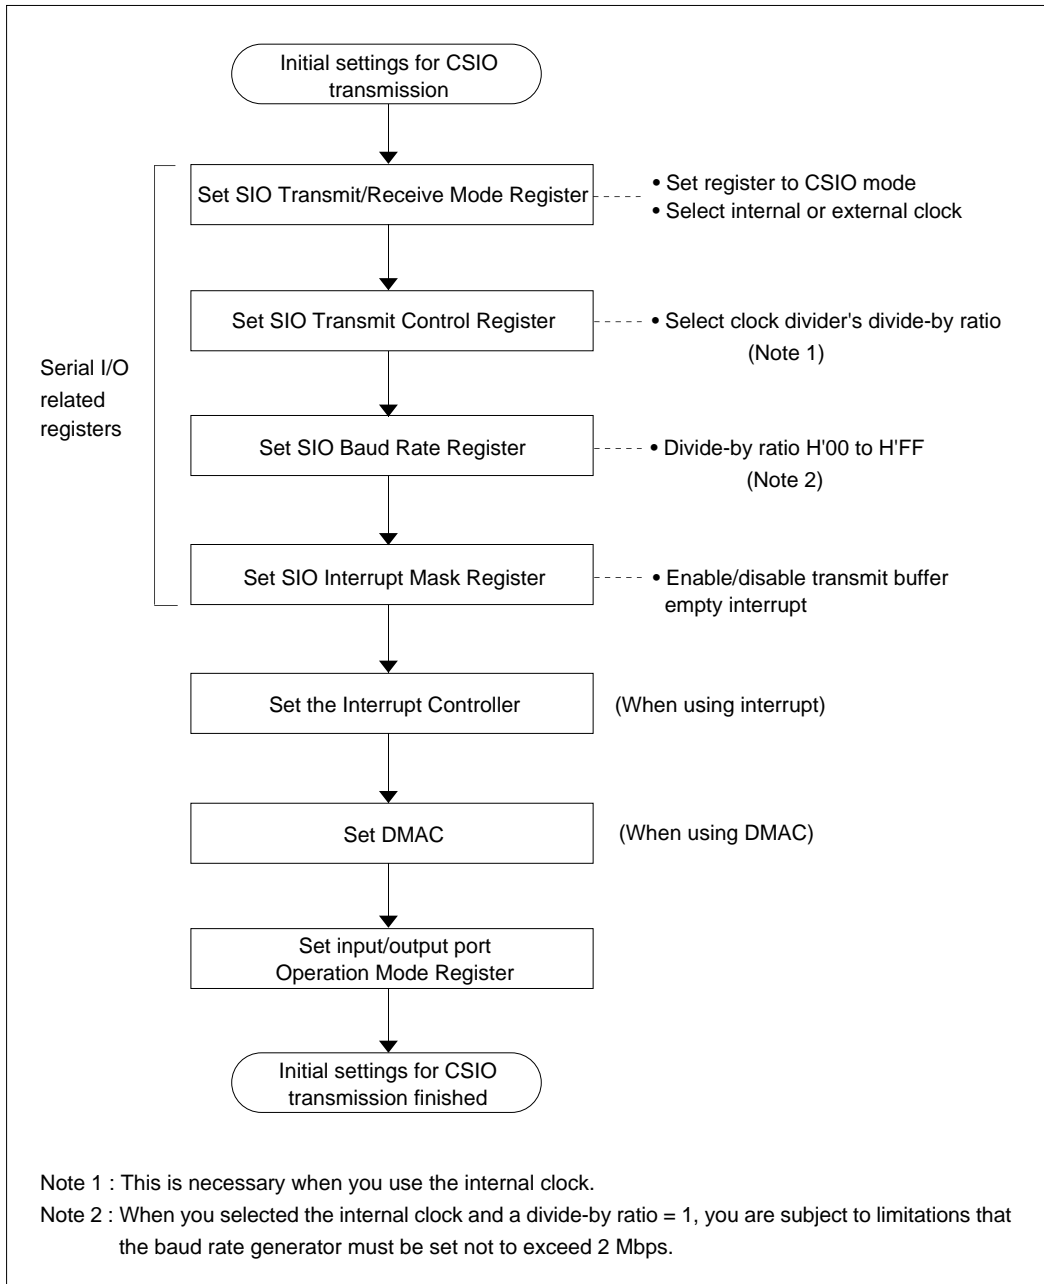

Figure 12.3.1 Procedure for CSIO Transmit Initialization

12.3.3 Starting CSIO Transmission

When all of the following transmit conditions are met after you finished initialization, the serial I/O starts transmit operation.

(1) Transmit conditions when CSIO mode internal clock is selected

- The SIO Transmit Control Register's transmit enable bit is set to 1.
- Transmit data (8 bits) is written to the lower byte of the SIO Transmit Buffer Register (transmit buffer empty bit = 0).

(2) Transmit conditions when CSIO mode external clock is selected

- The SIO Transmit Control Register's transmit enable bit is set to 1.
- Transmit data is written to the lower byte of the SIO Transmit Buffer Register (transmit buffer empty bit = 0).
- A falling edge of transmit clock on the SCLKI pin is detected.

Notes:

- While the transmit enable bit is cleared to 0, writes to the transmit buffer register are ignored. Always be sure to set the transmit enable bit to 1 before you write to the transmit buffer register.
- When the internal clock is selected, a write to the lower byte of the transmit buffer register in the note above triggers a start of transmission.
- The transmit status bit is set to 1 at the time data is set in the lower byte of the SIO Transmit Buffer Register.

When transmission starts, the serial I/O transmits data following the procedure below.

- Transfer the content of the SIO Transmit Buffer Register to the SIO Transmit Shift Register.
- Set the transmit buffer empty bit to 1. (Note 1)
- Start sending data synchronously with the shift clock beginning with the LSB.

Note 1: A transmit buffer empty interrupt request and/or a DMA transfer request can be generated when the transmit buffer is emptied.

12.3.4 Successive CSIO Transmission

Once data is transferred from the transmit buffer register to the transmit shift register, the next data can be written to the transmit buffer register even when transmission of the preceding data is not completed. When the next data is written to the transmit buffer before completion of the preceding data transmission, the preceding and the next data are successively transmitted.

To see if data has been transferred from the transmit buffer register to the transmit shift register, check the SIO Status Register's transmit buffer empty flag.

12.3.5 Processing at End of CSIO Transmission

When data transmission is completed, the following operation is automatically performed in hardware.

(1) When not transmitting successively

- The transmit status bit is set to 0.

(2) When transmitting successively

- When transmission of the last data in a consecutive data train is completed, the transmit status bit is set to 0.

12.3.6 Transmit Interrupt

If a transmit buffer empty interrupt has been enabled by the SIO Interrupt Mask Register, a transmit buffer empty interrupt is generated at the time data is transferred from the transmit buffer register to the transmit shift register. Also, a transmit buffer empty interrupt is generated when the TEN (transmit enable) bit is set to 1 (enabled after being disabled) while a transmit buffer empty interrupt has been enabled.

You must set the Interrupt Controller (ICU) before you can use transmit interrupts.

12.3.7 Transmit DMA Transfer Request

When data has been transferred from the transmit buffer register to the transmit shift register, a transmit DMA transfer request for the corresponding SIO channel is output to the DMAC. This transfer request is also output when the TEN (transmit enable) bit is set to 1 (enabled after being disabled).

You must set the Interrupt Controller (ICU) before you can transmit data using DMA transfers.

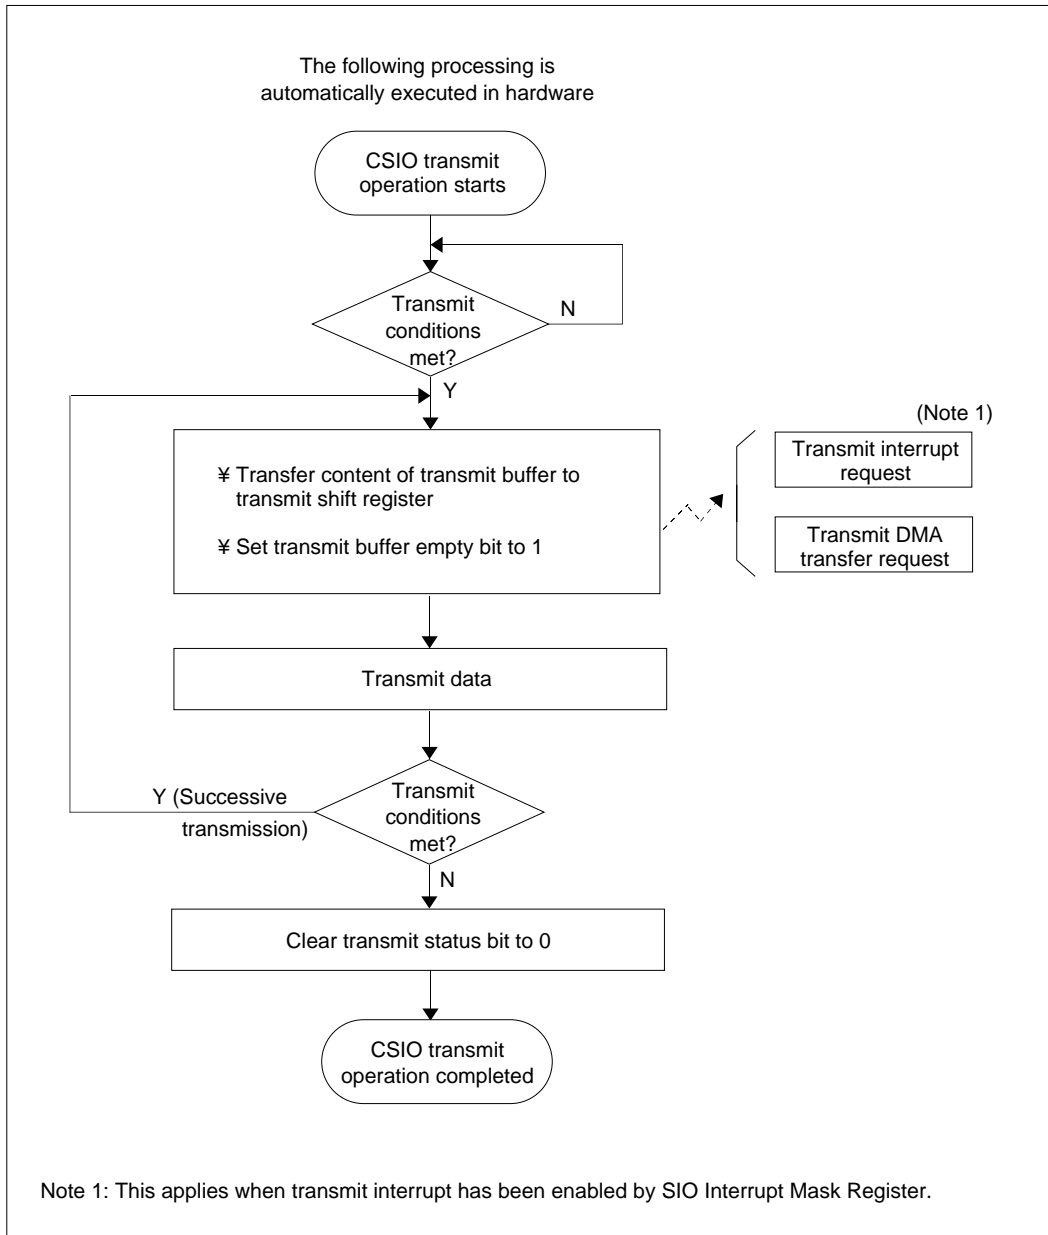

Figure 12.3.2 Transmit Operation during CSIO Mode (Hardware Processing)

12.3.8 Typical CSIO Transmit Operation

The following shows a typical transmit operation in CSIO mode.

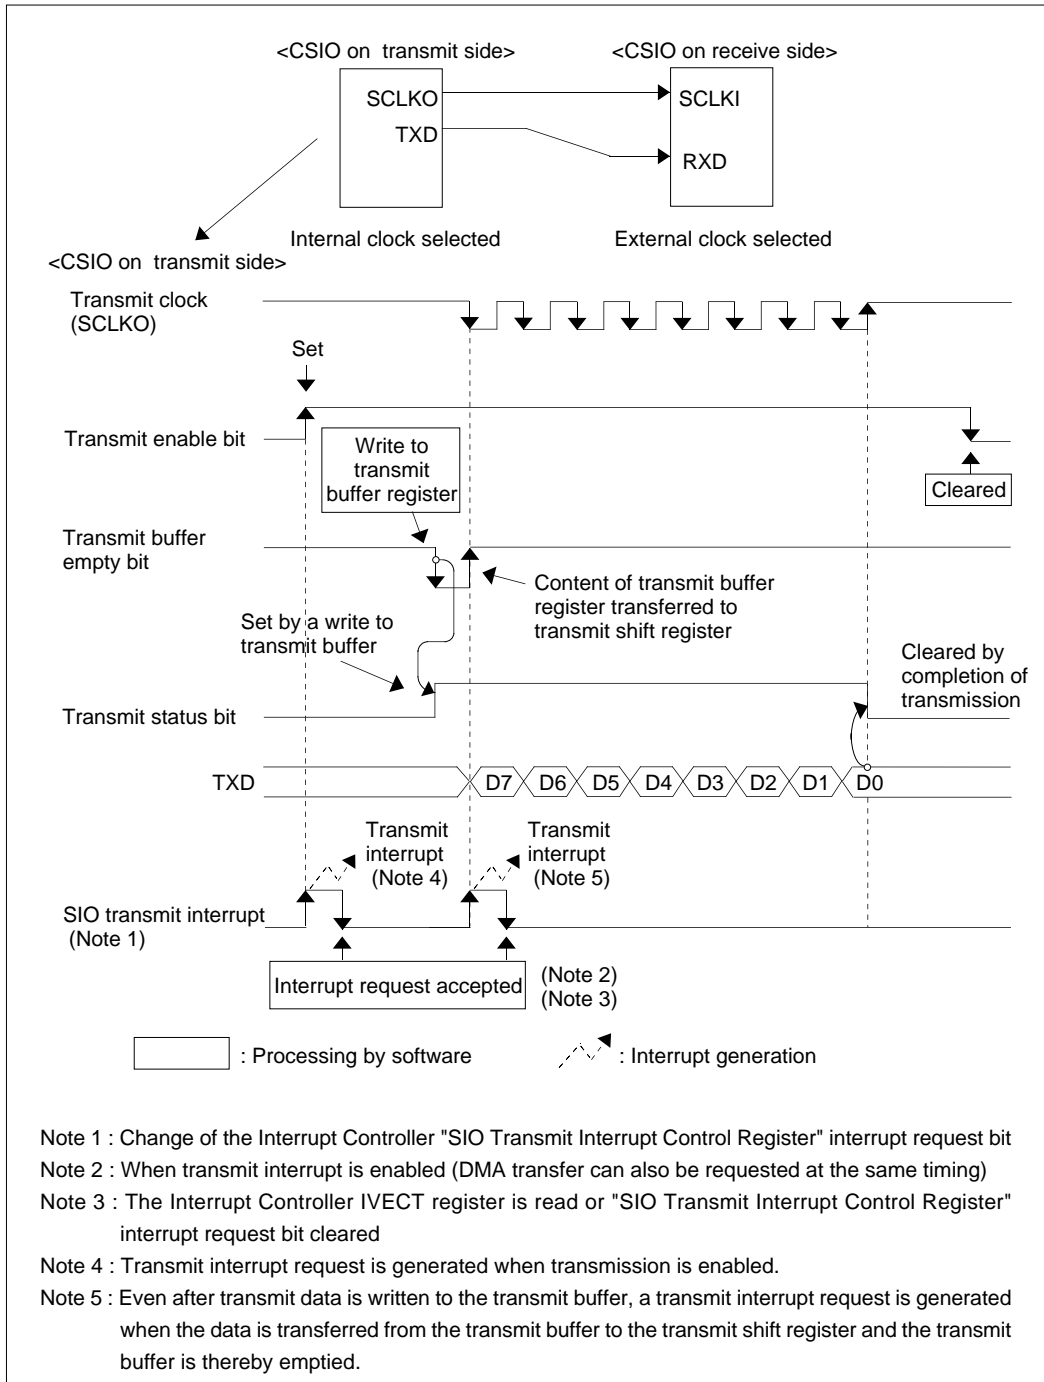

Figure 12.3.3 Example of CSIO Transmission (Transmitted Only Once, with Transmit Interrupt Used)

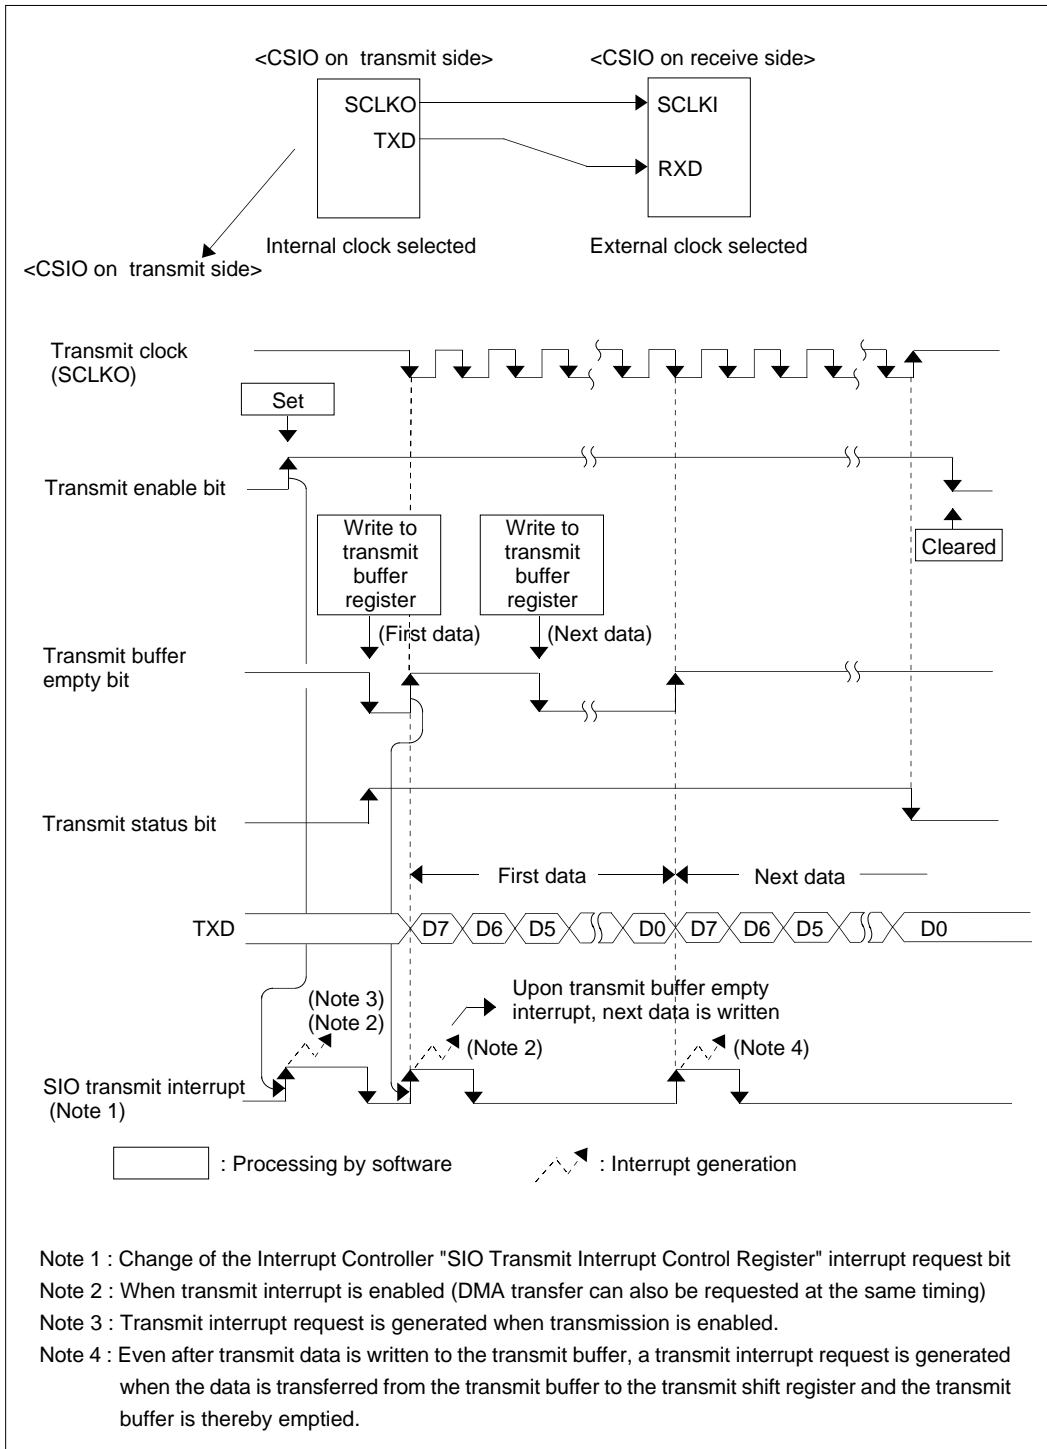

Figure 12.3.4 Example of CSIO Transmission (Successive Transmission, with Transmit Buffer Empty and Transmit Finished Interrupts Used)

12.4 Receive Operation in CSIO Mode

12.4.1 Initial Settings for CSIO Reception

To receive data in CSIO mode, initialize the serial I/O following the procedure described below. Note, however, that because the receive shift clock is derived from operation of the transmit circuit, you need to execute transmit operation even when you only want to receive data.

(1) Setting SIO Transmit/Receive Mode Register

- Set the register to CSIO mode
- Select the internal or an external clock

(2) Setting SIO Transmit Control Register

- Select the clock divider's divide-by ratio (when internal clock selected)

(3) Setting SIO Baud Rate Register

When the internal clock is selected, set a baud rate generator value. (Refer to Section 12.3.1, "Setting the CSIO Baud Rate.")

(4) Setting SIO Interrupt Mask Register

- Enable or disable the transmit buffer empty interrupt (SIO Interrupt Mask Register)
- Select the cause of receive interrupt (receive finished/error) (Cause of Receive Interrupt Select Register)

(5) Setting SIO Receive Control Register

Set the receive enable bit

(6) Setting the Interrupt Controller (SIO Transmit Interrupt Control Register)

When you use a transmit interrupt or receive interrupt during transmission/reception, set its priority level.

(7) Setting DMAC

When you generate a DMA transfer request to the internal DMAC when the transmit buffer is empty or transmission is completed, set the DMAC. (Refer to Chapter 9, "DMAC.")

(8) Selecting pin functions

Because the serial I/O related pins serve dual purposes (shared with input/output ports), set pin functions. (Refer to Chapter 8, "Input/Output Ports and Pin Functions.")

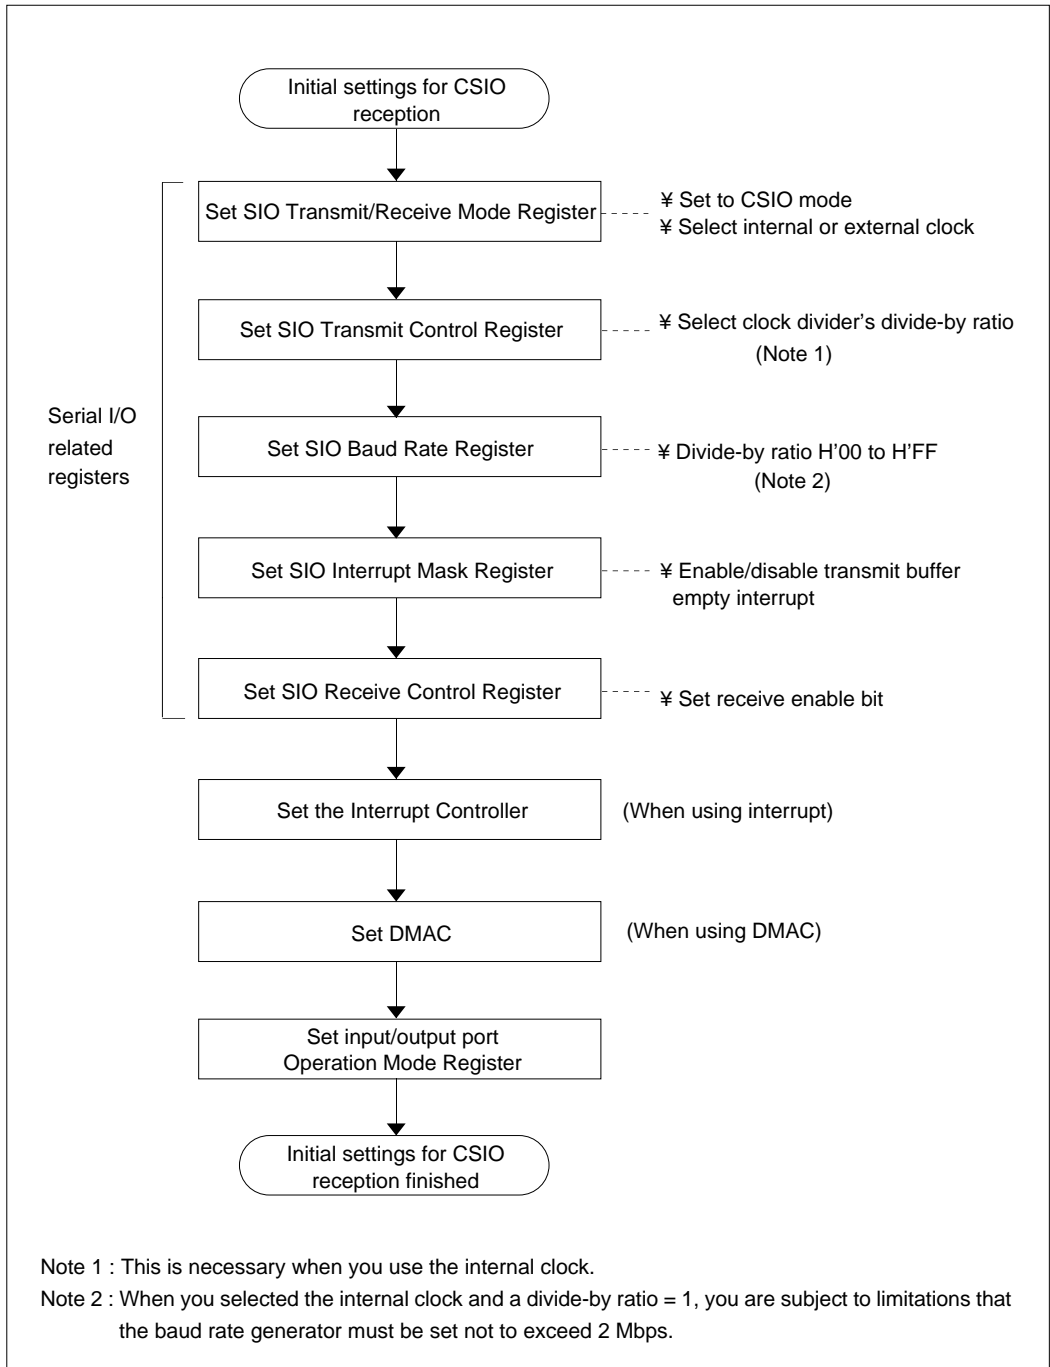

Figure 12.4.1 Procedure for CSIO Receive Initialization

12.4.2 Starting CSIO Reception

When all of the following receive conditions are met after you finished initialization, the serial I/O starts receive operation.

(1) Receive conditions when CSIO mode internal clock is selected

- The SIO Receive Control Register's receive enable bit is set to 1.
- Transmit conditions are met. (Refer to Section 12.3.3, "Starting CSIO Transmission.")

(2) Receive conditions when CSIO mode external clock is selected

- The SIO Receive Control Register's receive enable bit is set to 1.
- Transmit conditions are met. (Refer to Section 12.3.3, "Starting CSIO Transmission.")

Note: • The receive status bit is set to 1 at the time dummy data is set in the lower byte of the SIO Transmit Buffer Register.

When the above conditions are met, the serial I/O starts receiving 8-bit serial data (LSB first) synchronously with the receive shift clock.

12.4.3 Processing at End of CSIO Reception

When data reception is completed, the following operation is automatically performed in hardware.

(1) When reception is completed normally

The receive-finished (receive buffer full) bit is set to 1.

- Notes: • If a receive-finished (receive buffer full) interrupt has been enabled, an interrupt request is generated.
- A DMA transfer request is generated.

(2) When error occurs during reception

When an error (only overrun error in CSIO mode) occurs during reception, the overrun error bit and receive sum bit are set to 1.

- Notes: • If a receive-finished interrupt has been selected (by SIO Cause of Receive Interrupt Select Register), neither a receive-finished interrupt request nor a DMA transfer request is generated.
- If a receive error interrupt has been selected (by SIO Cause of Receive Interrupt Select Register), a receive error interrupt request is generated when interrupt requests are enabled. No DMA transfer requests are generated.

12.4.4 About Successive Reception

When the following conditions are met at completion of data reception, data may be received successively.

- The receive enable bit is set to 1.
- Transmit conditions are met.
- No overrun error has occurred.

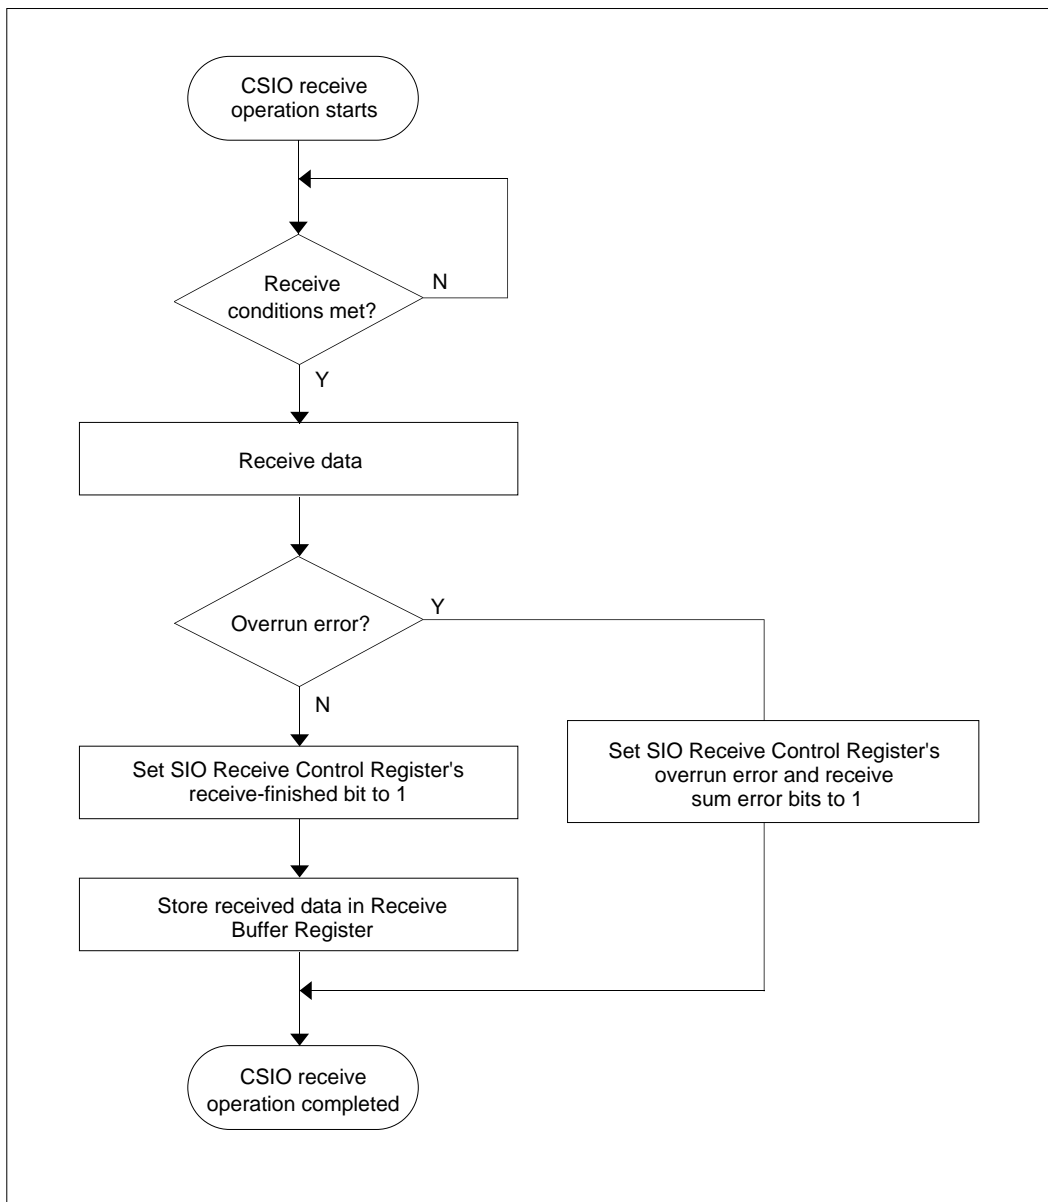

Figure 12.4.2 Receive Operation during CSIO Mode (Hardware Processing)

12.4.5 Flags Indicating the Status of CSIO Receive Operation

Following flags are available that indicate the status of receive operation in CSIO mode.

- SIO Receive Control Register receive status bit
- SIO Receive Control Register receive-finished bit
- SIO Receive Control Register receive error sum bit
- SIO Receive Control Register overrun error bit

After reception is completed, you may read out the content of the SIO Receive Buffer Register, but if the serial I/O finishes receiving the next data before you read, an overrun error occurs. In this case, the data received thereafter is not transferred to the SIO Receive Buffer Register. To restart reception, temporarily clear the receive enable bit to 0 and initialize the receive control block before you restart.

The said receive enable bit can be cleared, when there are no receive errors (Note 1) encountered, by reading the lower byte from the SIO Receive Buffer Register or clearing the REN (receive enable) bit. If any receive error has occurred, it can only be cleared by clearing the REN (receive enable) bit, and cannot be cleared by reading the lower byte from the SIO Receive Buffer Register.

Note 1: Overrun error is the only error that can be detected during reception in CSIO mode.

12.4.6 Typical CSIO Receive Operation

The following shows a typical receive operation in CSIO mode.

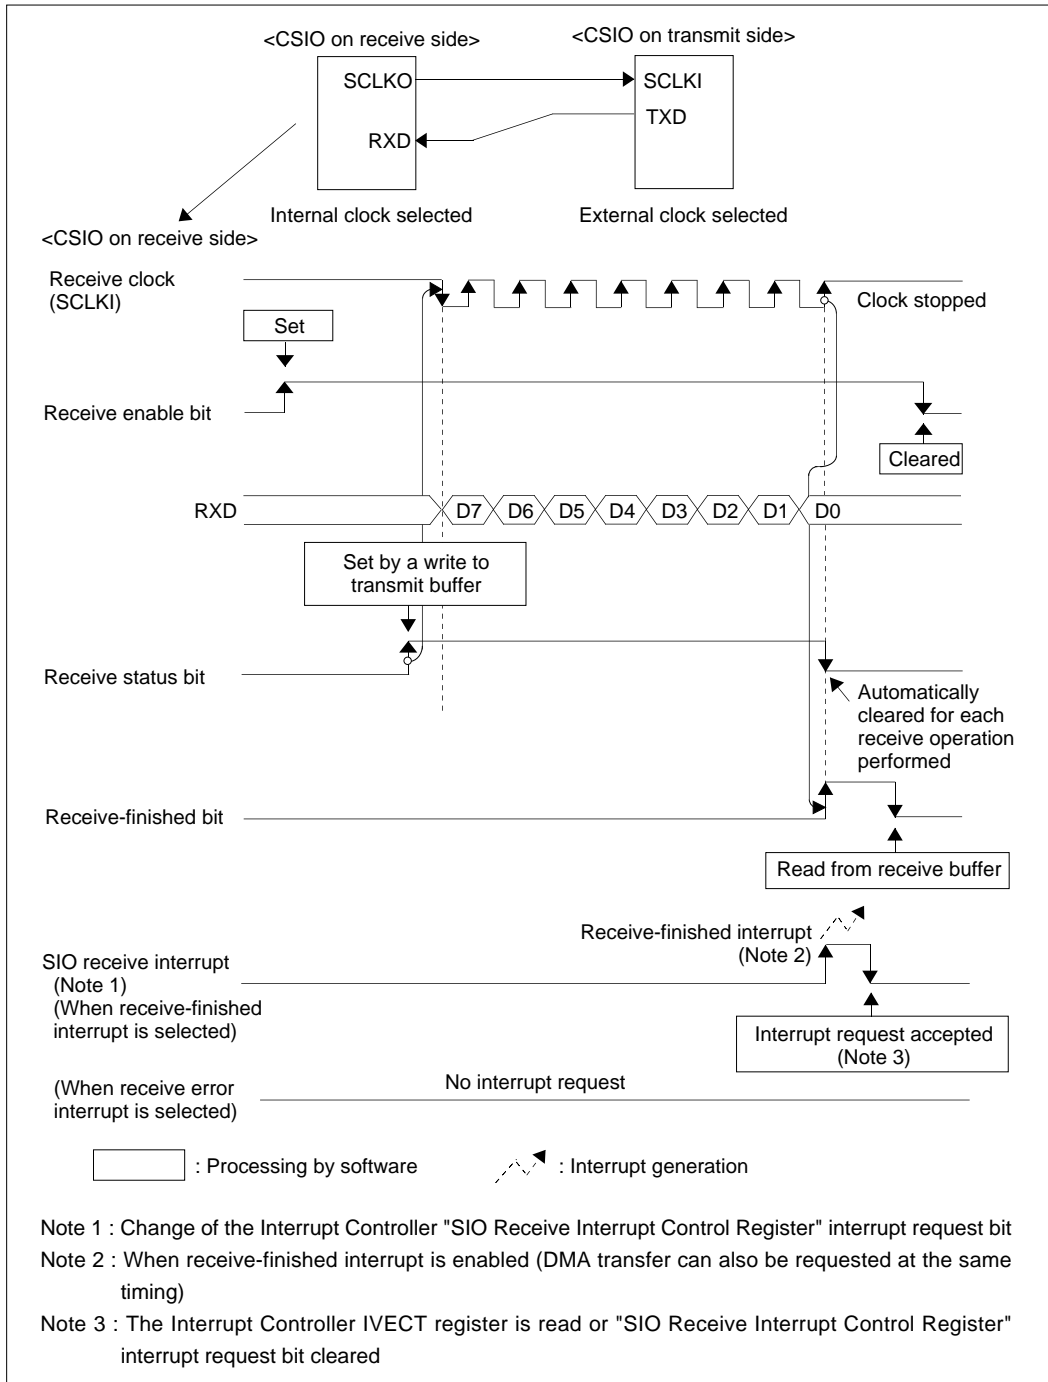

Figure 12.4.3 Example of CSIO Reception (When Received Normally)

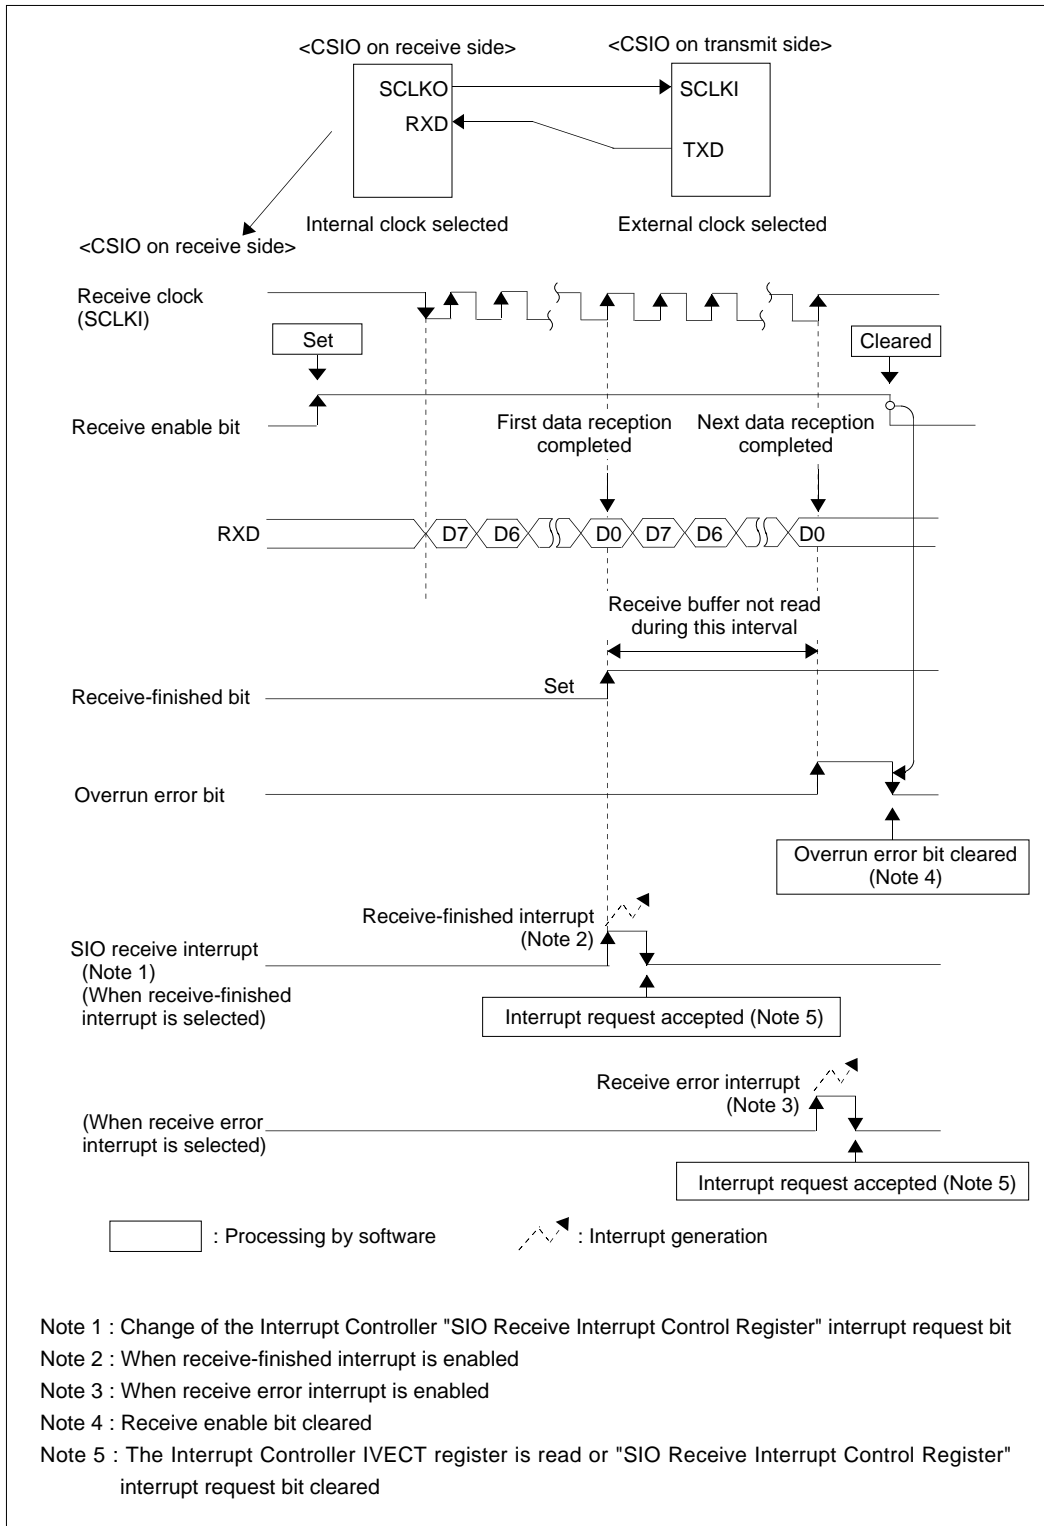

Figure 12.4.4 Example of CSIO Reception (When Overrun Error Occurred)

12.5 Precautions on Using CSIO Mode

- **Settings of SIO Transmit/Receive Mode Register and SIO Baud Rate Register**

The SIO Transmit/Receive Mode Register and SIO Baud Rate Register and the Transmit Control Register's BRG count source select bit must always be set when not operating. When transmitting or receiving data, be sure to check that transmission and/or reception under way has been completed and clear the transmit and receive enable bits before you set the registers.

- **Settings of Baud Rate (BRG) Register**

If you selected f(BCLK) with the BRG clock source select bit, make sure the BRG register value you set does not exceed 2 Mbps.

- **About successive transmission**

To transmit multiple data successively, set the next transmit data in the SIO Transmit Buffer Register before transmission of the preceding data is completed.

- **About reception**

Because during CSIO mode the receive shift clock is derived from operation of the transmit circuit, you need to execute transmit operation (by sending dummy data) even when you only want to receive data. In this case, note that if the port function is set for TXD pin (by setting the operation mode register to 1), dummy data is actually output from the pin.

- **About successive reception**

To receive multiple data successively, set data (dummy data) in the SIO Transmit Buffer Register before the transmitter starts sending data.

- **Transmit/receive operations using DMA**

To transmit/receive data in DMA request mode, enable the DMAC to accept transfer requests (by setting the DMA Mode Register) before you start serial communication.

- **About the receive-finished bit**

If a receive error (overrun error) occurs, the receive-finished bit cannot be cleared by reading out the receive buffer register. In this case, it can only be cleared by clearing the receive enable bit.

- **About overrun error**

If all bits of the next receive data are received in the SIO Receive Shift Register before you read out the SIO Receive Buffer Register (an overrun error occurs), the receive data is not stored in the Receive Buffer Register and the Receive Buffer Register retains the previously received data. Thereafter, although receive operation is continued, no receive data is stored in the Receive Buffer Register (the receive status bit = 1). To restart reception normally, you need to temporarily clear the receive enable bit before you restart. This is the only way you can clear the overrun error flag.

- **About DMA transfer request generation during SIO transmission**

If the Transmit Buffer Register becomes empty (the transmit buffer empty flag = 1) while the transmit enable bit is set to 1 (transmit enabled), an SIO transmit buffer empty DMA transfer request is generated.

- **About DMA transfer request generation during SIO reception**

When the receive-finished bit is set to 1 (the receive buffer register full), a receive-finished DMA transfer request is generated. However, if an overrun error has occurred, this DMA transfer request is not generated.

12.6 Transmit Operation in UART Mode

12.6.1 Setting the UART Baud Rate

The baud rate (data transfer rate) during UART mode is determined by a transmit/receive shift clock. In UART mode, the source for this transmit/receive shift clock is always the internal clock regardless of how the internal/external clock select bit (SIO Transmit/Receive Mode Register bit D11) is set.

(1) Calculating the UART mode baud rate

After being divided by the clock divider, $f(\text{BCLK})$ is fed into the Baud Rate Generator (BRG), after which it is further divided by 16 to produce a transmit/receive shift clock. The clock divider's divide-by value is selected from 1, 8, 32, or 256 using the SIO Transmit Control Register's CDIV (baud rate generator count source select) bits (D2, D3). The Baud Rate Generator divides the clock it received from the clock divider by (baud rate register set value + 1) and further divides the resulting clock by 16 to produce a transmit/receive shift clock.

During UART mode (in which the internal clock is always used), the baud rate is calculated using the equation below.

$$\text{Baud rate [bps]} = \frac{f(\text{BCLK})}{\text{Clock divider's divide-by value} \times (\text{baud rate register set value} + 1) \times 16}$$

Baud rate register set value = H'00 to H'FF

Clock divider's divide-by value = 1, 8, 32, or 256

12.6.2 UART Transmit/Receive Data Formats

The transmit/receive data format during UART mode is determined by setting the SIO Transmit/Receive Mode Register. Shown below is the transmit/receive data format that can be used in UART mode.

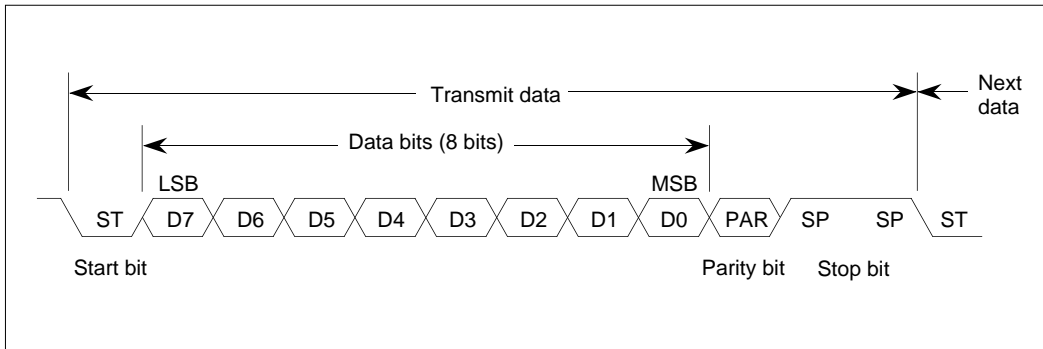

Figure 12.6.1 Example of Transmit/Receive Data Format in UART Mode

Table 12.6.1 Transfer Data in UART Mode

Bit Name	Content
ST (start bit)	Indicates the beginning of data transmission. This is a low signal of a one bit duration, which is added immediately before the transmit data.
D0-D8 (character bits)	Transmit/receive data transferred via serial I/O. In UART mode, data in 7, 8, or 9 bits can be transmitted/received.
PAR (parity bit)	Added to the transmit/receive characters. When parity is enabled, parity is automatically set in such a way that the number of 1's in characters including the parity bit itself is always even or odd as selected by the even/odd parity select bit.
SP (stop bit)	Indicates the end of data transmission, and is added immediately after characters (or if parity enabled, immediately after the parity bit). The stop bit can be chosen to be one bit or two bits long.

Figure 12.6.2 Selectable Data Formats during UART Mode

12.6.3 Initial Settings for UART Transmission

To transmit data in UART mode, initialize the serial I/O following the procedure described below.

(1) Setting SIO Transmit/Receive Mode Register

- Set the register to UART mode
- Set parity (when enabled, select odd/even)
- Set stop bit length
- Set character length

Note : • During UART mode, settings of the internal/external clock select bit have no effect (only the internal clock is useful).

(2) Setting SIO Transmit Control Register

Select the clock divider's divide-by ratio.

(3) Setting SIO Baud Rate Register

Set a baud rate generator value. (Refer to Section 12.6.1, "Setting the UART Baud Rate.")

(4) Setting SIO Interrupt Mask Register

- Enable or disable SIO transmit interrupt

(5) Setting the Interrupt Controller (SIO Transmit Interrupt Control Register)

When you use a transmit interrupt, set its priority level.

(6) Setting DMAC

When you issue DMA transfer requests to the internal DMAC when the transmit buffer is empty, set the DMAC. (Refer to Chapter 9, "DMAC.")

(7) Selecting pin functions

Because the serial I/O related pins serve dual purposes (shared with input/output ports), set pin functions. (Refer to Chapter 8, "Input/Output Ports and Pin Functions.")

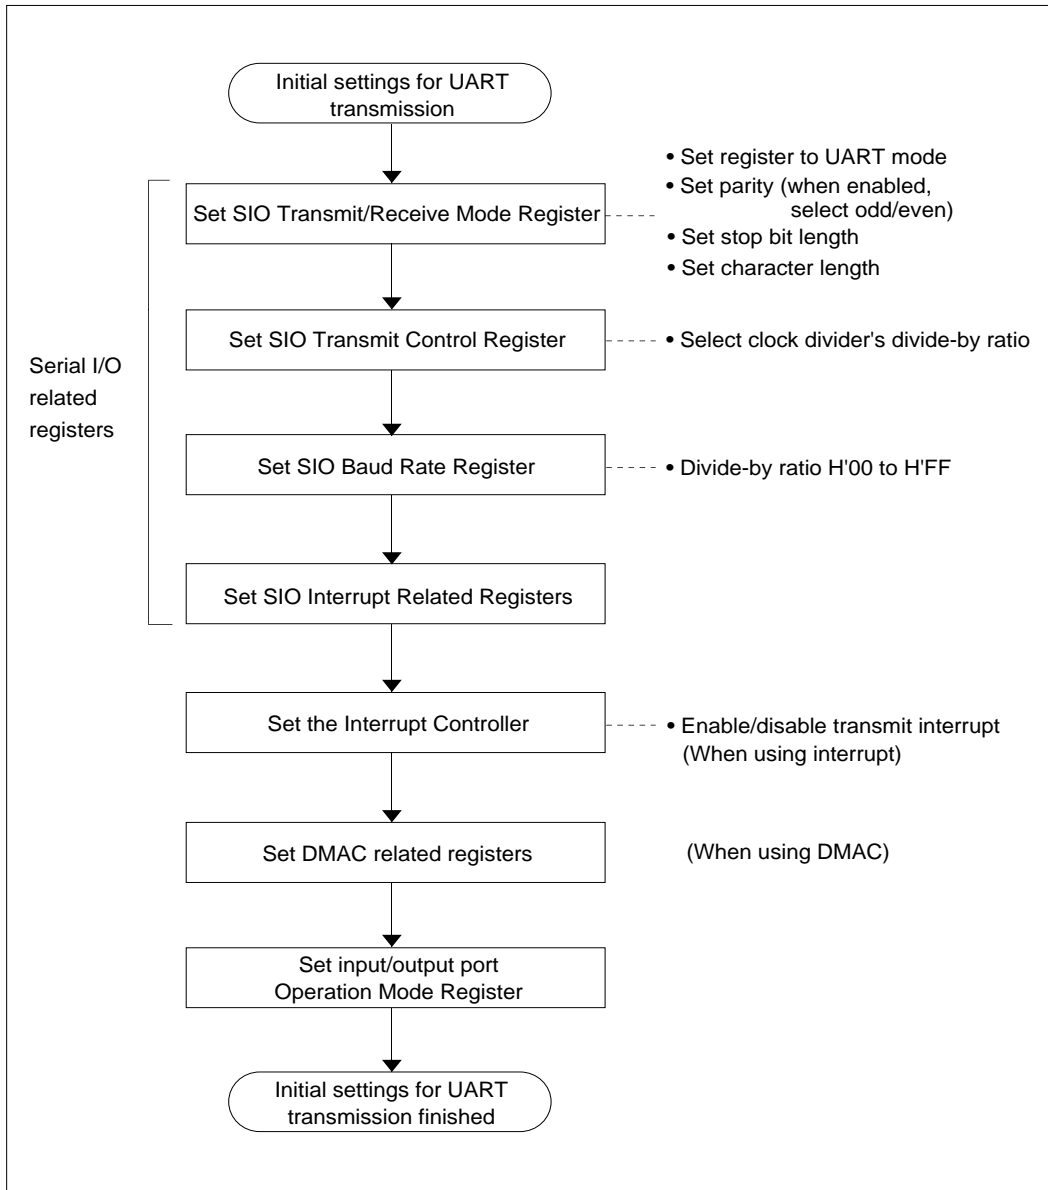

Figure 12.6.3 Procedure for UART Transmit Initialization

12.6.4 Starting UART Transmission

When all of the following transmit conditions are met after you finished initialization, the serial I/O starts transmit operation.

- The SIO Transmit Control Register's TEN (transmit enable) bit is set to 1. (Note 1)
- Transmit data is written to the SIO Transmit Buffer Register (transmit buffer empty bit = 0).

Note 1: While the transmit enable bit is cleared to 0, writes to the transmit buffer are ignored. Always be sure to set the transmit enable bit to 1 before you write to the transmit buffer register.

When transmission starts, the serial I/O transmits data following the procedure below.

- Transfer the content of the SIO Transmit Buffer Register to the SIO Transmit Shift Register.
- Set the transmit buffer empty bit to 1. (Note 2)
- Start sending data synchronously with the shift clock beginning with the LSB.

Note 2: A transmit buffer empty interrupt request and/or a DMA transfer request can be generated when the transmit buffer is emptied.

12.6.5 Successive UART Transmission

Once data is transferred from the transmit buffer register to the transmit shift register, the next data can be written to the transmit buffer register even when transmission of the preceding data is not completed. When the next data is written to the transmit buffer before completion of the preceding data transmission, the preceding and the next data are successively transmitted.

To see if data has been transferred from the transmit buffer register to the transmit shift register, check the SIO Transmit Control Register's transmit buffer empty flag.

12.6.6 Processing at End of UART Transmission

When data transmission is completed, the following operation is automatically performed in hardware.

(1) When not transmitting successively

- The transmit status bit is set to 0.

(2) When transmitting successively

- When transmission of the last data in a consecutive data train is completed, the transmit status bit is set to 0.

12.6.7 Transmit Interrupt

If a transmit buffer empty interrupt has been enabled by the SIO Interrupt Mask Register, a transmit buffer empty interrupt is generated at the time data is transferred from the transmit buffer register to the transmit shift register. Also, a transmit buffer empty interrupt is generated when the TEN (transmit enable) bit is set to 1 (enabled after being disabled) while a transmit buffer empty interrupt has been enabled.

You must set the Interrupt Controller (ICU) before you can use transmit interrupts.

12.6.8 Transmit DMA Transfer Request

When data has been transferred from the transmit buffer register to the transmit shift register, a transmit DMA transfer request for the corresponding SIO channel is output to the DMAC. This transfer request is also output when the TEN (transmit enable) bit is set to 1 (enabled after being disabled).

You must set the DMAC before you can transmit data using DMA transfers.

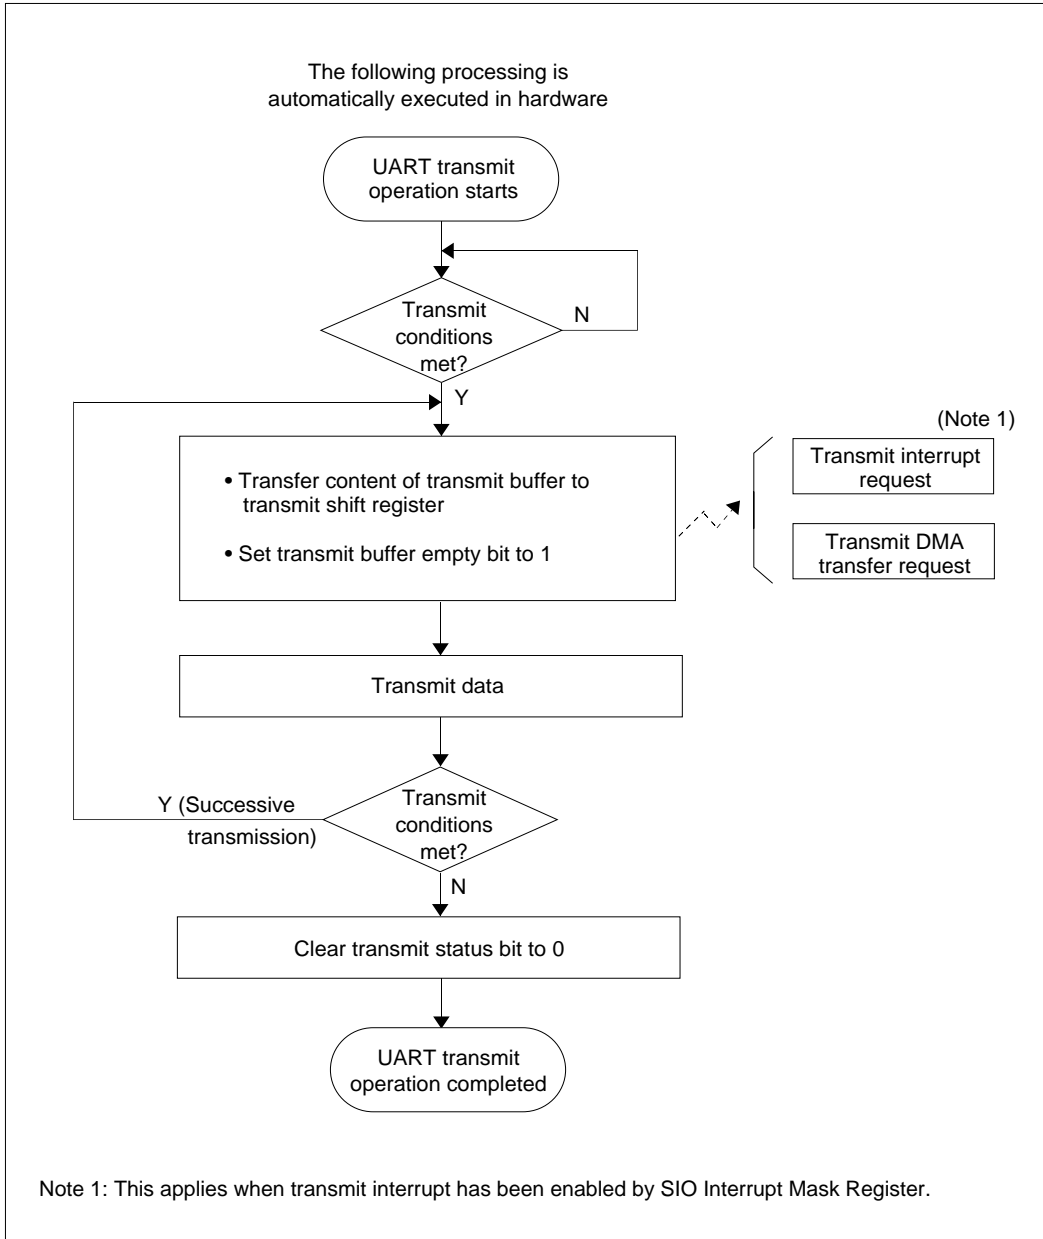

Figure 12.6.4 Transmit Operation during UART Mode (Hardware Processing)

12.6.9 Typical UART Transmit Operation

The following shows a typical transmit operation in CSIO mode.

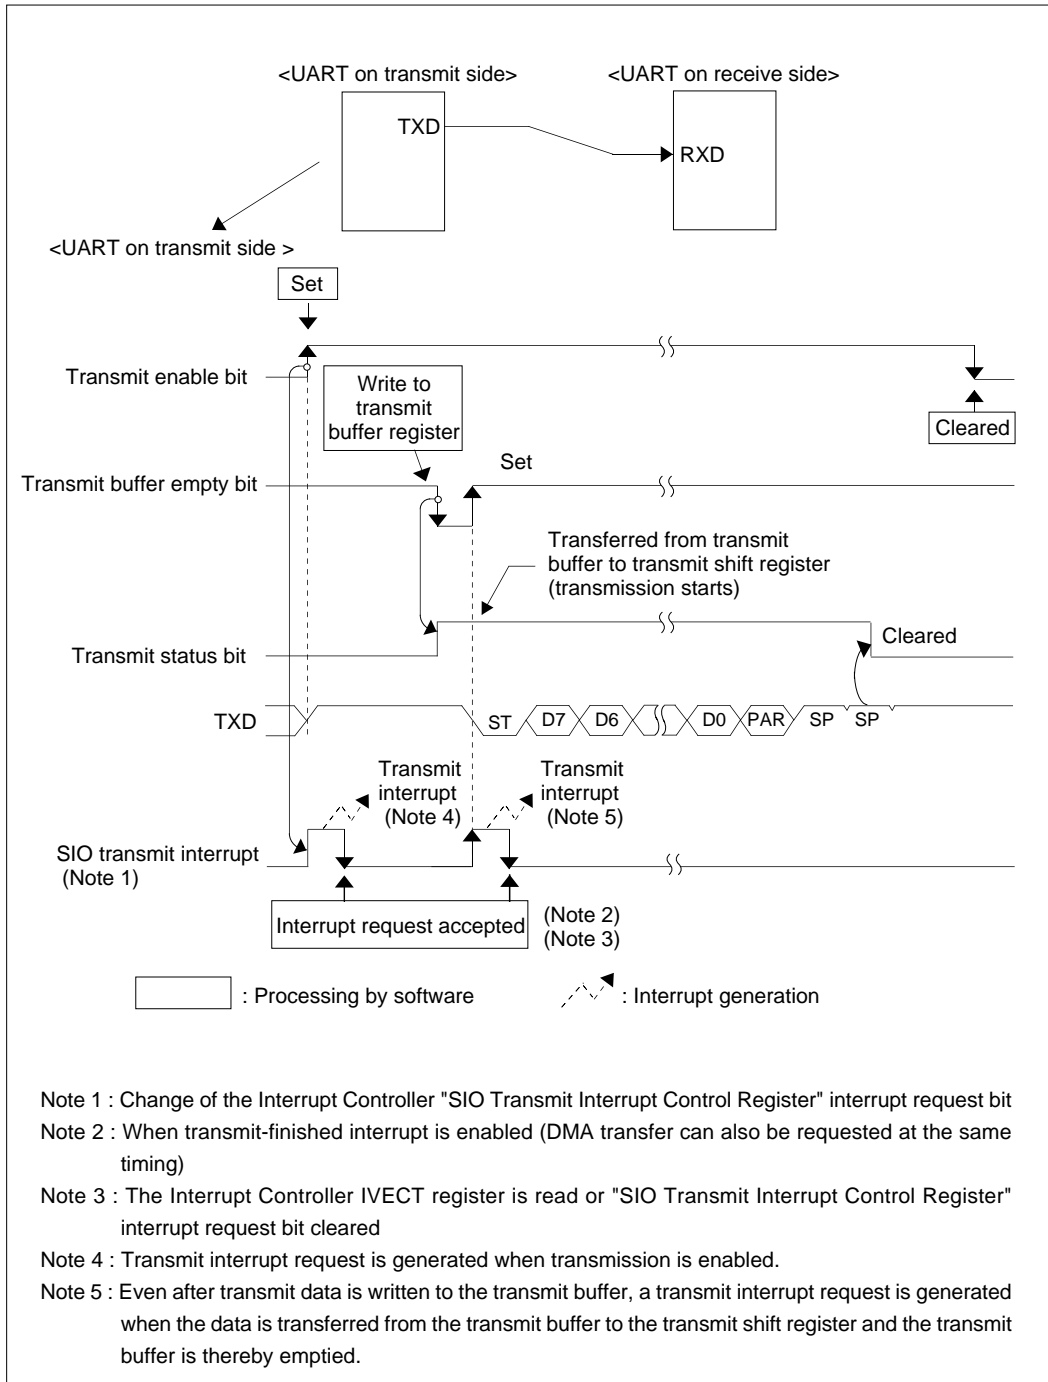

Figure 12.6.5 Example of UART Transmission (Transmitted Only Once, with Transmit Interrupt Used)

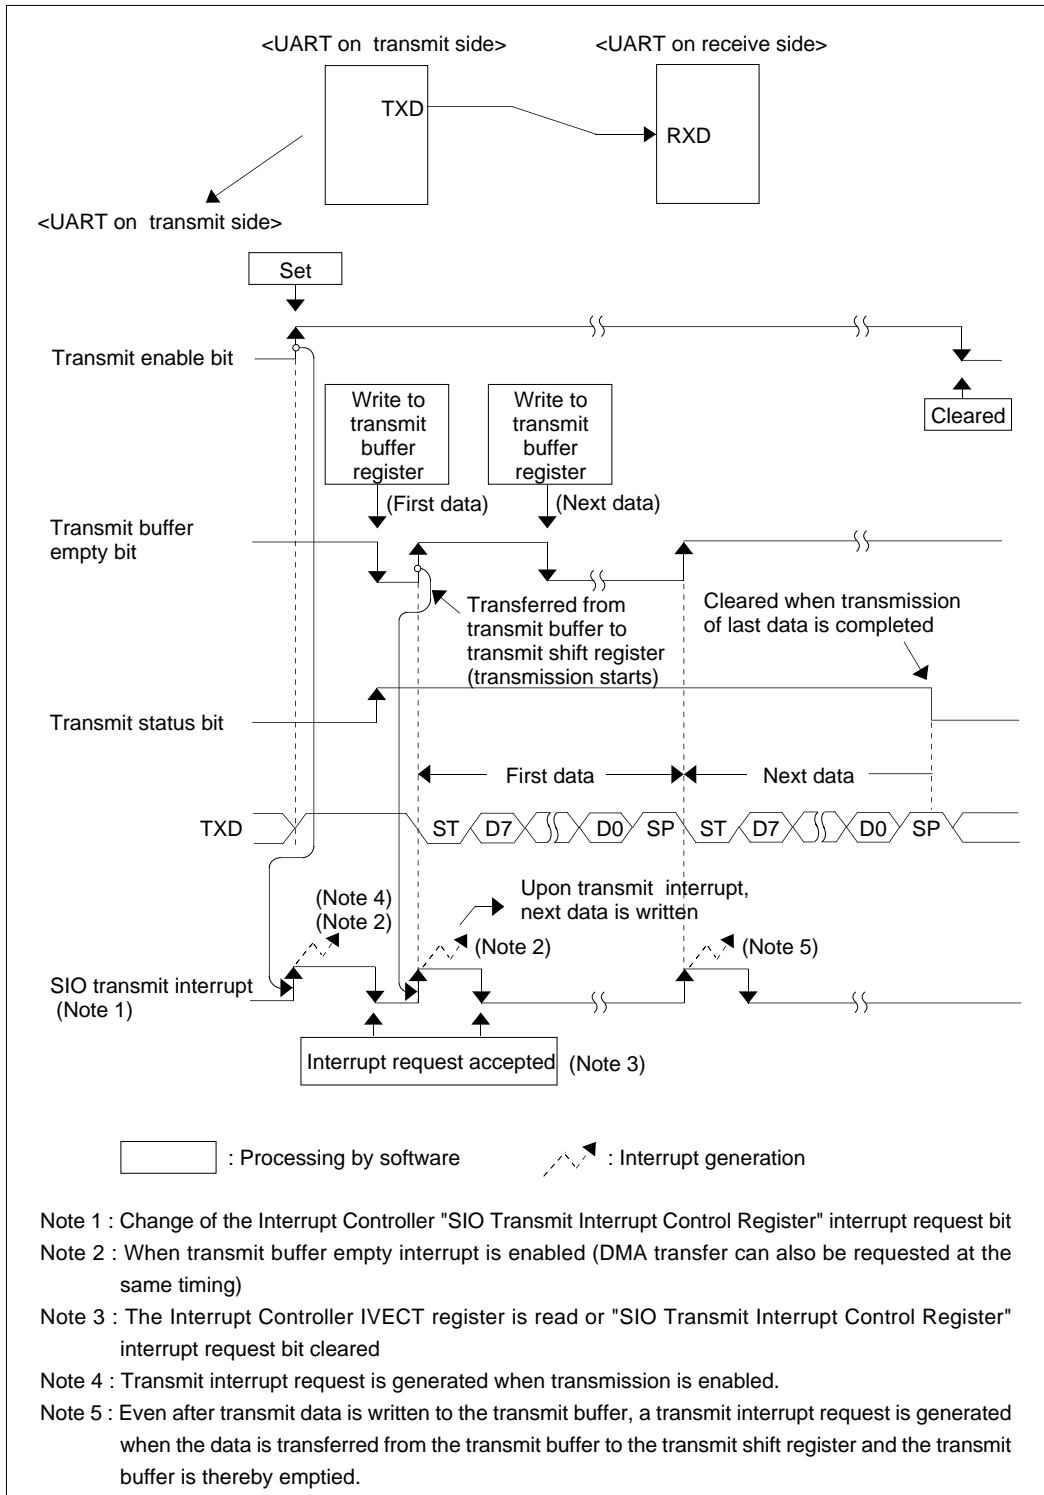

Figure 12.6.6 Example of UART Transmission (Successive Transmission, with Transmit Interrupt Used)

12.7 Receive Operation in UART Mode

12.7.1 Initial Settings for UART Reception

To receive data in UART mode, initialize the serial I/O following the procedure described below.

(1) Setting SIO Transmit/Receive Mode Register

- Set the register to UART mode
- Set parity (when enabled, select odd/even)
- Set stop bit length
- Set character length

Note : • During UART mode, settings of the internal/external clock select bit have no effect (only the internal clock is useful).

(2) Setting SIO Transmit Control Register

Select the clock divider's divide-by ratio.

(3) Setting SIO Baud Rate Register

Set a baud rate generator value. (Refer to Section 12.6.1, "Setting the UART Baud Rate.")

(4) Setting SIO interrupt related registers

- Cause of Receive Interrupt Select Register
Select the cause of receive interrupt (receive finished/receive error)
- Interrupt Mask Register
Enable/disable receive interrupts

(5) Setting the Interrupt Controller

When you use interrupts during reception, set its priority level.

(6) Setting DMAC

When you issue DMA transfer requests to the internal DMAC when reception is completed, set the DMAC. (Refer to Chapter 9, "DMAC.")

(7) Selecting pin functions

Because the serial I/O related pins serve dual purposes (shared with input/output ports), set pin functions. (Refer to Chapter 8, "Input/Output Ports and Pin Functions.")

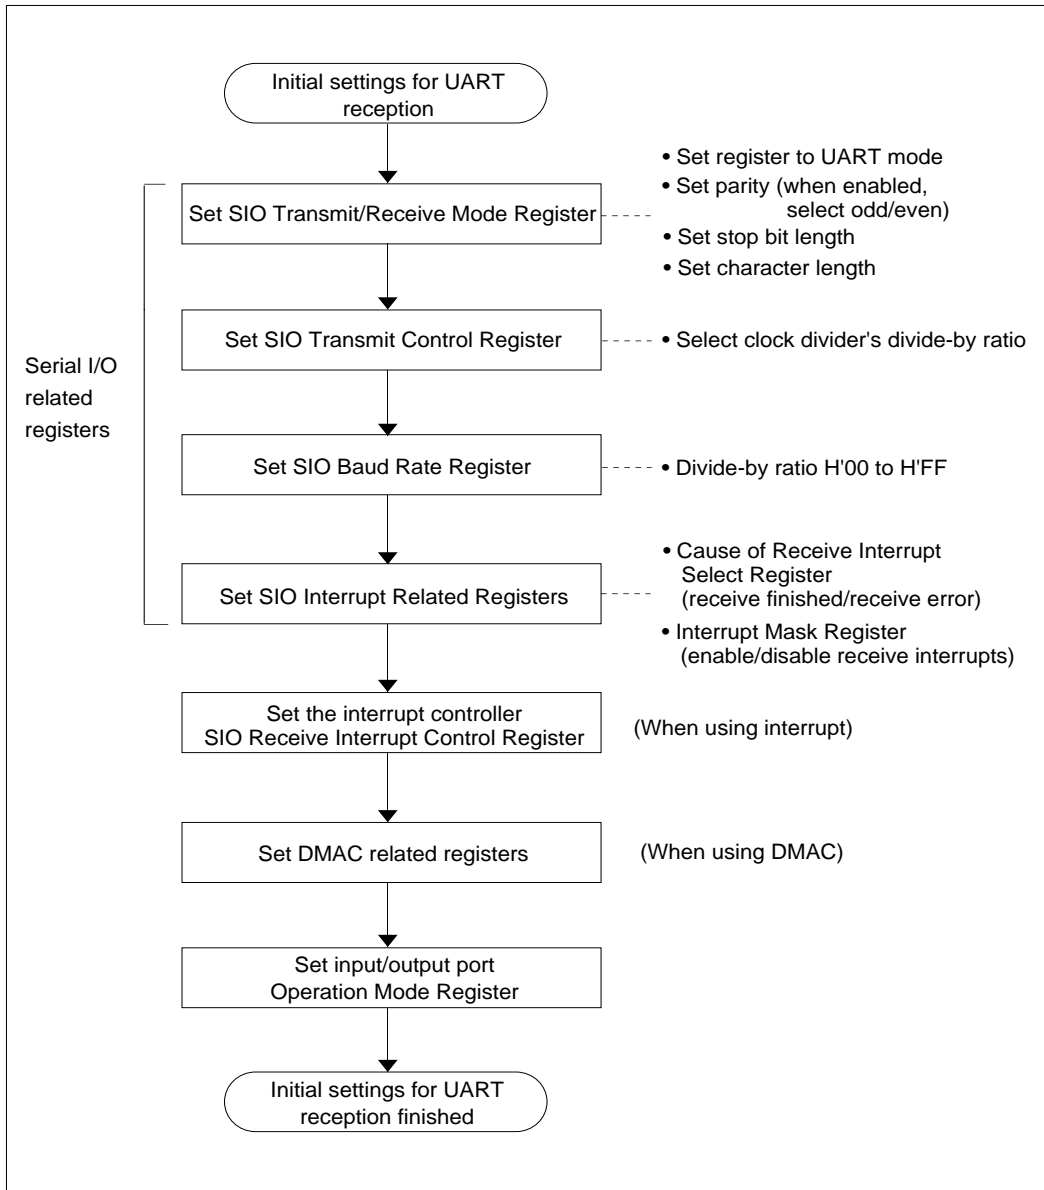

Figure 12.7.1 Procedure for UART Receive Initialization

12.7.2 Starting UART Reception

When all of the following receive conditions are met after you finished initialization, the serial I/O starts receive operation.

- The SIO Receive Control Register's receive enable bit is set to 1
- Start bit (falling edge signal) is applied to the RXD pin

When the above conditions are met, the serial I/O enters UART receive operation. However, if the start bit when checked again at the first rise of the internal receive shift clock is detected high for reason of noise, etc., the serial I/O stops receive operation and waits for the start bit again.

12.7.3 Processing at End of UART Reception

When data reception is completed, the following operation is automatically performed in hardware.

(1) When reception is completed normally

The receive-finished (receive buffer full) bit is set to 1.

- Notes:
- If a receive-finished (receive buffer full) interrupt has been enabled, an interrupt request is generated.
 - A DMA transfer request is generated.

(2) When error occurs during reception

When an error occurs during reception, the corresponding error bit (OE, FE, or PE) and the receive sum bit are set to 1.

- Notes:
- If a receive-finished interrupt has been selected (by SIO Cause of Receive Interrupt Select Register), a receive-finished interrupt request is generated when interrupt requests are enabled. However, if an overrun error has occurred, this interrupt is not generated.
 - If a receive error interrupt has been selected (by SIO Cause of Receive Interrupt Select Register), a receive error interrupt request is generated when interrupt requests are enabled.
 - No DMA transfer requests are generated.

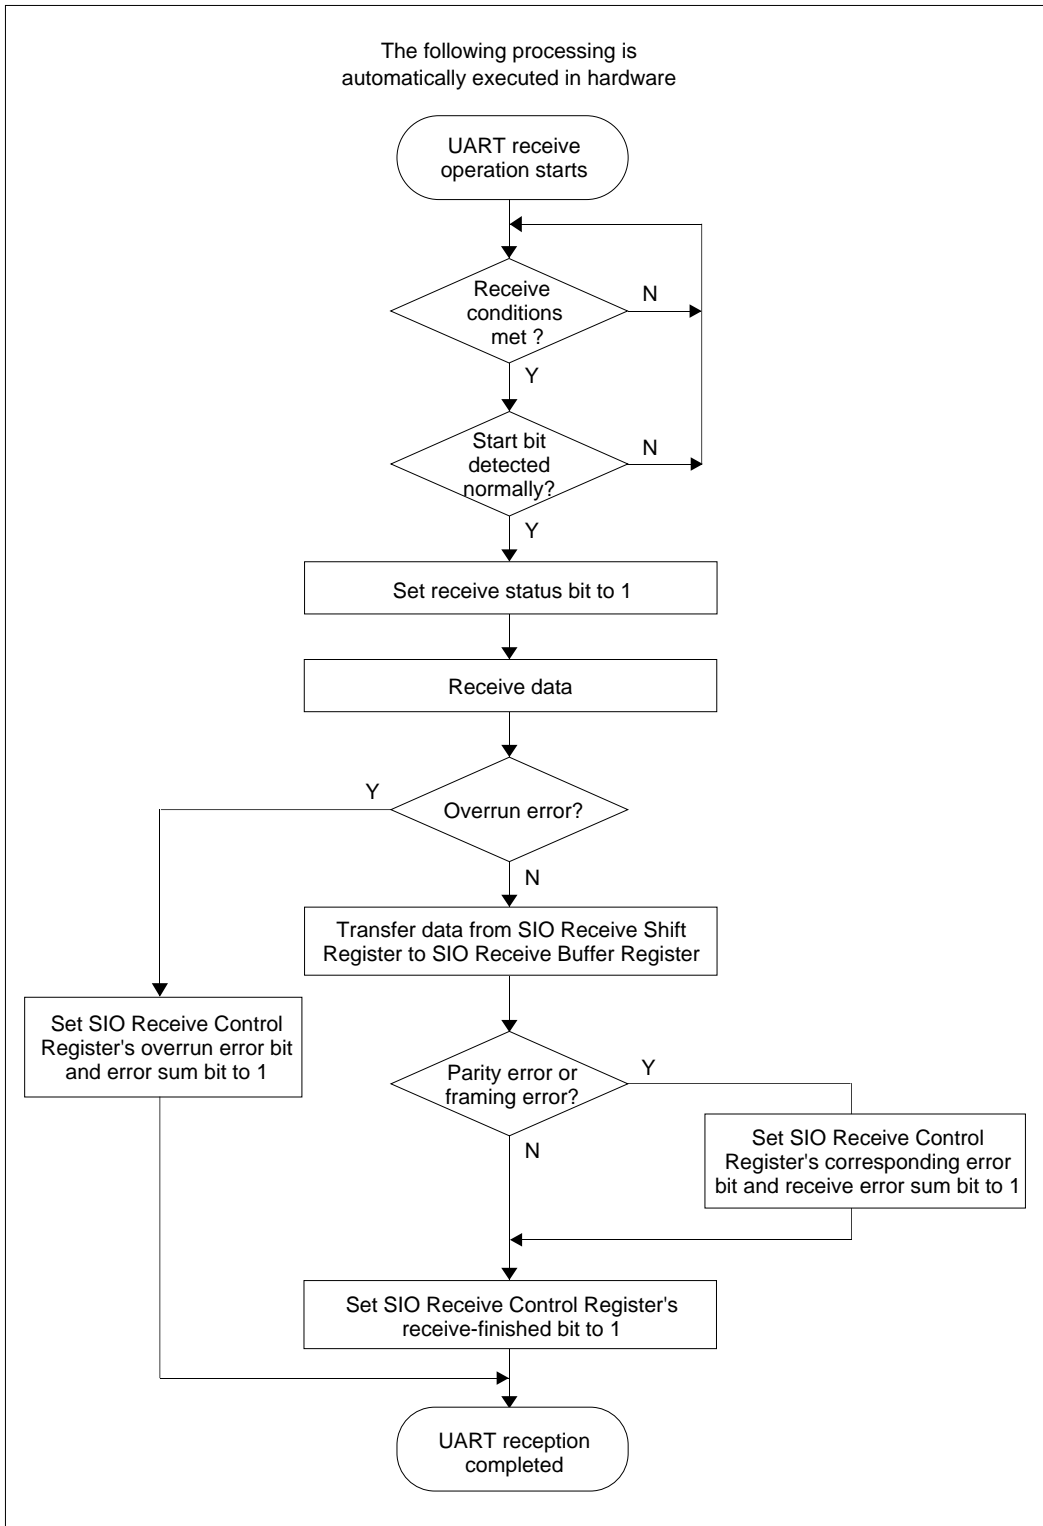

Figure 12.7.2 Receive Operation during UART Mode (Hardware Processing)

12.7.4 Typical UART Receive Operation

The following shows a typical receive operation in UART mode.

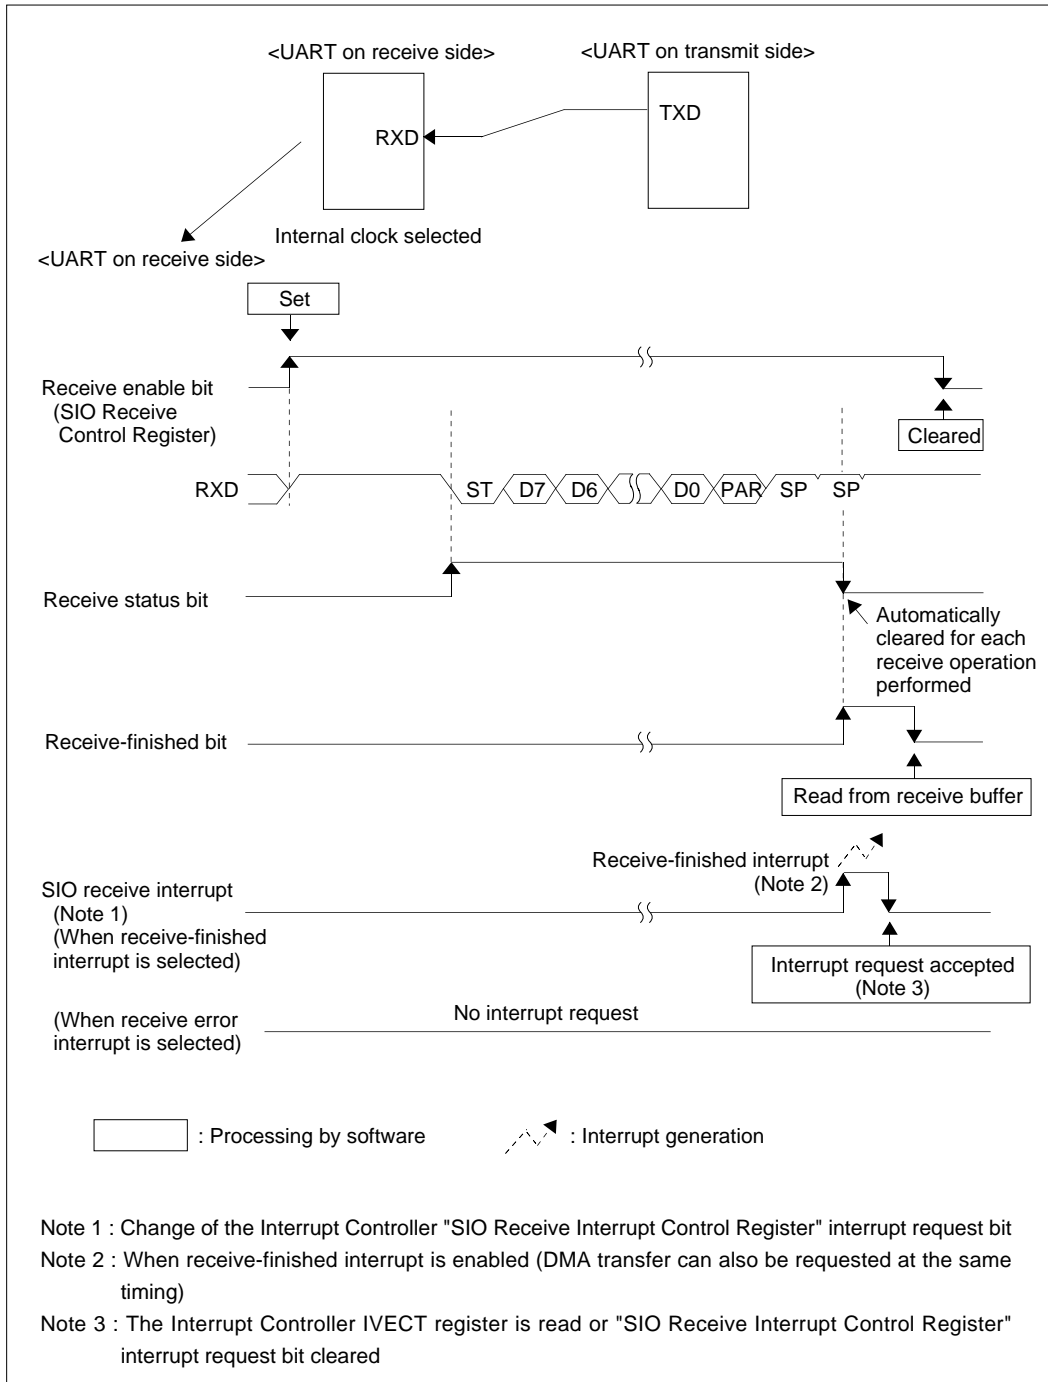

Figure 12.7.3 Example of UART Reception (When Received Normally)

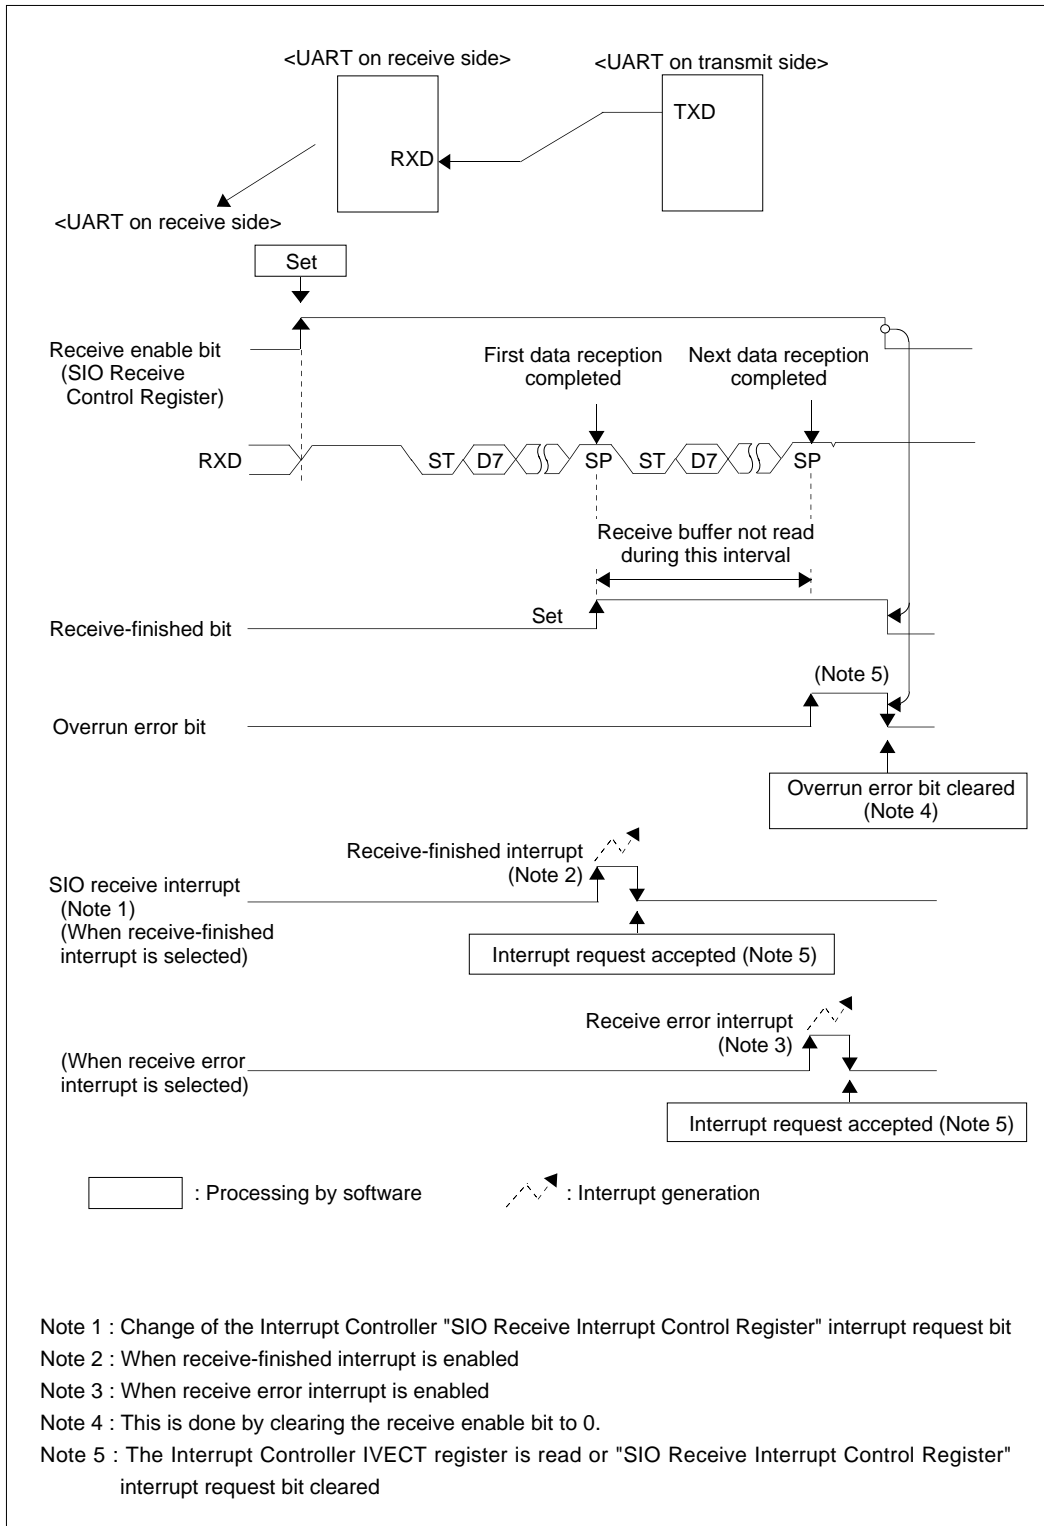

Figure 12.7.4 Example of UART Reception (When Overrun Error Occurred)

12.7.5 Detecting the Start Bit during UART Reception

The start bit is sampled synchronously with the internal BRG output timing. The start bit is detected as valid when RXD is sampled low eight internal BRG output cycles after detecting a falling edge of the start bit, and another eight cycles later the CPU starts latching RXD as the LSB data (first bit data). If RXD is sampled high at the 8th cycle, the CPU again starts detecting a low-going transition of the start bit. Because RXD is sampled synchronously with the internal BRG, there is a delay equal to a BRG output at maximum. Thereafter, RXD is received with the delayed timing.

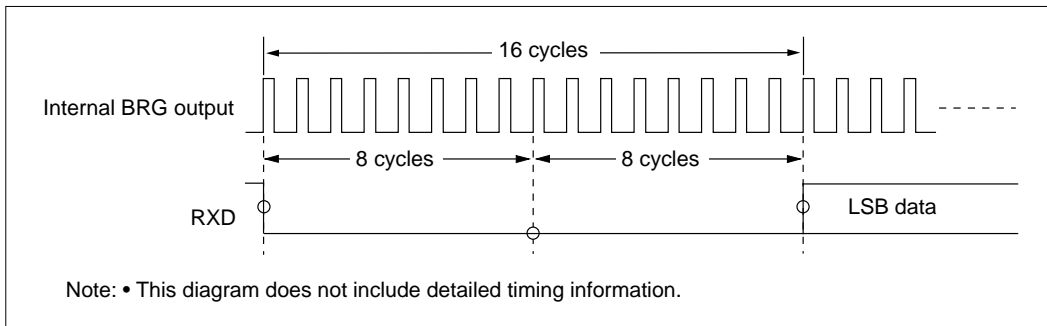

Figure 12.7.5 Detecting the Start Bit

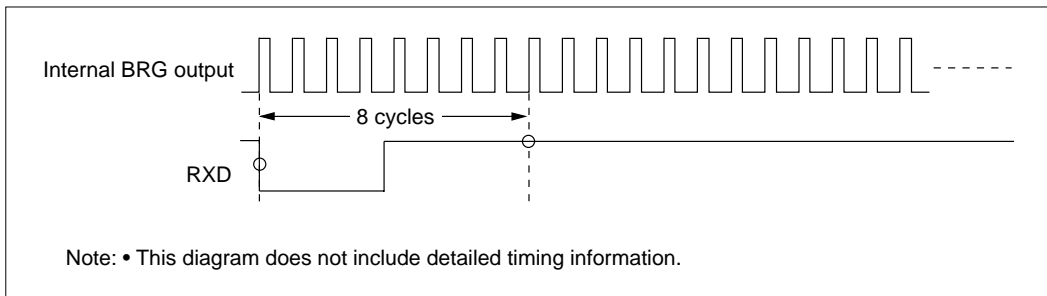

Figure 12.7.6 Example of an Invalid Start Bit (Not Received)

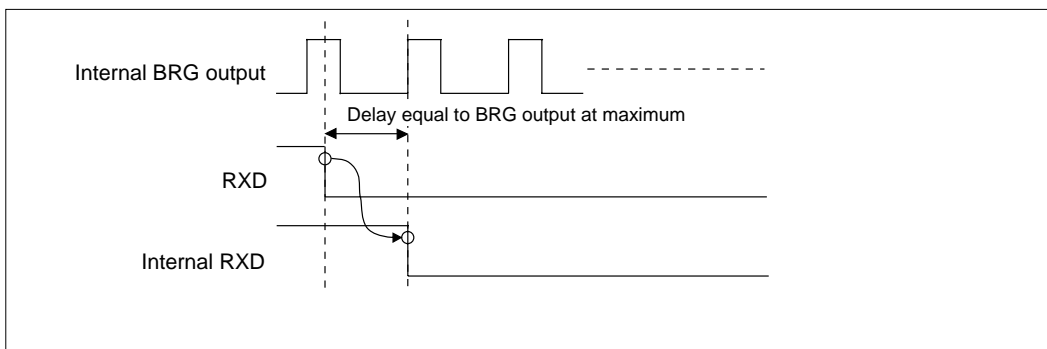

Figure 12.7.7 Delay when Receiving

12.8 Fixed Period Clock Output Function

When using SIO0 or SIO1 in UART mode, you can choose the relevant port (P84 or P87) to function as the SCLKO0 or SCLKO1 pin. In this way, a clock derived from BRG output by dividing it by 2 can be output from the SCLKO pin.

Note : • This clock is output not just during data transfer.

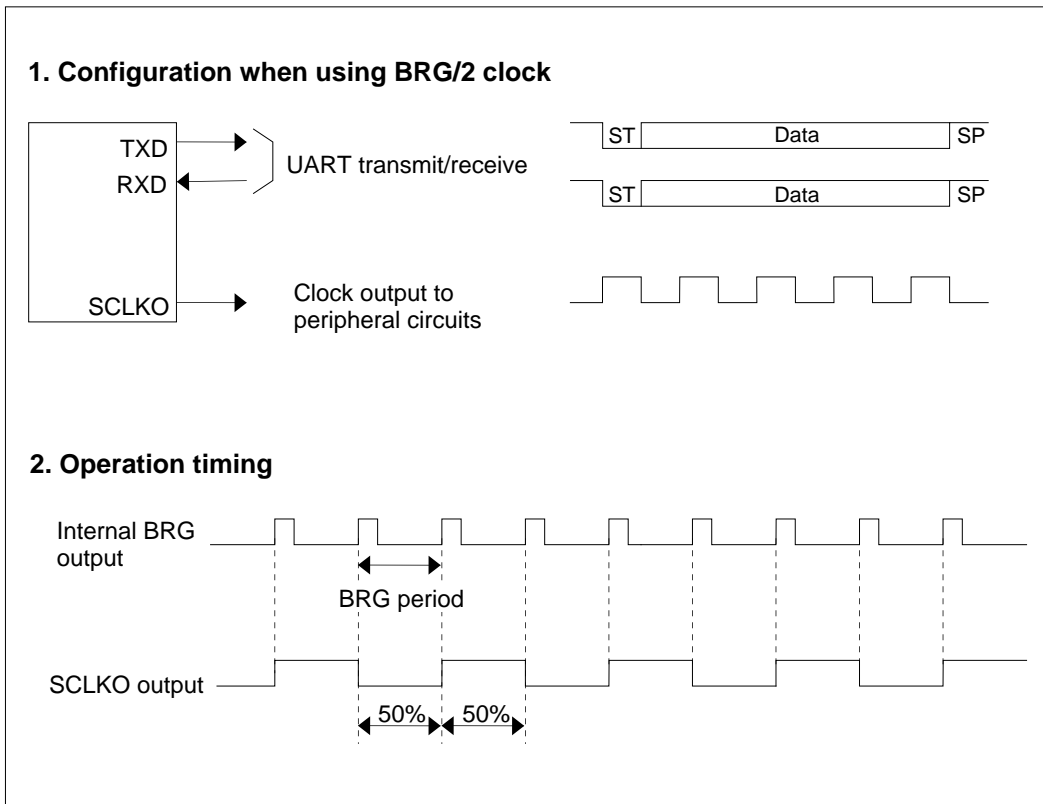

Figure 12.8.1 Example of Fixed Period Clock Output

12.9 Precautions on Using UART Mode

- **Settings of SIO Transmit/Receive Mode Register and SIO Baud Rate Register**

The SIO Transmit/Receive Mode Register and SIO Baud Rate Register and the Transmit Control Register's BRG count source select bit must always be set when not operating. When transmitting or receiving data, be sure to check that transmission and/or reception under way has been completed and clear the transmit and receive enable bits before you set the registers.

- **Settings of Baud Rate (BRG) Register**

The value written to the SIO Baud Rate Register becomes effective beginning with the next period after the BRG counter finished counting. However, when transmit and receive operations are disabled, the register value can be changed at the same time you write to the register.

- **Transmit/receive operations using DMA**

To transmit/receive data in DMA request mode, enable the DMAC to accept transfer requests (by setting the DMA Mode Register) before you start serial communication.

- **About overrun error**

If all bits of the next receive data are received in the SIO Receive Shift Register before you read out the SIO Receive Buffer Register (an overrun error occurs), the receive data is not stored in the Receive Buffer Register and the Receive Buffer Register retains the previously received data. Once an overrun error occurs, no receive data is stored in the Receive Buffer Register although receive operation is continued. To restart reception normally, you need to temporarily clear the receive enable bit before you restart. This is the only way you can clear the overrun error flag.

- **Flags indicating the status of UART receive operation**

Following flags are available that indicate the status of receive operation during UART mode.

- SIO Receive Control Register receive status bit
- SIO Receive Control Register receive-finished bit
- SIO Receive Control Register receive error sum bit
- SIO Receive Control Register overrun error bit
- SIO Receive Control Register parity error bit
- SIO Receive Control Register framing error bit

The manner in which the receive-finished bit and various error bit flags are cleared varies depending on whether an overrun error has occurred or not, as described below.

[When no overrun error has occurred]

Said bits can be cleared by reading the lower byte from the receive buffer register or clearing the receive enable bit to 0.

[When an overrun error has occurred]

Said bits can only be cleared by clearing the receive enable bit to 0.

Figure 13.2.4 CAN Module Related Register Map (4/4)

13.2.1 CAN Control Register

■ CAN0 Control Register (CAN0CNT)

<Address:H'0080 1000>

<When reset:H'0011>

D	Bit Name	Function	R	W
0-3	No functions assigned		0	-
4	RBO (Return bus off)	0: Enables normal operation 1: Requests clearing of error counter	○	△
5	TSR (Time stamp counter reset)	0: Enables count operation 1: Initializes count (by setting H'0000)	○	△
6-7	TSP (Time stamp prescaler)	D6 D7 0 0 : Selects CAN bus bit clock 0 1 : Selects CAN bus bit clock divided by 2 1 0 : Selects CAN bus bit clock divided by 3 1 1 : Selects CAN bus bit clock divided by 4	○	○
8-9	No functions assigned		0	-
10	No functions assigned (Always set this bit to 0)		0	-
11	FRST (Forcible reset)	0: Negates rest 1: Forcibly resets	○	○
12	BCM (BasicCAN mode)	0: Disables BasicCAN function 1: BasicCAN mode	○	○
13	No functions assigned		0	-
14	LBM (Loopback mode)	0: Disables loopback function 1: Enables loopback function	○	○
15	RST (CAN reset)	0: Negates reset 1: Requests reset	○	○

W = △ : Only writing a 1 is effective. Automatically cleared to 0 in hardware.

(1) RBO (Return Bus Off) bit (D4)

Setting this bit to 1 clears the Receive Error Counter (CAN0REC) and Transmit Error Counter (CAN0TEC) and forcibly places the CAN module into an error active state. This bit is cleared when an error active state is entered.

Note: • After clearing the error counter, transmission becomes possible when 11 consecutive recessive bits are detected on the CAN bus.

(2) TSR (Time Stamp Counter Reset) bit (D5)

Setting this bit to 1 clears the value of the CAN Time Stamp Counter Register (CAN0TSTMP) to H'0000. This bit is cleared when the value of the CAN Time Stamp Counter Register (CAN0TSTMP) is cleared to H'0000.

(3) TSP (Time Stamp Prescaler) bits (D6, D7)

These bits select the count clock source for the time stamp counter.

Note: • Do not change settings of TSP bits while CAN is operating (CAN Status Register CRS bit = 0).

(4) FRST (Forcible Reset) bit (D11)

When the FRST bit is set to 1, the CAN module is separated from the CAN bus regardless of whether or not the CAN module is communicating and the protocol control unit is reset. Up to 5 BCLK periods are required before the protocol control unit is reset after setting the FRST bit.

Notes: • If the FRST bit is set to 1 during communication, the CTX pin output goes high immediately after that. Therefore, setting the FRST bit to 1 while transmitting CAN frame may cause a CAN bus error.

- When the protocol control unit is reset by setting the RST bit to 1, the CAN Time Stamp Count Register and CAN Transmit/Receive Error Count Registers are initialized to 0.
- To restart CAN communication, the FRST and RST bits must be cleared to 0.
- The CAN Message Slot Control Register's transmit/receive request are not cleared for reasons that the FRST or RST bits are set.

(5) BCM (BasicCAN Mode) bit (D12)

By setting this bit to 1, the CAN module can be operated in BasicCAN mode.

- **Operation during BasicCAN mode**

In BasicCAN mode, two local slots-slots 14 and 15-are used as double buffers, and receive frames that are found matching to the ID by acceptance filtering are stored alternately in slots 14 and 15. Used for this acceptance filtering when slot 14 is active (next receive frame to be stored in slot 14) are the ID set for slot 14 and local mask A, and those used when slot 15 is active are the ID set for slot 15 and local mask B. Two types of frames-data frame and remote frame-can be received in this mode.

By using the same ID and setting the same value in mask registers for the two slots, the possibility of a message-lost trouble when, for example, receiving frames which have many IDs can be reduced.

- **Procedure for entering BasicCAN mode**

Follow the procedure below during initialization:

- 1 Set the IDs for slots 14 and 15 and local mask registers A and B. (We recommend setting the same value.)
- 2 Set the frame types handled by slots 14 and 15 (standard or extended) in the CAN Extended ID Register. (We recommend setting the same type.)
- 3 Set the Message Slot Control Register for slots 14 and 15 to for data frame reception.
- 4 Set the BCM bit to 1.

- Notes:
- Do not change settings of BCM bit when CAN is operating (CAN Status Register CRS bit = 0).
 - The first slot that is active after clearing the RST bit is slot 14.
 - Even during BasicCAN mode, slots 0 to 13 can be used as in normal operation.

(6) LBM (Loopback Mode) bit (D14)

When the LBM bit is set to 1, if a receive slot exists whose ID matches that of the frame sent by the CAN module itself, then the frame can be received.

- Notes:
- No ACK is returned for the transmit frame.
 - Do not change settings of LBM bit when CAN is operating (CAN Status Register CRS bit = 0).

(7) RST (CAN Reset) bit (D15)

When the RST bit is cleared to 0, the CAN module is connected to the CAN bus and becomes possible to communicate after detecting 11 consecutive recessive bits. Also, the CAN Time Stamp Count Register thereby starts counting.

When the RST bit is set to 1, the CAN module is reset so that after sending a frame from the slot which has had a transmit request set, the protocol control unit is reset and the CAN module is disconnected from the CAN bus. Frames received during this time are processed normally.

- Notes:
- It is inhibited to set a new transmit request for a while from when the CAN Status Register CRS bit is set to 1 after setting the RST bit to 1 till when the protocol control unit is reset.
 - When the protocol control unit is reset by setting the RST bit to 1, the CAN Time Stamp Count Register and CAN Transmit/Receive Error Count Registers are initialized to 0.
 - To restart CAN communication, the FRST and RST bits must be cleared to 0.

13.2.2 CAN Status Register

■ CAN0 Status Register (CAN0STAT)

<Address:H'0080 1002>

<When reset:H'0100>

D	Bit Name	Function	R	W
0	No functions assigned		0	-
1	BOS (Bus off status)	0: Not Bus off 1: Bus off state	○	-
2	EPS (Error passive status)	0: Not error passive 1: Error passive state	○	-
3	CBS (CAN bus error)	0: No error occurred 1: Error occurred	○	-
4	BCS (BasicCAN status)	0: Normal mode 1: BasicCAN mode	○	-
5	No functions assigned		0	-
6	LBS (Loopback status)	0: Normal mode 1: Loopback mode	○	-
7	CRS (CAN reset status)	0: Operating 1: Reset	○	-
8	RSB (Receive status)	0: Not receiving 1: Receiving	○	-
9	TSB (Transmit status)	0: Not transmitting 1: Transmitting	○	-
10	RSC (Receive complete status)	0: Reception not completed yet 1: Reception completed	○	-
11	TSC (Transmit complete status)	0: Transmission not completed yet 1: Transmission completed	○	-

D	Bit Name	Function	R	W
12-15	MSN (Message slot number)	Number of message slot which has finished sending or receiving 0000 : Slot0 0001 : Slot1 0010 : Slot2 0011 : Slot3 0100 : Slot4 0101 : Slot5 0110 : Slot6 0111 : Slot7 1000 : Slot8 1001 : Slot9 1010 : Slot10 1011 : Slot11 1100 : Slot12 1101 : Slot13 1110 : Slot14 1111 : Slot15	○	–

(1) BOS (Bus Off Status) bit (D1)

When BOS bit = 1, it means that the CAN module is in a bus-off state.

[Set condition]

This bit is set to 1 when the transmit error counter value exceeded 255 and a bus-off state is entered.

[Clear condition]

This bit is cleared when returned from the bus-off state.

(2) EPS (Error Passive Status) bit (D2)

When EPS bit = 1, it means that the CAN module is in an error passive state.

[Set condition]

This bit is set to 1 when the transmit or receive error counter value exceeded 127 and an error passive state is entered.

[Clear condition]

This bit is cleared when switched from the error passive state.

(3) CBS (CAN Bus Error) bit (D3)

[Set condition]

This bit is set to 1 when an error on the CAN bus is detected.

[Clear condition]

This bit is cleared when normally transmitted or received.

(4) BCS (BasicCAN Status) bit (D4)

When BCS bit = 1, it means that the CAN module is operating in BasicCAN mode.

[Set condition]

This bit is set to 1 when operating in BasicCAN mode.

BasicCAN mode operates under the following conditions:

- The CAN Control Register BCM bit must be set to 1.
- Slots 14 and 15 both must be set for data frame reception.

[Clear condition]

This bit is cleared by clearing the BCM bit to 0.

(5) LBS (Loopback Status) bit (D6)

When LBS bit = 1, it means that the CAN module is operating in loopback mode.

[Set condition]

This bit is set to 1 by setting the CAN Control Register LBM (loopback mode) bit to 1.

[Clear condition]

This bit is cleared by clearing the LBM bit to 0.

(6) CRS (CAN Reset Status) bit (D7)

When CRS bit = 1, it means that the protocol control unit is in a reset state.

[Set condition]

This bit is set to 1 when the CAN module's protocol control unit is in a reset state.

[Clear condition]

This bit is cleared by clearing the CAN Control Register RST (CAN reset) bit to 0.

(7) RSB (Receive Status) bit (D8)

[Set condition]

This bit is set to 1 when the CAN module is operating as a receive node.

[Clear condition]

This bit is cleared when the CAN module started operating as a transmit node or entered a bus idle state.

(8) TSB (Transmit Status) bit (D9)

[Set condition]

This bit is set to 1 when the CAN module is operating as a transmit node.

[Clear condition]

This bit is cleared when the CAN module started operating as a receive node or entered a bus idle state.

(9) RSC (Receive Complete Status) bit (D10)

[Set condition]

This bit is set to 1 when the CAN module finished receiving normally (regardless of whether any slot exists that meets receive conditions).

[Clear condition]

This bit is cleared when the CAN module finished transmitting normally.

(10) TSC (Transmit Complete Status) bit (D11)

[Set condition]

This bit is set to 1 when the CAN module finished transmitting normally.

[Clear condition]

This bit is cleared when the CAN module finished receiving normally.

(11) MSN (Message Slot Number) bits (D12-D15)

These bits show the relevant slot number when the CAN module finished transmitting or finished storing received data. This bit cannot be cleared to 0 in software.

13.2.3 CAN Extended ID Register

■ CAN0 Extended ID Register (CAN0EXTID)

<Address:H'0080 1004>

D0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	D15
IDE0	IDE1	IDE2	IDE3	IDE4	IDE5	IDE6	IDE7	IDE8	IDE9	IDE10	IDE11	IDE12	IDE13	IDE14	IDE15

<When reset:H'0000>

D	Bit Name	Function	R	W
0	IDE0 (Extended ID0)	0: Standard ID format	○	○
1	IDE1 (Extended ID1)	1: Extended ID format		
2	IDE2 (Extended ID2)			
3	IDE3 (Extended ID3)			
4	IDE4 (Extended ID4)			
5	IDE5 (Extended ID5)			
6	IDE6 (Extended ID6)			
7	IDE7 (Extended ID7)			
8	IDE8 (Extended ID8)			
9	IDE9 (Extended ID9)			
10	IDE10 (Extended ID10)			
11	IDE11 (Extended ID11)			
12	IDE12 (Extended ID12)			
13	IDE13 (Extended ID13)			
14	IDE14 (Extended ID14)			
15	IDE15 (Extended ID15)			

This register selects the format of frames handled in message slots corresponding to each bit. The standard ID format is selected when a message slot's corresponding bit is set to 0, or the extended ID format is selected when the bit is set to 1.

Note: • Settings of each bit of this register can only be changed when the corresponding slot does not have transmit or receive requests set.

13.2.4 CAN Configuration Register

■ CAN0 Configuration Register (CAN0CONF)

<Address:H'0080 1006>

<When reset:H'0000>

D	Bit Name	Function	R	W
0-1	SJW (reSynchronization Jump Width)	Sets reSynchronization Jump Width 00: SJW = 1Tq 01: SJW = 2Tq 10: SJW = 3Tq 11: SJW = 4Tq	○	○
2-4	PH2 (Phase Segment2)	Sets Phase Segment2 000: Settings inhibited 001: Phase Segment2 = 2Tq 010: Phase Segment2 = 3Tq 011: Phase Segment2 = 4Tq 100: Phase Segment2 = 5Tq 101: Phase Segment2 = 6Tq 110: Phase Segment2 = 7Tq 111: Phase Segment2 = 8Tq	○	○
5-7	PH1 (Phase Segment1)	Sets Phase Segment1 000: Phase Segment1 = 1Tq 001: Phase Segment1 = 2Tq 010: Phase Segment1 = 3Tq 011: Phase Segment1 = 4Tq 100: Phase Segment1 = 5Tq 101: Phase Segment1 = 6Tq 110: Phase Segment1 = 7Tq 111: Phase Segment1 = 8Tq	○	○

<When reset:H'0000>				
D	Bit Name	Function	R	W
8-10	PRB (Propagation Segment)	Sets Propagation Segment 000: Propagation Seqment = 1Tq 001: Propagation Seqment = 2Tq 010: Propagation Seqment = 3Tq 011: Propagation Seqment = 4Tq 100: Propagation Seqment = 5Tq 101: Propagation Seqment = 6Tq 110: Propagation Seqment = 7Tq 111: Propagation Seqment = 8Tq	<input type="radio"/>	<input type="radio"/>
11	SAM (Number of times sampled)	0: Samples once 1: Samples three times	<input type="radio"/>	<input type="radio"/>
12-15	No functions assigned		0	–

Notes: • During CAN operation (CNA Status Register CRS bit = 0), do not alter settings of the CAN Configuration Registers (CAN0CONF and CAN1CONF).

- The bit configuration in this register must be set so as to meet the conditions below.
 - Number of Tq's in one bit: 8 to 25 Tq's
 - $SJW \leq \min(\text{Phase Segment 1, Phase Segment 2})$
 - Phase Segment 2 = $\max(\text{Phase Segment 1, IPT})$ However, IPT = 2 for the M32R/ECU's internal CAN modules.

Note that min() is the function that returns a smaller value, whereas max() is the function that returns the maximum value.

(1) SJW bits (D0-D1)

These bits set reSynchronization Jump Width.

(2) PH2 bits (D2-D4)

These bits set the width of Phase Segment2.

Note: • The internal CAN module of the 32171 has IPT (Information Processing Time) = 2. Because PH2 bits = 0 after reset, be sure to change it to a value equal to or greater than 2 before you use the CAN module.

(3) PH1 bits (D5-D7)

These bits set the width of Phase Segment1.

(4) PRB bits (D8-D10)

These bits set the width of Propagation Segment.

(5) SAM bit (D11)

This bit sets the number of times each bit is sampled. When SAM = 0, the value sampled at the end of Phase Segment1 is assumed to be the value of the bit. When SAM = 1, the value of the bit is determined by a majority circuit from values sampled at three points-one sampled at the end of Phase Segment1, one sampled before 1Tq, and one sampled before 2Tq.

Table 13.2.1 Typical Settings of Bit Timing when CPU Clock = 40 MHz

Baud Rate	BRP Set Value	Tq Period (ns)	Tq's for 1 Bit	PROP+PH1	PH2	Sampling Point
1M bps	3	100	10	7	2	80%
	3	100	10	6	3	70%
	3	100	10	5	4	60%
	4	125	8	5	2	75%
	4	125	8	4	3	63%
500K bps	4	125	16	13	2	88%
	4	125	16	12	3	81%
	4	125	16	11	4	75%
	7	200	10	7	2	80%
	7	200	10	6	3	70%
	7	200	10	5	4	60%
	9	250	8	5	2	75%
	9	250	8	4	3	63%

Table 13.2.2 Typical Settings of Bit Timing when CPU Clock = 32 MHz

Baud Rate	BRP Set Value	Tq Period (ns)	Tq's for 1 Bit	PROP+PH1	PH2	Sampling Point
1M bps	1	62.5	16	10	5	69%
	3	125	8	5	2	75%
	3	125	8	4	3	63%
500K bps	3	125	16	13	2	88%
	3	125	16	11	4	75%
	7	250	8	5	2	75%
	7	250	8	4	3	63%

13.2.5 CAN Time Stamp Count Register

■ CAN0 Time Stamp Count Register (CAN0TSTMP)

<Address:H'0080 1008>

<When reset:H'0000>

D	Bit Name	Function	R	W
0-15	CANSTMP	16-bit counter value	○	–

The CAN module contains a 16-bit counter. The count period can be chosen to be the CAN bus bit period divided by 1, 2, 3, or 4 by setting the CAN Control Register (CAN0CNT)'s TSP (Time Stamp Prescaler) bits.

When the CAN module finishes transmitting or receiving, it captures the counter value and stores it in a message slot. The counter is made to start counting by clearing the CAN Control Register (CAN0CNT)'s RST bit to 0.

- Notes:
- The protocol control unit is reset and the counter is initialized to H'0000 by setting the CAN Control Register (CAN0CNT)'s RST (CAN Reset) bit to 1. Also, the counter can be initialized to H'0000 while the CAN module is operating by setting TSR (Time Stamp Counter Reset) bit to 1.
 - During loopback mode, if an ID-matching slot exists, the CAN module stores the time stamp value in the corresponding slot when it finished receiving. (No time stamp value is stored this way when the CAN module finished transmitting.)
 - The CAN Timestamp Count Register's count period varies with the CAN resynchronizing function.

13.2.6 CAN Error Count Registers

■ CAN0 Receive Error Count Register (CAN0REC)

<Address:H'0080 100A>

<When reset:H'00>

D	Bit Name	Function	R	W
0-7	REC (Receive error counter)	Receive error count value	○	-

In an error-active/error-passive state, a receive error count is stored in this register. When received normally, the counter counts down; when an error occurs, the counter counts up.

When received normally while $REC \geq 128$ (error-passive), REC is set to 127.

In a bus-off state, an indeterminate value is stored in this register. The count is reset to H'00 upon returning to an error-active state.

■ CAN0 Transmit Error Count Register (CAN0TEC)

<Address:H'0080 100B>

<When reset:H'00>

D	Bit Name	Function	R	W
8-15	TEC (Transmit error counter)	Transmit error count value	○	-

In an error-active/error-passive state, a transmit error count is stored in this register. When transmitted normally, the counter counts down; when an error occurs, the counter counts up.

In a bus-off state, an indeterminate value is stored in this register. The count is reset to H'00 upon returning to an error-active state.

13.2.7 CAN Baud Rate Prescaler

■ CAN0 Baud Rate Prescaler (CAN0BRP)

<Address:H'0080 1016>

<When reset:H'01>

D	Bit Name	Function	R	W
0-7	BRP	Selects baud rate prescaler value	○	○

This register sets the Tq period of CAN. The CAN baud rate is determined by (Tq period x number of Tq's for 1 bit).

$$Tq \text{ period} = (\text{CANBRP} + 1) / \text{CPU clock}$$

$$\text{CAN transfer baud rate} = \frac{1}{Tq \text{ period} \times \text{number of Tq's for 1 bit}}$$

$$\begin{aligned} \text{Number of Tq's for 1 bit} = & \text{Synchronization Segment} + \\ & \text{Progagation Segment} + \\ & \text{Phase Segment 1} + \\ & \text{Phase Segment 2} \end{aligned}$$

Note: • Setting H'00 (divided by 1) is inhibited.

13.2.8 CAN Interrupt Related Registers

■ CAN0 Slot Interrupt Status Register (CAN0SLIST)

<Address:H'0080 100C>

D0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	D15

W = △: Only writing a 0 is effective; when you write a 1, the previous value is retained.

When using CAN interrupts, this register lets you know which slot requested an interrupt.

- **Slots set for transmission**

The bit is set to 1 when the CAN module finished transmitting. The bit is cleared by writing a 0 in software.

- **Slots set for reception**

The bit is set to 1 when the CAN module finished receiving and finished storing the received message in the message slot. The bit is cleared by writing a 0 in software.

When writing to the CAN slot interrupt status, make sure the bits you want to clear are set to 0 and all other bits are set to 1. The bits thus set to 1 are unaffected by writing in software and retain the value they had before you write.

Notes:

- If the automatic response function is enabled for remote frame receive slots, the status is set after the CAN module received a remote frame and when it transmitted a data frame.

- For remote frame transmit slots, the status is set after the CAN module transmitted a remote frame and when it received a data frame.

- If the status is set by an interrupt request at the same time it is cleared in software, the former has priority so that the status is set.

■ CAN0 Slot Interrupt Mask Register (CAN0SLIMK)

<Address:H'0080 1010>

D0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	D15
IRB0	IRB1	IRB2	IRB3	IRB4	IRB5	IRB6	IRB7	IRB8	IRB9	IRB10	IRB11	IRB12	IRB13	IRB14	IRB15

<When reset:H'0000>

D	Bit Name	Function	R	W
0	IRB0 (Slot 0 interrupt request mask)	0: Masks (disables) interrupt request	<input type="radio"/>	<input type="radio"/>
1	IRB1 (Slot 1 interrupt request mask)	1: Enables interrupt request		
2	IRB2 (Slot 2 interrupt request mask)			
3	IRB3 (Slot 3 interrupt request mask)			
4	IRB4 (Slot 4 interrupt request mask)			
5	IRB5 (Slot 5 interrupt request mask)			
6	IRB6 (Slot 6 interrupt request mask)			
7	IRB7 (Slot 7 interrupt request mask)			
8	IRB8 (Slot 8 interrupt request mask)			
9	IRB9 (Slot 9 interrupt request mask)			
10	IRB10 (Slot 10 interrupt request mask)			
11	IRB11 (Slot 11 interrupt request mask)			
12	IRB12 (Slot 12 interrupt request mask)			
13	IRB13 (Slot 13 interrupt request mask)			
14	IRB14 (Slot 14 interrupt request mask)			
15	IRB15 (Slot 15 interrupt request mask)			

This register controls interrupt requests generated at completion of data transmission or reception in each corresponding slot by enabling or disabling them. When IRBn (n = 0-15) is set to 1, interrupt requests to be generated at completion of transmission or reception in the corresponding slot are enabled.

The CAN Slot Interrupt Status Register (CAN0SLIST) shows you which slot has requested the interrupt.

■ CAN0 Error Interrupt Status Register (CAN0ERIST)

<Address:H'0080 1014>

<When reset:H00>

D	Bit Name	Function	R	W
0-4	No functions assigned		0	-
5	EIS (CAN bus error interrupt status)	0: No interrupt request 1: Interrupt requested	○	△
6	PIS (Error passive interrupt status)			
7	OIS (Bus off interrupt status)			

W = △: Only writing a 0 is effective; when you write a 1, the previous value is retained.

When using CAN interrupts and the interrupt sources are associated with errors, this register lets you know which source generated the interrupt.

(1) EIS (CAN Bus Error Interrupt Status) bit (D5)

This bit is set to 1 when a communication error is detected. This bit is cleared by writing a 0 in software.

(2) PIS (Error Passive Interrupt Status) bit (D6)

This bit is set to 1 when the CAN module goes to an error passive state. This bit is cleared by writing a 0 in software.

(3) OIS (Bus Off Interrupt Status) bit (D7)

This bit is set to 1 when the CAN module goes to a bus-off state. This bit is cleared by writing a 0 in software.

When writing to the CAN error interrupt status, make sure the bits you want to clear are set to 0 and all other bits are set to 1. The bits thus set to 1 are unaffected by writing in software and retain the value they had before you write.

■ CAN0 Error Interrupt Mask Register (CAN0ERIMK)

<Address:H'0080 1015>

<When reset:H00>

D	Bit Name	Function	R	W
8-12	No functions assigned		0	-
13	EIM (CAN bus error interrupt mask)	0: Masks (disables) interrupt request 1: Enables interrupt request	<input type="radio"/>	<input type="radio"/>
14	PIM (Error passive interrupt mask)			
15	OIM (Bus off interrupt mask)			

(1) EIM (CAN Bus Error Interrupt Mask) bit (D13)

This bit controls interrupt requests generated for occurrence of CAN bus errors by enabling or disabling them. CAN bus error interrupt requests are enabled by setting this bit to 1.

(2) PIM (Error Passive Interrupt Mask) bit (D14)

This bit controls interrupt requests generated when the CAN module enters an error passive state by enabling or disabling them. Error passive interrupt requests are enabled by setting this bit to 1.

(3) OIM (Bus Off Interrupt Mask) bit (D15)

This bit controls interrupt requests generated when the CAN module enters a bus-off state by enabling or disabling them. Bus-off interrupt requests are enabled by setting this bit to 1.

<When reset:H'00>

D	Bit Name	Function	R	W
8-9	No functions assigned		0	-
10-15	SID5M-SID10M (Standard ID5 to standard ID10)	0: ID not checked 1: ID checked	<input type="radio"/>	<input type="radio"/>

Three registers are used in acceptance filtering: Global Mask Register, Local Mask Register A, and Local Mask Register B. The Global Mask Register is used for message slots 0-13, while Local Mask Registers A and B are used for message slots 14 and 15, respectively.

- When a bit in this register is set to 0, its corresponding ID bit is masked (assumed to have matched) during acceptance filtering.
- When a bit in this register is set to 1, its corresponding ID bit is compared with the receive ID during acceptance filtering and when it matches the ID set for the message slot, the received data is stored in it.

Notes: • SID0M corresponds to the MSB of standard ID.

- The Global Mask Register can only be changed when none of slots 0-13 have receive requests set.
- The Local Mask Register A can only be changed when slot 14 does not have a receive request set.
- The Local Mask Register B can only be changed when slot 15 does not have a receive request set.

- **CAN0 Global Mask Register Extended ID0 (C0GMSKE0)** <Address:H'0080 102A>
- **CAN0 Local Mask Register A Extended ID0 (C0LMSKAE0)** <Address:H'0080 1032>

- **CAN0 Global Mask Register Extended ID2 (C0GMSKE2)** <Address:H'0080 102C>
- **CAN0 Local Mask Register A Extended ID2 (C0LMSKAE2)** <Address:H'0080 1034>
- **CAN0 Local Mask Register B Extended ID2 (C0LMSKBE2)** <Address:H'0080 103C>

<When reset:H'00>

D	Bit Name	Function	R	W
0,1	No functions assigned		0	-
2-7	EID12M-EID17M (Extended ID12 to extended ID17)	0: ID not checked 1: ID checked	○	○

Three registers are used in acceptance filtering: Global Mask Register, Local Mask Register A, and Local Mask Register B. The Global Mask Register is used for message slots 0-13, while Local Mask Registers A and B are used for message slots 14 and 15, respectively.

- When a bit in this register is set to 0, its corresponding ID bit is masked (assumed to have matched) during acceptance filtering.
- When a bit in this register is set to 1, its corresponding ID bit is compared with the receive ID during acceptance filtering and when it matches the ID set for the message slot, the received data is stored in it.

Notes: • EID0M corresponds to the MSB of extended ID.

- The Global Mask Register can only be changed when none of slots 0-13 have receive requests set.
- The Local Mask Register A can only be changed when slot 14 does not have a receive request set.
- The Local Mask Register B can only be changed when slot 15 does not have a receive request set.

		For receive slots		
		0: Not received yet		
		1: Finished receiving		

W = △: Only writing a 0 is effective; when you write a 1, the previous value is retained.

(1) TR (Transmit Request) bit (D0) (D8)

To use the message slot as a transmit slot, set this bit to 1. To use the message slot as a data frame or remote frame receive slot, set this bit to 0.

(2) RR (Receive Request) bit (D1) (D9)

To use the message slot as a receive slot, set this bit to 1. To use the message slot as a data frame or remote frame transmit slot, set this bit to 0.

If both TR (Transmit Request) and RR (Receive Request) bits are set to 1, device operation is indeterminate.

(3) RM (Remote) bit (D2) (D10)

To handle remote frames in the message slot, set this bit to 1. The message slot may be set to handle remote frames in following two ways:

- **Set for remote frame transmission**

The data set in the message slot is transmitted as a remote frame. When the CAN module finished transmitting, the slot is automatically changed to a data frame receive slot. However, if a data frame is received before the CAN module finished sending a remote frame, the data is stored in the message slot and the remote frame is not transmitted.

- **Set for remote frame reception**

Remote frames are received. The processing to be performed after receiving a remote frame is selected by RL (automatic response inhibit) bit.

(4) RL (Automatic Response Inhibit) bit (D3) (D11)

This bit is effective when the message slot has been set as a remote frame receive slot. It selects the processing to be performed after receiving a remote frame. When this bit is set to 0, the message slot automatically changes to a transmit slot after receiving a remote frame and transmits the data set in it as a data frame. When this bit is set to 1, the message slot stops operating after receiving a remote frame.

Note: Always set this bit to 0 unless the message slot is set for remote frame reception.

(5) RA (Remote Active) bit (D4) (D12)

This bit functions differently for slots 0-13 and slots 14 and 15.

- **Slots 0-13**

This bit is set to 1 when the message slot is set for remote frame transmission (reception). Then it is cleared to 0 when remote frame transmission (reception) is completed.

- **Slots 14, 15**

The function of this bit differs depending on how the CAN Control Register's BCM (BasicCAN mode) bit is set. If BCM = 0 (normal operation), this bit is set to 1 when the message slot is set for remote frame transmission (reception). If BCM = 1 (BasicCAN), this bit shows which type of frame is received. In BasicCAN mode, the received data is stored in slots 14 and 15 for both data frame and remote frame. If RA = 0, it means that the frame stored in the slot is a data frame; if RA = 1, it means that the frame stored in the slot is a remote frame.

(6) ML (Message Lost) bit (D5) (D13)

This bit is effective for receive slots. It is set to 1 when the message slot contains unread receive data which is overwritten by reception. This bit is cleared by writing a 0 in software.

(7) TRSTAT (Transmit/Receive Status) bit (D6) (D14)

This bit indicates that the CAN module is transmitting or receiving and is accessing the message slot. This bit is set to 1 when the CAN module is accessing, and set to 0 when not accessing.

- **For transmit slots**

This bit is set to 1 when a transmit request for the message slot is accepted. It is cleared to 0 when the CAN module lost bus arbitration, when a CAN bus error occurs, or when transmission is completed.

- **For receive slots**

This bit is set to 1 when during data reception, the received data is being stored in the message slot. Note that the value read from message slot while TRSTAT bit remains set is indeterminate.

(8) TRFIN (Transmit/Receive Finished) bit (D7) (D15)

This bit indicates that the CAN module finished transmitting or receiving.

- **When set for transmit slots**

This bit is set to 1 when the CAN module finished transmitting the data stored in the message slot. This bit is cleared by writing a 0 in software. However, it cannot be cleared when TRSTAT (Transmit/Receive Status) bit = 1.

- **When set for receive slots**

This bit is set to 1 when the CAN module finished receiving normally the data to be stored in the message slot. This bit is cleared by writing a 0 in software. However, it cannot be cleared when TRSTAT (Transmit/Receive Status) bit = 1.

- Notes:
- Before you can read received data from the message slot, you must clear the TRFIN (Transmit/Receive Finished) bit. Note also that if the TRFIN (Transmit/Receive Finished) bit is set to 1 after you read data, it means that new receive data was stored while you were reading and the data you read contains an indeterminate value. In this case, discard the read data, clear the TRFIN (Transmit/Receive Finished) bit, and read out data again.
 - The TRFIN (Transmit/Receive Finished) bit has no effect for remote frames, so that it is not set when remote frame transmission or reception is completed.

13.2.11 CAN Message Slots

- CAN0 Message Slot 0 Standard ID0 (C0MSL0SID0) <Address:H'0080 1100>
- CAN0 Message Slot 1 Standard ID0 (C0MSL1SID0) <Address:H'0080 1110>

These registers are the transmit frame/receive frame memory space. When the CAN module finishes transmitting or receiving, the CAN0 Time Stamp Count Register value is set in this register.

13.3 CAN Protocol

13.3.1 CAN Protocol Frame

There are four types of frames which are handled by CAN protocol:

- (1) Data frame
- (2) Remote frame
- (3) Error frame
- (4) Overload frame

Frames are separated from each other by an interframe space.

Figure 13.3.1 CAN Protocol Frames (1)

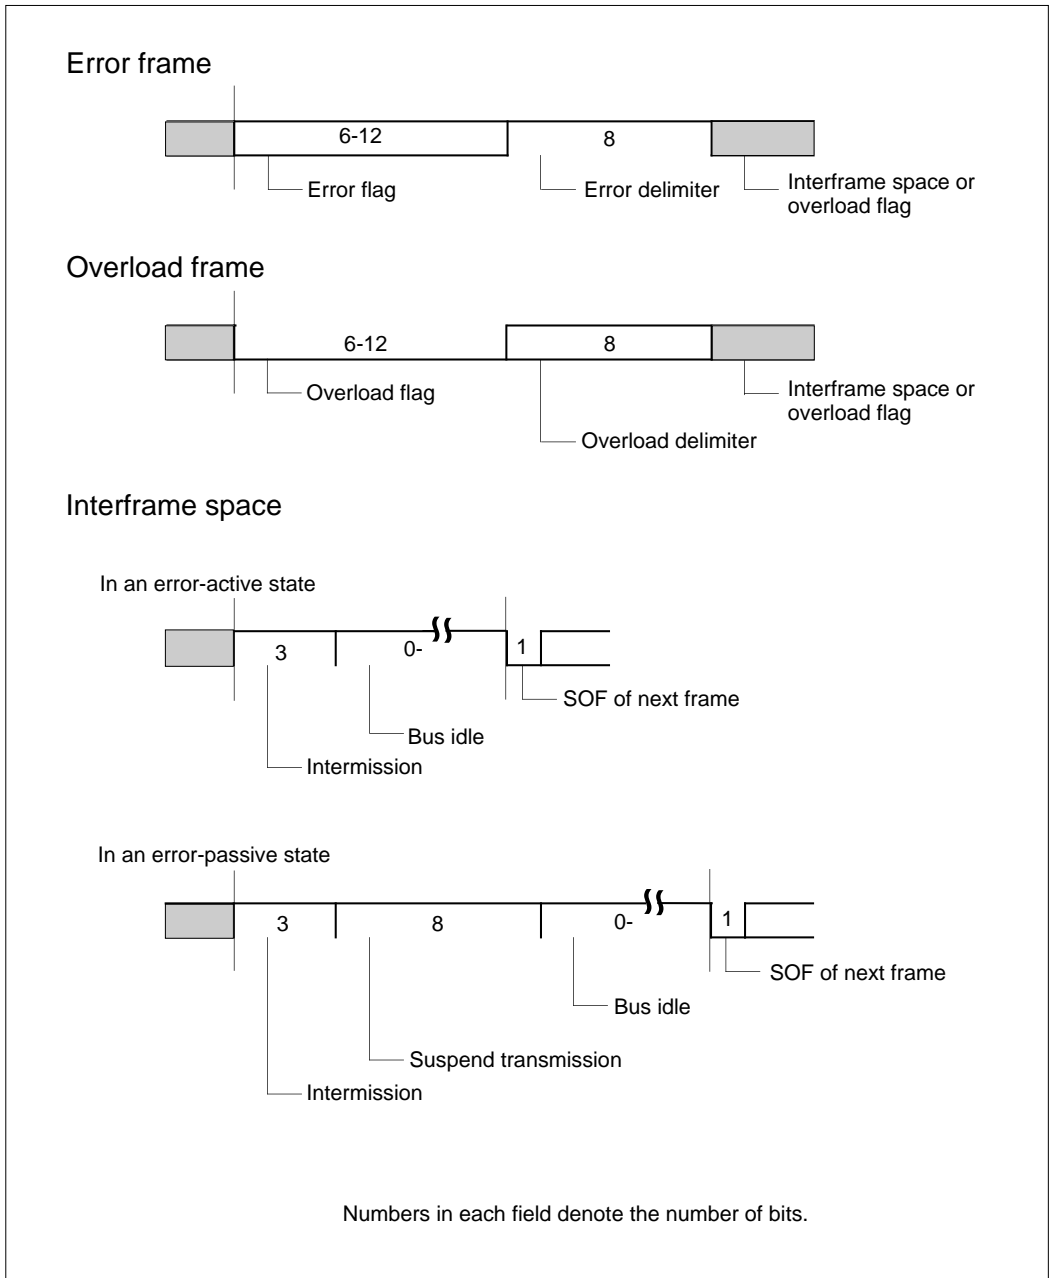

Figure 13.3.2 CAN Protocol Frames (2)

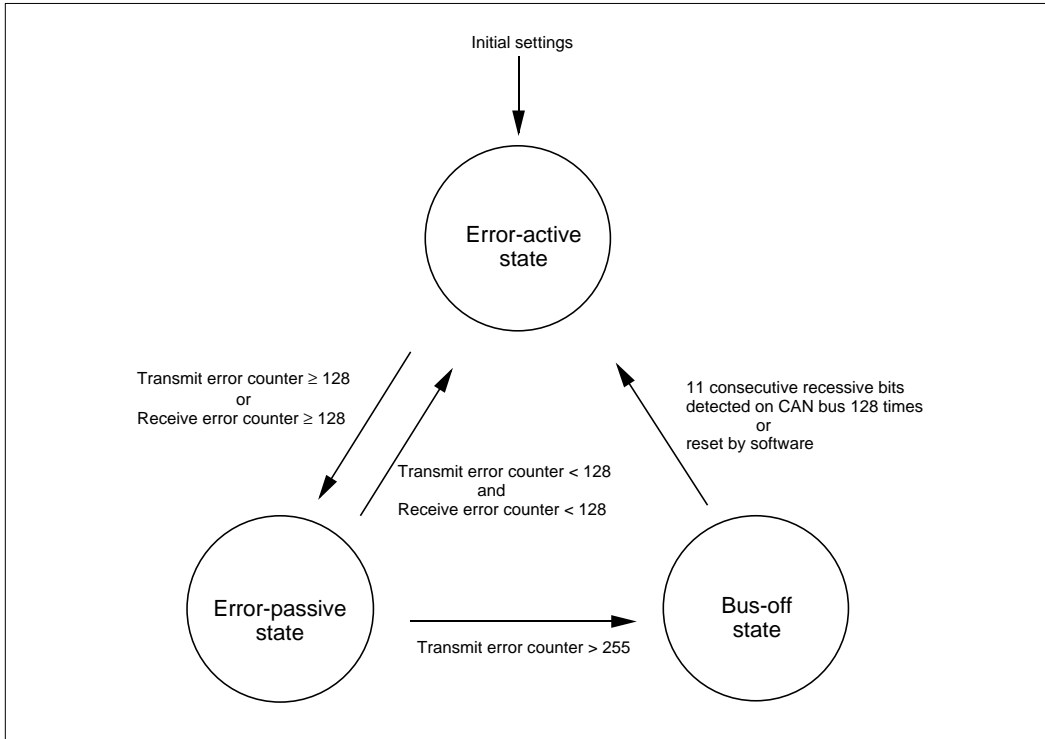

Figure 13.3.3 CAN Control Error States

The CAN controller assumes one of the following three error states depending on the transmit error and receive error counter values.

(1) Error-active state

- This is a state where almost no errors have occurred.
- When an error is detected, an active error flag is transmitted.
- Immediately after being initialized, the CAN controller is in this state.

(2) Error-passive state

- This is a state where many errors have occurred.
- When an error is detected, a passive error flag is transmitted.

(3) Bus-off state

- This is a state where a large number of errors have occurred.
- CAN communication with other nodes cannot be performed until the CAN module returns to an error-active state.

Error status of the unit	Transmit error counter		Receive error counter
Error-active state	0 -127	and	0 - 127
Error-passive state	128 - 255	or	128 -
Bus-off state	256 -		-

13.4 Initializing the CAN Module

13.4.1 Initialization of the CAN Module

Before you perform communication, set up the CAN module as described below.

(1) Selecting pin functions

The CAN transmit data output pin (CTX) and CAN data receive input pin (CRX) are shared with input/output ports, so be sure to select the functions of these pins. (Refer to Chapter 8, "Input/Output Ports and Pin Functions.")

(2) Setting the interrupt controller (ICU)

When you use CAN module interrupts, set the interrupt priority.

(3) Setting CAN Error Interrupt Mask and CAN Slot Interrupt Mask Registers

When you use CAN bus error interrupts, CAN error passive interrupts, CAN error bus-off interrupts, or CAN slot interrupts, set each corresponding bit to 1 to enable interrupt requests.

(4) Setting bit timing and the number of times sampled

Using the CAN Configuration Register and CAN Baud Rate Prescaler, set the bit timing and the number of times the CAN bus is sampled.

1) Setting the bit timing

Determine the period T_q that is the base of bit timing, the configuration of Propagation Segment, Phase Segment1, and Phase Segment2, and reSynchronization Jump Width. The equation to calculate T_q is shown below.

$$T_q = (\text{BRP}+1) / \text{CPU clock}$$

The baud rate is determined by the number of T_q 's that comprise one bit. The equation to calculate the baud rate is shown below.

$$\text{Baud rate (bps)} = \frac{1}{T_q \text{ period} \times \text{number of } T_q\text{'s for 1 bit}}$$

$$\begin{aligned} \text{Number of } T_q\text{'s for 1 bit} = & \text{Synchronization Segment} + \\ & \text{Propagation Segment} + \\ & \text{Phase Segment 1} + \\ & \text{Phase Segment 2} \end{aligned}$$

Note: • The maximum communicatable baud rate depends on the system configuration (e.g., bus length, clock error, CAN bus transceiver, sampling position, and bit configuration). Please consider the system configuration when setting the baud rate and the number of T_q 's.

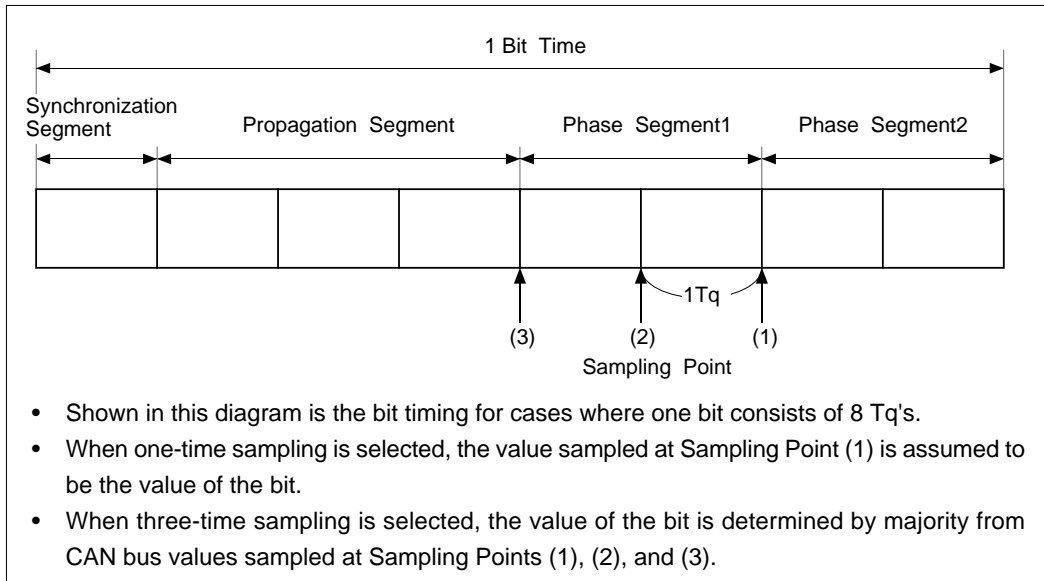

Figure 13.4.1 Example of Bit Timing

2) Setting the number of times sampled

Select the number of times the CAN bus is sampled from "one time" and "three times."

- When you select one-time sampling, the value sampled at the end of Phase Segment1 is assumed to be the value of the bit.
- When you select three-time sampling, the value of the bit is determined by majority from values sampled at three points, i.e., the value sampled at the first point and those sampled one Tq before and two Tq's before that.

(5) Setting ID Mask Registers

Set the values of ID Mask Registers (Global Mask Register, Local Mask Register A, and Local Mask Register B) which are used in acceptance filtering of received messages.

(6) Settings when running in BasicCAN mode

- Set the CAN Extended ID Register IDE14 and IDE15 bits. (We recommend setting the same value in these bits.)
- Set IDs for message slots 14 and 15.
- Set the Message Control Registers 14 and 15 for data frame reception (H'40).

(7) Setting CAN module operation mode

Using the CAN Control Register (CAN0CNT), select the CAN module's operation mode (BasicCAN or loopback mode) and the clock source for the time stamp counter.

(8) Releasing the CAN module from reset

After you finished settings (1) through (7) above, clear the CAN Control Register (CAN0CNT)'s forcible reset bit (FRST) and reset bit (RST) to 0. Then, after detecting 11 consecutive "recessive" bits on the CAN bus, the CAN module becomes ready to communicate.

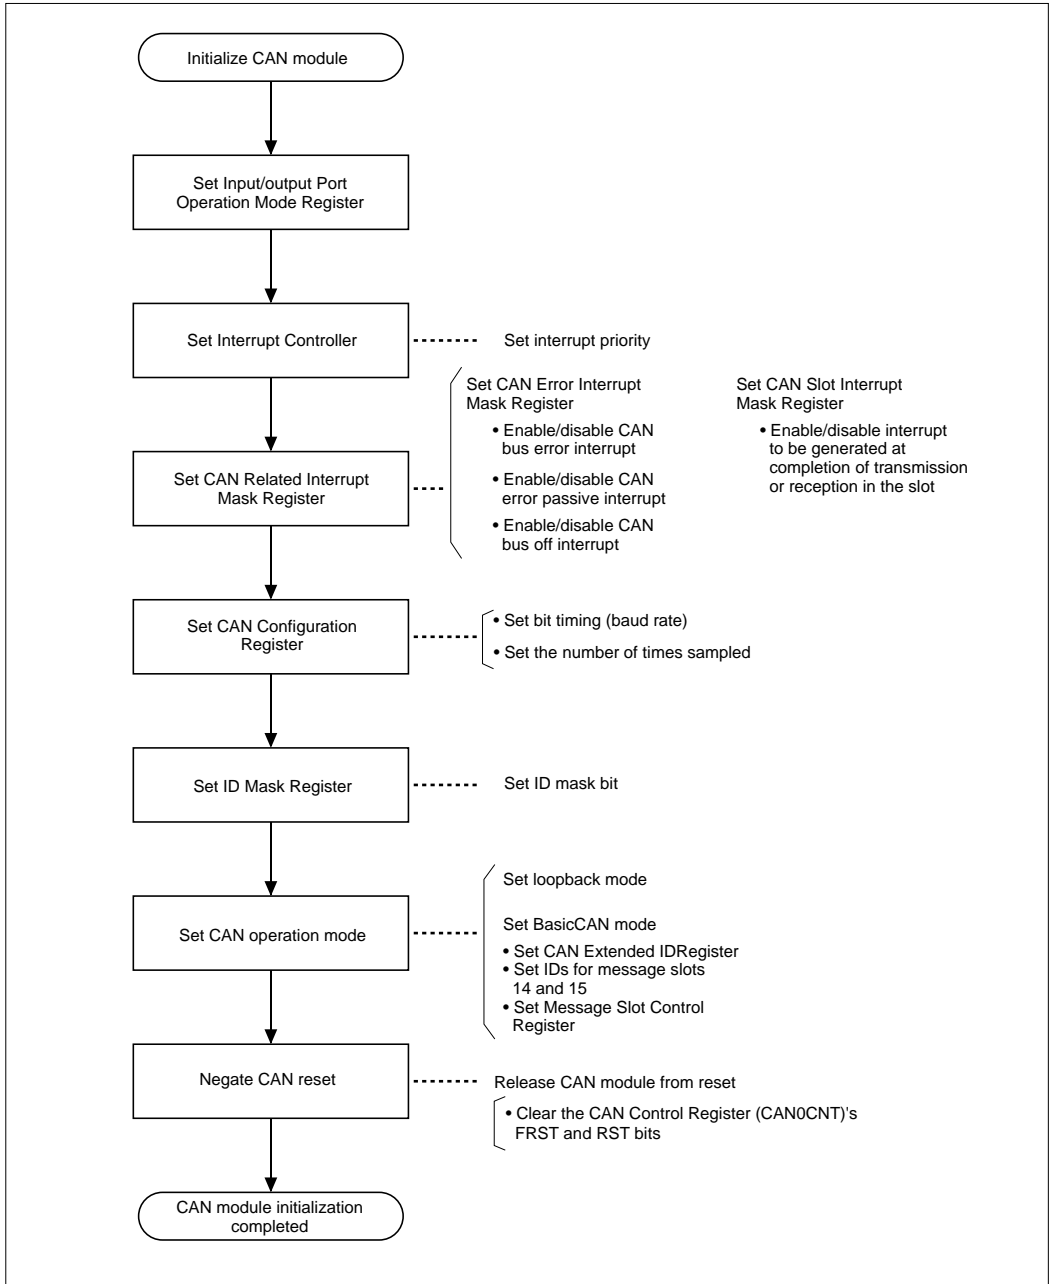

Figure 13.4.2 Initializing the CAN Module

13.5 Transmitting Data Frames

13.5.1 Data Frame Transmit Procedure

The following describes the procedure for transmitting data frames.

(1) Initializing the CAN Message Slot Control Register

Initialize the CAN Message Slot Control Register for the slot in which you want to transmit by writing H'00 to the register.

(2) Confirming that transmission is idle

Read the initialized CAN Message Slot Control Register and check the TRSTAT (transmit/receive status) bit to see that CAN has stopped sending or receiving. If this bit = 1, it means that the CAN module is accessing the message slot, so you need to wait until the bit is cleared.

(3) Setting transmit data

Set the transmit ID and transmit data in the message slot.

(4) Setting the Extended ID Register

Set the corresponding bit of the Extended ID Register to 0 when you want to transmit the data as a standard frame or 1 when you want to transmit the data as an extended frame.

(5) Setting the CAN Message Slot Control Register

Write H'80 (Note 1) to the CAN Message Slot Control Register to set the TR (Transmit Request) bit to 1.

Note 1: When you are transmitting a data frame, always write H'80 to this register.

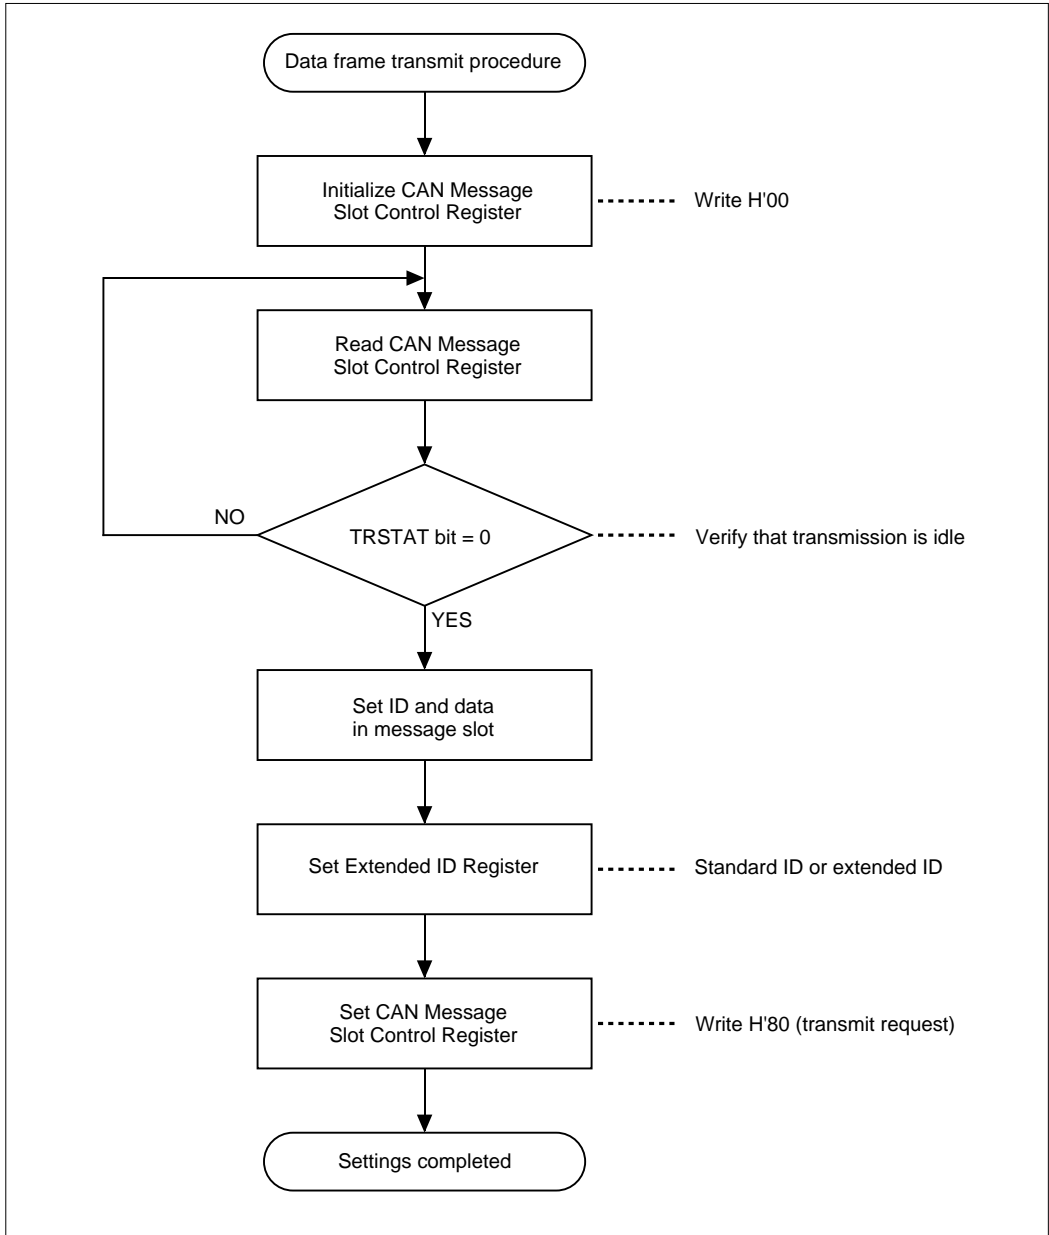

Figure 13.5.1 Data Frame Transmit Procedure

13.5.2 Data Frame Transmit Operation

The following describes data frame transmit operation. The operations described below are automatically performed in hardware.

(1) Selecting a transmit frame

The CAN module checks slots which have transmit requests (including remote frame transmit slots) every intermission to determine the frame to transmit. If there are multiple transmit slots, frames are transmitted in order of slot numbers beginning with the smallest.

(2) Transmitting a data frame

After determining the transmit slot, the CAN module sets the corresponding CAN Message Slot Control Register's TRSTAT (Transmit/Receive Status) bit to 1, thereby starting transmission.

(3) If the CAN module lost bus arbitration or a CAN bus error occurs

If the CAN module lost bus arbitration or a CAN bus error occurs while transmitting, the CAN module clears the CAN Message Slot Control Register's TRSTAT (Transmit/Receive Status) bit to 0. If the CAN module requested a transmit abort, the transmit abort is accepted and writing to the message slot is enabled.

(4) Completion of data frame transmission

When data frame transmission is completed, the CAN Message Slot Control Register's TRFIN (Transmit/Receive Finished) bit and the CAN Slot Interrupt Status Register are set to 1. Also, a time stamp count value at the time transmission was completed is written to the CAN Message Slot Time Stamp (COMSLnTSP), and the transmit operation is thereby completed.

If the CAN slot interrupt has been enabled, an interrupt request is generated at completion of transmit operation. The slot which has had transmission completed goes to an inactive state and remains inactive (neither transmit nor receive) until it is newly set in software.

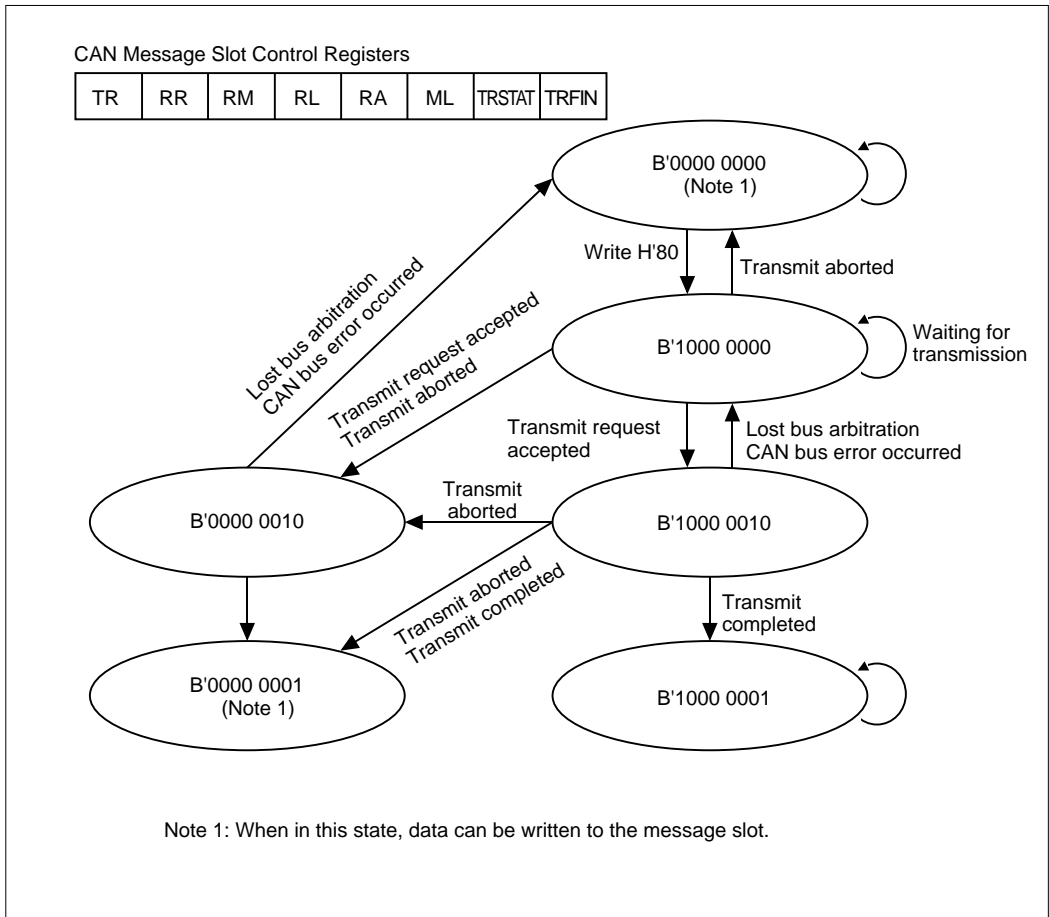

Figure 13.5.2 Operation of the CAN Message Slot Control Register when Transmitting Data Frames

13.5.3 Transmit Abort Function

The transmit abort function is used to cancel a transmit request that has once been set. This is accomplished by writing H'0F to the CAN Message Slot Control Register for the slot concerned. When transmit abort is accepted, the CAN module clears the CAN Message Slot Control Register's TRSTAT (Transmit/Receive Status) bit to 0, allowing for data to be written to the message slot. The following shows conditions under which transmit abort is accepted:

[Conditions]

- When the target message is waiting for transmission
- When a CAN bus error occurs during transmission
- When the CAN module lost bus arbitration

13.6 Receiving Data Frames

13.6.1 Data Frame Receive Procedure

The following describes the procedure for receiving data frames.

(1) Initializing the CAN Message Slot Control Register

Initialize the CAN Message Slot Control Register for the slot in which you want to receive by writing H'00 to the register.

(2) Confirming that reception is idle

Read the CAN Message Slot Control Register after being initialized and check the TRSTAT (Transmit/Receive Status) bit to see that reception has stopped and remains idle. If this bit = 1, it means that the CAN module is accessing the message slot, so you need to wait until the bit is cleared.

(3) Setting the receive ID

Set the ID you want to receive in the message slot.

(4) Setting the Extended ID Register

Set the corresponding bit of the Extended ID Register to 0 when you want to receive a standard frame or 1 when you want to receive an extended frame.

(5) Setting the CAN Message Slot Control Register

Write H'40 to the CAN Message Slot Control Register to set the RR (Receive Request) bit to 1.

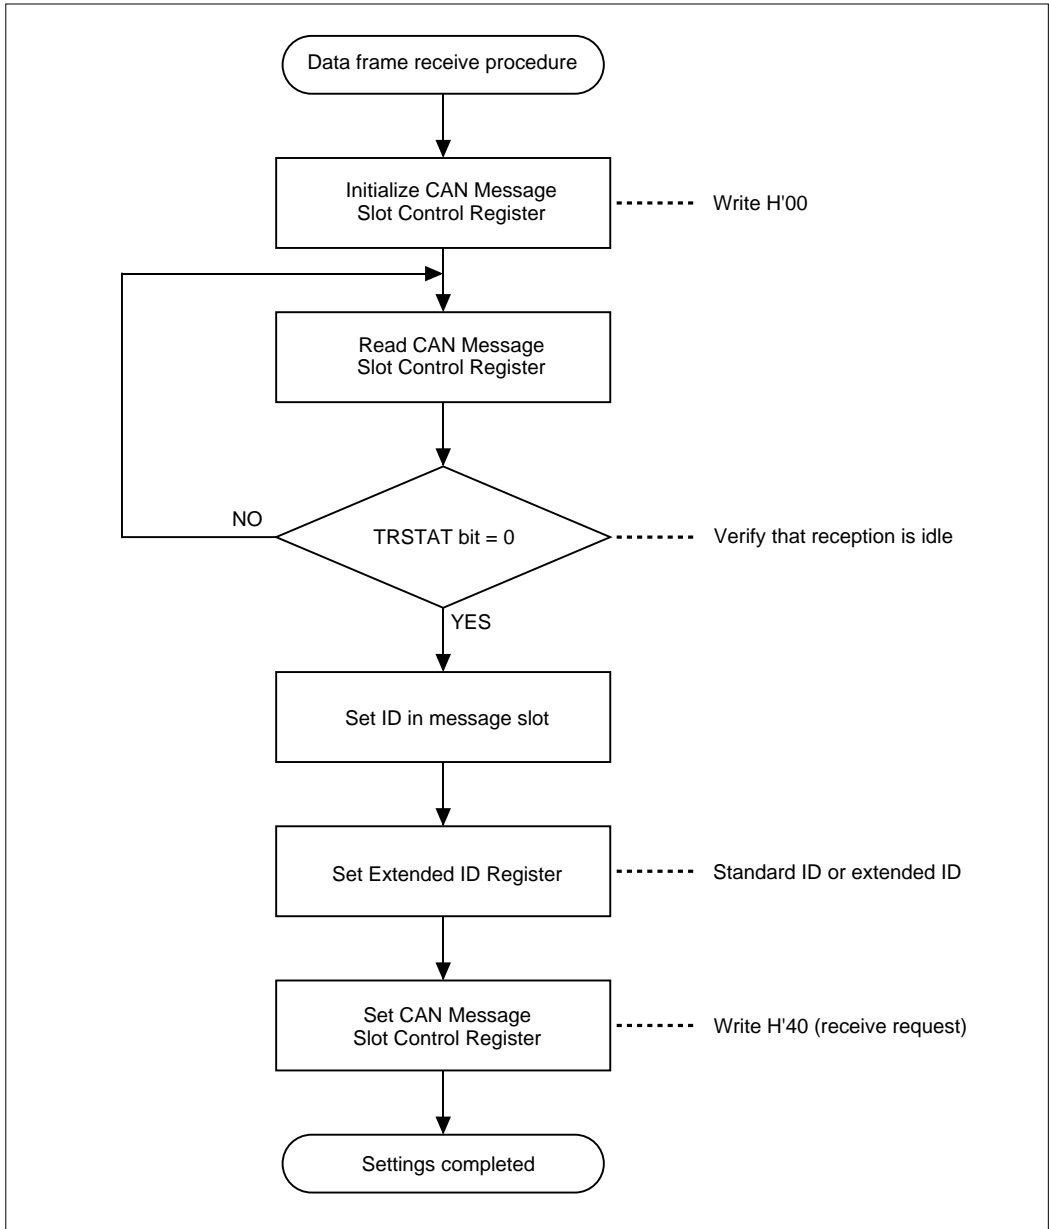

Figure 13.6.1 Data Frame Receive Procedure

13.6.2 Data Frame Receive Operation

The following describes data frame receive operation. The operations described below are automatically performed in hardware.

(1) Acceptance filtering

When the CAN module finished receiving data, it starts searching for the slot that satisfies conditions for receiving the received message sequentially from slot 0 (up to slot 15). The following shows receive conditions for slots that have been set for data frame reception.

[Conditions]

- The receive frame is a data frame.
- The receive ID and the slot ID are identical, assuming the ID Mask Register bits set to 0 are "Don't care bits."
- The standard and extended frame types are the same.

Note: • In BasicCAN mode, slots 14 and 15 while being set for data frame reception can also receive remote frames.

(2) When receive conditions are met

When receive conditions in (1) above are met, the CAN module sets the CAN Message Slot Control Register's TRSTAT (Transmit/Receive Status) and TRFIN (Transmit/Receive Finished) bits to 1 while at the same time writing the received data to the message slot. If the TRFIN (Transmit/Receive Finished) bit is already 1, the CAN module also sets the ML (Message Lost) bit to 1, indicating that the message slot has been overwritten. The message slot has its ID field and DLC field both overwritten and an indeterminate value written in its unused area (e.g., extended ID field for standard frame reception and an unused data field).

Furthermore, a time stamp count value at the time the message was received is written to the CAN Message Slot Time Stamp (C0MSLnTSP) along with the received data. When the CAN module finished writing to the message slot, it sets the CAN Slot Interrupt Status bit to 1. If the interrupt for the slot has been enabled, an interrupt request is generated, and the slot goes to a wait state for the next reception.

(3) When receive conditions are not met

The received frame is discarded, and the CAN module goes to the next transmit/receive operation without writing to the message slot.

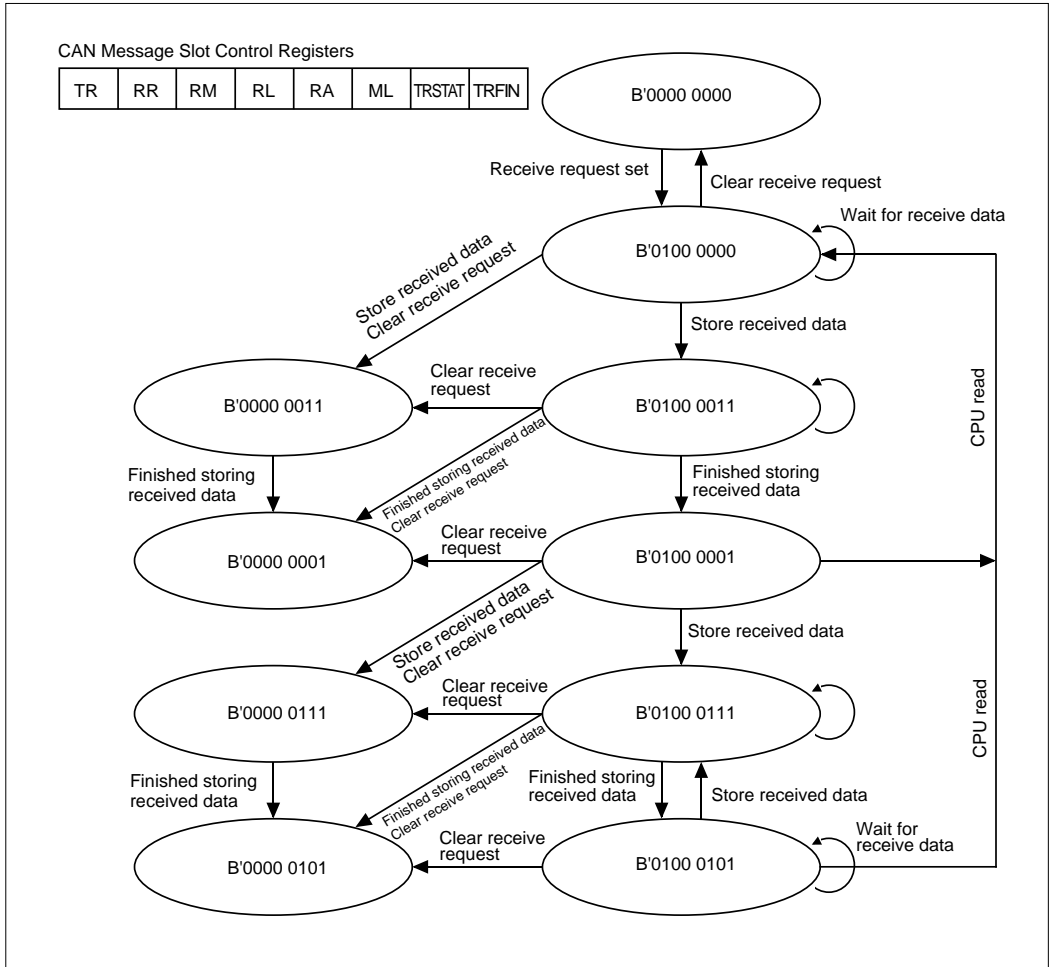

Figure 13.6.2 Operation of the CAN Message Slot Control Register when Receiving Data Frames

13.6.3 Reading Out Received Data Frames

The following describes the procedure for reading out received data frames from the slot.

(1) Clearing the TRFIN (Transmit/Receive Finished) bit

Write H'4E, H'40 or H'00 to the CAN Message Control Register (COMSLnCNT) to clear the TRFIN bit to 0. After this write, the slot operates as follows:

Value written to COMSLnCNT	Slot operation after write
H'4E	Operates as a data frame receive slot. Overwrite can be verified by ML bit.
H'40	Operates as a data frame receive slot. Overwrite cannot be verified by ML bit.
H'00	The slot stops transmit/receive operation.

- Notes:
- If message-lost check by the ML bit is needed, write H'4E to the COMSLnCNT register as you clear the TRFIN bit.
 - If you clear the TRFIN bit by writing H'4E, H'40 or H'00, it is possible that new data will be stored in the slot while still reading a message from the slot.

(2) Reading out from the message slot

Read out a message from the message slot.

(3) Checking the TRFIN (Transmit/Receive Finished) bit

Read the CAN Message Control Register to check the TRFIN (Transmit/Receive Finished) bit.

1) When TRFIN (Transmit/Receive Finished) bit = 1

It means that new data was stored in the slot while still reading out from the slot in (2). In this case, the data read out in (2) may contain an indeterminate value. Therefore, reexecute beginning with clearing of the TRFIN (Transmit/Receive Finished) bit in (1).

2) When TRFIN (Transmit/Receive Finished) bit = 0

It means that the CAN module finished reading out from the slot normally.

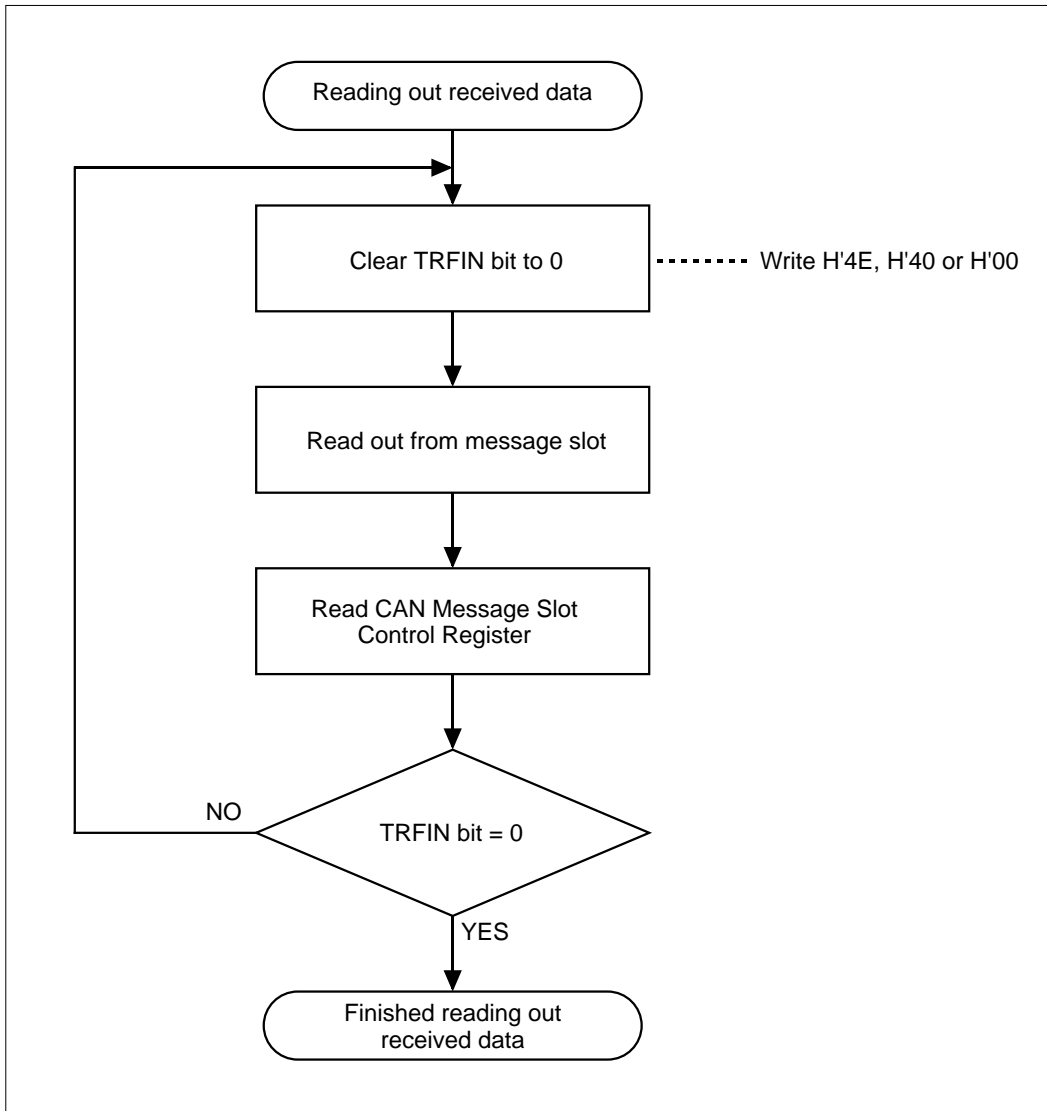

Figure 13.6.3 Procedure for Reading Out Received Data

13.7 Transmitting Remote Frames

13.7.1 Remote Frame Transmit Procedure

The following describes the procedure for transmitting remote frames.

(1) Initializing the CAN Message Slot Control Register

Initialize the CAN Message Slot Control Register for the slot in which you want to transmit by writing H'00 to the register.

(2) Confirming that transmission is idle

Read the CAN Message Slot Control Register after being initialized and check the TRSTAT (Transmit/Receive Status) bit to see that transmission has stopped and remains idle. If this bit = 1, it means that the CAN module is accessing the message slot, so you need to wait until the bit is cleared.

(3) Setting transmit ID

Set the ID to be transmitted in the message slot.

(4) Setting the Extended ID Register

Set the corresponding bit of the Extended ID Register to 0 when you want to transmit the frame as a standard frame or 1 when you want to transmit the frame as an extended frame.

(5) Setting the CAN Message Slot Control Register

Write H'A0 to the CAN Message Slot Control Register to set the TR (Transmit Request) and RM (Remote) bits to 1.

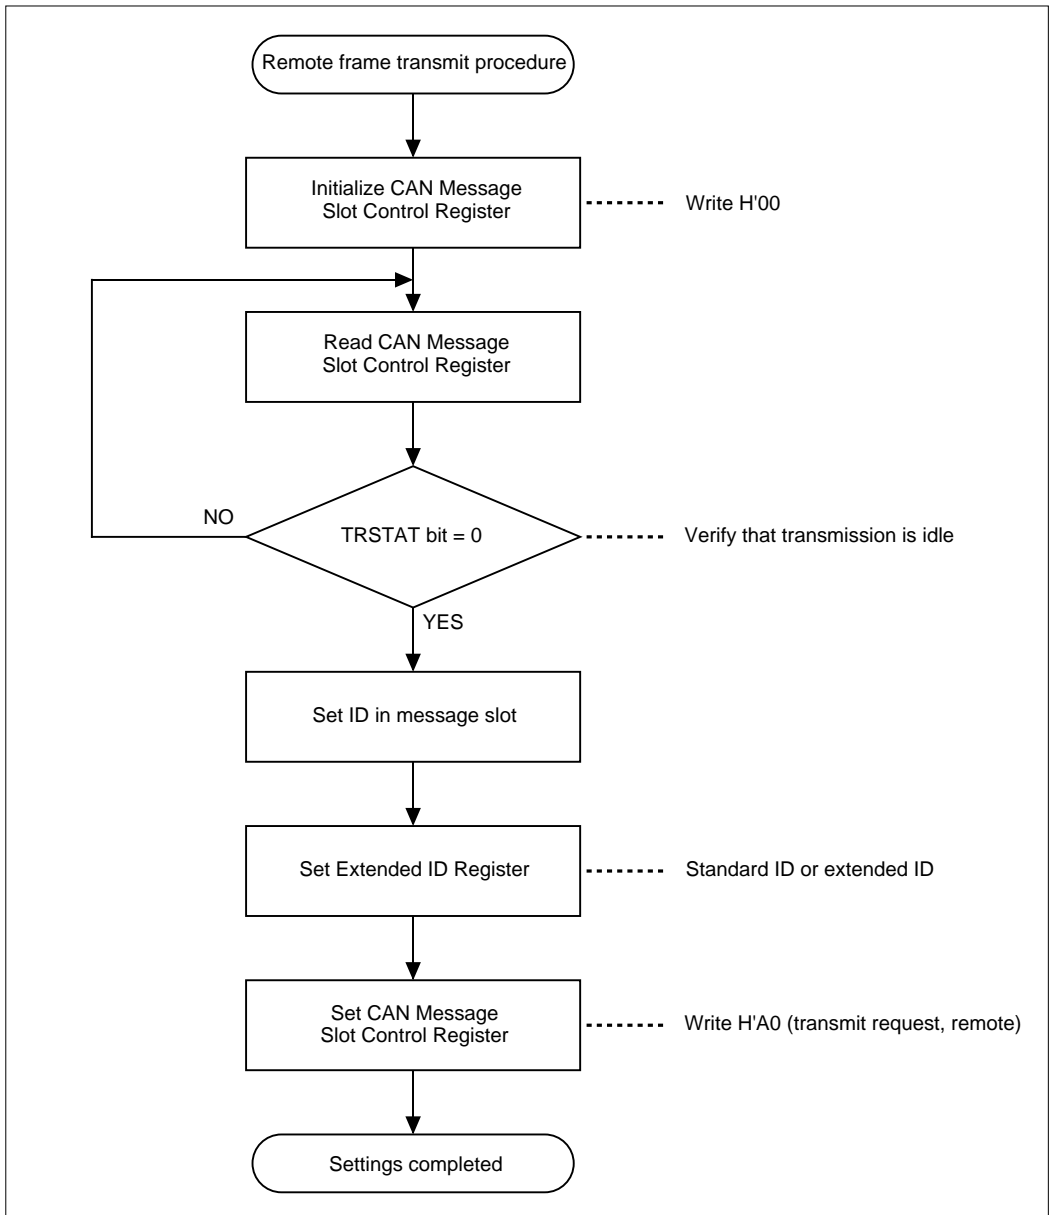

Figure 13.7.1 Remote Frame Transmit Procedure

13.7.2 Remote Frame Transmit Operation

The following describes remote frame transmit operation. The operations described below are automatically performed in hardware.

(1) Setting the RA (Remote Active) bit

At the same time H'A0 (Transmit Request, Remote) is written to the CAN Message Slot Control Register, the RA (Remote Active) bit is set to 1, indicating that the corresponding slot is to handle remote frames.

(2) Selecting a transmit frame

The CAN module checks slots which have transmit requests (including data frame transmit slots) every intermission to determine the frame to transmit. If there are multiple transmit slots, frames are transmitted in order of slot numbers beginning with the smallest.

(3) Transmitting a remote frame

After determining the transmit slot, the CAN module sets the corresponding CAN Message Slot Control Register's TRSTAT (Transmit/Receive Status) bit to 1, thereby starting transmission.

(4) If the CAN module lost bus arbitration or a CAN bus error occurs

If the CAN module lost bus arbitration or a CAN bus error occurs while transmitting, the CAN module clears the CAN Message Slot Control Register's TRSTAT (Transmit/Receive Status) bit to 0. If the CAN module requested a transmit abort, the transmit abort is accepted and writing to the message slot is enabled.

(5) Completion of remote frame transmission

When remote frame transmission is completed, a time stamp count value at the time transmission was completed is written to the CAN Message Slot Time Stamp (COMSLnTSP) and the CAN Message Slot Control Register's RA (Remote Active) bit is cleared to 0. Also, the CAN Slot Interrupt Status bit is set to 1 by completion of transmission, but the CAN Message Slot Control Register's TRFIN (Transmit/Receive Finished) bit is not set to 1. If the CAN slot interrupt has been enabled, an interrupt request is generated upon completion of transmission.

(6) Receiving a data frame

When remote frame transmission is completed, the slot automatically starts functioning as a data frame receive slot.

(7) Acceptance filtering

When the CAN module finished receiving data, it starts searching for the slot that satisfies conditions for receiving the received message sequentially from slot 0 (up to slot 15).

The following shows receive conditions for slots that have been set for data frame reception.

[Conditions]

- The receive frame is a data frame.
- The receive ID and the slot ID are identical, assuming the ID Mask Register bits set to 0 are "Don't care bit."
- The standard and extended frame types are the same.

Note: • In BasicCAN mode, slots 14 and 15 cannot be used as transmit slots.

(8) When receive conditions are met

When receive conditions in (7) above are met, the CAN module sets the CAN Message Slot Control Register's TRSTAT (Transmit/Receive Status) and TRFIN (Transmit/Receive Finished) bits to 1 while at the same time writing the received data to the message slot. If the TRFIN (Transmit/Receive Finished) bit is already 1, the CAN module also sets the ML (Message Lost) bit to 1, indicating that the message slot has been overwritten. The message slot has its ID field and DLC field both overwritten and an indeterminate value written in its unused area (e.g., extended ID field for standard frame reception and an unused data field).

Furthermore, a time stamp count value at the time the message was received is written to the CAN Message Slot Time Stamp (COMSLnTSP) along with the received data. When the CAN module finished writing to the message slot, it sets the CAN Slot Interrupt Status bit to 1. If the interrupt for the slot has been enabled, an interrupt request is generated, and the slot goes to a wait state for the next reception.

Note: • If the CAN module received a data frame before transmitting a remote frame, it stores the data frame in the slot and does not transmit the data frame.

(9) When receive conditions are not met

The received frame is discarded, and the CAN module goes to the next transmit/receive operation without writing to the message slot.

13.7.3 Reading Out Received Data Frames when Set for Remote Frame Transmission

The following describes the procedure for reading out received data frames from the slot when it is set for remote frame transmission.

(1) Clearing the TRFIN (Transmit/Receive Finished) bit

Write H'AE or H'00 to the CAN Message Control Register (C0MSLnCNT) to clear the TRFIN bit to 0. After this write, the slot operates as follows:

Value written to C0MSLnCNT	Slot operation after write
H'AE	Operates as a data frame receive slot. Overwrite can be verified by ML bit.
H'00	The slot stops transmit/receive operation.

- Notes:
- If message-lost check by the ML bit is needed, write H'AE to the C0MSLnCNT register as you clear the TRFIN bit.
 - If you clear the TRFIN bit by writing H'AE or H'00, it is possible that new data will be stored in the slot while still reading a message from the slot.
 - The received data frame cannot be read out by writing H'A0 to the register. If you clear the TRFIN bit by writing H'A0, the slot performs remote frame transmit operation.

(2) Reading out from the message slot

Read out a message from the message slot.

(3) Checking the TRFIN (Transmit/Receive Finished) bit

Read the CAN Message Control Register to check the TRFIN (Transmit/Receive Finished) bit.

1) When TRFIN (Transmit/Receive Finished) bit = 1

It means that new data was stored in the slot while still reading out from the slot in (2). In this case, the data read out in (2) may contain an indeterminate value. Therefore, reexecute beginning with clearing of the TRFIN (Transmit/Receive Finished) bit in (1).

2) When TRFIN (Transmit/Receive Finished) bit = 0

It means that the CAN module finished reading out from the slot normally.

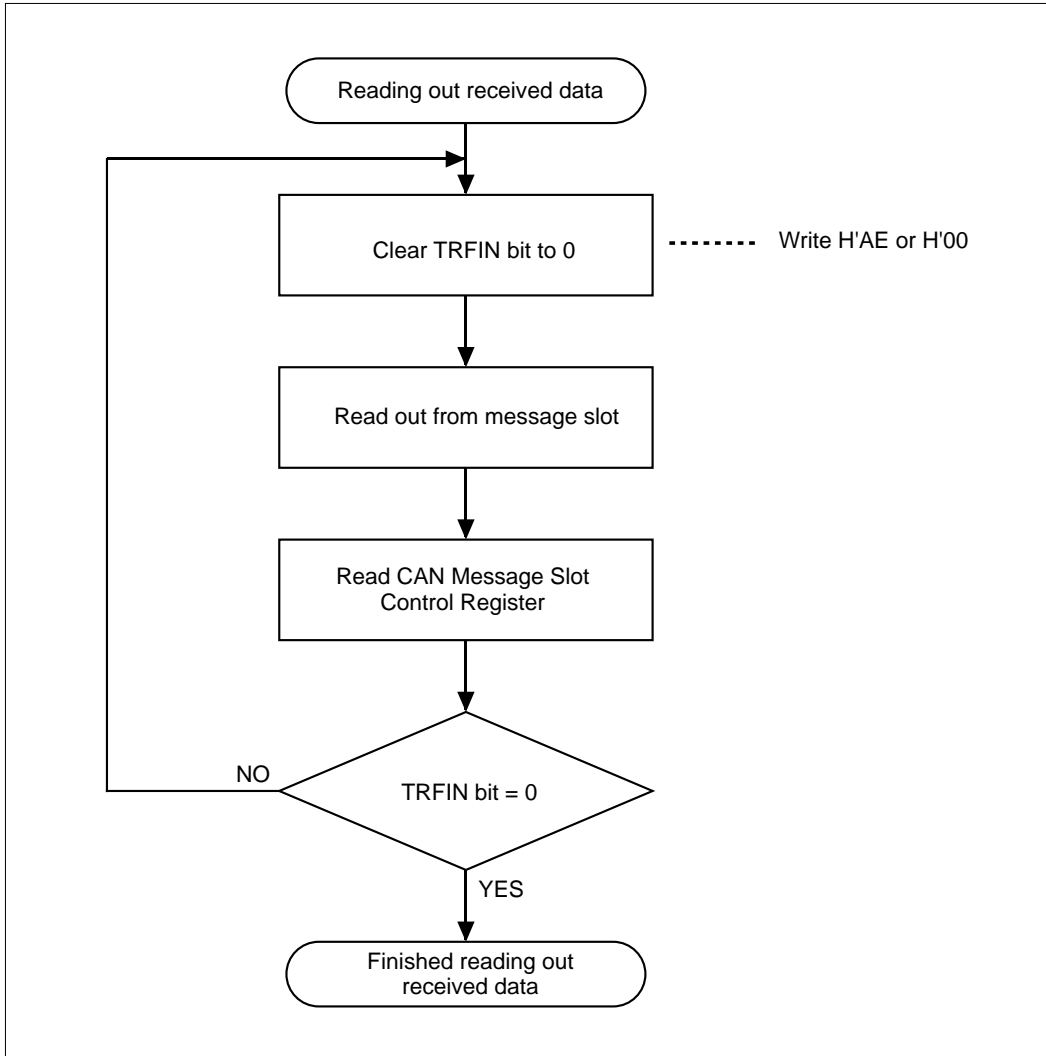

Figure 13.7.3 Procedure for Reading Out Received Data when Set for Remote Frame Transmission

13.8 Receiving Remote Frames

13.8.1 Remote Frame Receive Procedure

The following describes the procedure for receiving remote frames.

(1) Initializing the CAN Message Slot Control Register

Initialize the CAN Message Slot Control Register for the slot in which you want to receive by writing H'00 to the register.

(2) Confirming that reception is idle

Read the CAN Message Slot Control Register after being initialized and check the TRSTAT (Transmit/Receive Status) bit to see that reception has stopped and remains idle. If this bit = 1, it means that the CAN module is accessing the message slot, so you need to wait until the bit is cleared.

(3) Setting the receive ID

Set the ID you want to receive in the message slot.

(4) Setting the Extended ID Register

Set the corresponding bit of the Extended ID Register to 0 when you want to receive a standard frame or 1 when you want to receive an extended frame.

(5) Setting the CAN Message Slot Control Register

- 1) When automatic response (data frame transmission) for remote frame reception is desired
Write H'60 to the CAN Message Slot Control Register to set the RR (Receive Request) and RM (Remote) bits to 1.
- 2) When automatic response (data frame transmission) for remote frame reception is not needed
Write H'70 to the CAN Message Slot Control Register to set the RR (Receive Request), RM (Remote), and RL (Automatic Response Inhibit) bits to 1.

Note: • In BasicCAN mode, slots 14 and 15, although capable of receiving remote frames, cannot automatically respond to remote frame reception.

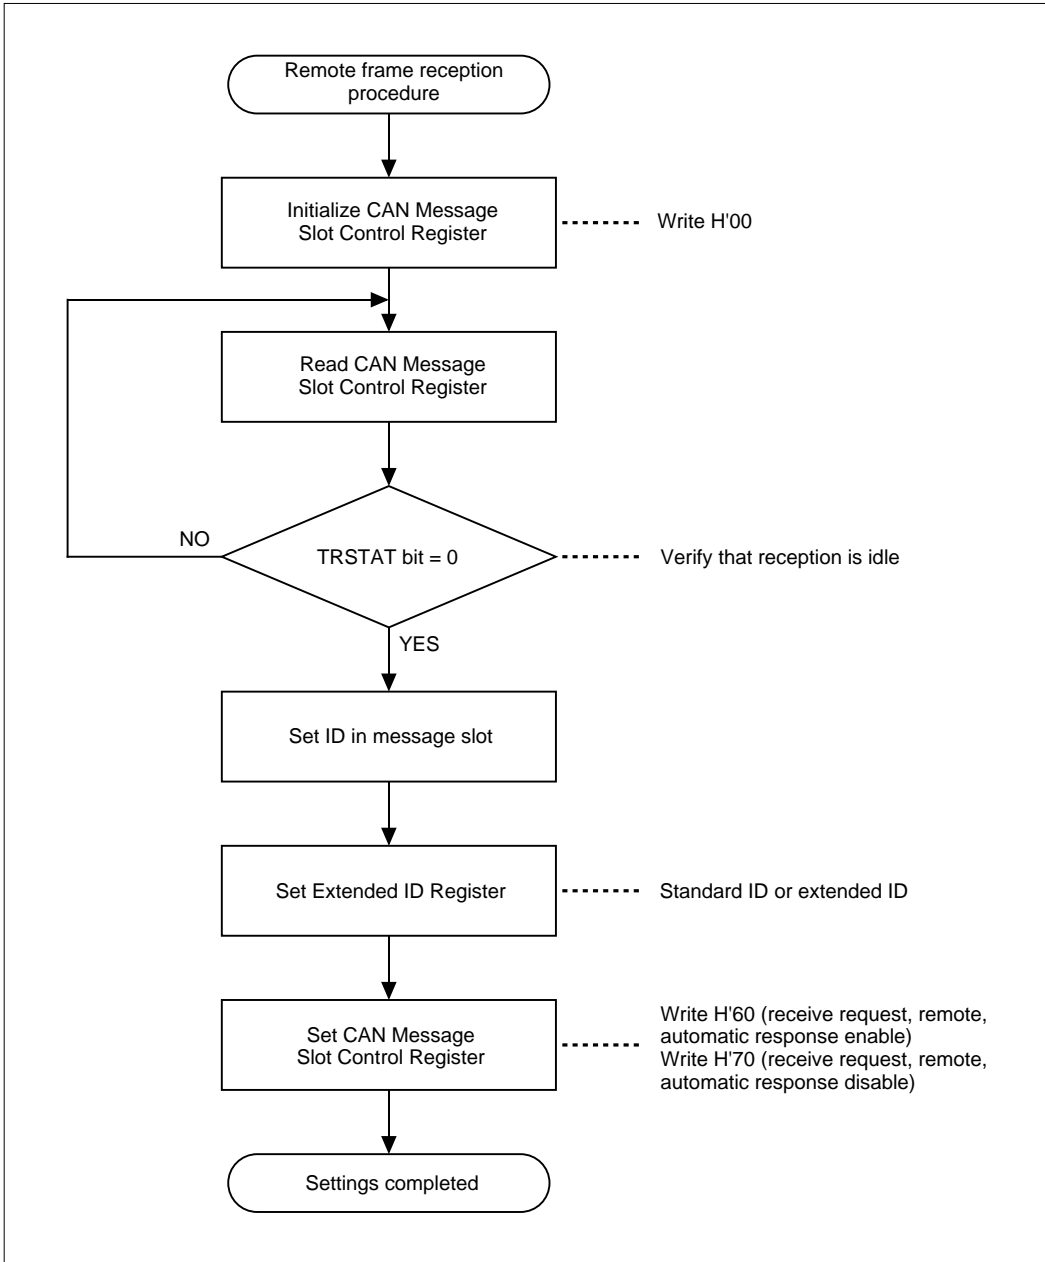

Figure 13.8.1 Remote Frame Receive Procedure

13.8.2 Remote Frame Receive Operation

The following describes remote frame receive operation. The operations described below are automatically performed in hardware.

(1) Setting the RA (Remote Active) bit

When H'60 (Receive Request, Remote) or H'70 (Receive Request, Remote, Automatic Response Disable) is written to the CAN Message Slot Control Register, the RA (Remote Active) bit is set to 1, indicating that the corresponding slot is to handle remote frames.

(2) Acceptance filtering

When the CAN module finished receiving data, it starts searching for the slot that satisfies conditions for receiving the received message sequentially from slot 0 (up to slot 15). The following shows receive conditions for slots that have been set for data frame reception.

[Conditions]

- The receive frame is a remote frame.
- The receive ID and the slot ID are identical, assuming the ID Mask Register bits set to 0 are "Don't care bit."
- The standard and extended frame types are the same.

(3) When receive conditions are met

When receive conditions in (2) above are met, the CAN module sets the CAN Message Slot Control Register's TRSTAT (Transmit/Receive Status) and TRFIN (Transmit/Receive Finished) bits to 1 while at the same time writing the received data to the message slot. Furthermore, a time stamp count value at the time the message was received is written to the CAN Message Slot Time Stamp (COMSLnTSP) along with the received data. When the CAN module finished writing to the message slot, it sets the CAN Slot Interrupt Status bit to 1. If the interrupt for the slot has been enabled, an interrupt request is generated.

- Notes:
- The ID field and DLC value are written to the message slot.
 - When receiving standard format frames, an indeterminate value is written to the extended ID area.
 - The data field is not accessed for write.
 - The RA and TRFIN bits are cleared to 0 after writing the remote frame received data.

(4) When receive conditions are not met

The received frame is discarded, and the CAN module waits for the next receive frame. No data is written to the message slot.

(5) Operation after receiving a remote frame

The operation performed after receiving a remote frame differs depending on how automatic response is set.

1) When automatic response is disabled

The slot which finished receiving goes to an inactive state and remains inactive (neither transmit nor receive) until it is newly set in software.

2) When automatic response is enabled

After receiving a remote frame, the slot automatically changes to a data frame transmit slot and performs the transmit operation described below. In this case, the transmitted data conforms to the ID and DLC of the received remote frame.

- Selecting a transmit frame

The CAN module checks slots which have transmit requests (including remote frame transmit slots) every intermission to determine the frame to transmit. If there are multiple transmit slots, frames are transmitted in order of slot numbers beginning with the smallest.

- Transmitting a data frame

After determining the transmit slot, the CAN module sets the corresponding CAN Message Slot Control Register's TRSTAT (Transmit/Receive Status) bit to 1, thereby starting transmission.

- If the CAN module lost bus arbitration or a CAN bus error occurs

If the CAN module lost bus arbitration or a CAN bus error occurs while transmitting, the CAN module clears the CAN Message Slot Control Register's TRSTAT (Transmit/Receive Status) bit to 0. If the CAN module requested a transmit abort, the transmit abort is accepted and writing to the message slot is enabled.

- Completion of data frame transmission

When data frame transmission is completed, the CAN Message Slot Control Register's TRFIN (Transmit/Receive Finished) bit and the CAN Slot Interrupt Status Register are set to 1. Also, a time stamp count value at the time transmission was completed is written to the CAN Message Slot Time Stamp (COMSLnTSP), and the transmit operation is thereby completed.

If the CAN slot interrupt has been enabled, an interrupt request is generated at completion of transmit operation. The slot which has had transmission completed goes to an inactive state and remains inactive (neither transmit nor receive) until it is newly set in software.

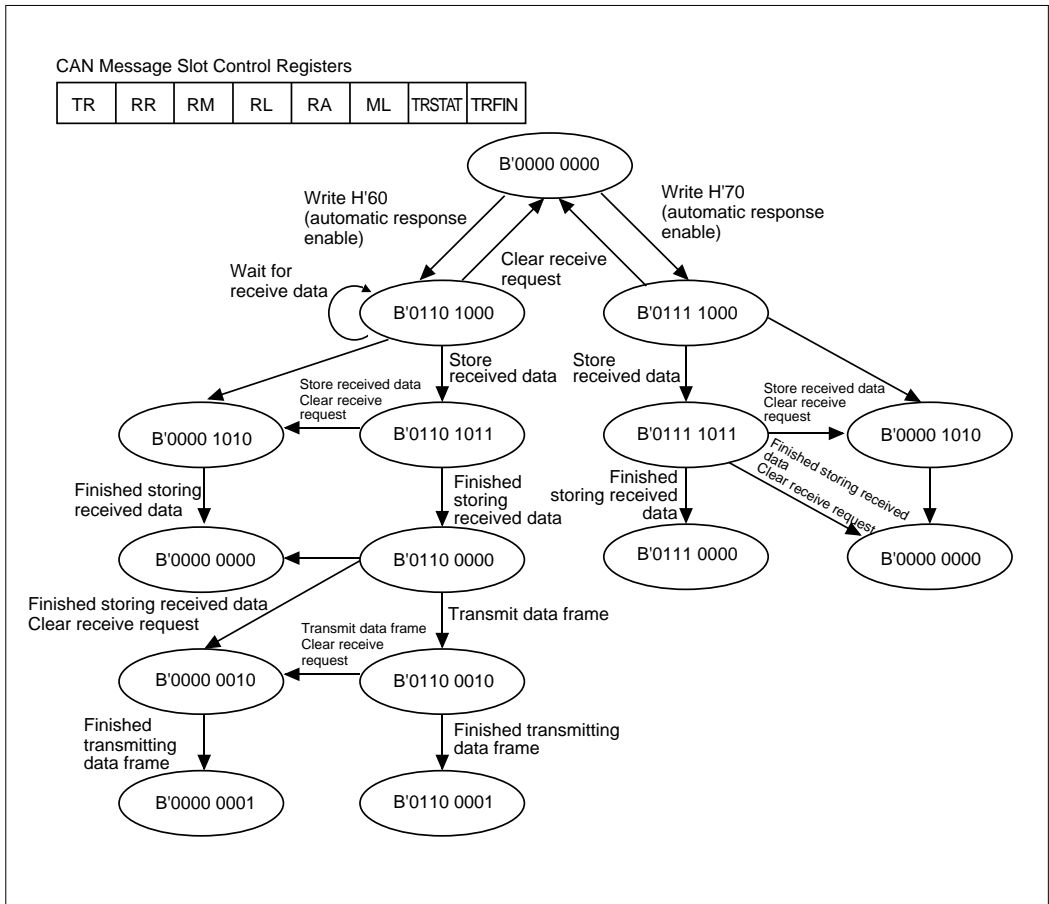

Figure 13.8.2 Operation of the CAN Message Slot Control Register when Receiving Remote Frames

CHAPTER 14

REAL-TIME DEBUGGER (RTD)

- 14.1 Outline of the Real-Time Debugger (RTD)
- 14.2 Pin Function of the RTD
- 14.3 Functional Description of the RTD
- 14.4 Typical Connection with the Host

14.1 Outline of the Real-Time Debugger (RTD)

The Real-Time Debugger (RTD) is a serial I/O through which to read or write to the internal RAM's entire area using commands from outside the microprocessor. Because data transfers between the RTD and internal RAM are performed using an internal dedicated bus independently of the M32R CPU, operation can be controlled without having to stop the M32R CPU.

Table 14.1.1 Outline of the Real-Time Debugger (RTD)

Item	Content
Transfer method	Clock-synchronized serial I/O
Generation of transfer clock	Generated by external host
RAM access area	Entire area of internal RAM (controlled by A16-A29)
Transmit/receive data length	32 bits (fixed)
Bit transfer sequence	LSB first
Maximum transfer rate	2 Mbits/second
Input/output pins	4 lines (RTDCLK, RTDACK, RTDCLK, RTDCLK)
Number of commands	Following five functions <ul style="list-style-type: none"> • Monitors continuously • Outputs real-time RAM contents • Forcibly rewrites RAM contents (with verify) • Recovers from runaway • Requests RTD interrupt

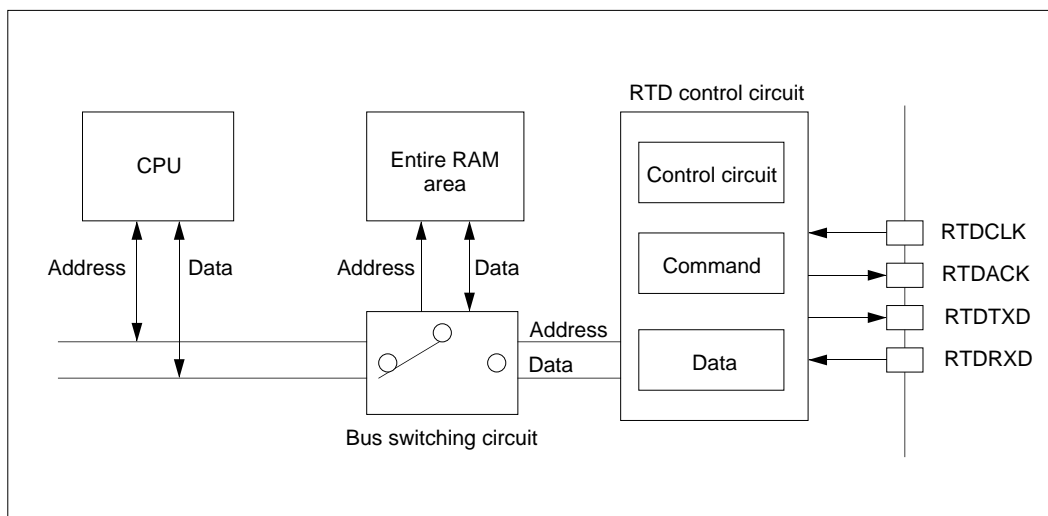

Figure 14.1.1 Block Diagram of the Real-Time Debugger (RTD)

14.2 Pin Function of the RTD

Pin functions of the RTD are shown below.

Table 14.2.1 Pin Function of the RTD

Pin Name	Type	Function
RTDTXD	Output	RTD serial data output
RTDRXD	Input	RTD serial data input
RTDACK	Output	<p>Outputs a low-level pulse synchronously with the beginning clock edge of the output data word. The width of the low-level pulse thus output indicates the type of instruction/data that the RTD received.</p> <p>1 clock period : VER (continuous monitor) command</p> <p>1 clock period : VEI (RTD interrupt request) command</p> <p>2 clock periods : RDR (real-time RAM content output) command</p> <p>3 clock periods : WRR (RAM content forcible rewrite) command or the data to rewrite</p> <p>4 clock periods or more : RCV (recover from runaway) command</p>
RTDCLK	Input	RTD transfer clock input

14.3 Functional Description of the RTD

14.3.1 Outline of RTD Operation

Operation of the RTD is specified by a command entered from devices external to the chip. A command is specified in bits 16-19 (Note 1) of the RTD receive data.

Table 14.3.1 RTD Commands

RTD Receive Data				Command Mnemonic	RTD Function
b19	b18	b17	b16		
0	0	0	0	VER (VERify)	Continuous monitor
0	1	0	0		
0	1	0	1		
0	1	1	0	VEI (VERify Interrupt request)	RTD interrupt request
0	0	1	0	RDR (ReaD RAM)	Real-time RAM content output
0	0	1	1	WRR (WRite RAM)	RAM content forcibly rewrite (with verify)
1	1	1	1	RCV (ReCoVer)	Recover from runaway (Note 2, Note 3)
0	0	0	1	System reserved (use inhibited)	

↑ (Note 1)

Note 1 : Bit 19 of RTD receive data is not actually stored in the command register and except for the RCV command, is handled as "Don't Care" bit. (Bits 16-18 are effective for the command specified.)

Note 2 : The RCV command must always be transmitted twice in succession.

Note 3 : For the RCV command, all bits, not just bits 16-19, (i.e., bits 0-15 and bits 20-31) must be set to 1.

14.3.2 Operation of RDR (Real-time RAM Content Output)

When the RDR (real-time RAM content output) command is issued, the RTD is made possible to transfer the contents of the internal RAM to external devices without causing the CPU's internal bus to stop. Because the RTD reads data from the internal RAM while no transfers are being performed between the CPU and internal RAM, the CPU in no extra load. The address to be read from the internal RAM can only be specified on 32-bit word boundaries. (The two low-order address bits specified by a command are ignored.) Note also that data are read out in units of 32 bits as transferred from the internal RAM to an external device.

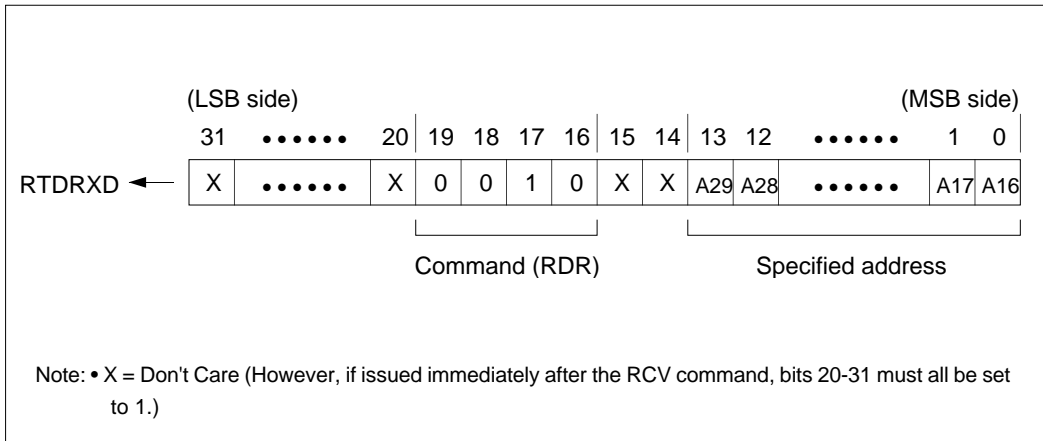

Figure 14.3.1 RDR Command Data Format

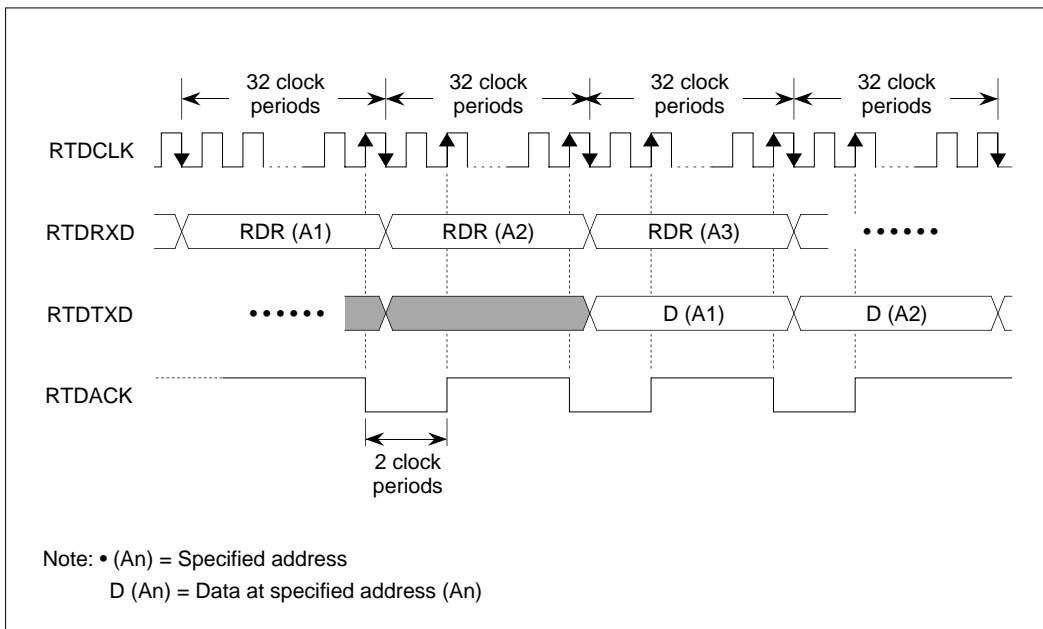

Figure 14.3.2 Operation of the RDR Command

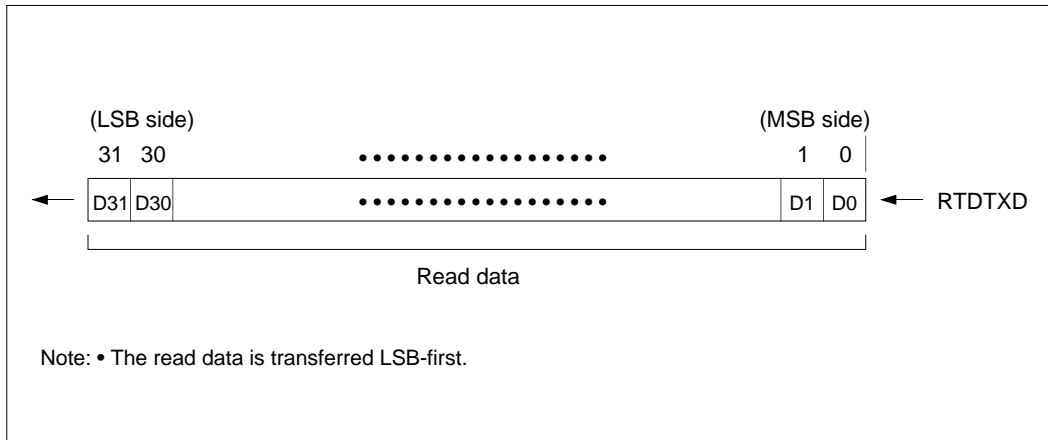

Figure 14.3.3 Read Data Transfer Format

14.3.3 Operation of WRR (RAM Content Forcible Rewrite)

When the WRR (RAM content forcible rewrite) command is issued, the RTD forcibly rewrites the contents of the internal RAM without causing the CPU's internal bus to stop. Because the RTD writes data to the internal RAM while no transfers are being performed between the CPU and internal RAM, the CPU incurs no extra load.

The address to be read from the internal RAM can only be specified on 32-bit word boundaries. (The two low-order address bits specified by a command are ignored.) Note also that data are written to the internal RAM in units of 32 bits.

The external host should transmit the command and address in the first frame and then the write data in the second frame. The timing at which the RTD writes to the internal RAM occurs in the third frame after receiving the write data.

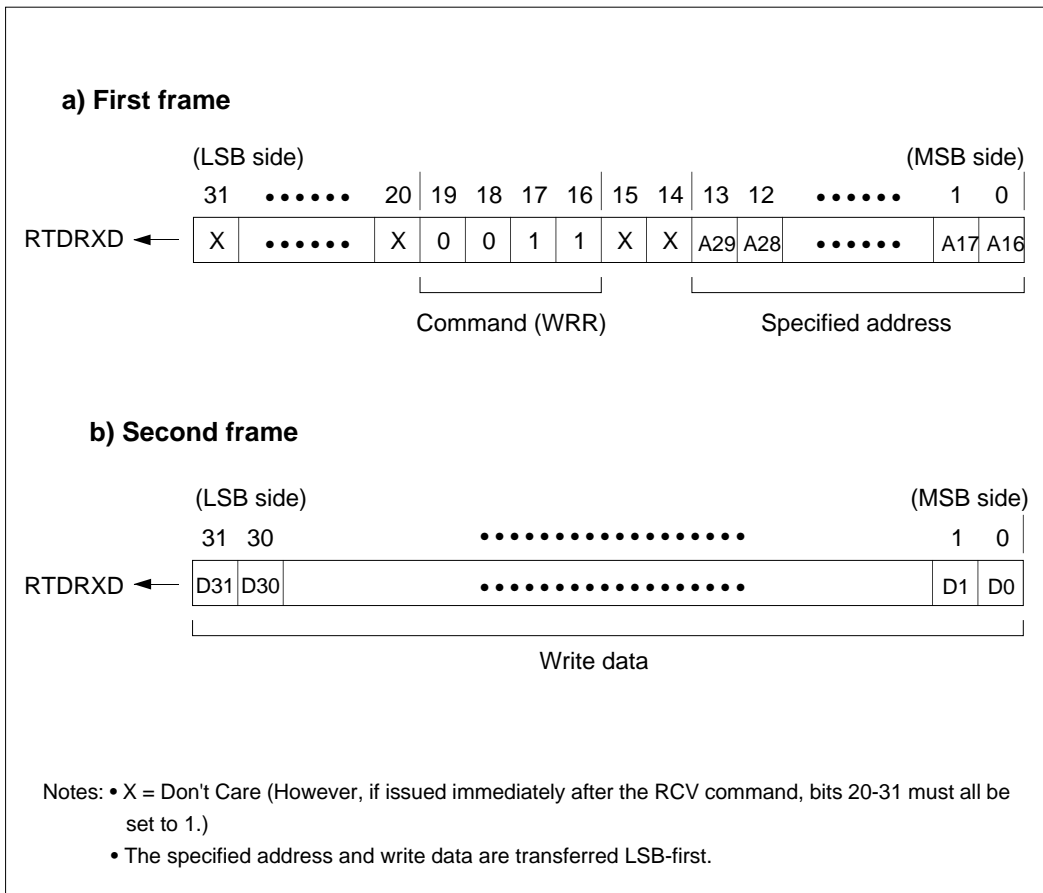

Figure 14.3.4 WRR Command Data Format

The RTD reads out data from the specified address before writing to the internal RAM and again reads out from the same address immediately after writing to the internal RAM (this helps to verify the data written to the internal RAM). The read data is output at the timing shown below.

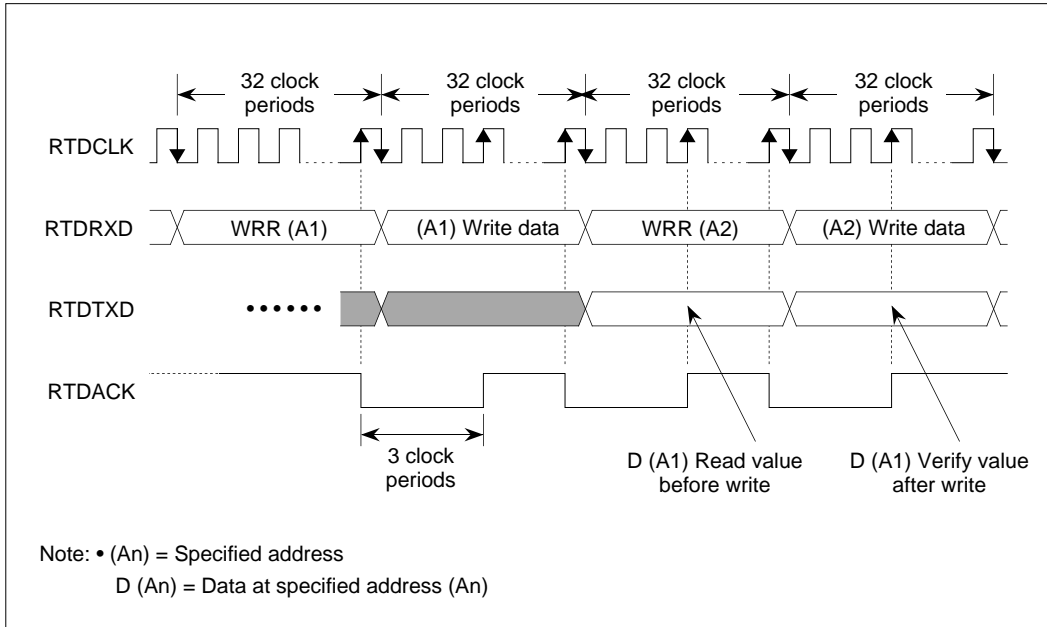

Figure 14.3.5 Operation of the WRR Command

14.3.4 Operation of VER (Continuous Monitor)

When the VER (continuous monitor) command is issued, the RTD outputs data from the address that has been accessed by the instruction (either read or write) immediately before receiving the VER command.

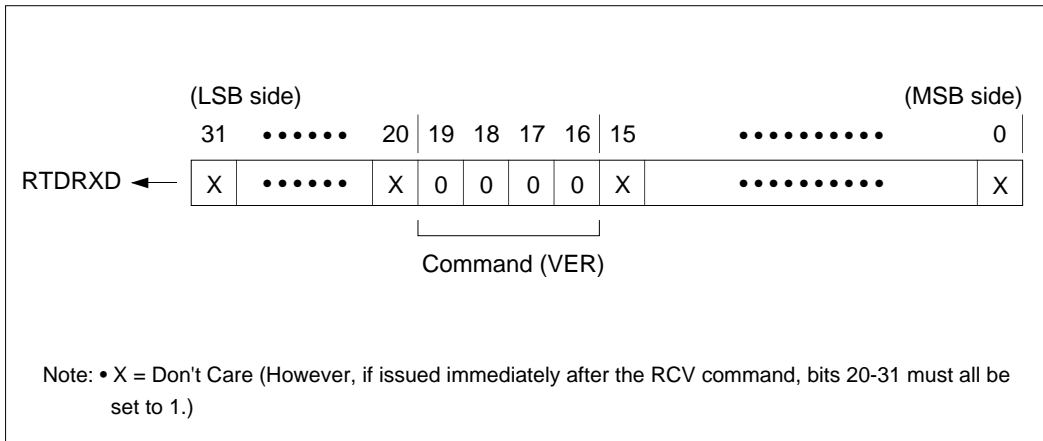

Figure 14.3.6 VER (Continuous Monitor) Command Data Format

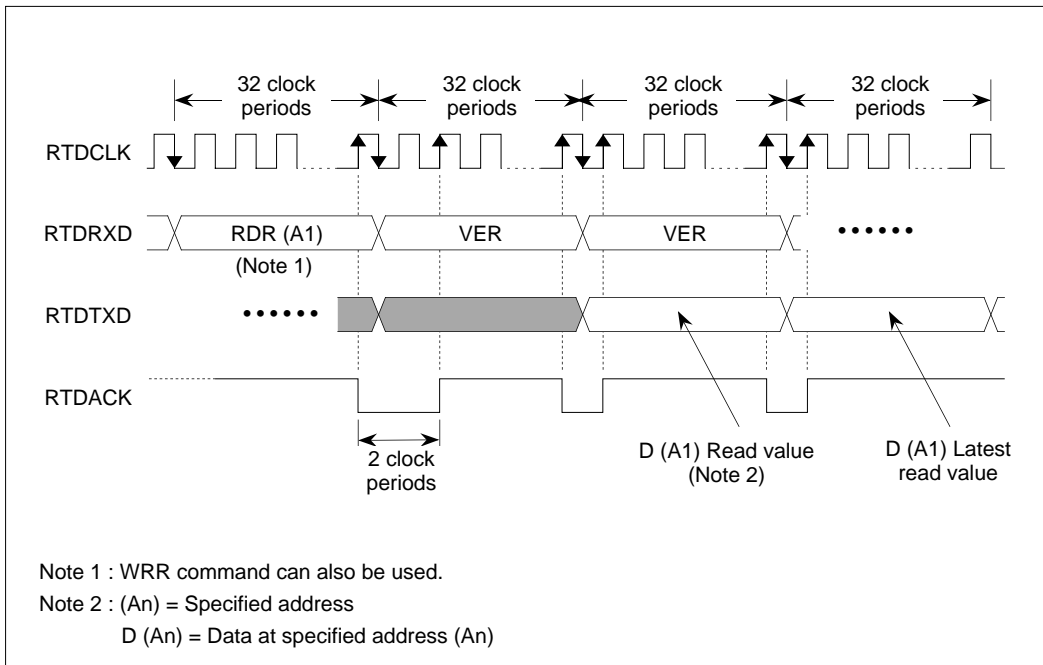

Figure 14.3.7 Operation of the VER (Continuous Monitor) Command

14.3.5 Operation of VEI (Interrupt Request)

When the VEI (interrupt request) command is issued, the RTD outputs data from the address that has been accessed by the instruction (either read or write) immediately before receiving the VEI command.

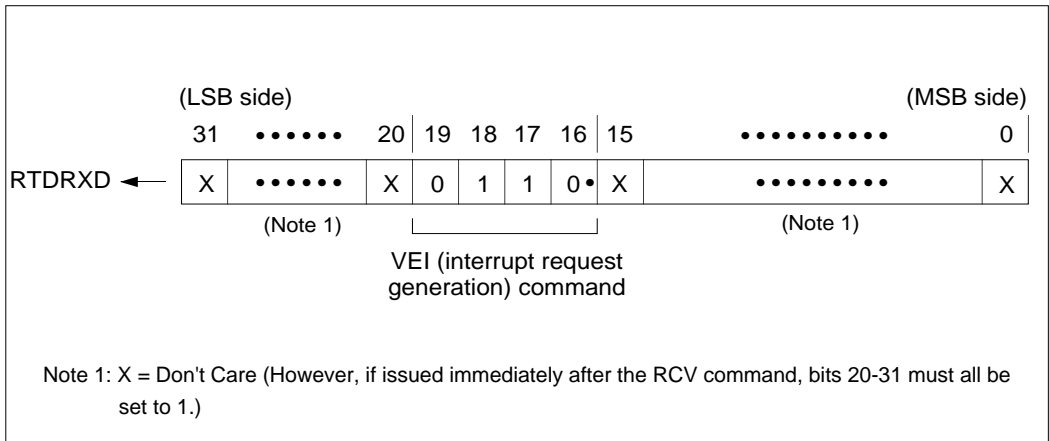

Figure 14.3.8 VEI (Interrupt Request) Command Data Format

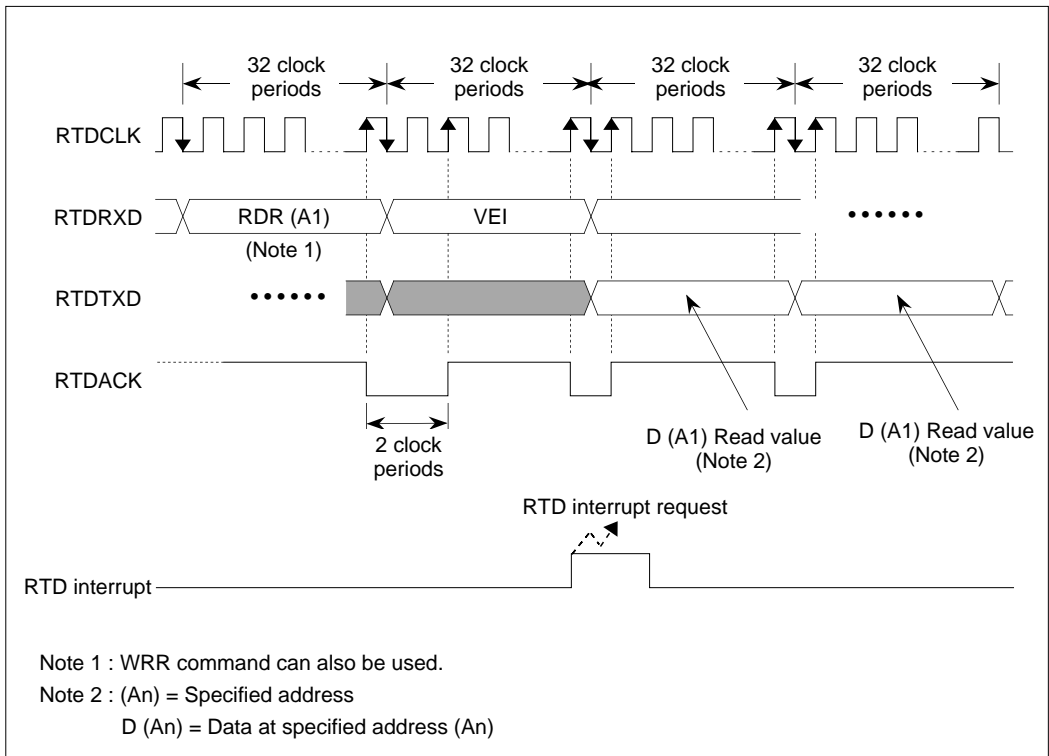

Figure 14.3.9 Operation of the VEI (Interrupt Request) Command

14.3.6 Operation of RCV (Recover from Runaway)

When the RTD runs out of control, the RCV (recover from runaway) command can be issued to forcibly recover from the runaway condition without having to reset the system. The RCV command must always be issued twice in succession. Also, any command issued subsequently after the RCV command must have its bits 20-31 all set to 1.

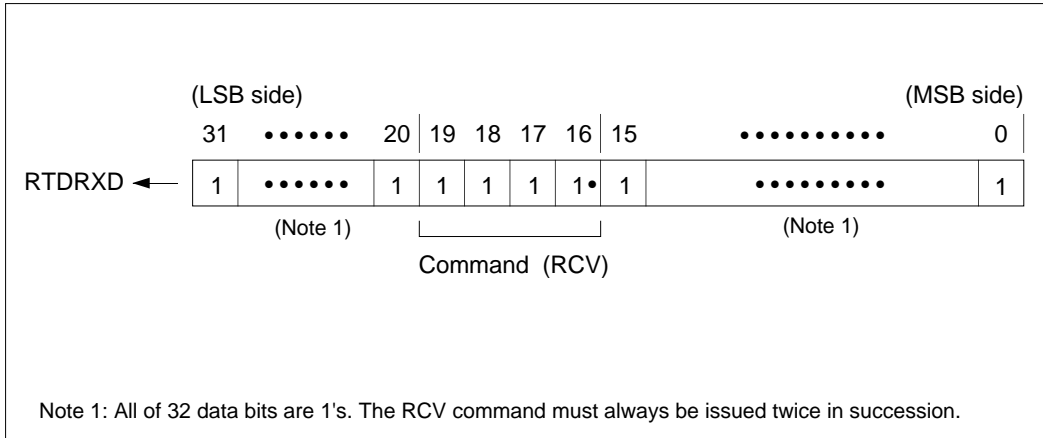

Figure 14.3.10 RCV Command Data Format

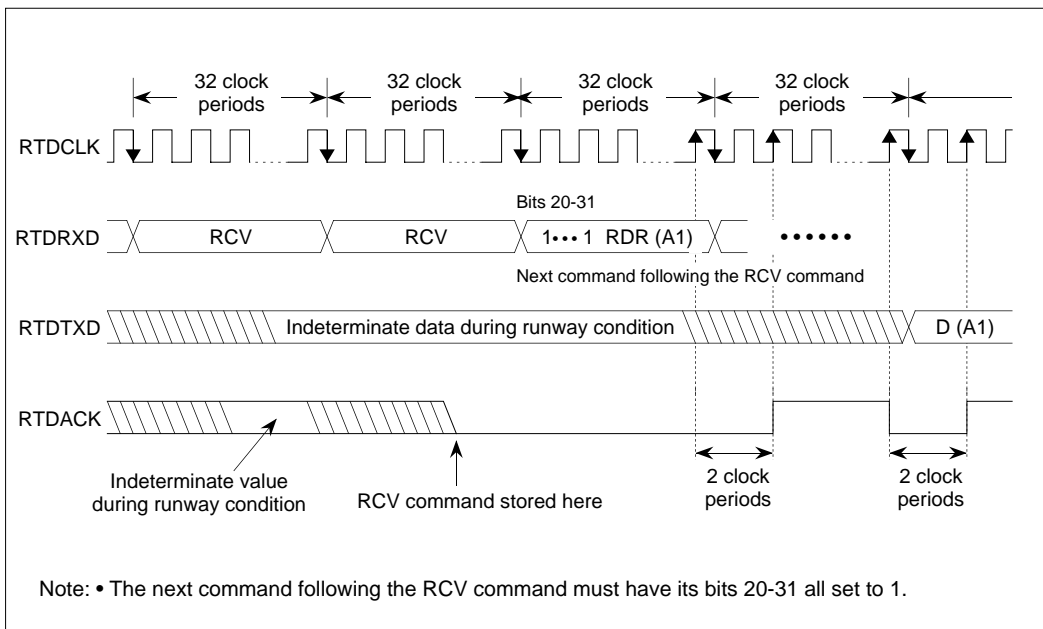

Figure 14.3.11 Operation of the RCV Command

14.3.7 Method to Set a Specified Address when Using the RTD

When using the Real-Time Debugger (RTD), you can set low-order 16-bit addresses of the internal RAM area. Because the internal RAM area is located in a 48 KB area ranging from H'0080 4000 to H'0080 FFFF, you can set low-order 16-bit addresses (H'4000 to H'FFFF) of that area. However, access to any locations other than the area where the RAM resides is inhibited. Note also that two least significant address bits, A31 and A30, are always 0's because data are read and written to the internal RAM in a fixed length of 32 bits.

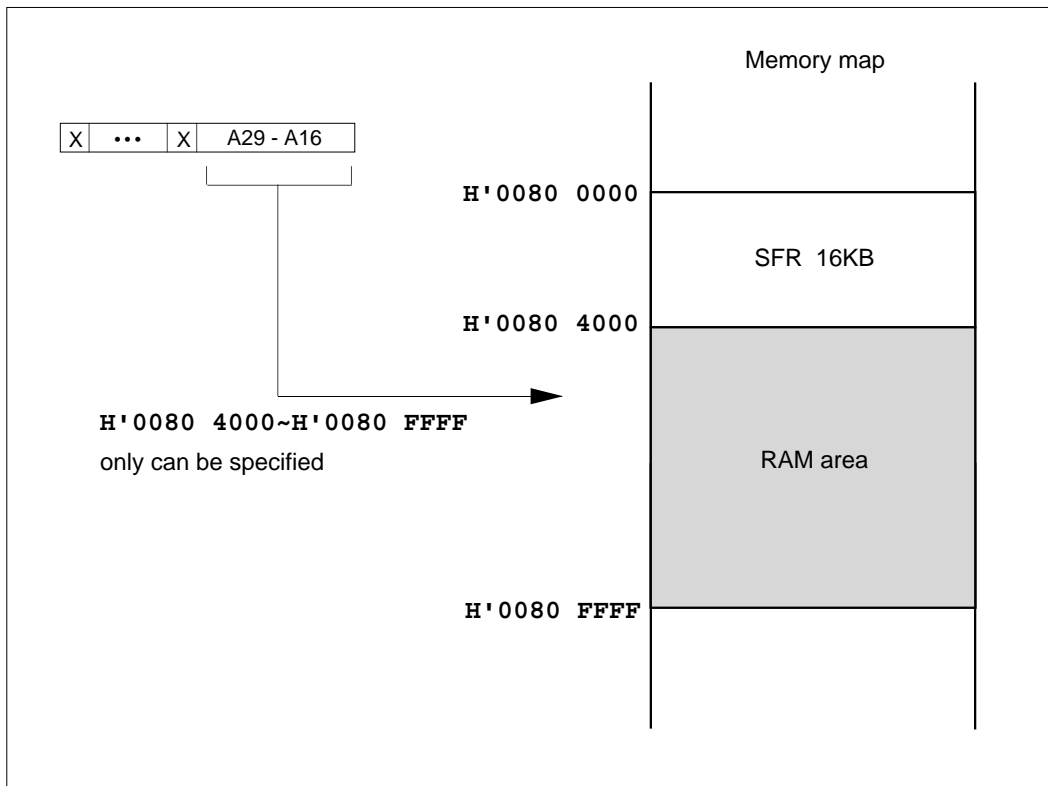

Figure 14.3.12 Method for Setting Addresses in Real-Time Debugger

14.3.8 Resetting the RTD

The RTD is reset by applying a system rest (i.e., by entering the $\overline{\text{RESET}}$ signal). The status of the RTD related output pins after a system reset are shown below.

Table 14.3.2 RTD Pin State after Releasing System from Reset

Pin Name	State
RTDACK	High-level output
RTDTXD	High-level output

The first command transfer to the RTD after it was reset is initiated by transferring data to the RTDRXD pin synchronously with falling edges of RTDCLK.

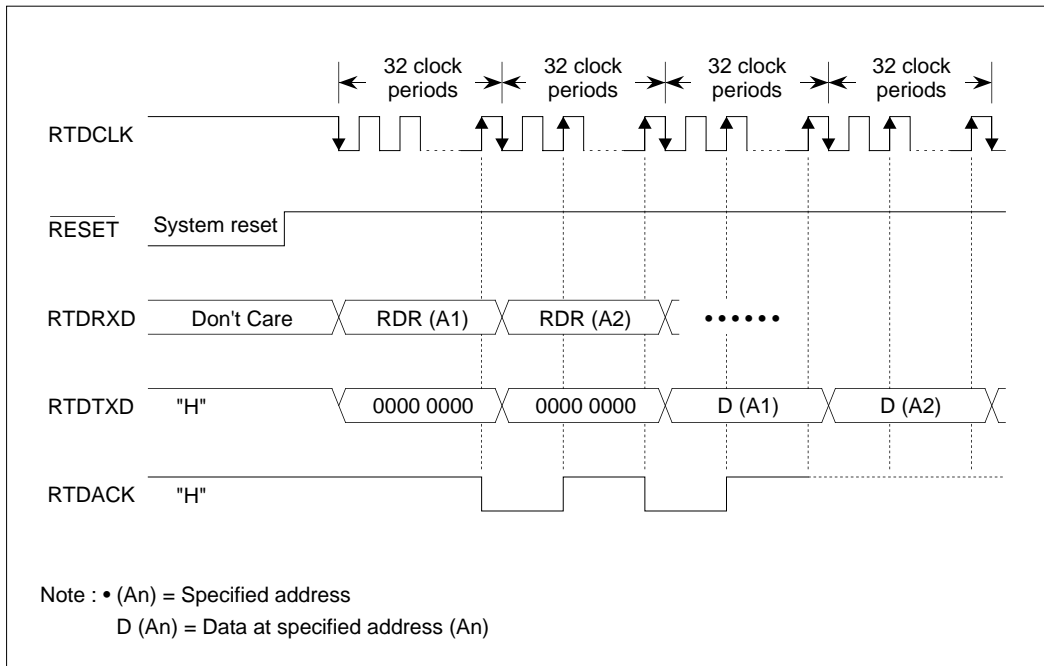

Figure 14.3.13 Command Transfer to the RTD after System Reset

14.4 Typical Connection with the Host

The host uses a serial synchronous interface to transfer data. The clock for synchronous is generated by the host. An example for connecting the RTD and host is shown below.

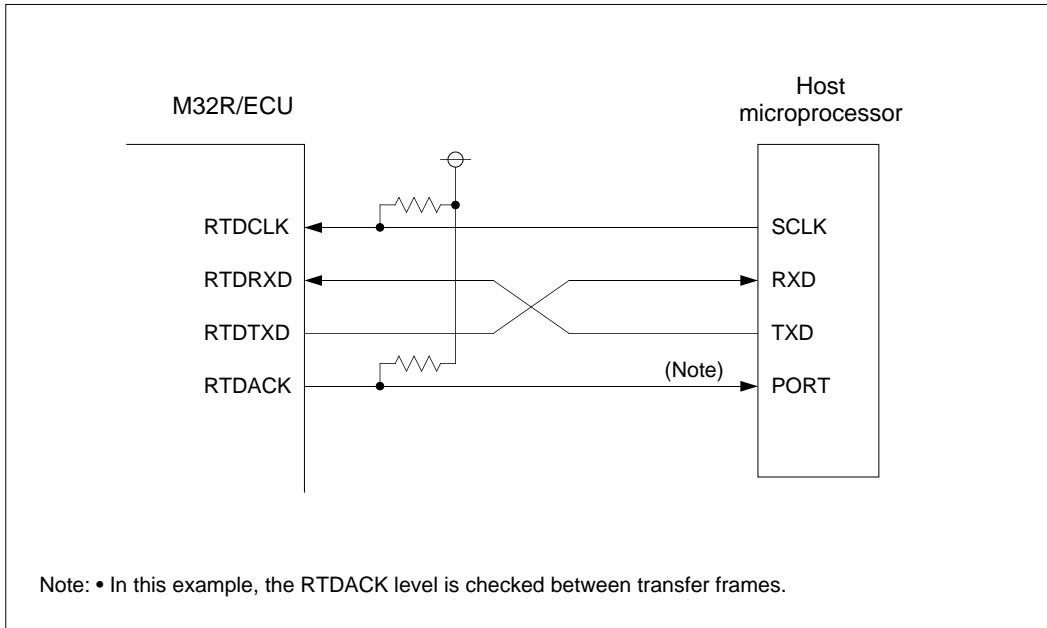

Figure 14.4.1 Connecting the RTD and Host

The RTD communication for a fixed length of 32 bits per frame generally is performed in four operations sending 8 bits at a time, because most serial interfaces transfer data in units of 8 bits. The RTDACK signal is used to verify that communication is performed normally.

After transmitting a command, the RTDACK signal is pulled low, making it possible to verify the communication status. When issuing the VER command, the RTDACK signal goes low for only one clock period. Therefore, after sending 32 bits in one frame, turn off RTDCLK output and check whether RTDACK is low. If RTDACK is low, you know that the RTD is communicating normally.

If you want to identify the type of transmitted command by the width of RTDACK, use the 32171's internal measurement timer (to count RTDCLK pulses while RTDACK is low) or create a dedicated circuit.

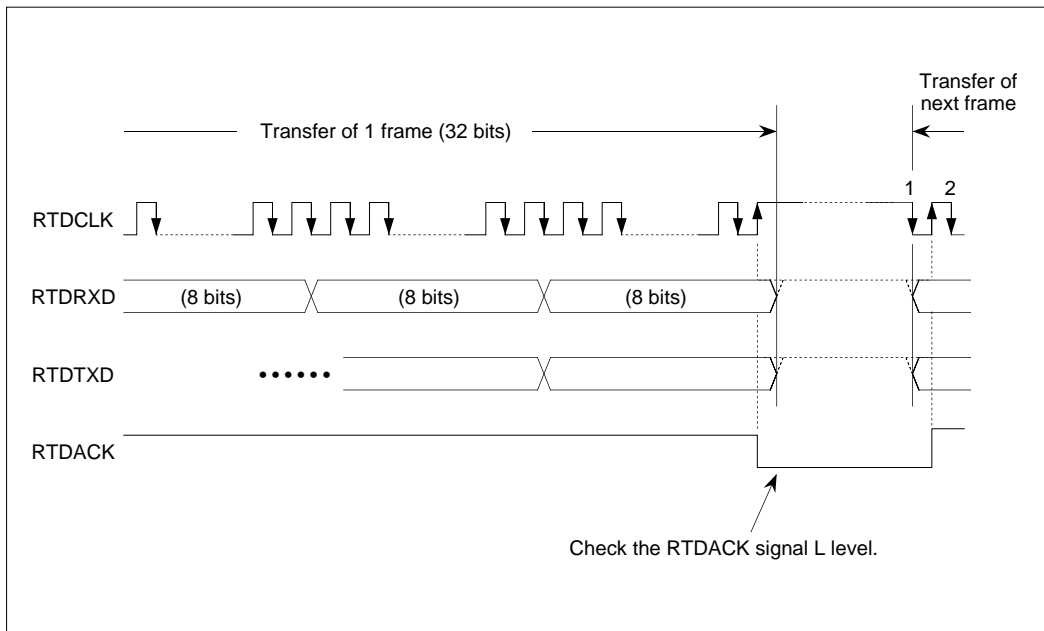

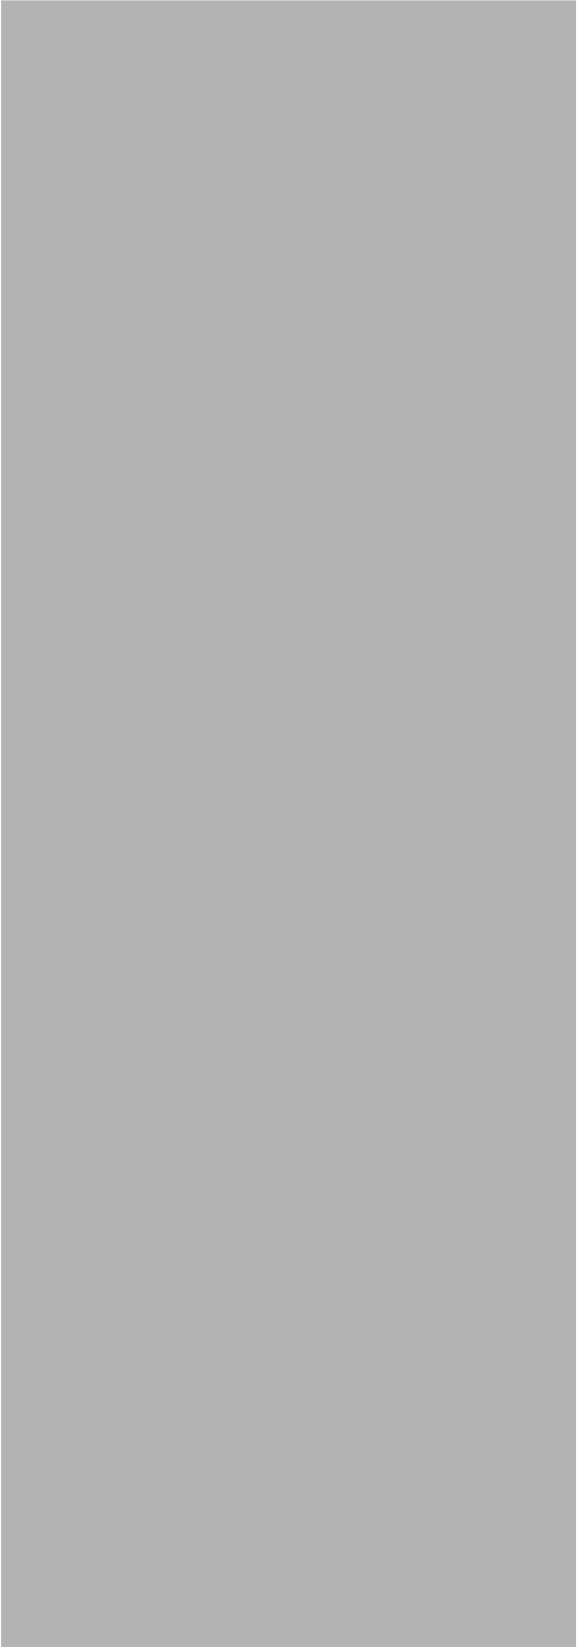

Figure 14.4.2 Typical Operation for Communication with the Host (when Issuing VER Command)

CHAPTER 15

EXTERNAL BUS INTERFACE

- 15.1 External Bus Interface Related Signals
- 15.2 Read/Write Operations
- 15.3 Bus Arbitration
- 15.4 Typical Connection of External Extension Memory

15.1 External Bus Interface Related Signals

The 32171 comes with external bus interface related signals shown below. These signals can be used in external extension mode or processor mode.

(1) Address

The 32171 outputs a 19-bit address (A12-A30) for addressing any location in 1 Mbytes of space. The least significant A31 is not output, and in external write cycles, the 32171 outputs $\overline{\text{BHW}}$ and $\overline{\text{BLW}}$ signals to indicate the valid byte position at which to write on the 16-bit data bus. In read cycles, the 32171 reads data always in 16 bits, transferring only the data read from the valid byte position of the bus.

(2) Chip select ($\overline{\text{CS0}}$, $\overline{\text{CS1}}$)

These signals are output in external extension mode or processor mode, with $\overline{\text{CS0}}$ and $\overline{\text{CS1}}$ specifying an external extension area of 2 Mbytes each. The $\overline{\text{CS0}}$ signal points to a 2-Mbyte area in processor mode or a 1-Mbyte area in external extension mode. (For details, refer to Chapter 3, "Address Space.")

(3) Read strobe ($\overline{\text{RD}}$)

Output during external read cycle, this signal indicates the timing at which to read data from the bus. This signal is driven high when writing to the bus or accessing the internal function.

(4) Byte High Write/Byte High Enable ($\overline{\text{BHW}}$ / $\overline{\text{BHE}}$)

The pin function changes depending on the Bus Mode Control Register (BUSMODC).

When $\text{BUSMOD} = 0$ and this signal is Byte High Write ($\overline{\text{BHW}}$), during external write access it indicates that the upper byte (DB0-DB7) of the data bus is the valid data to transfer. During external read and when accessing the internal function it outputs a high.

When $\text{BUSMOD} = 1$ and this signal is Byte High Enable ($\overline{\text{BHE}}$), during external access it indicates that the upper byte (DB0-DB7) of the data bus is the valid data to transfer. When accessing the internal function, it outputs a high.

(5) Byte Low Write/Byte Low Enable ($\overline{\text{BLW}}$ / $\overline{\text{BLE}}$)

The pin function changes depending on the Bus Mode Control Register (BUSMODC).

When $\text{BUSMOD} = 0$ and this signal is Byte Low Write ($\overline{\text{BLW}}$), during external write access it indicates that the lower byte (DB8-DB15) of the data bus is the valid data to transfer. During external read cycle, it outputs a high.

When $\text{BUSMOD} = 1$ and this signal is Byte Low Enable ($\overline{\text{BLE}}$), during external access it indicates that the lower byte (DB8-DB15) of the data bus is the valid data to transfer. When accessing the internal function, it outputs a high.

(6) Data bus (DB0 - DB15)

This is the 16-bit data bus used to access external devices.

(7) System clock/write (BCLK / \overline{WR})

The pin function changes depending on the Bus Mode Control Register (BUSMODC).

When BUSMOD = 0 and this signal is System Clock (BCLK), it outputs the system clock necessary to synchronize operations in an external system. When the CPU clock = 40 MHz, a 20 MHz clock is output from BCLK. When not using the BCLK/WR function, this pin can be used as P70 by setting the P7 Operation Mode Register P70MOD bit to 0.

When BUSMOD = 1 and this signal is Write (\overline{WR}), during external write access it indicates the valid data on the data bus to transfer. During external read cycle and when accessing the internal function, it outputs a high.

(8) Wait (\overline{WAIT})

When the 32171 started an external bus cycle, it automatically inserts wait cycles while the \overline{WAIT} signal is asserted. For details, refer to Chapter 16, "Wait Controller." When not using the WAIT function, this pin can be used as P71 by setting the P7 Operation Mode Register P71MOD bit to 0. Note that the 32171 always inserts one or more wait cycles for external access. Therefore, the shortest time in which an external device can be accessed is one wait cycle (2 BCLK periods).

(9) Hold control (\overline{HREQ} , \overline{HACK})

The hold state refers to a state in which the 32171 has stopped bus access and bus interface related pins are tristated (high impedance). While the 32171 is in a hold state, any bus master external to the chip can use the system bus to transfer data.

The 32171 is placed in a hold state by pulling the \overline{HREQ} pin input low. While the 32171 remains in a hold state after accepting the hold request and during a transition to the hold state, the \overline{HACK} pin outputs a low-level signal. To exit from the hold state and return to normal operating state, release the \overline{HREQ} signal back high. When not using the \overline{HREQ} and \overline{HACK} functions, these pins can be used as P72 and P73 by setting the P7 Operation Mode Register P72MOD and P73MOD bits to 0. The status of each 32171 pin during hold are shown below.

Table 15.1.1 Pin State during Hold Period

Pin Name	Pin State or Operation
A12-A30, DB0-DB15, $\overline{CS0}$, $\overline{CS1}$, RD, BHW, BLW, BHE, BLE, WR	High impedance
HACK	Outputs a low
Other pins (e.g., ports and timer output)	Normal operation

(10) Port P7 Operation Mode Register (P7MOD)

The BCLK/ \overline{WR} , \overline{WAIT} , \overline{HREQ} , and \overline{HACK} pins respectively are shared with P70, P71, P72, and P73. The Port P7 Operation Mode Register is used to select the function of port P7. Configuration of this register is shown below.

■ P7 Operation Mode Register

<Address: H'0080 0747>

D8	9	10	11	12	13	14	D15
P70MOD	P71MOD	P72MOD	P73MOD	P74MOD	P75MOD	P76MOD	P77MOD

<When reset : H'00>

D	Bit Name	Function	R	W
8	P70MOD (Port P70 operation mode)	0 : P70 1 : BCLK / \overline{WR}	○	○
9	P71MOD (Port P71 operation mode)	0 : P71 1 : \overline{WAIT}	○	○
10	P72MOD (Port P72 operation mode)	0 : P72 1 : \overline{HREQ}	○	○
11	P73MOD (Port P73 operation mode)	0 : P73 1 : \overline{HACK}	○	○
12	P74MOD (Port P74 operation mode)	0 : P74 1 : RTD TXD	○	○
13	P75MOD (Port P75 operation mode)	0 : P75 1 : RTD RXD	○	○
14	P76MOD (Port P76 operation mode)	0 : P76 1 : RTD ACK	○	○
15	P77MOD (Port P77 operation mode)	0 : P77 1 : RTD CLK	○	○

(11) Bus Mode Control Register (BUSMODC)

The 32171 contains a function to switch between two external bus modes.

■ Bus Mode Control Register (BUSMODC)

<Address: H'0080 077F>

<When reset : H'00>

D	Bit Name	Function	R	W
8 - 15	No functions assigned		0	—
15	BUSMOD (Bus mode control)	0: WR signal separate mode 1: Byte enable separate mode	○	○

This register is used to facilitate memory connection in processor mode and external extension mode.

When Bus Mode Control Register (BUSMOD) = 0, the WR signal is output separately for each byte area. Signals RD, BHW, BLW, BCLK, and WAIT can be used. For memory connection in boot mode, the Bus Mode Control Register has no effect and the interface operates under conditions where Bus Mode Control Register (BUSMOD) = 0.

When Bus Mode Control Register (BUSMOD) = 1, the byte enable signal is output separately for each byte area. Signals RD, BHW, BLE, WR, and WAIT can be used. For WAIT control circuit configuration, because BCLK is not output, external timing control is required.

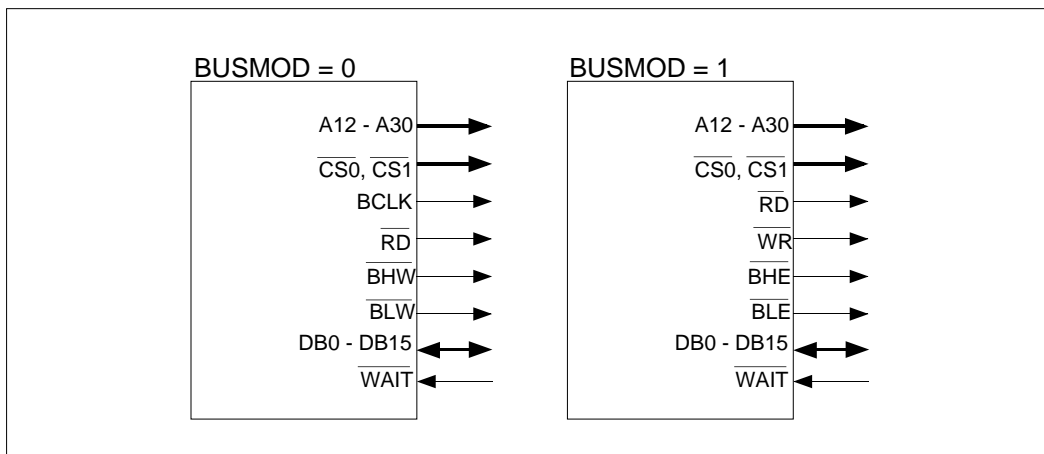

Figure 15.1.1 Pin Function when Bus Modes are Changed

15.2 Read/Write Operations

(1) When Bus Mode Control Register = 0

External read/write operations are performed using the address bus, data bus, and signals $\overline{CS0}$, $\overline{CS1}$, \overline{RD} , \overline{BHW} , \overline{BLW} , \overline{WAIT} , and \overline{BCLK} . In external read cycle, the \overline{RD} signal is low while \overline{BHW} and \overline{BLW} both are high, reading data from only the valid byte position of the bus. In external write cycle, \overline{BHW} or \overline{BLW} output for the byte position to which to write is pulled low as data is written to the bus.

When an external bus cycle starts, wait cycles are inserted as long as the \overline{WAIT} signal is low. Unless the \overline{WAIT} signal is needed, leave it held high. During external bus cycles, at least one wait cycle is inserted even for the shortest-case access. (The shortest bus cycle is 2 \overline{BCLK} periods.)

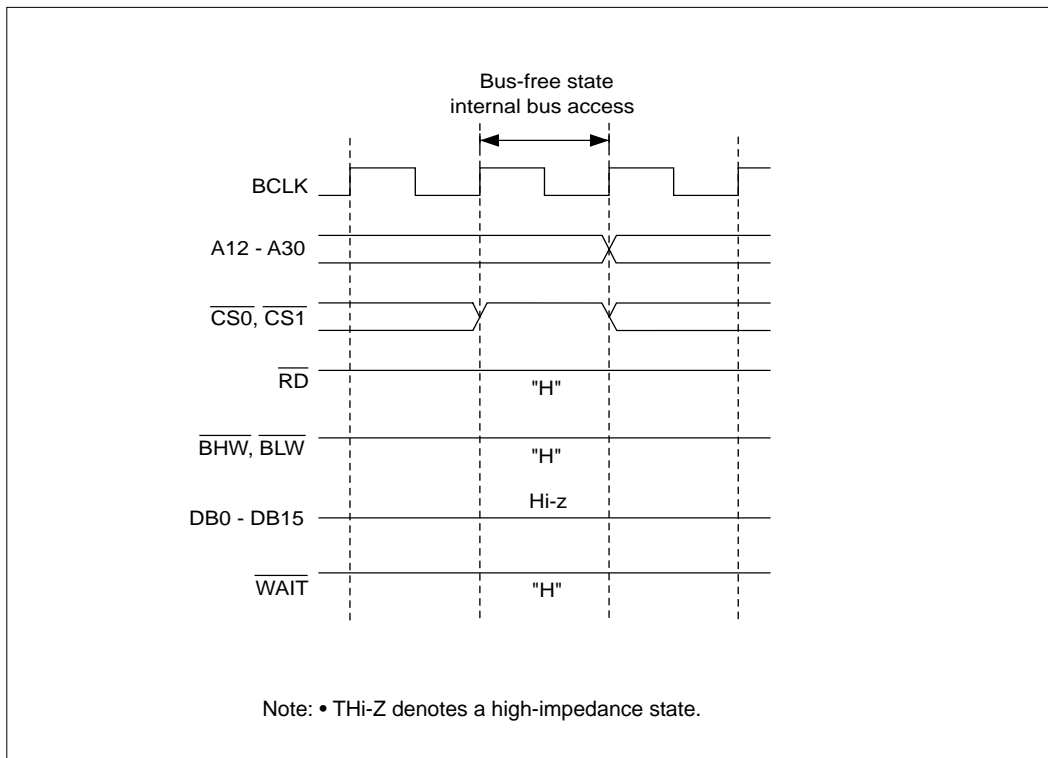

Figure 15.2.1 Internal Bus Access during Bus Free State

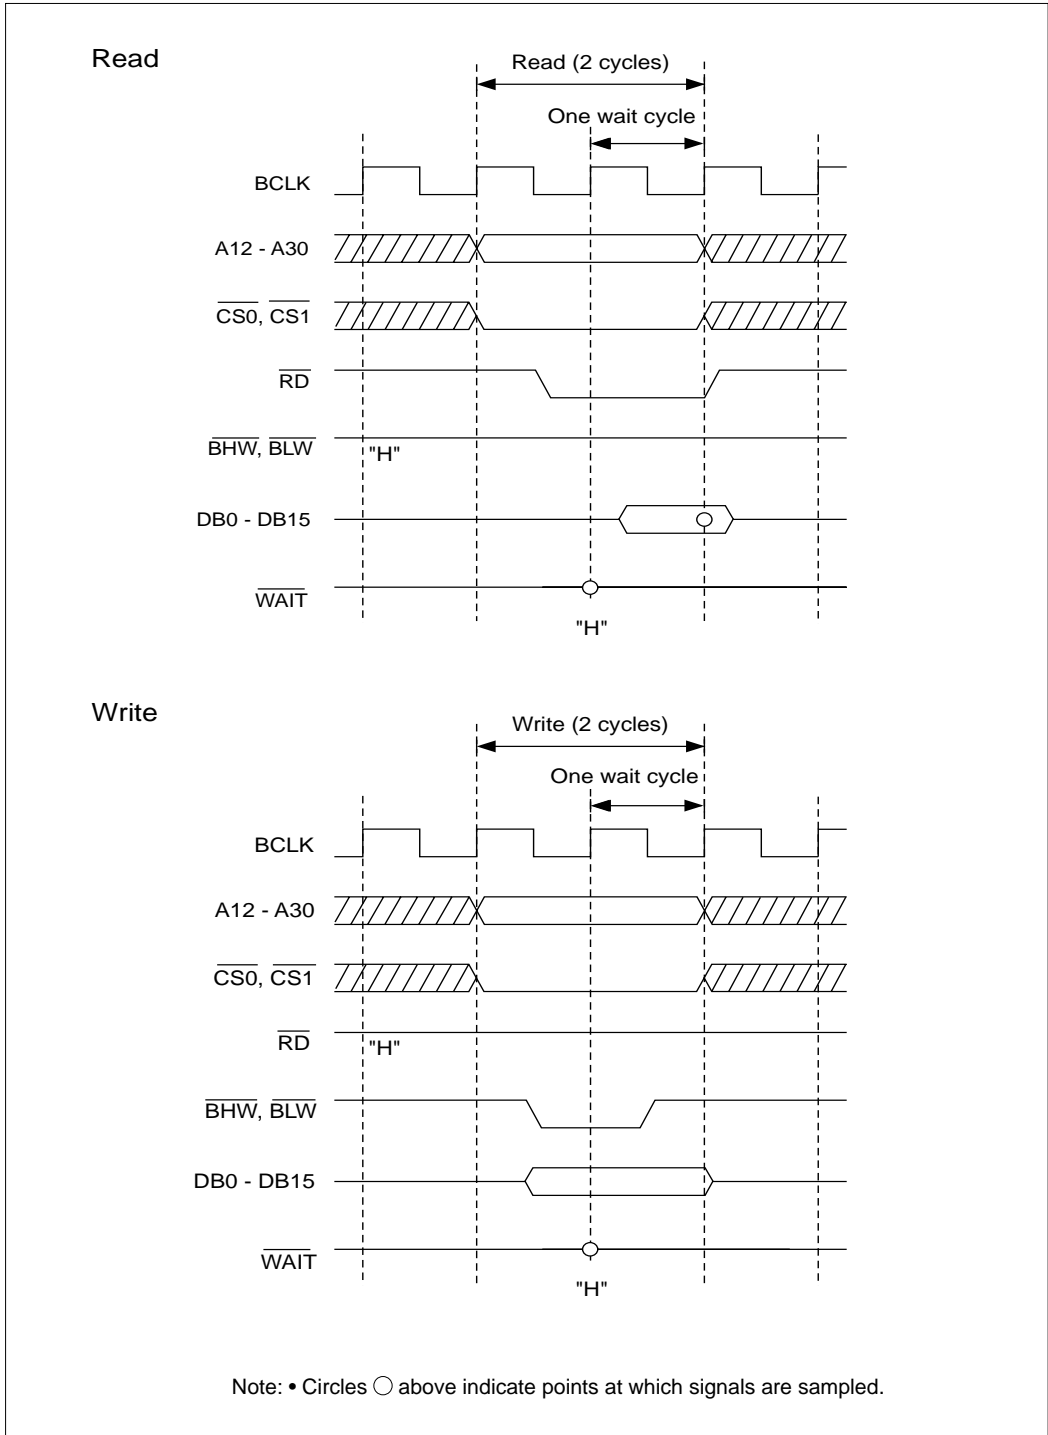

Figure 15.2.2 Read/Write Timing (for Shortest-case External Access)

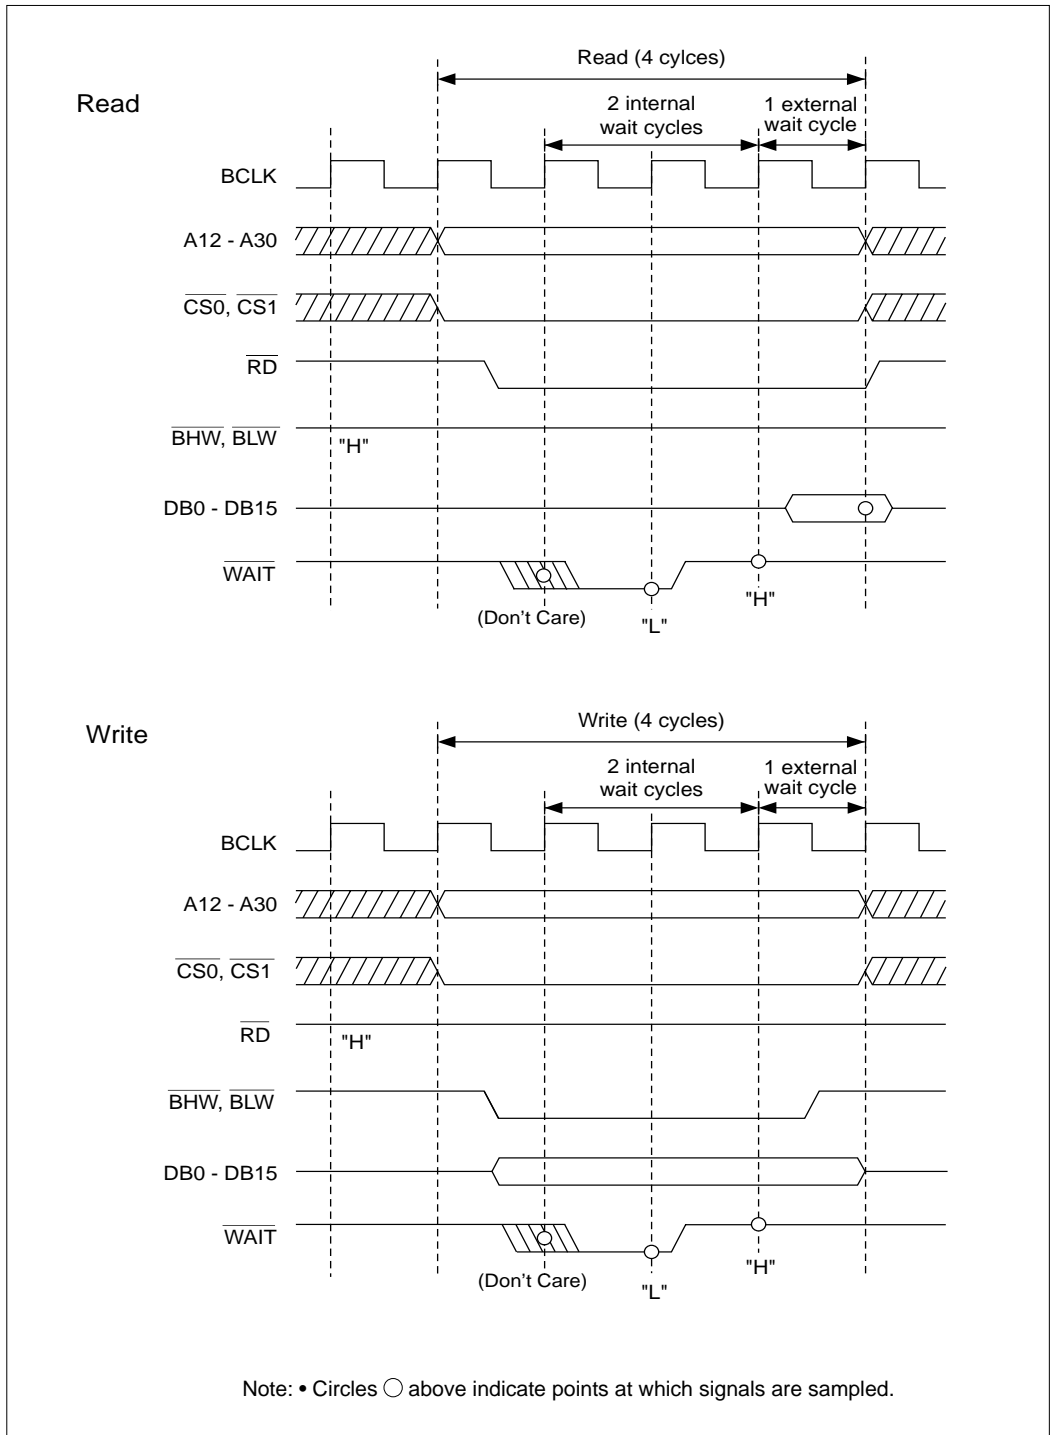

Figure 15.2.3 Read/Write Timing (for Access with 2 Internal and 1 External Wait Cycles)

(2) When Bus Mode Control Register = 1

External read/write operations are performed using the address bus, data bus, and signals $\overline{CS0}$, $\overline{CS1}$, \overline{RD} , \overline{BHE} , \overline{BLE} , \overline{WAIT} , and \overline{WR} . In external read cycle, the \overline{RD} signal goes low and \overline{BHE} or \overline{BLE} output for the byte position from which to read is pulled low, reading data from only the byte position of the bus. In external write cycle, the \overline{WR} signal goes low and \overline{BHE} or \overline{BLE} output for the byte position to which to write is pulled low, writing data to the necessary byte position.

When an external bus cycle starts, wait cycles are inserted as long as the \overline{WAIT} signal is low. Unless the \overline{WAIT} signal is needed, leave it held high. During external bus cycle, at least one wait cycle is inserted even for the shortest-case access. (The shortest bus cycle is 2 BCLK periods.) When not using the \overline{WAIT} function, the pin can be used as P71 by setting the P7 Operation Mode Register P71MOD bit to 0.

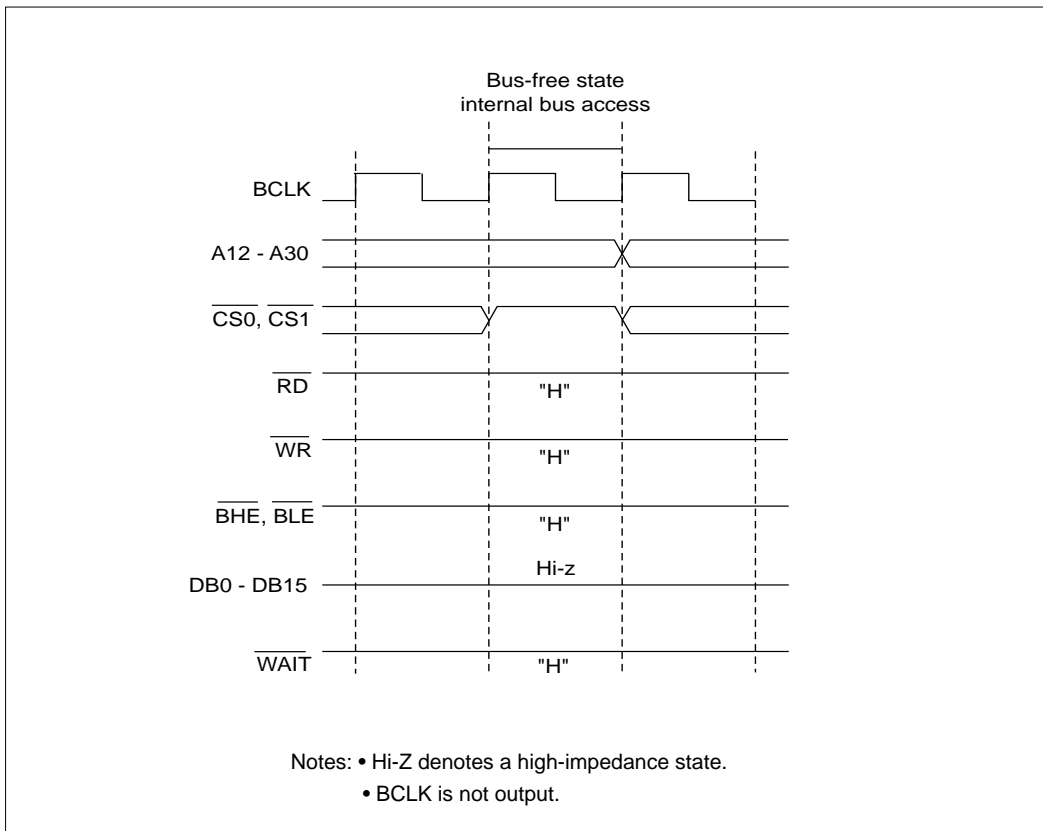

Figure 15.2.4 Internal Bus Access during Bus Free State

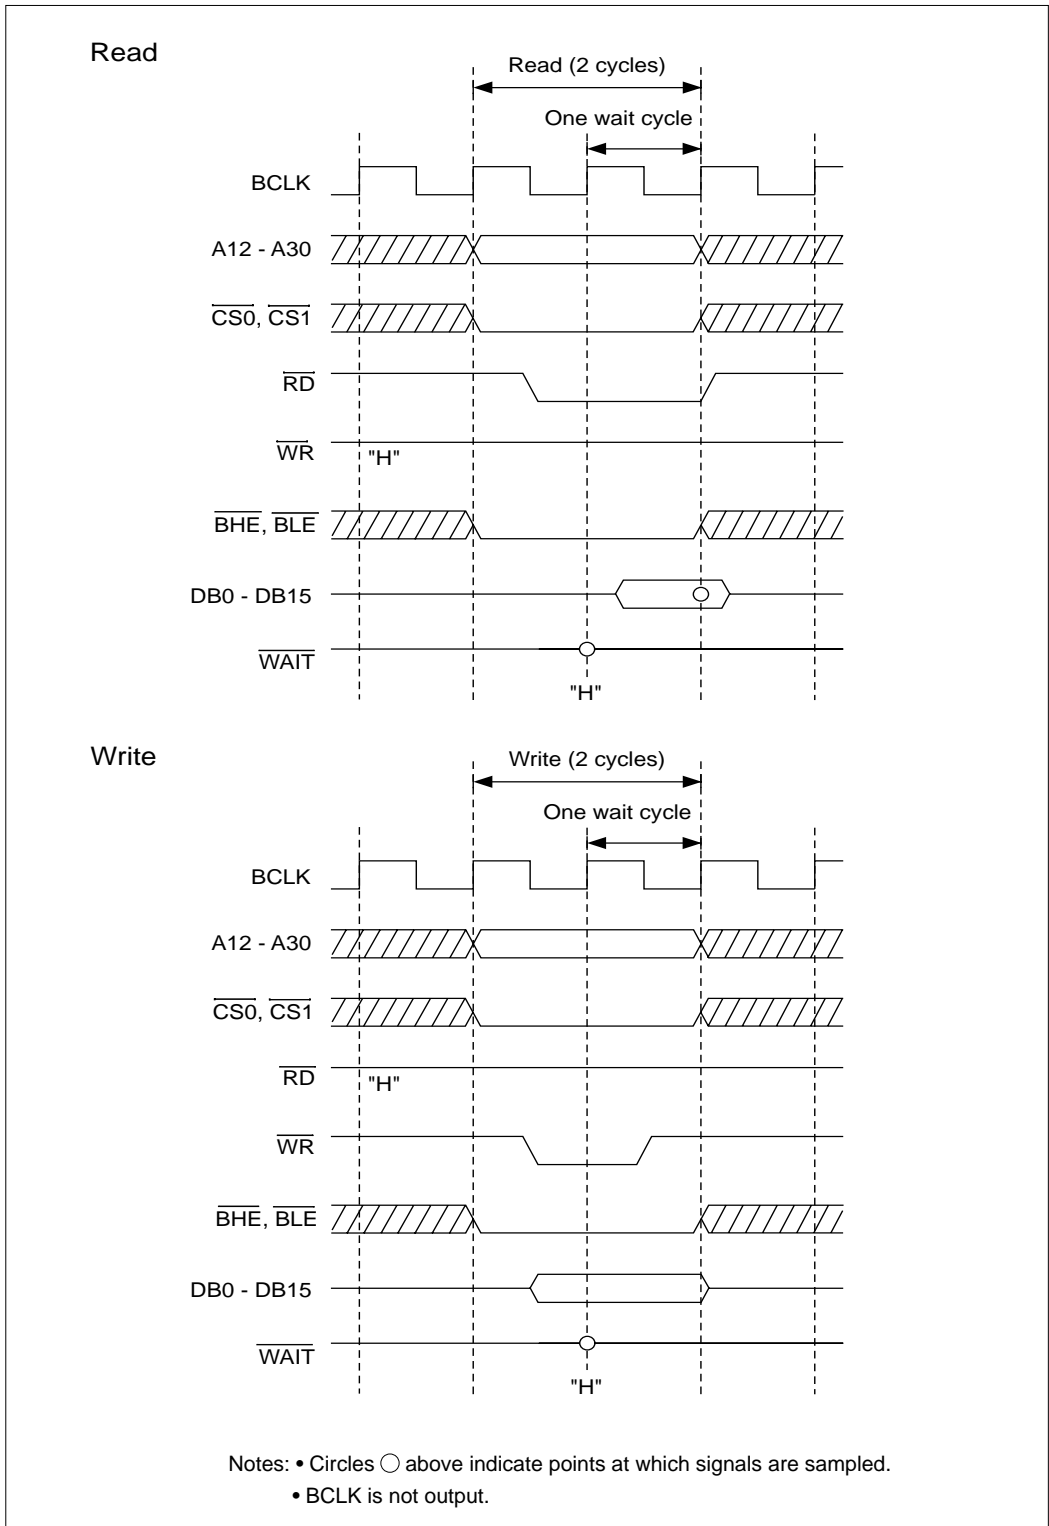

Figure 15.2.5 Read/Write Timing (for Shortest-case External Access)

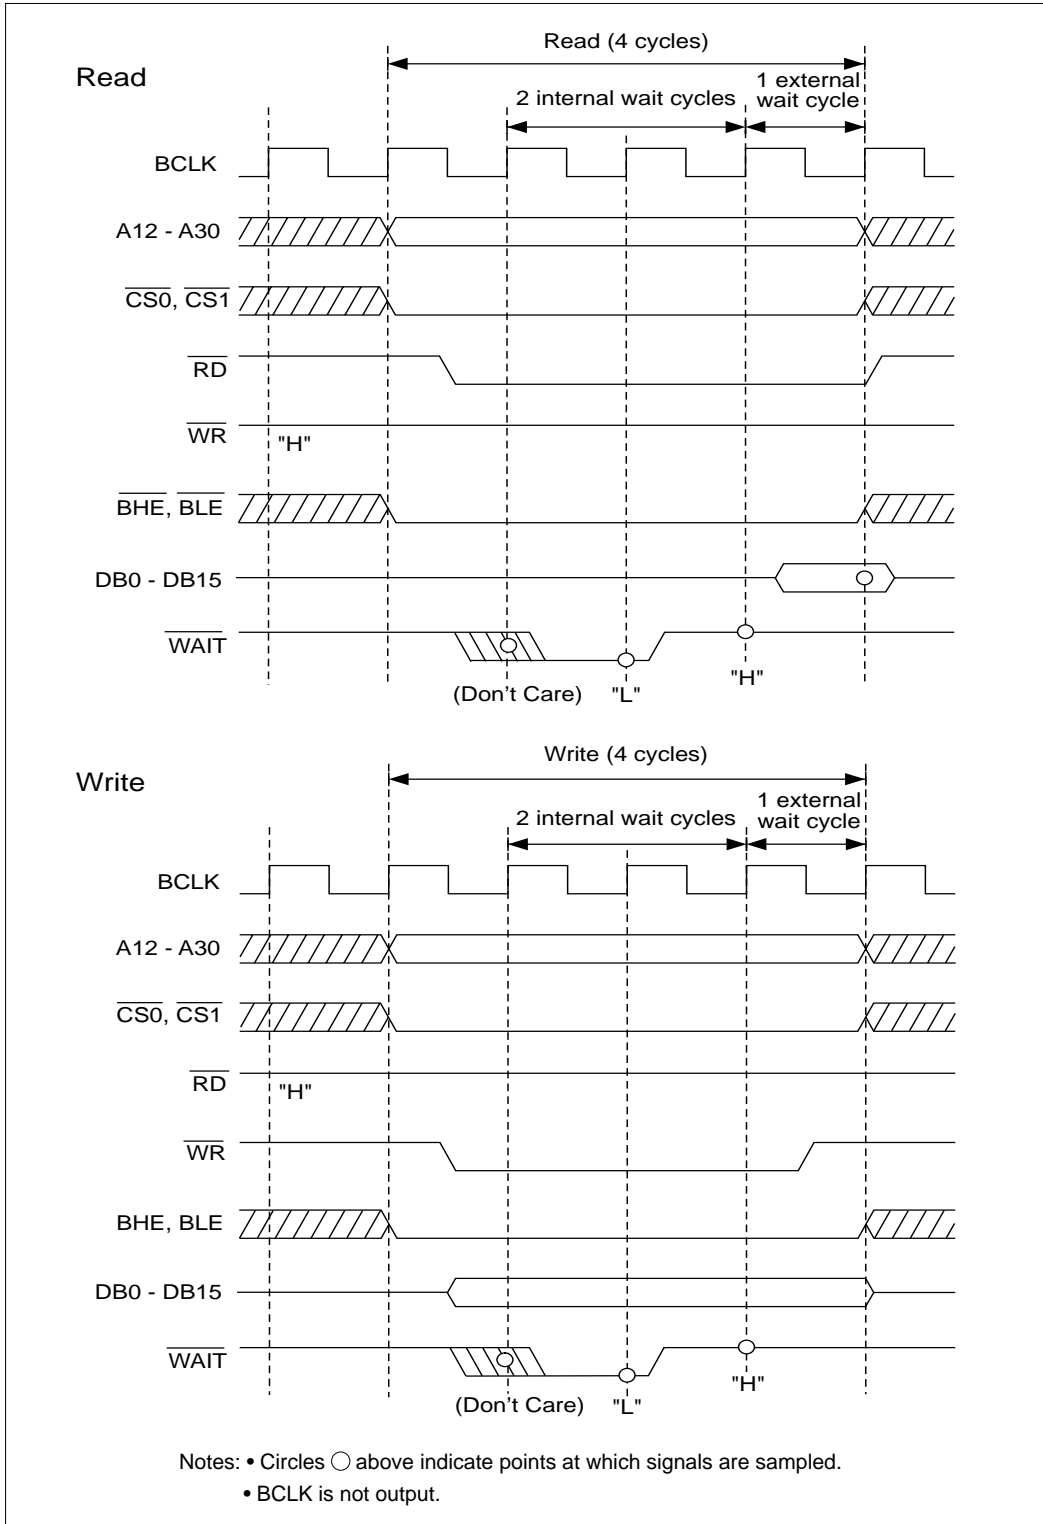

Figure 15.2.6 Read/Write Timing (for Access with 2 Internal and 1 External Wait Cycles)

15.3 Bus Arbitration

(1) When Bus Mode Control Register = 0

When $\overline{\text{HREQ}}$ pin input is pulled low and the hold request is accepted, the 32171 goes to a hold state and outputs a low from the $\overline{\text{HACK}}$ pin. During hold state, all bus related pins are placed in the high-impedance state, allowing data to be transferred on the system bus. To exit the hold state and return to normal operating state, release the HREQ signal back high.

Figure 15.3.1 Bus Arbitration Timing

(2) When Bus Mode Control Register = 1

When $\overline{\text{HREQ}}$ pin input is pulled low and the hold request is accepted, the 32171 goes to a hold state and outputs a low from the $\overline{\text{HACK}}$ pin. During hold state, all bus related pins are placed in the high-impedance state, allowing data to be transferred on the system bus. To exit the hold state and return to normal operating state, release the $\overline{\text{HREQ}}$ signal back high.

Figure 15.3.2 Bus Arbitration Timing

15.4 Typical Connection of External Extension Memory

(1) When Bus Mode Control Register = 0

A typical connection when using external extension memory is shown in Figure 15.4.1. (External extension memory can only be used in external extension mode and processor mode.)

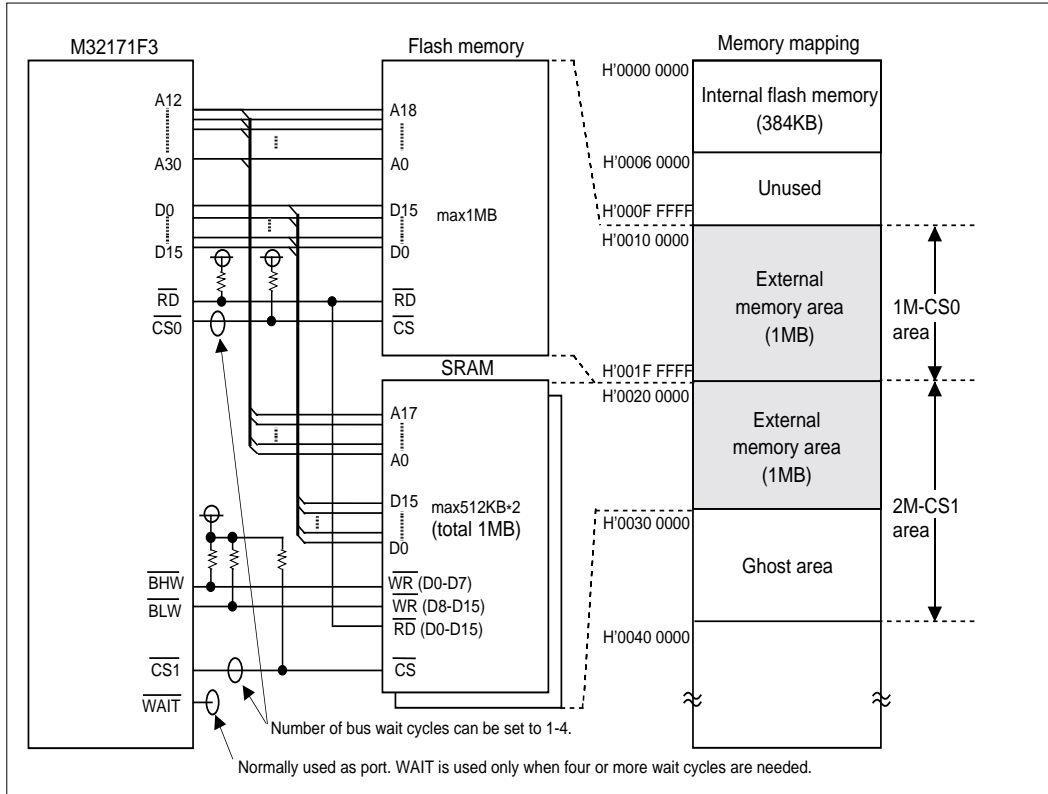

Figure 15.4.1 Typical Connection of External Extension Memory (When BUSMOD = 0)

Note: • The 32171 addresses and data are arranged in such a way that bit 0 = MSB, and bit 15 = LSB. Therefore, the MSB and LSB sides must be reversed when connecting external extension memory.

(2) When Bus Mode Control Register = 1

A typical connection when using external extension memory is shown in Figure 15.4.2. (External extension memory can only be used in external extension mode and processor mode.)

Figure 15.4.2 Typical Connection of External Extension Memory (When BUSMOD = 1)

Note: • The 32171 addresses and data are arranged in such a way that bit 0 = MSB, and bit 15 = LSB. Therefore, the MSB and LSB sides must be reversed when connecting external extension memory.

(3) Using 8/16-bit data bus memories in combination when Bus Mode Control Register = 1

The diagram below shows a typical connection of external extension memory, with 8-bit data bus memory located in the CS0 area, and 16-bit data bus memory located in the CS1 area. (External extension memory can only be used in external extension mode and processor mode.)

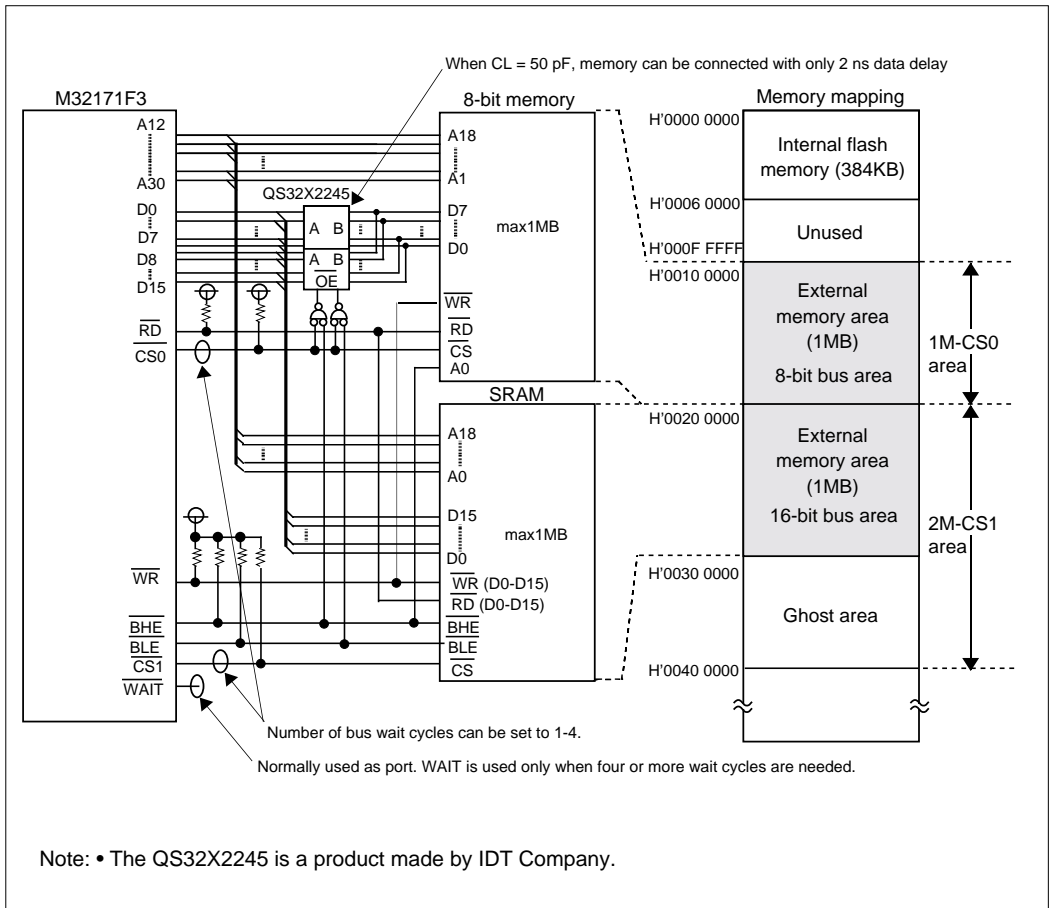

Figure 15.4.3 Typical Connection of External Extension Memory (Using 8/16-bit Mixed Memories when BUSMOD = 1)

Note: • The 32171 addresses and data are arranged in such a way that bit 0 = MSB, and bit 15 = LSB. Therefore, the MSB and LSB sides must be reversed when connecting external extension memory.

CHAPTER 16

WAIT CONTROLLER

- 16.1 Outline of the Wait Controller
- 16.2 Wait Controller Related Registers
- 16.3 Typical Operation of the Wait Controller

16.1 Outline of the Wait Controller

The wait controller controls the number of wait cycles inserted in bus cycles during access to an external extension area. The following outlines the wait controller.

Table 16.1.1 Outline of the Wait Controller

Item	Specification
Target space	Wait cycles in following memory spaces are controlled depending on operation mode Single-chip mode : No target space (Wait controller settings have no effect) External extension mode : CS0 area (1 Mbytes), CS1 area (1 Mbytes) Processor mode : CS0 area (1 Mbytes), CS1 area (1 Mbytes)
Number of wait cycles that can be inserted	1 to 4 wait cycles inserted by software + any number of wait cycles inserted from $\overline{\text{WAIT}}$ pin (Bus cycles with 1 wait cycle are the shortest bus cycle for external access.)

In external extension mode and processor mode, two chip select signals ($\overline{\text{CS0}}$, $\overline{\text{CS1}}$) are output to an external extension area. Two areas in it corresponding to $\overline{\text{CS0}}$ and $\overline{\text{CS1}}$ signals are called the CS0 and the CS1 areas, respectively.

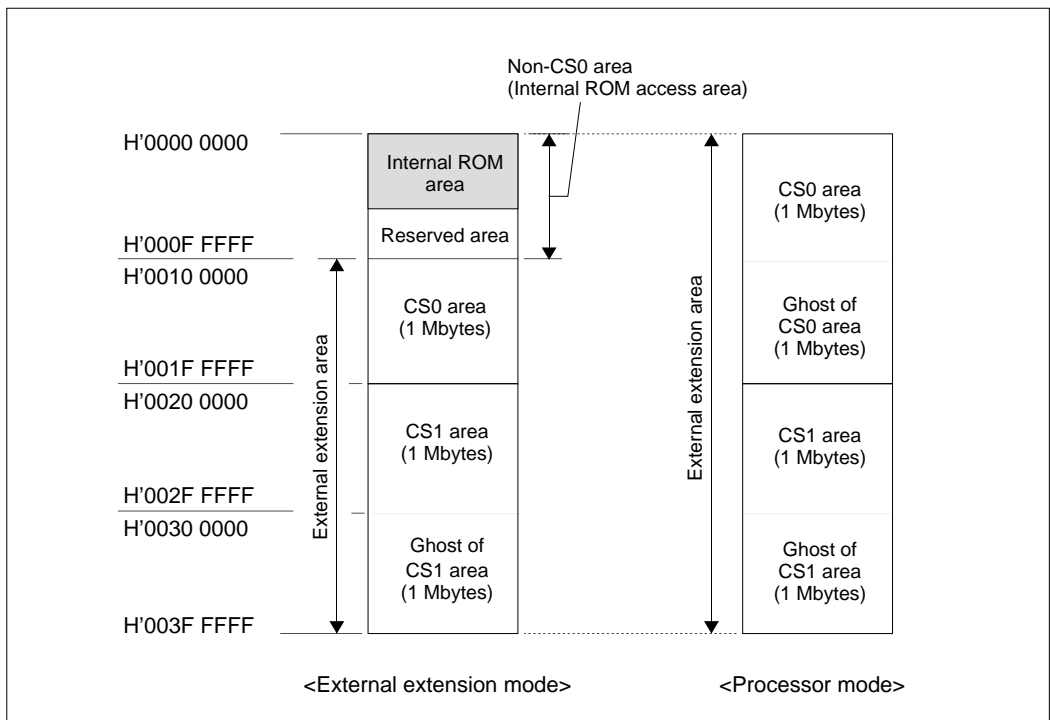

Figure 16.1.1 CS0 and CS1 Area Address Map

When accessing an external extension area, the wait controller controls the number of wait cycles to be inserted in bus cycles based on the number of wait cycles set by software and those entered from the $\overline{\text{WAIT}}$ pin.

The number of wait cycles that can be controlled in software is 1 to 4. (For external access, bus cycles with 1 wait cycle are the shortest bus cycle.)

When the $\overline{\text{WAIT}}$ pin input is sampled low in the last cycle of internal wait cycles set by software, the wait cycle is extended as long as the $\overline{\text{WAIT}}$ signal is held low. Then when the $\overline{\text{WAIT}}$ signal is released back high, the wait cycle is terminated and the next new bus cycle is entered into.

Table 16.1.2 Number of Wait Cycles that Can be Set by the Wait Controller

External Extension Area	Address	Number of Wait Cycles Inserted
CS0 area	H'0010 0000 - H'001F FFFF (External extension mode)	One to 4 wait cycles set by software + any number of wait cycles entered from $\overline{\text{WAIT}}$ pin
	H'0000 0000 - H'000F FFFF (Processor mode) (Note 1)	(However, wait cycles set by software have priority.)
CS1 area	H'0020 0000 - H'002F FFFF (External extension mode and processor mode) (Note 2)	One to 4 wait cycles set by software + any number of wait cycles entered from $\overline{\text{WAIT}}$ pin (However, wait cycles set by software have priority.)

Note 1: During processor mode, a ghost (1 Mbyte) of the CS0 area appears in an area of H'0010 0000 through H'001F FFFF.

Note 2: A ghost (1 Mbyte) of the CS1 area appears in an area of H'0030 0000 through H'003F FFFF.

16.2 Wait Controller Related Registers

The following shows a wait controller related register map.

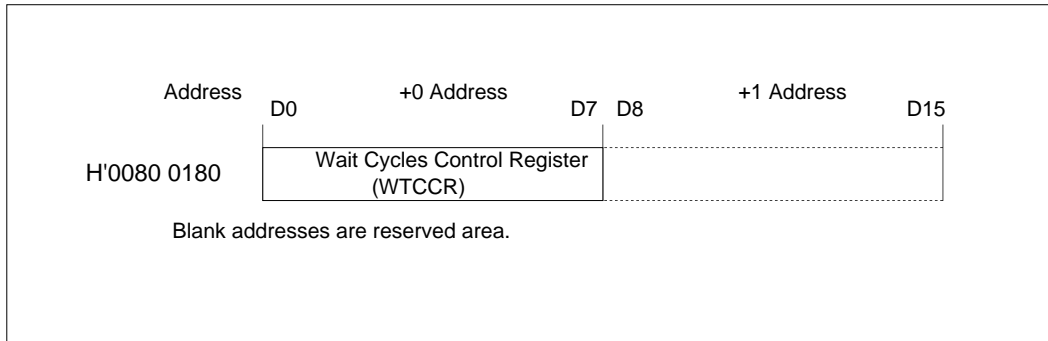

Figure 16.2.1 Wait Controller Related Register Map

16.2.1 Wait Cycles Control Register

■ Wait Cycles Control Register (WTCCR)

<Address: H'0080 0180>

<When reset : H'00>

D	Bit Name	Function	R	W
0, 1	No functions assigned		0	—
2, 3	CS0WTC (CS0 wait cycles control)	00 : 4 wait cycles (when reset) 01 : 3 wait cycles 10 : 2 wait cycles 11 : 1 wait cycle	○	○
4, 5	No functions assigned		0	—
6, 7	CS1WTC (CS1 wait cycles control)	00 : 4 wait cycles (when reset) 01 : 3 wait cycles 10 : 2 wait cycles 11 : 1 wait cycle	○	○

16.3 Typical Operation of the Wait Controller

The following shows a typical operation of the wait controller. The wait controller can control bus access in the range of 2 to 5 cycles. If more access cycles than that are needed, use the WAIT function in combination with the wait controller.

(1) When Bus Mode Control Register = 0

External read/write operations are performed using the address bus, data bus, and signals $\overline{CS0}$, $\overline{CS1}$, \overline{RD} , \overline{BHW} , \overline{BLW} , \overline{WAIT} , and \overline{BCLK} .

CHAPTER 17

RAM BACKUP MODE

- 17.1 Outline of RAM Backup Mode
- 17.2 Example of RAM Backup when Power is Down
- 17.3 Example of RAM Backup for Saving Power Consumption
- 17.4 Exiting RAM Backup Mode (Wakeup)

17.1 Outline of RAM Backup Mode

In RAM backup mode, the contents of the internal RAM are retained while the power is turned off. RAM backup mode is used for the following two purposes:

- Back up the internal RAM data when the power is down
- Turn off the power to the CPU whenever necessary to save on the system's power consumption

The 32R/E CPU is placed in RAM backup mode by applying a voltage of 2.0-3.3 V to the VDD pin (provided for RAM backup) and 0 V to all other pins. During RAM backup mode, the contents of the internal RAM are retained, while the CPU and internal peripheral I/O remain idle. Also, because all pins except VDD are held low during RAM backup mode, power consumption in the system can effectively be reduced.

17.2 Example of RAM Backup when Power is Down

A typical circuit for RAM backup at power outage is shown in Figure 17.2.1. The following explains how the RAM can be backed up by using this circuit as an example.

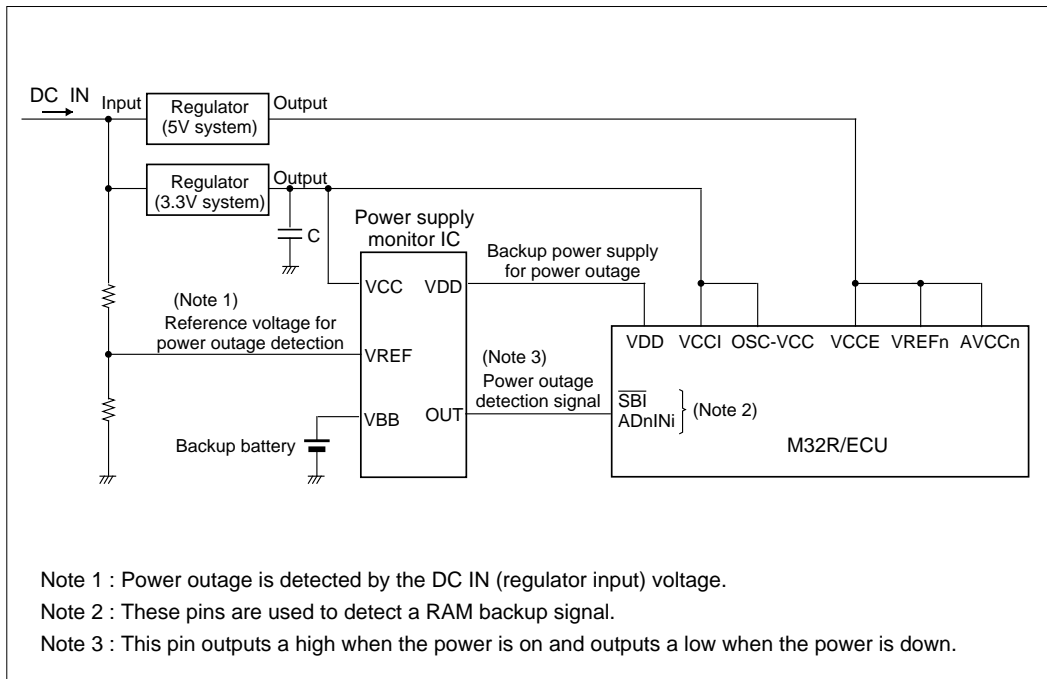

Figure 17.2.1 Typical Circuit for RAM Backup at Power Outage

17.2.1 Normal Operating State

Figure 17.2.2 shows the normal operating state of the M32R/ECU. During normal operation, input on the $\overline{\text{SBI}}$ pin or ADnINi ($i = 0-15$) pin used for RAM backup signal detection remains high.

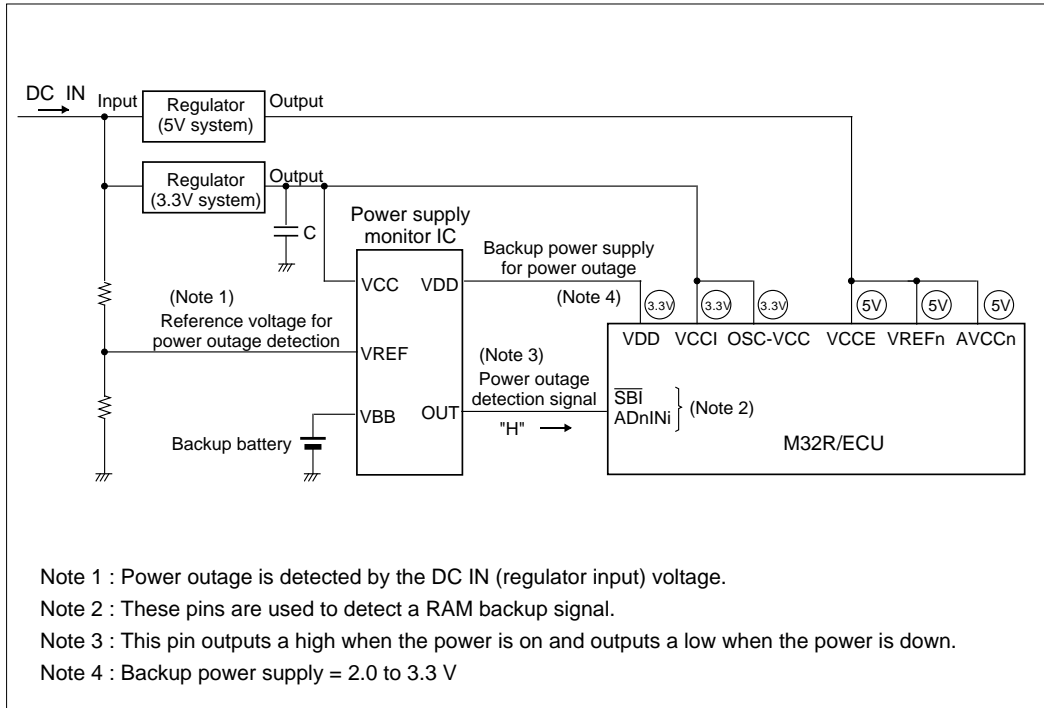

Figure 17.2.2 Normal Operating State

17.2.2 RAM Backup State

Shown in Figure 17.2.3 is the power outage RAM backup state of the M32R/ECU. When the power supply goes down, the power supply monitor IC starts feeding current from the backup battery to the M32R/ECU. Also, the power supply monitor IC's power outage detection pin outputs a low, causing the $\overline{\text{SBI}}$ pin or ADnINi pin input to go low, which generates a RAM backup signal ((a) in Figure 17.2.3). Whether the power is down or not must be determined with respect to the DC IN (regulator input) voltage in order to allow for a software processing time at power outage.

To enable RAM backup mode, make the following settings.

- (1) Create check data to verify after returning from RAM backup to normal mode whether the RAM data has been retained normally ((b) in Figure 17.2.3).

When the power supply to VCC goes down after settings in (1), the voltage applied to the VDD pin becomes 2.0-3.3 V and voltages applied to all other pins drop to 0 V, and the M32R/ECU thereby enters RAM backup mode ((c) in Figure 17.2.3).

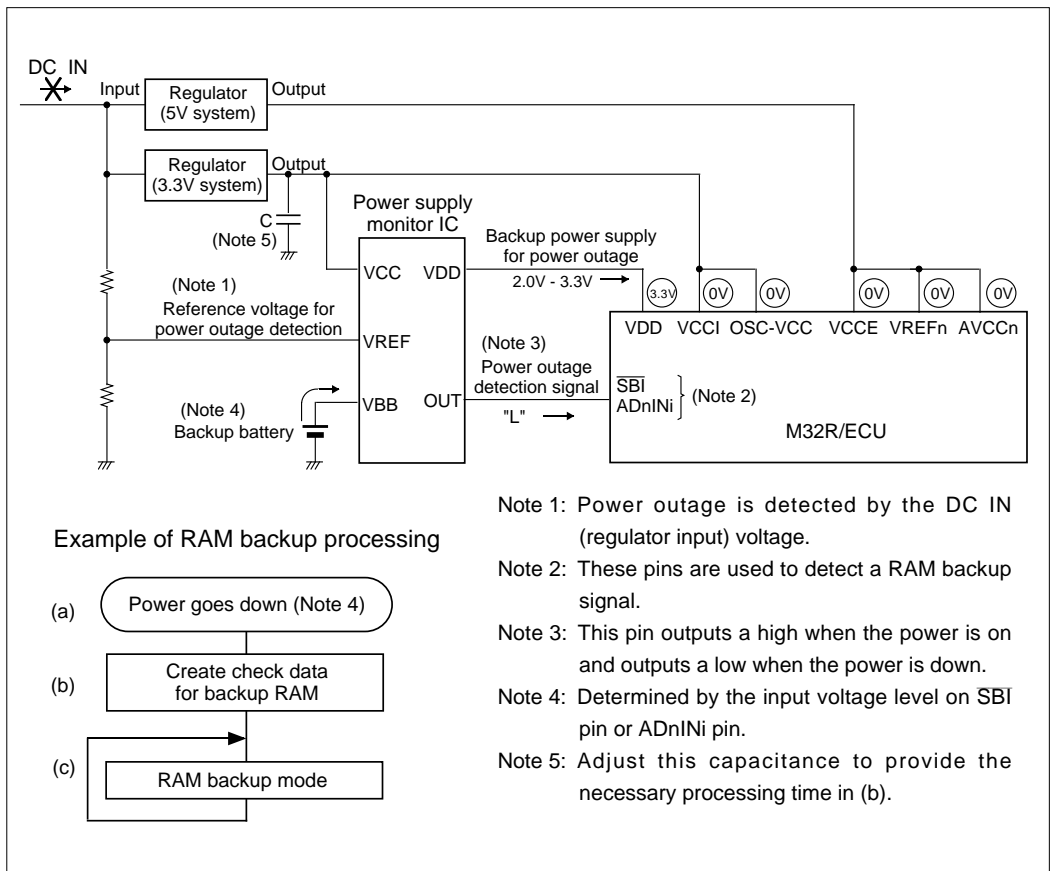

Figure 17.2.3 RAM Backup State at Power Outage

17.3 Example of RAM Backup for Saving Power Consumption

Figure 17.3.1 shows a typical circuit for RAM backup to save on power consumption. The following explains how the RAM is backed up for the purpose of low-power operation by using this circuit as an example.

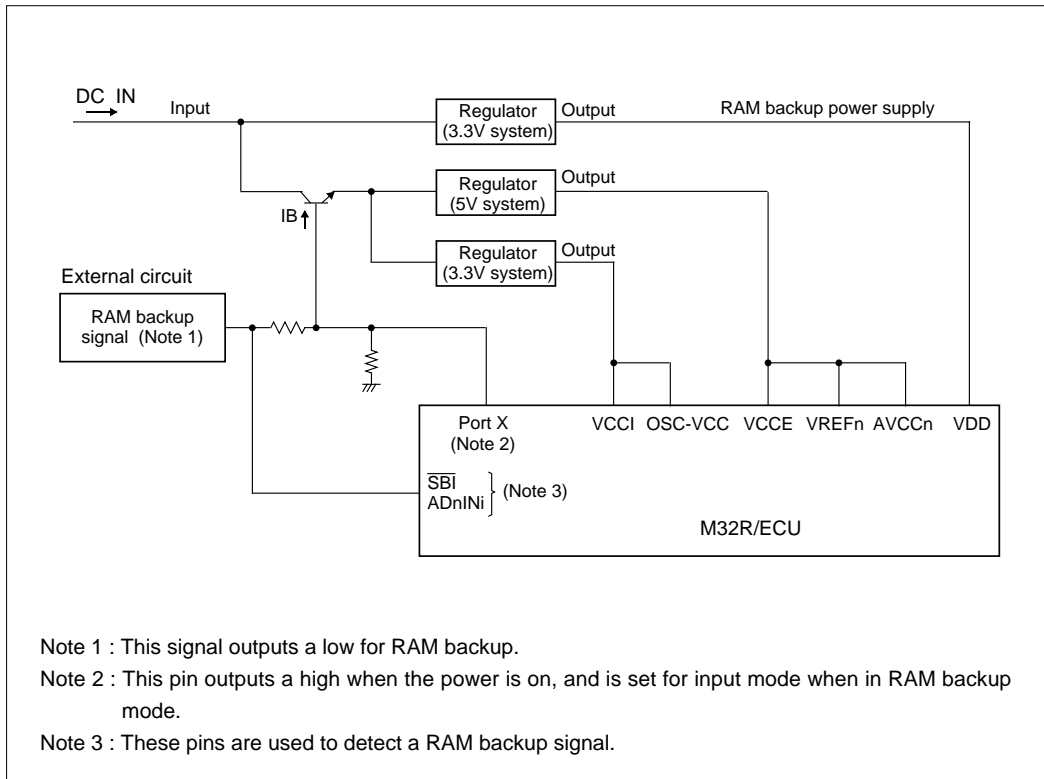

Figure 17.3.1 Typical Circuit for RAM Backup to Save on Power Consumption

17.3.1 Normal Operating State

Figure 17.3.2 shows the normal operating state of the M32R/ECU. During normal operation, the RAM backup signal output by the external signal is high. Also, input on the $\overline{\text{SBI}}$ pin or ADnINi ($i = 0-15$) pin used for RAM backup signal detection remains high.

Port X, which is the transistor's base connecting pin, should output a high. This causes the transistor's base voltage, I_B , to go high, so that current is fed from the power supply to the VCC pin via the transistor.

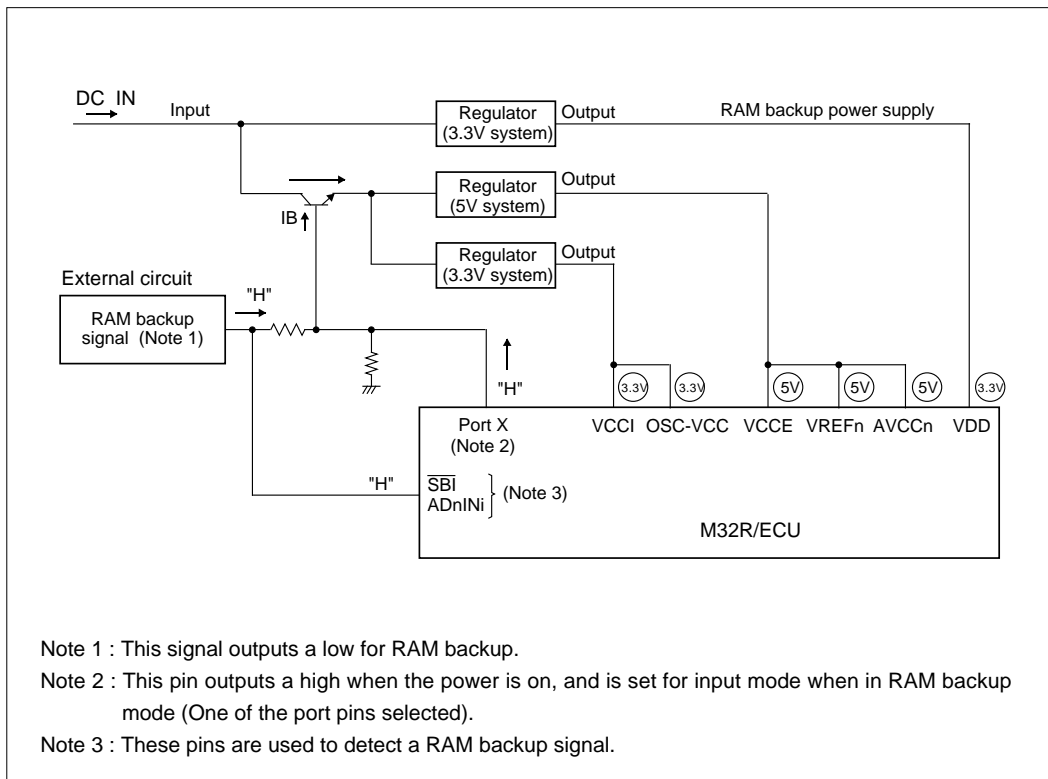

Figure 17.3.2 Normal Operating State

17.3.2 RAM Backup State

Figure 17.3.3 shows the RAM backup state of the M32R/ECU. Figure 17.3.4 shows a RAM backup sequence. When the external circuit outputs a low, input on the $\overline{\text{SBI}}$ pin or ADnINi pin goes low. A low on these input pins generates a RAM backup signal (A and (a) in Figure 17.3.3). To enable RAM backup mode, make the following settings.

- (1) Create check data to verify after returning from RAM backup to normal mode whether the RAM data has been retained normally ((b) in Figure 17.3.3).
- (2) To materialize low-power operation, set all programmable input/output pins except port X for input mode (or for output mode, with pins outputting a low) ((c) in Figure 17.3.3).
- (3) Set port X for input mode (B and (d) in Figure 17.3.3). This causes the transistor's base voltage, IB, to go low, so that no current flows from the power supply to the VCC pin via the transistor (C in Figure 17.3.3). Consequently, the power to the VCC pin is shut off (D in Figure 17.3.3).

Due to settings in (1) to (3), the voltage applied to the VDD pin becomes $3.3\text{ V} \pm 10\%$ and voltages applied to all other pins drop to 0 V, thus placing the M32R/ECU in RAM backup mode ((d) in Figure 17.3.3).

Figure 17.3.3 RAM Backup State for Low-Power Operation

Figure 17.3.4 Example of RAM Backup Sequence for Low-Power Operation

17.3.3 Precautions to Be Observed at Power-on

When changing port X from input mode to output mode after power-on, pay attention to the following.

If port X is set for output mode while no data is set in the Port X Data Register, the port's initial output level is indeterminate. Therefore, be sure to set the output high level in the Port X Data Register before you set port X for output mode. Unless this method is followed, port output may go low at the same time port output is set after the clock oscillation has stabilized, causing the device to enter RAM backup mode.

17.4 Exiting RAM Backup Mode (Wakeup)

Processing to exit RAM backup mode and return to normal operation is referred to as "wakeup processing." Figure 17.4.1 shows an example of wakeup processing. Wakeup processing is initiated by reset input. The following shows how to execute wakeup processing.

- (1) Reset the device ((a) in Figure 17.4.1). For details about reset, refer to Chapter 7, "Reset."
- (2) Set port X for output mode and output a high from the port ((b) in Figure 17.4.1). (Note 1)
- (3) Check the RAM contents against the check data created before entering RAM backup mode ((c) in Figure 17.4.1).
- (4) If the RAM contents and check data did not match when checked in (3), initialize the RAM ((d) in Figure 17.4.1). If the RAM contents and check data matched, use the retained data in the program.
- (5) After initializing each internal circuit ((e) in Figure 17.4.1), return the main routine ((f) in Figure 17.4.1).

Note 1: For wakeup from power outage RAM backup mode, settings for port X are unnecessary.

Figure 17.4.1 Wakeup Processing

* This is a blank page.*

CHAPTER 18

OSCILLATION CIRCUIT

18.1 Oscillator Circuit

18.2 Clock Generator Circuit

18.1 Oscillator Circuit

The M32R/ECU contains an oscillator circuit that supplies operating clocks for the CPU core, internal peripheral I/O, and internal memory. The frequency fed to the clock input pin (XIN) is multiplied by 4 by the internal PLL circuit to produce the CPU clock, which is the operating clock for the CPU core and internal memory. The frequency of this clock is divided by 2 in the subsequent circuit to produce the internal peripheral clock, which is the operating clock for the internal peripheral I/O.

18.1.1 Example of an Oscillator Circuit

A clock generating circuit can be configured by connecting a ceramic (or crystal) resonator between the XIN and XOUT pins external to the chip. Figure 18.1.1 below shows an example of a system clock generating circuit using a resonator connected external to the chip and an RC network connected to the PLL circuit control pin (VCNT). For constants R_f , C_{IN} , C_{OUT} , and R_d , consult your resonator manufacturer to determine the appropriate values.

When you use an externally sourced clock signal without using the internal oscillator circuit, connect the external clock signal to the XIN pin and leave the XOUT pin open.

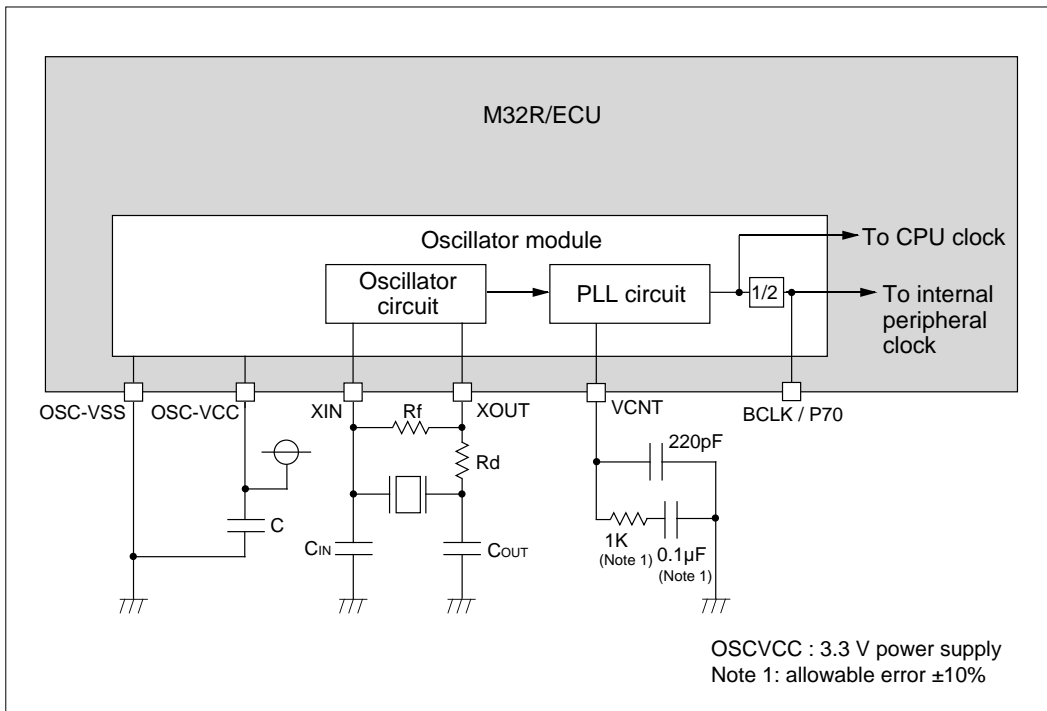

Figure 18.1.1 Example of a System Clock Generating Circuit

18.1.2 System Clock Output Function

A clock whose frequency is twice the input frequency can be output from the BCLK pin. The BCLK pin is shared with port P70. When you use this pin to output the system clock, set the P7 Operation Mode Register (P7MOD)'s D8 bit to 1. Configuration of the P7 Operation Mode Register is shown below.

18.1.3 Oscillation Stabilization Time at Power-on

The oscillator circuit comprised of a ceramic (or crystal) resonator has a finite time after power-on at which its oscillation is instable. Therefore, create a certain amount of oscillation stabilization time that suits the oscillator circuit used. Figure 18.1.2 shows an oscillation stabilization time at power-on.

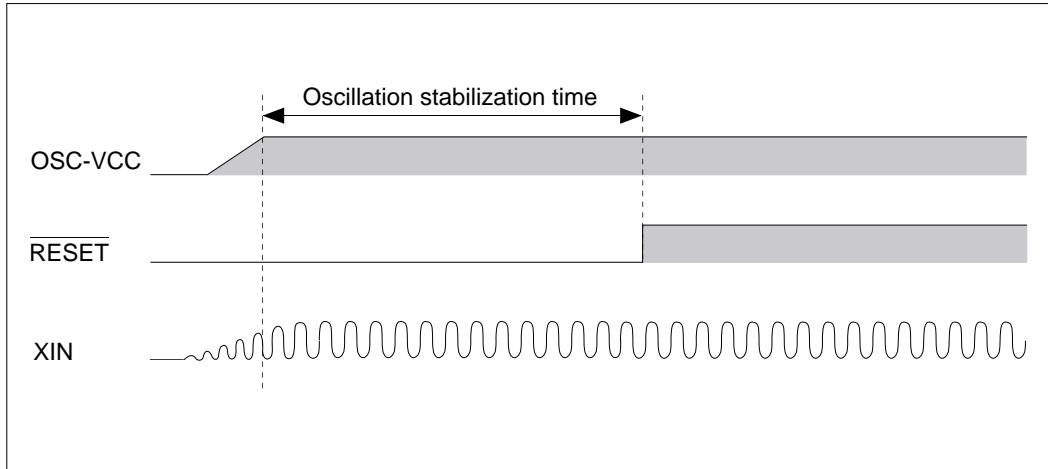

Figure 18.1.2 Oscillation Stabilization Time at Power-on

18.2 Clock Generator Circuit

The clock generator supplies independent clocks to the CPU and internal peripheral circuits.

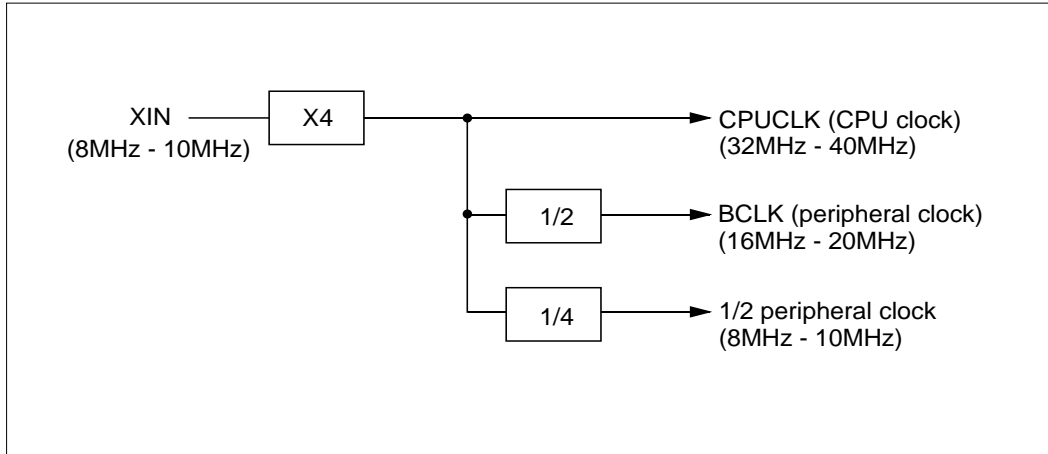

Figure 18.2.1 Configuration of the Clock Generator Circuit

CHAPTER 19

JTAG

- 19.1 Outline of JTAG
- 19.2 Configuration of the JTAG Circuit
- 19.3 JTAG Registers
- 19.4 Basic Operation of JTAG
- 19.5 Boundary Scan Description Language
- 19.6 Precautions on Board Design when Using JTAG
- 19.7 Processing Pins when Not Using JTAG

19.1 Outline of JTAG

The 32171 contains a JTAG (Joint Test Action Group) interface based on IEEE Standard Test Access Port and Boundary-Scan Architecture (IEEE Std. 1149.1a-1993). This JTAG interface can be used as an input/output path for boundary-scan test (boundary-scan path). For details about IEEE 1149.1 JTAG test access ports, refer to the IEEE Std. 1149.1a-1993 documentation.

The functions of JTAG interface related pins mounted on the 32171 are shown below.

Table 19.1.1 JTAG Pin Functions

Type	Symbol	Pin Name	I/O	Function
TAP	JTCK	Test clock	Input	Clock input to the test circuit.
(Note1)	JTDI	Test data input	input	Synchronous serial data input pin used to enter test instruction code and test data. This input is sampled on rising edges of JTCK.
	JTDO	Test data output	output	Synchronous serial data output pin used to output test instruction code and test data. This signal changes state on falling edges of JTCK, and is output only in Shift-IR or Shift-DR state.
	JTMS	Test mode select	Input	Test mode select input to control the test circuit's state transitions. This input is sampled on rising edges of JTCK.
	JTRST	Test reset	Input	Active-low test reset input to initialize the test circuit asynchronously. To ensure that the test circuit is reset without fail, JTMS signal input must be held high while this signal changes state from low to high.

Note 1: TAP = Test Access Port, a JTAG interface stipulated in IEEE 1149.1.

19.2 Configuration of the JTAG Circuit

The 32171's JTAG circuit consists of the following blocks:

- Instruction register to hold instruction codes which are fetched through the boundary-scan path
- A set of data registers which are accessed through the boundary-scan path
- Test access port (abbreviated TAP) controller to control the JTAG unit's state transitions
- Control logic to select input, output, etc.

A configuration of the JTAG circuit is shown below.

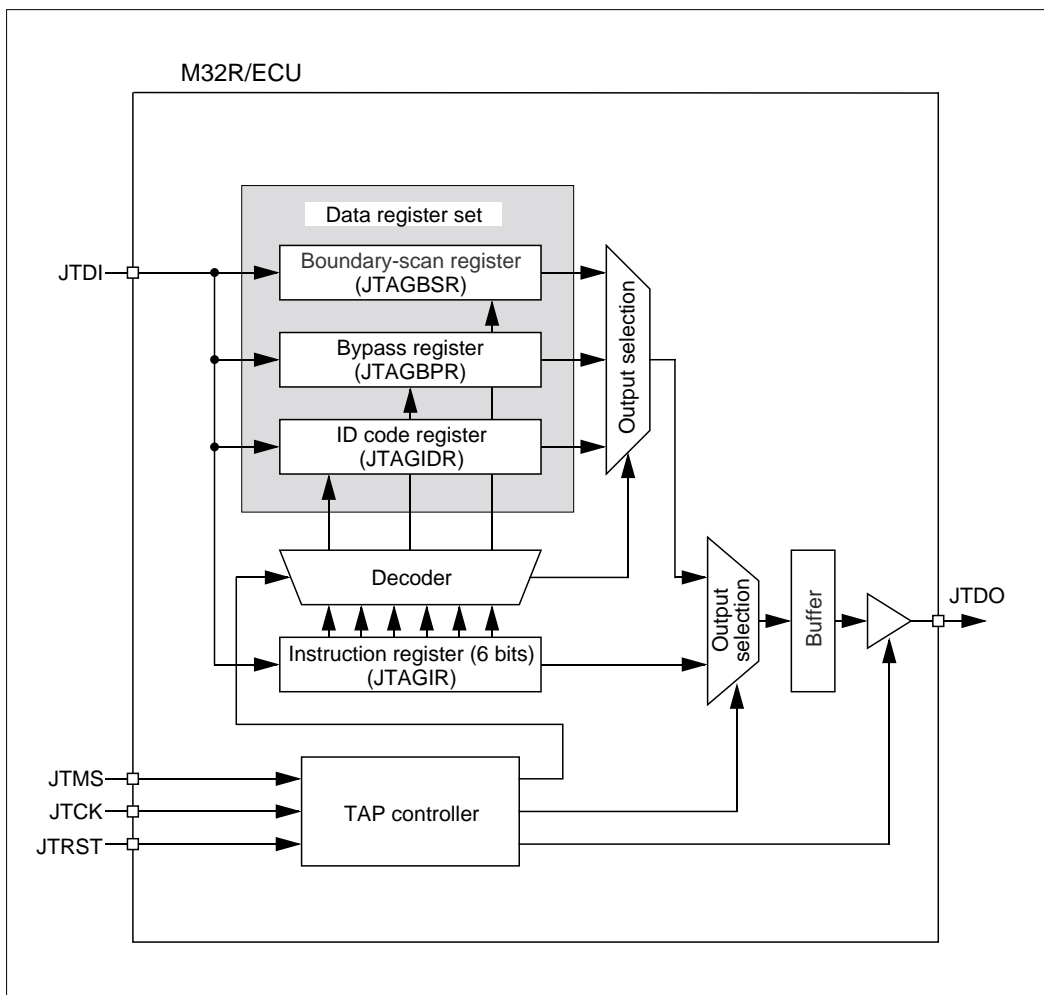

Figure 19.2.1 Configuration of the JTAG Circuit

19.3 JTAG Registers

19.3.1 Instruction Register (JTAGIR)

The Instruction Register (JTAGIR) is a 6-bit register to hold instruction code. This register is set in IR path sequence. The instructions set in this register determine the data register to be selected in the subsequent DR path sequence.

When test is reset (to initialize the test circuit), the initial value of this register is b'000010 (IDCODE instruction). After a test reset, the IDCODE Register is selected as the data register until an instruction code is set by an external device. In "Capture-IR" state, this register always has b'110001 (fixed value) loaded into it. Therefore, when in "Shift-IR" state, no matter what value was set in this register, b'110001 is always output from the JTDO pin (sequentially beginning with LSB). However, this value normally is not handled as instruction code.

Shown below is outside the scope of guaranteed operations. Note that if this operation is performed, the device may inadvertently handle b'110001 as instruction code, which makes it unable to operate normally.

[Capture-IR] → [Exit1-IR] → [Update-IR]

The 32171's JTAG interface supports the following instructions:

- Three instructions stipulated as essential in IEEE 1149.1 (EXTEST, SAMPLE/PRELOAD, BYPASS)
- Device ID register access instruction (IDCODE)

Table 19.3.1 JTAG Instruction List

Instruction Code	Abbreviation	Operation
b'000000	EXTEST	Tests circuit/board-level connections outside the chip.
b'000001	SAMPLE/PRELOAD	Samples operating circuit status and outputs the sampled status from JTDO pin, while at the same time entering the data used for boundary-scan test from the JTDI pin and presets it in Boundary Scan Register.
b'000010	IDCODE	Selects ID Code Register and outputs device and manufacturer identification data from JTDO pin.
b'111111	BYPASS	Selects Bypass Register and inspects or sets data.

Notes: • Do not set any other instruction code.

- For details about "IR path sequence," "DR path sequence," "Test reset," "Capture-IR" state, "Shift-IR" state, "Exit1-IR" state, and "Update-IR" state, refer to Section 19.4.

19.3.2 Data Registers

(1) Boundary Scan Register (JTAGBSR)

The Boundary Scan Register is a 471-bit register used to perform boundary-scan test. Bits in this register are assigned to each pin on the 32171.

Connected between the JTDI and JTDO pins, this register is selected when issuing EXTEST or SAMPLE/PRELOAD instruction. In "Capture-DR" state, this register captures the status of input pins or internal logic output values. In "Shift-DR" state, while outputting the sampled value, it is used to set pin functions (input/output pin and tristate output pin direction) and output values by entering data for boundary-scan test.

(2) Bypass Register (JTAGBPR)

The Bypass Register is a 1-bit register used to bypass boundary-scan passes when the 32171 is not the target of boundary-scan test. Connected between the JTDI and JTDO pins, this register is selected when issuing BYPASS instruction. This register when in "Capture-DR" state has b'0 (fixed value) loaded into it.

(3) ID Code Register (JTAGIDR)

The ID Code Register is a 32-bit register used to identify the device and manufacturer. It holds the following information:

- Version information (4 bits) : b'0000
- Part number (16 bits) : b'0011 0010 0010 0000
- Manufacturer ID (11 bits) : b'000 0001 1100

This register is connected between the JTDI and JTDO pins, and is selected when issuing IDCODE instruction. When in "Capture-DR" state, this register has the said IDCODE data loaded into it, which is output from the JTDO pin in "Shift_DR" state.

This register is a read-only register, so that the data written from the JTDI pin during DR pass sequence is ignored. Therefore, make sure JTDI input = low during "Shift-DR" state.

Note: • For details about "Capture-DR" and "Shift-DR" states, refer to Section 19.4.

19.4 Basic Operation of JTAG

19.4.1 Outline of JTAG Operation

The instruction and data registers basically are accessed in the following three operations, which are performed based on state transitions of the TAP controller. The TAP controller changes state according to JTMS input, and generates control signals required for operation in each state.

- **Capture operation**

The result of boundary-scan test or the fixed data defined for each register is sampled. As register operation, the input data is loaded into the shift register stage.

- **Shift operation**

The register is accessed from outside through the boundary-scan path. The sampled value is output to an external device at the same time data is set from outside. As register operation, bits are shifted right between each shift register stage.

- **Update operation**

The data set from outside during shift is driven. As register operation, the value set in the shift register stage is transferred to the parallel output stage.

The JTAG interface undergoes transitions of internal state depending on JTMS input as it performs the following two operations. In either case, the operation basically is performed in order of Capture → Shift → Update.

- **IR path sequence**

Instruction code is set in the instruction register to select the data register to be operated on in the subsequent DR path sequence.

- **DR path sequence**

The selected data register is operated on to inspect or set data.

The state transitions of the TAP controller and the basic configuration of the 32171's JTAG related registers are shown below.

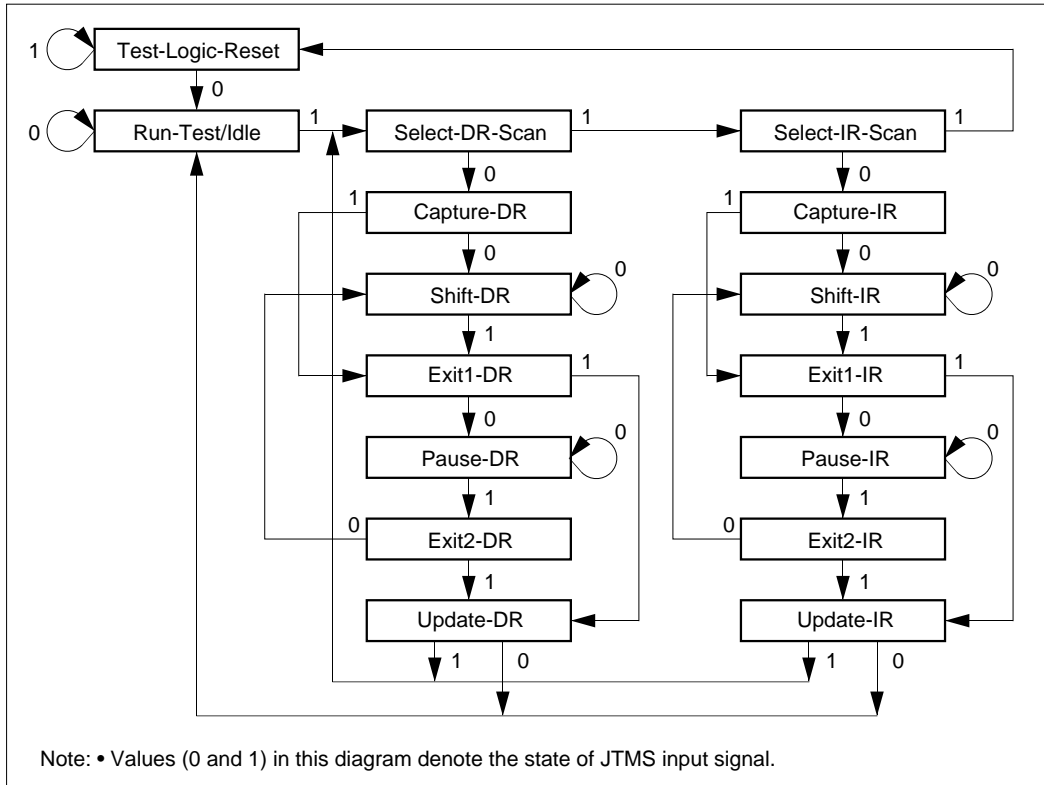

Figure 19.4.1 TAP Controller State Transition

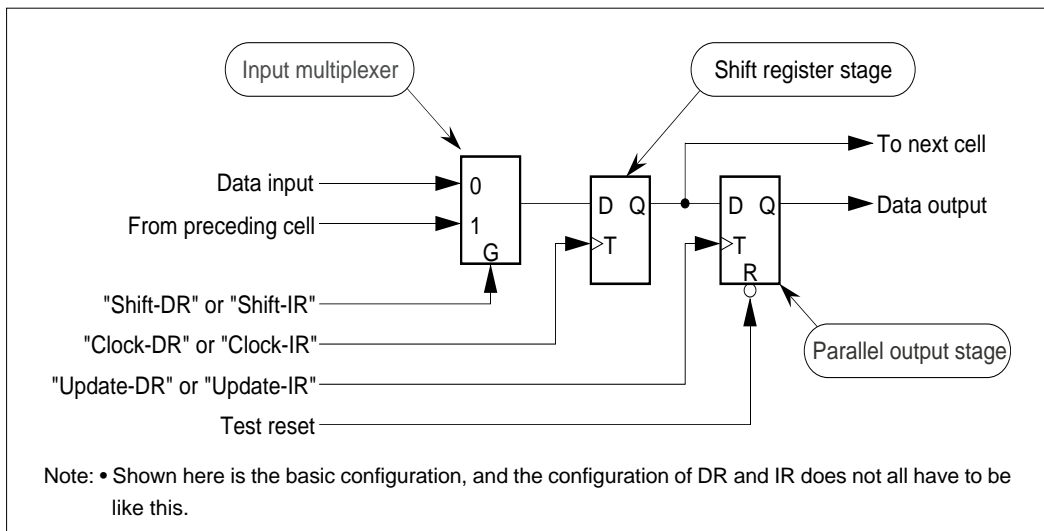

Figure 19.4.2 Basic Configuration of JTAG Related Registers

19.4.2 IR Path Sequence

Instruction code is set in the Instruction Register (JTAGIR) to select the data register to be accessed in the subsequent DR path sequence. The IR path sequence is performed following the procedure described below.

- (1) Enter JTMS = high for a period of two JTCK cycles from "Run-Test/Idle" state to go to "Select-IR-Scan" state.
- (2) Set JTMS = low to go to "Capture-IR" state. At this time, b'110001 (fixed value) is set in the instruction register's shift register stage.
- (3) Subsequently, enter JTMS = low to go to "Shift-IR" state. In "Shift-IR" state, the value of the shift register stage is shifted right one bit every cycle, and the data b'110001 (fixed value) that was set in (2) is serially output from the JTDO pin. At the same time, the instruction code serially entered from the JTDI pin is set in the shift register stage bit by bit. Because instruction code is set in the instruction register which is comprised of 6 bits, the "Shift-IR" state continues for a period of 6 JTCK cycles. To stop the shift operation in the middle, go to "Pause-IR" state via temporarily "Exit1-IR" state (by setting JTMS input from high to low). Also, to return from "Pause-IR" state, go to "Shift-IR" state via temporarily "Exit2-IR" state (by setting JTMS input from high to low).
- (4) By setting JTMS = high, go from "Shift-IR" state to "Exit1-IR" state. This completes the shift operation.
- (5) Subsequently, enter JTMS = high to go to "Update-IR" state. In "Update-IR" state, the instruction code that was set in the instruction register's shift register stage is transferred to the instruction register's parallel output stage and, thus, JTAG instruction decoding begins.
- (6) Subsequently, enter JTMS = high to go to "Select-DR-Scan" state or JTMS = low to go to "Run-Test/Idle" state.

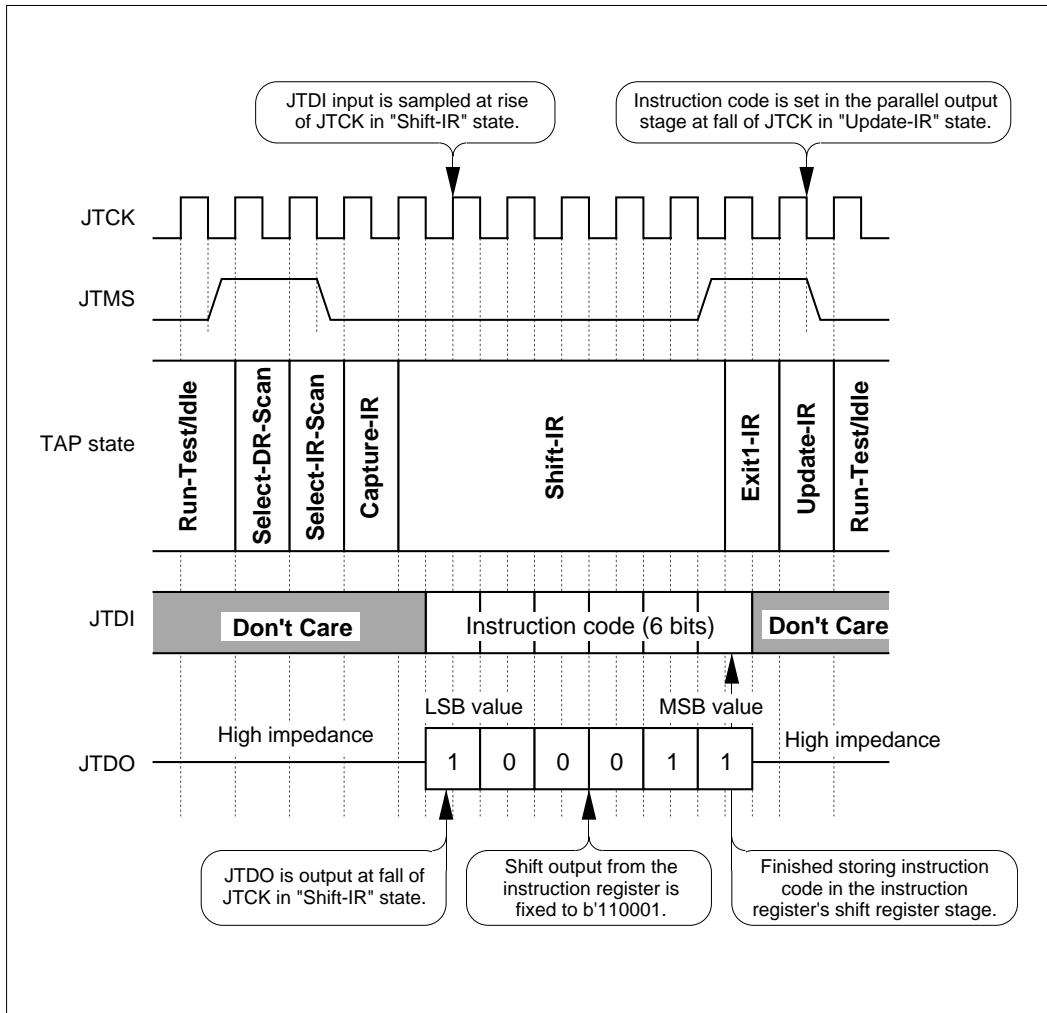

Figure 19.4.3 IR Path Sequence

19.4.3 DR Path Sequence

The data register that was selected during the IR path sequence prior to the DR path sequence is operated on to inspect or set data in it. The DR path sequence is performed following the procedure described below.

- (1) Enter JTMS = high for a period of one JTCK cycle from "Run-Test/Idle" state to go to "Select-DR-Scan" state. Which data register will be selected at this time depends on the instruction that was set during the IR path sequence performed prior to the DR path sequence.
- (2) Set JTMS = low to go to "Capture-DR" state. At this time, the result of boundary-scan test or the fixed data defined for each register is set in the data register's shift register stage.
- (3) Subsequently, enter JTMS = low to go to "Shift-DR" state. In "Shift-DR" state, the DR value is shifted right one bit every cycle, and the data that was set in (2) is serially output from the JTDO pin. At the same time, the setup data serially entered from the JTDI pin is set in the data register's shift register stage bit by bit. By continuing the "Shift-DR" state as long as the number of bits of the selected data register (by entering JTMS = low), all bits of data can be set in and read out from the shift register stage. To stop the shift operation in the middle, go to "Pause-DR" state via temporarily "Exit1-DR" state (by setting JTMS input from high to low). Also, to return from "Pause-DR" state, go to "Shift-DR" state via temporarily "Exit2-DR" state (by setting JTMS input from high to low).
- (4) Set JTMS = high to go from "Shift-DR" state to "Exit1-DR" state. This completes the shift operation.
- (5) Subsequently, enter JTMS = high to go to "Update-DR" state. In "Update-DR" state, the data that was set in the data register's shift register stage is transferred to the parallel output stage and, thus, the setup data becomes ready for use.
- (6) Subsequently, enter JTMS = high to go to "Select-DR-Scan" state or JTMS = low to go to "Run-Test/Idle" state.

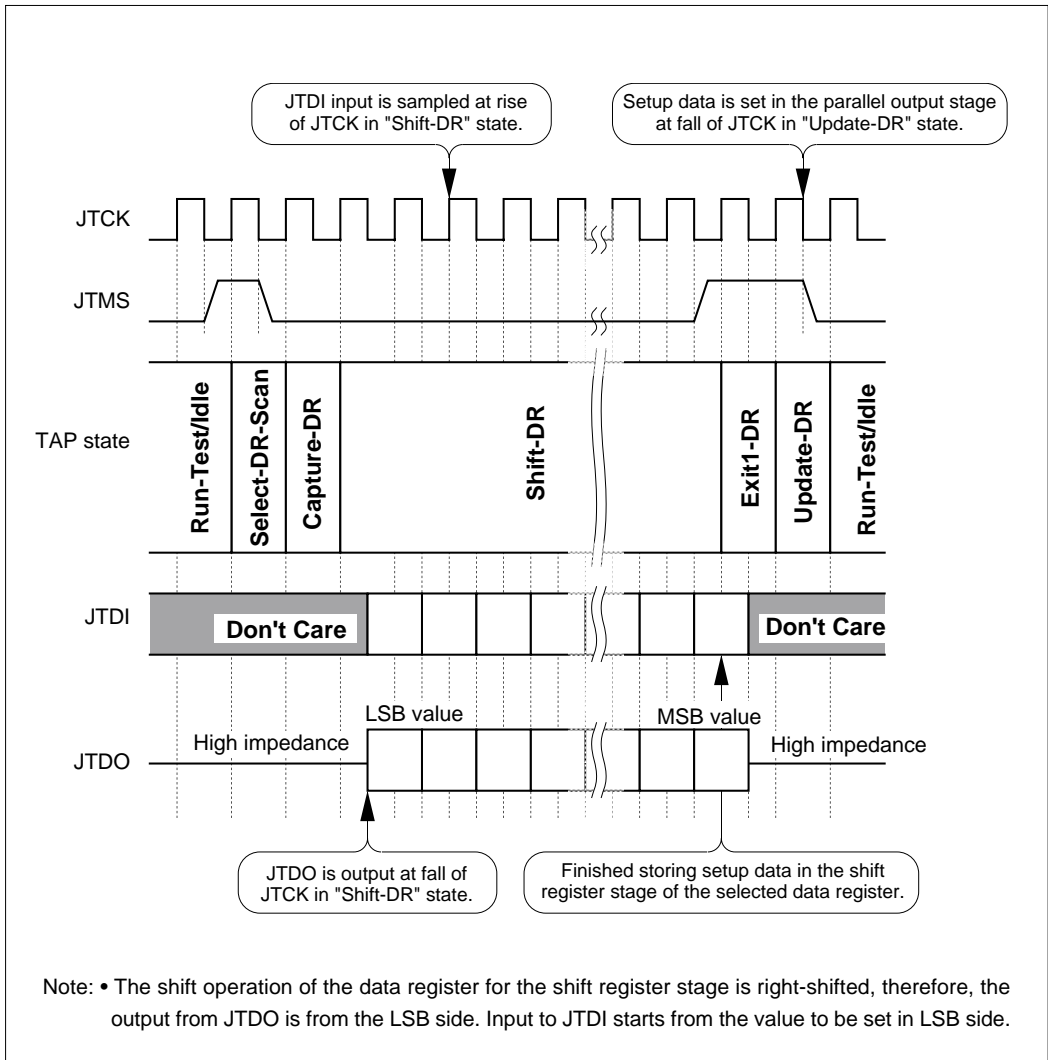

Figure 19.4.4 DR Path Sequence

19.4.4 Examining and Setting Data Registers

To inspect or set the data register, follow the procedure described below.

- (1) To access the test access port (JTAG) for the first time, enter test reset (to initialize the test circuit). Test reset can be entered by one of the following two methods:
 - Pull JTRST pin input low
 - Drive JTMS pin input high and enter JTCK for 5 cycles or more
- (2) Set JTMS = low to go to "Run-Test/Idle" state. To continue the idle state, hold JTMS input low.
- (3) Set JTMS = high to exit "Run-Test/Idle" state and perform IR path sequence. In IR path sequence, specify the data register you want to inspect or set.
- (4) Subsequently, perform DR path sequence. For the data register specified in IR path sequence, enter setup data from the JTDI pin and read out reference data from the JTDO pin.
- (5) If you want to proceed and perform IR path sequence or DR path sequence after DR path sequence is completed, enter JTMS = high to return to "Select-DR-Scan" state. If you want to wait for the next processing after a series of IR and DR path sequence processing is completed, enter JTMS = low to go to "Run-Test/Idle" state and retain the state.

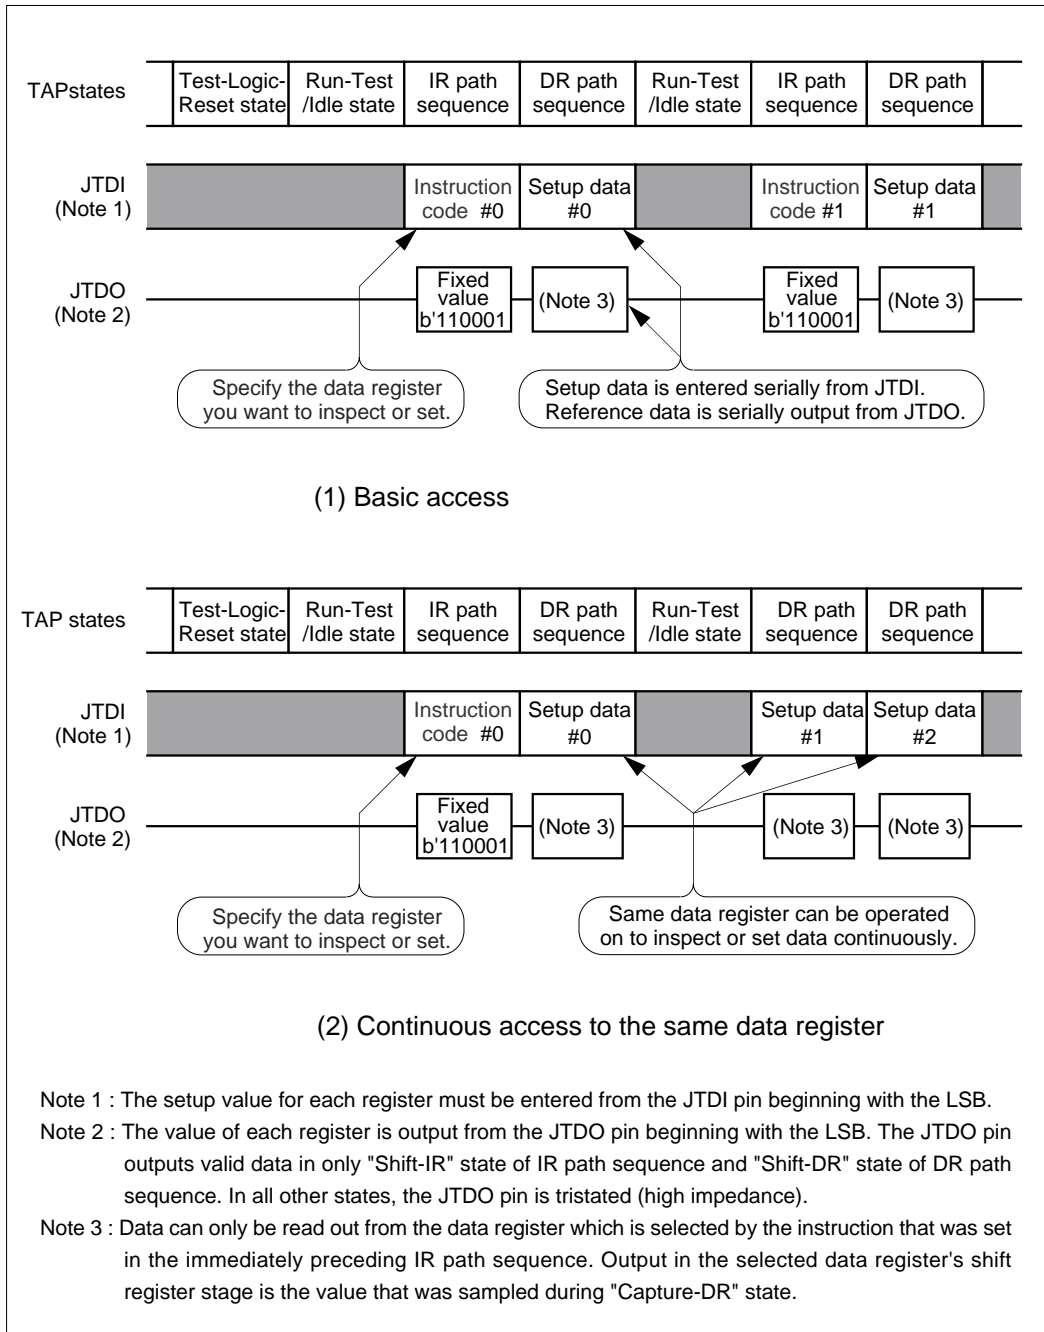

Figure 19.4.5 Continuous JTAG Access

19.5 Boundary Scan Description Language

The Boundary Scan Description Language (abbreviated BSDL) is stipulated in supplements to "Standard Test Access Port and Boundary-Scan Architecture" of IEEE 1149.1-1990 and IEEE 1149.1a-1993. BSDL is a subset of IEEE 1076-1993 Standard VHSIC Hardware Description Language (VHDL). BSDL helps to precisely describe the functions of standard-compliant components to be tested. For package connection test, this language is used by Automated Test Pattern Generation tools, and for synthesized test logic and verification, it is used by Electronic Design Automation tools. BSDL provides powerful extended functions usable in internal test generation and necessary to write hardware debug and diagnostics software.

The primary section of BSDL contains statements of logical port description, physical pin map, instruction set, and boundary register description.

- **Logical port description**

The logical port description assigns meaningful symbol names to each pin on the chip. This determines the logic type of input, output, input/output, buffer, or link of each pin that defines the logical direction of signal flow.

- **Physical pin map**

The physical pin map correlates the chip's logical ports to the physical pins on each package. Use of separate names for each map makes it possible to define multiple physical pin maps in one BSDL description.

- **Instruction set statement**

The instruction set statement writes bit patterns to be shifted in into the chip's instruction register. This bit pattern is necessary to place the chip into each test mode defined in standards. It is also possible to write instructions exclusive to the chip.

- **Boundary register description**

The boundary register description is a list of boundary register cells or shift stages. Each cell is assigned a separate number. The cell with number 0 is located closest to the test data output (JTDO) pin, and the cell with the largest number is located closest to the test data input (JTDI) pin. Cells also contain related other information which includes cell type, logical port corresponding to cell, logical function of cell, safety value, control cell number, disable value, and result value.

Note: • Information on the Boundary Scan Description Language (BSDL) can be downloaded from the M32R family application engineering data in "Renesas Home Page."

The URL address of this home page is shown below.

19.6 Precautions on Board Design when Using JTAG

The JTAG pins require that wiring lengths be matched during board design in order to accomplish fast, highly reliable communication with JTAG tools.

An example of how to process pins when using JTAG tools is shown below.

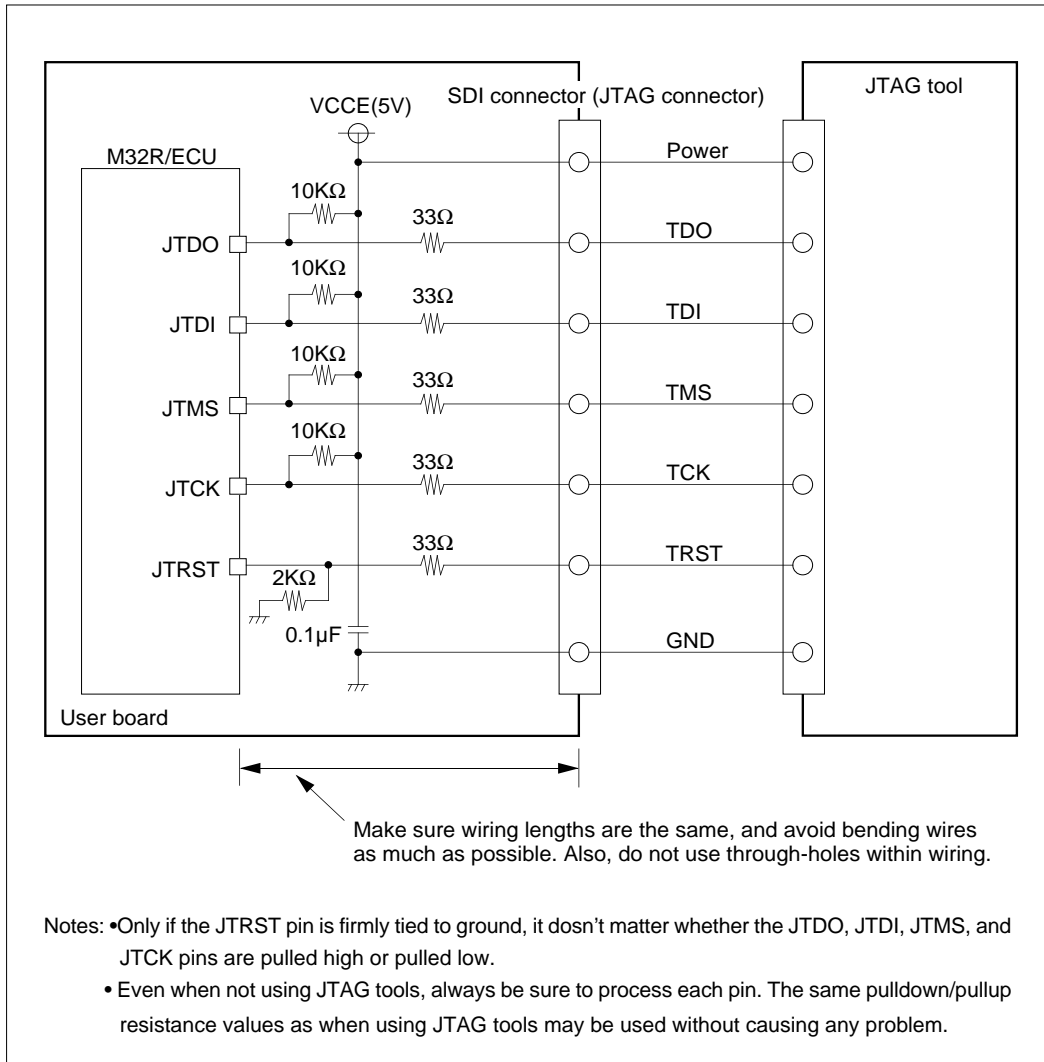

Figure 19.6.1 Example for Processing Pins when Using JTAG Tools

19.7 Processing Pins when Not Using JTAG

The diagram below shows how to process JTAG pins when not using these pins (i.e. for boards that do not have pins/connectors connecting to JTAG tools).

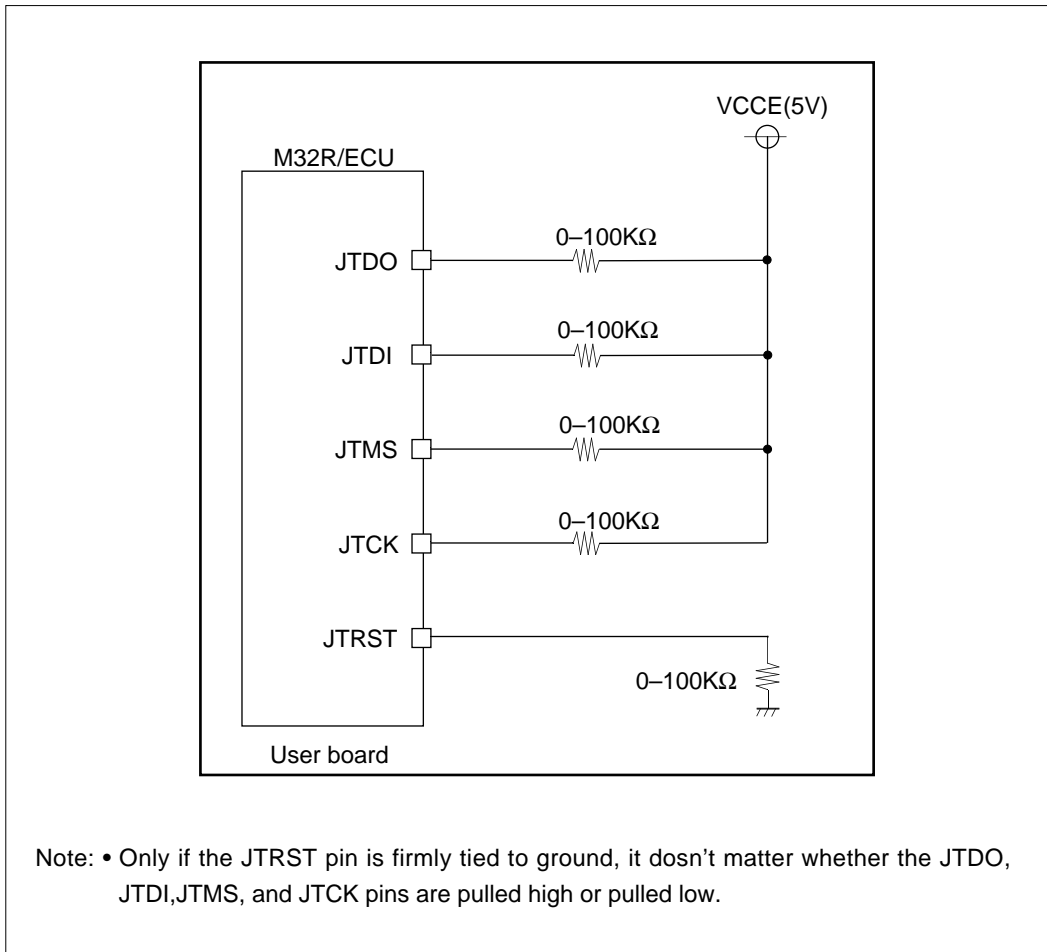

Figure 19.7.1 Processing Pins when Not Using JTAG

Circuit

20.2 Power-on Sequence

20.3 Power-off Sequence

20.1 Configuration of the Power Supply Circuit

To allow for high-speed operation with low power consumption, the M32/ECU is designed in such a way that the external interface circuits operate with a 5 V or 3.3 V external I/O power supply, while all other circuits operate with the 3.3 V internal power supply. This requires that control timing of both 5 V and 3.3 V power supplies be considered when designing your circuit.

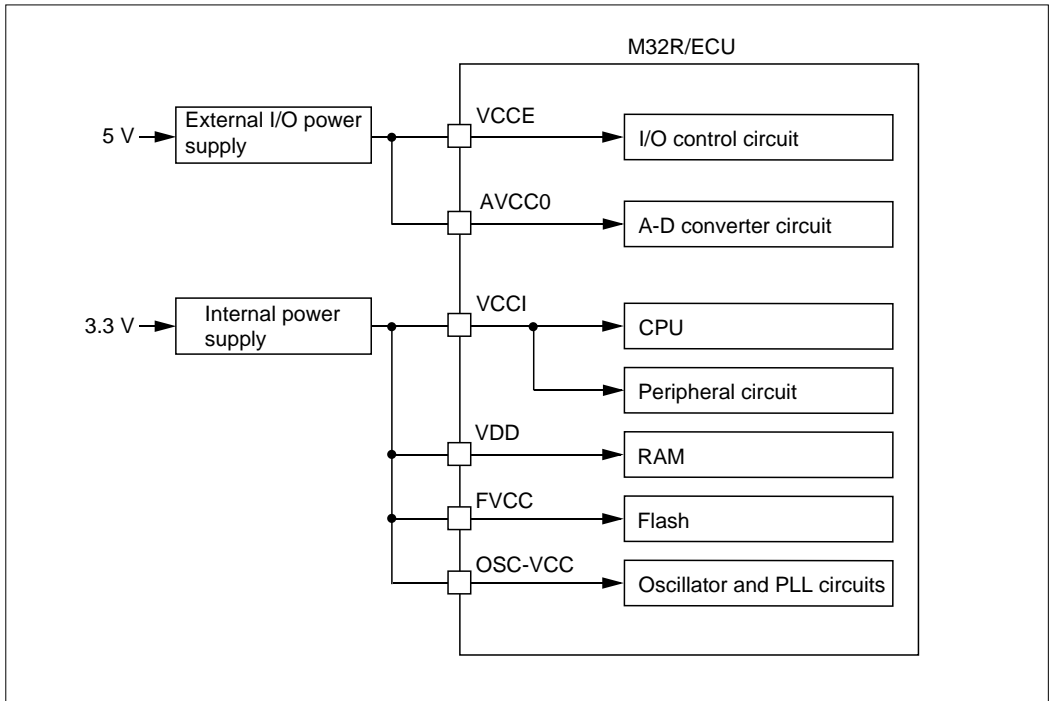

Figure 20.1.1 Configuration of the Power Supply Circuit (when external I/O power supply = 5V)

Table 20.1.1 List of Power Supply Functions

Type of Power Supply	Pin Name	Function
External I/O	VCCE	Supplies power to external I/O ports
Power Supply	AVCC0	Power supply for A-D converter
	VREF0	Reference voltage for A-D converter
Internal	VCCI	Supplies power to internal logic
Power Supply	FVCC	Power supply for internal flash memory
	VDD	Power supply for internal RAM backup
	OSC-VCC	Power supply for oscillator and PLL circuits

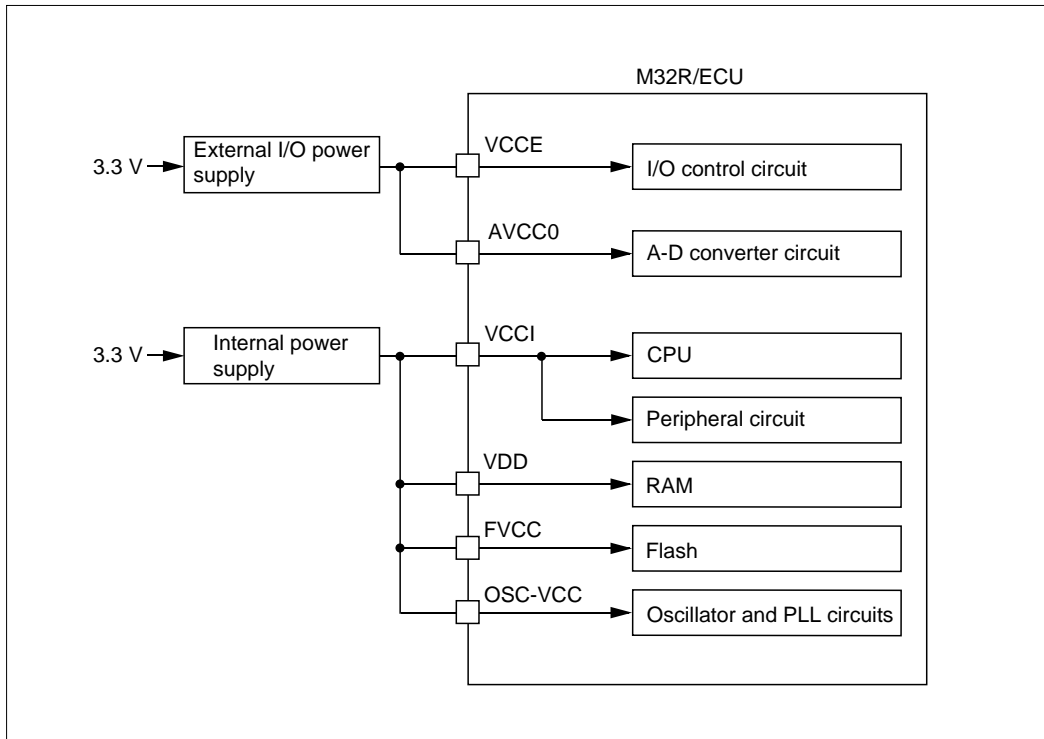

Figure 20.1.2 Configuration of the Power Supply Circuit (when external I/O power supply = 3.3V)

IOH(peak)	High State Peak Output Current P0-P22 (Note 3)				-10	mA
IOH(avg)	High State Average Output Current P0-P22 (Note 4)				-5	mA
IOL(peak)	Low State Peak Output Current P0-P22 (Note 3)				10	mA
IOL(avg)	Low State Average Output Current P0-P22 (Note 4)				5	mA
CL	Output Load Capacitance	JTCK, JTDI, JTMS, JTDO, JTRST			80	PF
		Other than above	15		50	PF
f(XIN)	External Clock Input Frequency		5		8	MHz

Note 1: Subject to conditions $VCCE \geq AVCC \geq VREF$.

Note 2: Subject to conditions $VDD \geq VCCI \geq FVCC \geq OSC-VCC$

Note 3: The total amount of output current (peak) on ports must satisfy the conditions below.

$$| \text{Ports P0} + \text{P1} + \text{P2} | \leq 80\text{ mA}$$

$$| \text{Ports P3} + \text{P4} + \text{P13} + \text{P15} + \text{P22} | \leq 80\text{ mA}$$

$$| \text{Ports P6} + \text{P7} + \text{P8} + \text{P9} + \text{P17} | \leq 80\text{ mA}$$

$$| \text{Ports P10} + \text{P11} + \text{P12} | \leq 80\text{ mA}$$

Note 4: The average output current is a value averaged during a 100 ms period.

21.1.3 DC Characteristics

21.1.3.1 Electrical Characteristics

(1) Electrical characteristics when $f(XIN) = 10\text{ MHz}$

(Referenced to $VCCE = 5\text{ V} \pm 0.5\text{V}$, $VCCI = 3.3\text{ V} \pm 0.3\text{ V}$, $T_a = -40\text{ to }85^\circ\text{C}$ Unless Otherwise Noted)

Symbol	Parameter	Condition	Rated Value			Unit
			MIN	TYP	MAX	
VOH	Output High Voltage	$IOH \geq -5\text{mA}$	$VCCE + 0.165 \times IOH(\text{mA})$		VCCE	V
VOL	Output Low Voltage	$IOL \leq 5\text{mA}$	0		$0.15 \times IOL(\text{mA})$	V
VDD	RAM Retention Power Supply Voltage	When operating	3.0		VCCI	V
		When back-up	2.0		3.6	
IIH	High State Input Current	$VI = VCCE$	-5		5	μA
IIL	Low State Input Current	$VI = 0\text{V}$	-5		5	μA
ICC-5V	5 V power supply (Note 1)	$f(XIN) = 10.0\text{MHz}$, When reset			1	mA
		$f(XIN) = 10.0\text{MHz}$, When operating		1	10	
ICCI-3V	3.3 V power supply (Note 2)	$f(XIN) = 10.0\text{MHz}$, When reset			75	mA
		$f(XIN) = 10.0\text{MHz}$, When operating		75	125	
IDDhold	RAM Retention Power Supply Current	$T_a = 25^\circ\text{C}$			50	μA
		$T_a = 85^\circ\text{C}$			1500	
$V_{T+} - V_{T-}$	Hysteresis (Note 3) RTDCLK, RTDRXD, SCLKI0,1, RXD0,1,2, TCLK3-0, TIN0,3,16-23, $\overline{\text{RESET}}$, FP, MOD0,1, JTMS, JTRST, JTDI	$VCCE = 5\text{V}$	1.0			V
$V_{T+} - V_{T-}$	Hysteresis (Note 4) $\overline{\text{SBI}}$, HREQ	$VCCE = 5\text{V}$	0.3			V

Note 1: Total current when $VCCE = AVCC = VREF$ in single-chip mode. See the next page for the rated values of power supply current on each power supply pin.

Note 2: Total current when $VCCI = VDD = FVCC = \text{OSC-VCC}$ in single-chip mode. See the next page for the rated values of power supply current on each power supply pin.

Note 3: All these pins except $\overline{\text{RESET}}$, FP, MOD0, 1, JTMS, JTRST, and JTDI serve dual-functions.

Note 4: The HREQ pin serves dual-functions.

- (2) Electrical characteristics of each power supply pin when $f(XIN) = 10\text{ MHz}$
 (Referenced to $VCCE = 5\text{ V} \pm 0.5\text{V}$, $VCCI = 3.3\text{ V} \pm 0.3\text{ V}$, $T_a = -40\text{ to }85^\circ\text{C}$ Unless Otherwise Noted)

Symbol	Parameter	Condition	Rated Value			Unit
			MIN	TYP	MAX	
ICCE	VCCE power supply current when operating	$f(XIN)=10.0\text{MHz}$			10	mA
ICCI	VCCI power supply current when operating	$f(XIN)=10.0\text{MHz}$			120	
IOSC-VCC	OSC-VCC power supply current when operating	$f(XIN)=10.0\text{MHz}$			20	mA
FICC	FVCC power supply current when operating (Note 1)	$f(XIN)=10.0\text{MHz}$			50	mA
IDD	VDD power supply current when operating (Note 2)	$f(XIN)=10.0\text{MHz}$			35	mA
IAVCC	AVCC power supply current when operating	$f(XIN)=10.0\text{MHz}$			3	mA
IVREF	VREF power supply current	$f(XIN)=10.0\text{MHz}$			1	mA

Note 1: Maximum value including currents during program/erase operation.

Note 2: Maximum value including cases where the program is executed in RAM.

(3) Electrical characteristics when $f(XIN) = 8\text{ MHz}$

(Referenced to $VCCE = 5\text{ V} \pm 0.5\text{V}$, $VCCI = 3.3\text{ V} \pm 0.3\text{ V}$, $T_a = -40\text{ to }125^\circ\text{C}$ Unless Otherwise Noted)

Symbol	Parameter	Condition	Rated Value			Unit
			MIN	TYP	MAX	
VOH	Output High Voltage	$I_{OH} \geq -5\text{mA}$	$VCCE + 0.165 \times I_{OH}(\text{mA})$		VCCE	V
VOL	Output Low Voltage	$I_{OL} \leq 5\text{mA}$	0		$0.15 \times I_{OL}(\text{mA})$	V
VDD	RAM Retention Power Supply Voltage	When operating	3.0		VCCI	V
		When back-up	2.0		3.6	
IIH	High State Input Current	$V_I = VCCE$	-5		5	μA
IIL	Low State Input Current	$V_I = 0\text{V}$	-5		5	μA
ICC-5V	5 V power supply (Note 1)	$f(XIN) = 8.0\text{MHz}$, When reset			1	mA
		$f(XIN) = 8.0\text{MHz}$, When operating		1	10	
ICCI-3V	3.3 V power supply (Note 2)	$f(XIN) = 8.0\text{MHz}$, When reset			70	mA
		$f(XIN) = 8.0\text{MHz}$, When operating		60	110	
IDDhold	RAM Retention Power Supply Current	$T_a = 25^\circ\text{C}$		See RAM retention power supply current characteristic graph	50	μA
		$T_a = 125^\circ\text{C}$			4000	
$V_{T+} - V_{T-}$	Hysteresis (Note 3) RTDCLK, RTDRXD, SCLKI0,1, RXD0,1,2, TCLK3-0, TIN0,3,16-23, RESET, FP, MOD0,1, JTMS, JTRST, JTDI	$VCCE = 5\text{V}$	1.0			V
$V_{T+} - V_{T-}$	Hysteresis (Note 4) SBI, HREQ	$VCCE = 5\text{V}$	0.3			V

Note 1: Total current when $VCCE = AVCC = VREF$ in single-chip mode. See the next page for the rated values of power supply current on each power supply pin.

Note 2: Total current when $VCCI = VDD = FVCC = OSC-VCC$ in single-chip mode. See the next page for the rated values of power supply current on each power supply pin.

Note 3: All these pins except RESET, FP, MOD0, 1, JTMS, JTRST, and JTDI serve dual-functions.

Note 4: The HREQ pin serves dual-functions.

(4) Electrical characteristics of each power supply pin when $f(XIN) = 8\text{ MHz}$
 (Referenced to $VCCE = 5\text{ V} \pm 0.5\text{ V}$, $VCCI = 3.3\text{ V} \pm 0.3\text{ V}$, $T_a = -40\text{ to }125^\circ\text{C}$ Unless Otherwise Noted)

Symbol	Parameter	Condition	Rated Value			Unit
			MIN	TYP	MAX	
ICCE	VCCE power supply current when operating	$f(XIN)=8.0\text{MHz}$			10	mA
ICCI	VCCI power supply current when operating	$f(XIN)=8.0\text{MHz}$			105	
IOSC-VCC	OSCVCC power supply current when operating	$f(XIN)=8.0\text{MHz}$			16	mA
FICC	FVCC power supply current when operating (Note 1)	$f(XIN)=8.0\text{MHz}$			50	mA
IDD	VDD power supply current when operating (Note 2)	$f(XIN)=8.0\text{MHz}$			30	mA
IAVCC	AVCC power supply current when operating	$f(XIN)=8.0\text{MHz}$			3	mA
IVREF	VREF power supply current	$f(XIN)=8.0\text{MHz}$			1	mA

Note 1: Maximum value including currents during program/erase operation.

Note 2: Maximum value including cases where the program is executed in RAM.

RAM retention power supply current in a standard sample (reference value)

Standard sample's ICCI-3V temperature characteristics (when operating: f = 8 MHz, 10 MHz)

Standard sample's ICCI-3V temperature characteristics (when reset: f = 8 MHz, 10 MHz)

21.1.3.2 Flash Related Electrical Characteristics

Flash Related Electrical Characteristics (Referenced to VCCE = 5 V ± 0.5 V, VCCI = 3.3 V ± 0.3 V Unless Otherwise Noted)

Symbol	Parameter	Condition	Rated Value			Unit
			MIN	TYP	MAX	
I _{fvcc1}	FVCC Power Supply Current (when Programming)				50	mA
I _{fvcc2}	FVCC Power Supply Current (when Erasing)				40	mA
T _{opr}	Flash Rewrite Ambient Temperature		0		70	°C
cycle	Rewrite Durability				100	times
t _{PRG}	Program Time	1 Page		8	120	ms
t _{BERS}	Block Erase Time	1 Block		50	600	ms

21.1.4 A-D Conversion Characteristics

A-D Conversion Characteristics (Referenced to AVCC = VREF = VCCE = 5.12 V, Ta = -40 to 85°C, f(XIN) = 10.0 MHz Unless Otherwise Noted)

Symbol	Parameter		Condition	Rated Value			Unit
				MIN	TYP	MAX	
—	Resolution		VREF=VCCE			10	Bits
—	Absolute Accuracy (Note 1)					±2	LSB
TCONV	Conversion Time	During normal mode		14950			ns
		During double-speed mode		8650			
IIAN	Analog Input Leakage Current		(Note 2)	-5		5	μA

Note 1: The absolute accuracy represents the accuracy of output code including all error sources (including quantization error) of the A-D converter relative to the analog input, and is obtained by the equation below:

$$\text{Absolute accuracy} = \text{output code} - (\text{analog input voltage ANi} / 1 \text{ LSB})$$

$$\text{When AVCC} = \text{VREF} = 5.12 \text{ V}, 1 \text{ LSB} = 5 \text{ mV.}$$

Note 2: This refers to input leakage current on AN0-AN15 when the A-D converter remains idle. Input voltage condition: $0 \leq \text{ANi} \leq \text{AVCC}$. Temperature condition: -40 to 85°C.

A-D Conversion Characteristics (Referenced to AVCC = VREF = VCCE = 5.12 V, Ta = -40 to 125°C, f(XIN) = 8.0 MHz Unless Otherwise Noted)

Symbol	Parameter		Condition	Rated Value			Unit
				MIN	TYP	MAX	
—	Resolution		VREF=VCCE			10	Bits
—	Absolute Accuracy (Note 1)					±2	LSB
TCONV	Conversion Time	During normal mode		18687.5			ns
		During double-speed mode		10812.5			
IIAN	Analog Input Leakage Current		(Note 2)	-5		5	μA

Note1: The absolute accuracy represents the accuracy of output code including all error sources (including quantization error) of the A-D converter relative to the analog input, and is obtained by the equation below:

$$\text{Absolute accuracy} = \text{output code} - (\text{analog input voltage ANi} / 1 \text{ LSB})$$

$$\text{When AVCC} = \text{VREF} = 5.12 \text{ V}, 1 \text{ LSB} = 5 \text{ mV.}$$

Note 2: This refers to input leakage current on AN0-AN15 when the A-D converter remains idle. Input voltage condition: $0 \leq \text{ANi} \leq \text{AVCC}$. Temperature condition: -40 to 85°C.

21.2 ELECTRICAL CHARACTERISTICS (VCCE = 3.3V)**21.2.1 Absolute Maximum Ratings**

Absolute Maximum Ratings (Guaranteed for Operation at -40 to 125°C)

Symbol	Parameter	Condition	Rated Value	Unit
VCCI	Internal Logic Power Supply Voltage	$VDD \geq VCCI \geq FVCC = OSC - VCC$	-0.3 to 4.2	V
VDD	RAM Power Supply Voltage	$VDD \geq VCCI \geq FVCC = OSC - VCC$	-0.3 to 4.2	V
OSC-VCC	PLL Power Supply Voltage	$VDD \geq VCCI \geq FVCC = OSC - VCC$	-0.3 to 4.2	V
FVCC	Flash Power Supply Voltage	$VDD \geq VCCI \geq FVCC = OSC - VCC$	-0.3 to 4.2	V
VCCE	External I/O Buffer Voltage	$VCCE \geq AVCC \geq VREF$	-0.3 to 6.5	V
AVCC	Analog Power Supply Voltage	$VCCE \geq AVCC \geq VREF$	-0.3 to 6.5	V
VREF	Analog Reference Voltage	$VCCE \geq AVCC \geq VREF$	-0.3 to 6.5	V
VI	Xin, VCNT		-0.3 to OSC-VCC+0.3	V
	Other		-0.3 to VCCE+0.3	
VO	Xout		-0.3 to OSC-VCC+0.3	V
	Other		-0.3 to VCCE+0.3	
Pd	Power Dissipation	Ta=-40 to 85°C	600	mW
		Ta=-40 to 125°C	500	mW
TOPR	Operating Ambient Temperature (Note 1)		-40 to 125	°C
Tstg	Storage Temperature		-65 to 150	°C

Note 1: This does not guarantee that the device can operate continuously at 125°C. If you are considering the use of this product in 125°C application, please consult Renesas.

21.2.2 Recommended Operating Conditions

Recommended Operating Conditions (Referenced to VCCE = VCCI = 3.3 V ± 0.3 V, Ta = -40 to 85°C Unless Otherwise Noted)

Symbol	Parameter		Rated Value			Unit
			MIN	TYP	MAX	
VCCE	External I/O Buffer Power Supply Voltage		3.0	3.3	3.6	V
VCCI	Internal Logic Power Supply Voltage		3.0	3.3	3.6	V
VDD	RAM Power Supply Voltage		$3.0 \leq VCCI - 0.3$	VCCI	$VCCI + 0.3 \leq 3.6$	V
FVCC	Flash Power Supply Voltage		$3.0 \leq VCCI - 0.3$	VCCI	$VCCI + 0.3 \leq 3.6$	V
AVCC	Analog Power Supply Voltage		$3.0 \leq VCCE - 0.3$	VCCE	$VCCE + 0.3 \leq 3.6$	V
OSC-VCC	PLL Power Supply Voltage		$3.0 \leq VCCI - 0.3$	VCCI	$VCCI + 0.3 \leq 3.6$	V
VREF	Analog Reference Voltage		$3.0 \leq VCCE - 0.3$	VCCE	$VCCE + 0.3 \leq 3.6$	V
VIH	Input High Voltage	Ports P0-P22, \overline{RESET} , MOD0, MOD1, FP	0.8VCCE		VCCE	V
		Ports P0, P1 (external extension/ processor mode only), \overline{WAIT}	0.43VCCE		VCCE	V
VIL	Input Low Voltage	Ports P0-P22, \overline{RESET} , MOD0, MOD1, FP	0		0.2VCCE	V
		Ports P0, P1 (external extension/ processor mode only), \overline{WAIT}	0		0.16VCCE	V
IOH(peak)	High State Peak Output Current P0-P22 (Note 1)				-10	mA
IOH(avg)	High State Average Output Current P0-P22 (Note 2)				-5	mA
IOL(peak)	Low State Peak Output Current P0-P22 (Note 1)				10	mA
IOL(avg)	Low State Average Output Current P0-P22 (Note 2)				5	mA
CL	Output Load Capacitance	JTCK, JTDI, JTMS, JTDO, JTRST			80	PF
		Other than above	15		50	PF
f(XIN)	External Clock Input Frequency		5		10	MHz

Note 1: The total amount of output current (peak) on ports must satisfy the conditions below.

$$| \text{Ports P0} + \text{P1} + \text{P2} | \leq 80 \text{ mA}$$

$$| \text{Ports P3} + \text{P4} + \text{P13} + \text{P15} + \text{P22} | \leq 80 \text{ mA}$$

$$| \text{Ports P6} + \text{P7} + \text{P8} + \text{P9} + \text{P17} | \leq 80 \text{ mA}$$

$$| \text{Ports P10} + \text{P11} + \text{P12} | \leq 80 \text{ mA}$$

Note 2: The average output current is a value averaged during a 100 ms period.

Recommended Operating Conditions (Referenced to VCCE = VCCI = 3.3 V ± 0.3 V, Ta = -40 to 125°C Unless Otherwise Noted)

Symbol	Parameter		Rated Value			Unit
			MIN	TYP	MAX	
VCCE	External I/O Buffer Power Supply Voltage		3.0	3.3	3.6	V
VCCI	Internal Logic Power Supply Voltage		3.0	3.3	3.6	V
VDD	RAM Power Supply Voltage		$3.0 \leq VCCI - 0.3$	VCCI	$VCCI + 0.3 \leq 3.6$	V
FVCC	Flash Power Supply Voltage		$3.0 \leq VCCI - 0.3$	VCCI	$VCCI + 0.3 \leq 3.6$	V
AVCC	Analog Power Supply Voltage		$3.0 \leq VCCE - 0.3$	VCCE	$VCCE + 0.3 \leq 3.6$	V
OSC-VCC	PLL Power Supply Voltage		$3.0 \leq VCCI - 0.3$	VCCI	$VCCI + 0.3 \leq 3.6$	V
VREF	Analog Reference Voltage		$3.0 \leq VCCE - 0.3$	VCCE	$VCCE + 0.3 \leq 3.6$	V
VIH	Input High Voltage	Ports P0-P22, RESET, MOD0, MOD1, FP	$0.8VCCE$		VCCE	V
		Ports P0, P1 (external extension/processor mode only), WAIT	$0.43VCCE$		VCCE	V
VIL	Input Low Voltage	Ports P0-P22, RESET, MOD0, MOD1, FP	0		$0.2VCCE$	V
		Ports P0, P1 (external extension/processor mode only), WAIT	0		$0.16VCCE$	V
IOH(peak)	High State Peak Output Current P0-P22 (Note 1)				-10	mA
IOH(avg)	High State Average Output Current P0-P22 (Note 2)				-5	mA
IOL(peak)	Low State Peak Output Current P0-P22 (Note 1)				10	mA
IOL(avg)	Low State Average Output Current P0-P22 (Note 2)				5	mA
CL	Output Load Capacitance	JTCK, JTDI, JTMS, JTDO, JTRST			80	PF
		Other than above	15		50	PF
f(XIN)	External Clock Input Frequency		5		8	MHz

Note 1: The total amount of output current (peak) on ports must satisfy the conditions below.

- | Ports P0 + P1 + P2 | ≤ 80 mA
- | Ports P3 + P4 + P13 + P15 + P22 | ≤ 80 mA
- | Ports P6 + P7 + P8 + P9 + P17 | ≤ 80 mA
- | Ports P10 + P11 + P12 | ≤ 80 mA

Note 2: The average output current is a value averaged during a 100 ms period.

21.2.3 DC Characteristics

21.2.3.1 Electrical Characteristics

(1) Electrical characteristics when $f(XIN) = 10\text{ MHz}$ (Referenced to $VCCE = VCCI = 3.3\text{ V} \pm 0.3\text{ V}$, $T_a = -40\text{ to }85^\circ\text{C}$ Unless Otherwise Noted)

Symbol	Parameter	Condition	Rated Value			Unit
			MIN	TYP	MAX	
VOH	Output High Voltage	$I_{OH} \geq -2\text{mA}$	$VCCE + 0.5 \times I_{OH}(\text{mA})$		VCCE	V
VOL	Output Low Voltage	$I_{OL} \leq 2\text{mA}$	0		$0.225 \times I_{OL}(\text{mA})$	V
VDD	RAM Retention Power Supply Voltage	When operating	3.0		VCCI	V
		When back-up	2.0		3.6	
IIH	High State Input Current	$V_I = VCCE$	-5		5	μA
IIL	Low State Input Current	$V_I = 0\text{V}$	-5		5	μA
ICCres	Power supply current when reset (Note 1)	$f(XIN) = 10.0\text{MHz}$, When reset			76	mA
ICC	Power supply current when operating (Note 1)	$f(XIN) = 10.0\text{MHz}$, When operating		76	132	
IDDhold	RAM Retention Power Supply Current	$T_a = 25^\circ\text{C}$		See RAM retention power supply current characteristic graph	50	μA
		$T_a = 85^\circ\text{C}$			1500	
$V_{T+} - V_{T-}$	Hysteresis (Note 2) RTDCLK, RTDRXD, SCLKI0,1, RXD0,1,2, TCLK3-0, TIN0,3,16-23, RESET, FP, MOD0,1, JTMS, JTRST, JTDI	$VCCE = 3.3\text{V}$	0.65			V
$V_{T+} - V_{T-}$	Hysteresis (Note 3) SBI, HREQ	$VCCE = 3.3\text{V}$	0.2			V

Note 1: Total current when $VCCE = AVCC = VREF = VCCI = VDD = FVCC = OSC - VCC$ in single-chip mode. See the next page for the rated values of power supply current on each power supply pin.

Note 2: All these pins except $\overline{\text{RESET}}$ serve dual-functions.

Note 3: The $\overline{\text{HREQ}}$ pin serves dual-functions.

(2) Electrical characteristics of each power supply pin when $f(XIN) = 10\text{ MHz}$

(Referenced to $VCCE = VCCI = 3.3\text{ V} \pm 0.3\text{ V}$, $T_a = -40\text{ to }85^\circ\text{C}$ Unless Otherwise Noted)

Symbol	Parameter	Condition	Rated Value			Unit
			MIN	TYP	MAX	
ICCE	VCCE power supply current when operating	$f(XIN)=10.0\text{MHz}$			7	mA
ICCI	VCCI power supply current when operating	$f(XIN)=10.0\text{MHz}$			120	
OSC-ICC	OSC-VCC power supply current when operating	$f(XIN)=10.0\text{MHz}$			20	mA
FICC	FVCC power supply current when operating (Note 1)	$f(XIN)=10.0\text{MHz}$			50	mA
IDD	VDD power supply current when operating (Note 2)	$f(XIN)=10.0\text{MHz}$			35	mA
IAVCC	AVCC power supply current when operating	$f(XIN)=10.0\text{MHz}$			2	mA
IVREF	VREF power supply current	$f(XIN)=10.0\text{MHz}$			1	mA

Note 1: Maximum value including currents during program/erase operation.

Note 2: Maximum value including cases where the program is executed in RAM.

(3) Electrical characteristics when $f(XIN) = 8\text{ MHz}$

(Referenced to $VCCE = VCCI = 3.3\text{ V} \pm 0.3\text{ V}$, $T_a = -40\text{ to }125^\circ\text{C}$ Unless Otherwise Noted)

Symbol	Parameter	Condition	Rated Value			Unit
			MIN	TYP	MAX	
VOH	Output High Voltage	$I_{OH} \geq -2\text{mA}$	$VCCE + 0.5 \times I_{OH}(\text{mA})$		VCCE	V

ICCres	Power supply current when reset (Note 1)	$f(XIN) = 8.0\text{MHz}$, When reset			71	mA
ICC	Power supply current when operating (Note 1)	$f(XIN) = 8.0\text{MHz}$, When operating		61	117	
IDDhold	RAM Retention Power Supply Current	$T_a = 25^\circ\text{C}$		See RAM retention power supply current characteristic graph	50	μA
		$T_a = 125^\circ\text{C}$			4000	
$V_{T+} - V_{T-}$	Hysteresis (Note 2) RTDCLK, RTDRXD, SCLKI0,1, RXD0,1,2, TCLK3-0, TIN0,3,16-23, RESET, FP, MOD0,1, JTMS, JTRST, JTDI	$VCCE = 3.3\text{V}$	0.65			V
$V_{T+} - V_{T-}$	Hysteresis (Note 3) SBI, HREQ	$VCCE = 3.3\text{V}$	0.2			V

Note 1: Total current when $VCCE = AVCC = VREF = VCCI = VDD = FVCC = OSC - VCC$ in single-chip mode. See the next page for the rated values of power supply current on each power supply pin.

Note 2: All these pins except $\overline{\text{RESET}}$ serve dual-functions.

Note 3: The HREQ pin serves dual-functions.

- (4) Electrical characteristics of each power supply pin when $f(XIN) = 8\text{ MHz}$
 (Referenced to $VCCE = VCCI = 3.3\text{ V} \pm 0.3\text{ V}$, $T_a = -40\text{ to }125^\circ\text{C}$ Unless Otherwise Noted)

Symbol	Parameter	Condition	Rated Value			Unit
			MIN	TYP	MAX	
ICCE	VCCE power supply current when operating	$f(XIN)=8.0\text{MHz}$			7	mA
ICCI	VCCI power supply current when operating	$f(XIN)=8.0\text{MHz}$			105	
OSC-ICC	OSC-VCC power supply current when operating	$f(XIN)=8.0\text{MHz}$			16	mA
FICC	FVCC power supply current when operating (Note 1)	$f(XIN)=8.0\text{MHz}$			50	mA
IDD	VDD power supply current when operating (Note 2)	$f(XIN)=8.0\text{MHz}$			30	mA
IAVCC	AVCC power supply current when operating	$f(XIN)=8.0\text{MHz}$			2	mA
IVREF	VREF power supply current	$f(XIN)=8.0\text{MHz}$			1	mA

Note 1: Maximum value including currents during program/erase operation.

Note 2: Maximum value including cases where the program is executed in RAM.

21.2.3.2 Flash Related Electrical Characteristics

Flash Related Electrical Characteristics (Referenced to $VCCE = VCCI = 3.3\text{ V} \pm 0.3\text{ V}$ Unless Otherwise Noted)

Symbol	Parameter	Condition	Rated Value			Unit
			MIN	TYP	MAX	
I _{fvcc1}	FVCC Power Supply Current (when Programming)				50	mA
I _{fvcc2}	FVCC Power Supply Current (when Erasing)				40	mA
T _{opr}	Flash Rewrite Ambient Temperature		0		70	°C
cycle	Rewrite Durability				100	times
t _{PRG}	Program Time	1 Page		8	120	ms
t _{BERS}	Block Erase Time	1 Block		50	600	ms

21.2.4 A-D Conversion Characteristics

A-D Conversion Characteristics (Referenced to AVCC = VREF = VCCE = 3.3 V, Ta = -40 to 85°C, f(XIN) = 10.0 MHz Unless Otherwise Noted)

Symbol	Parameter		Condition	Rated Value			Unit
				MIN	TYP	MAX	
—	Resolution		VREF=VCCE			10	Bits
—	Absolute Accuracy (Note 1)					±4	LSB
TCONV	Conversion Time	During normal mode		14950			ns
		During double-speed mode		8650			
IIAN	Analog Input Leakage Current		(Note 2)	-5		5	μA

Note 1: The absolute accuracy represents the accuracy of output code including all error sources (including quantization error) of the A-D converter relative to the analog input, and is obtained by the equation below:

$$\text{Absolute accuracy} = \text{output code} - (\text{analog input voltage ANi} / 1 \text{ LSB})$$

$$\text{When AVCC} = \text{VREF} = 3.072 \text{ V, } 1 \text{ LSB} = 3 \text{ mV.}$$

Note 2: This refers to input leakage current on AN0-AN15 when the A-D converter remains idle. Input voltage condition: $0 \leq \text{ANi} \leq \text{AVCC}$. Temperature condition: -40 to 85°C.

A-D Conversion Characteristics (Referenced to AVCC = VREF = VCCE = 3.3 V, Ta = -40 to 125°C, f(XIN) = 8.0 MHz Unless Otherwise Noted)

Symbol	Parameter		Condition	Rated Value			Unit
				MIN	TYP	MAX	
—	Resolution		VREF=VCCE			10	Bits
—	Absolute Accuracy (Note 1)					±4	LSB
TCONV	Conversion Time	During normal mode		18687.5			ns
		During double-speed mode		10812.5			
IIAN	Analog Input Leakage Current		(Note 2)	-5		5	μA

Note 1: The absolute accuracy represents the accuracy of output code including all error sources (including quantization error) of the A-D converter relative to the analog input, and is obtained by the equation below:

$$\text{Absolute accuracy} = \text{output code} - (\text{analog input voltage ANi} / 1 \text{ LSB})$$

$$\text{When AVCC} = \text{VREF} = 3.072 \text{ V, } 1 \text{ LSB} = 3 \text{ mV.}$$

Note 2: This refers to input leakage current on AN0-AN15 when the A-D converter remains idle. Input voltage condition: $0 \leq \text{ANi} \leq \text{AVCC}$. Temperature condition: -40 to 85°C.

21.3 AC Characteristics

21.3.1 Timing Requirements

- Unless otherwise noted, timing conditions are $V_{CC} = 5\text{ V} \pm 0.5\text{ V}$ or $V_{CC} = 3.3\text{ V} \pm 0.3\text{ V}$, $V_{CCI} = 3.3\text{ V} \pm 0.3\text{ V}$, $T_a = -40$ to 125°C
- The characteristic values apply to the case of concentrated capacitance with an output load capacitance of 15 to 50 pF (however, 80 pF for JTAG-related).

(1) Input/output ports

Symbol	Parameter	Condition	Rated Value		Unit	See Figure 21.3.1
			MIN	MAX		
$t_{su}(P-E)$	Port Input Setup Time		100		ns	①

APPENDIX 2

INSTRUCTION PROCESSING TIME

Appendix 2.1 M32R/ECU Instruction
Processing Time

Appendix 2.1 M32R/ECU Instruction Processing Time

For the M32R/ECU, the number of instruction execution cycles in E stage normally represents its instruction processing time. However, depending on pipeline operation, other stages may affect the instruction processing time. Especially when a branch instruction is executed, the processing time in the IF (instruction fetch), D (decode) and E (execution) stages of the next instruction must also be taken into account.

The table below shows the instruction processing time in each pipelined stage of the M32R/ECU.

Table 2.1.1 Instruction Processing Time of Each Pipeline Stage

Instruction	Number of execution cycles in each stage (Note 1)				
	IF	D	E	MEM	WB
Load instructions (LD, LDB, LDUB, LDH, LDUH, LOCK)	R	1	1	R	1
Store instructions (ST,STB,STH,UNLOCK)	R	1	1	W	-
Multiply instruction (MUL)	R	1	3	-	1
Divide/remainder instructions (DIV, DIVU,REM,REMU)	R	1	37	-	1
Other instructions (including those for DSP function)	R	1	1	-	1

Note 1: For R and W, refer to the calculation methods described in the next page.

The following shows the number of memory access cycles in IF and MEM stages. Shown here are the minimum number of cycles required for memory access. Therefore, these values do not always reflect the number of cycles required for actual memory or bus access.

In write access, for example, although the CPU finishes the MEM stage by only writing to the write buffer, this operation actually is followed by a write to memory. Depending on the memory or bus state before or after the CPU requested a memory access, the instruction processing may take more time than the calculated value.

■ R (read cycle)	Cycles
When existing in instruction queue	1
When reading internal resource (ROM, RAM)	1
When reading internal resource (SFR)(byte, halfword)	2
When reading internal resource (SFR)(word)	4
When reading external memory (byte, halfword)	5 (Note 1)
When reading external memory (word)	9 (Note 1)
When successively fetching instructions from external memory	8 (Note 1)

■ W (write cycle)	Cycles
When writing to internal resource (RAM)	1
When writing to internal resource (SFR)(byte, halfword)	2
When writing to internal resource (SFR)(word)	4
When writing to external memory (byte, halfword)	4 (Note 1)
When writing to external memory (word)	8 (Note 1)

Note 1: This applies for external access with one wait cycle. (When the M32R/ECU accesses external circuits, it requires at least one wait cycle inserted.)

Appendix 2

APPENDIX 3

PROCESSING OF UNUSED PINS

Appendix 3.1 Example for Processing
Unused Pins

Appendix 3.1 Example for Processing Unused Pins

An example for processing unused pins is shown below.

(1) When operating in single-chip mode

Table A3.1.1 Example for Processing Unused Pins when Operating in Single-chip Mode

Pin name	Processing
Input/output ports (Note 1) P00-P07, P10-P17, P20-P27, P30-P37, P41-P47, P61-P63, P70-P77, P82-P87, P93-P97, P100-P107, P110-P117, P124-P127, P130-P137, P150, P153, P174, P175, P220, P221, P225 (Note 2)	Set these pins for input mode and connect them to VSS via 1 kΩ to 10 kΩ resistors (pulldown).
P64 / $\overline{\text{SBI}}$ (Note 3)	Connect this pin to VSS (pulldown) via a 1 to 10 kΩ resistor.
XOUT (Note 4)	Leave these pins open.
A-D converter	
AD0IN0-AD0IN15, AVREF0, AVSS0	Connect these pins to VSS.
AVCC0	Connect this pin to VCCE.
JTAG	
JTDO, JTMS, JTDI, JTCK	Connect these pins to VCCE (pullup) or VSS (pulldown) via 0 to 100 kΩ resistors.
JTRST	Connect this pin to VSS (pulldown) via a 0 to 100 kΩ resistor.

Note 1: After exiting reset, the input/output ports are set for input by default.

Note 2: P221 is used exclusively for CAN input.

Note 3: P64 is used exclusively for $\overline{\text{SBI}}$ input. Make sure that unintended falling edges due to noise, etc. will not be applied. (A falling edge at P64/ $\overline{\text{SBI}}$ pin causes a system break interrupt to occur).

Note 4: This applies when an external clock is fed to XIN.

(2) When operating in external extension mode or processor mode

Table A3.1.2 Example for Processing Unused Pins when Operating in External Extension or Processor Mode

Pin name	Processing
Input/output ports (Note 1) P61-P63, P70-P77, P82-P87, P93-P97, P100-P107, P110-P117, P124-P127, P130-P137, P150, P153, P174, P175, P220, P221, P225 (Note 2)	Set these pins for input mode and connect them to VSS via 1 kΩ to 10 kΩ resistors (pulldown).
P64 / \overline{SBI} (Note 3)	Connect this pin to VSS (pulldown) via a 1 to 10 kΩ resistor.
$\overline{BLW}/\overline{BLE}$, $\overline{BHW}/\overline{BHE}$, $\overline{CS1}$	Leave these pins open.
XOUT (Note 4)	Leave these pins open.
A-D converter	
AD0IN0-AD0IN15, AVREF0, AVSS0	Connect these pins to VSS.
AVCC0	Connect these pins to VCCE.
JTAG	
JTDO, JTMS, JTDI, JTCK	Connect these pins to VCCE (pullup) or VSS (pulldown) via 0 to 100 kΩ resistors.
JTRST	Connect this pin to VSS (pulldown) via a 0 to 100 kΩ resistor.

Note 1: After exiting reset, the input/output ports are set for input by default.

Note 2: P221 is used exclusively for CAN input.

Note 3: P64 is used exclusively for \overline{SBI} input. Make sure that unintended falling edges due to noise, etc. will not be applied. (A falling edge at P64/ \overline{SBI} pin causes a system break interrupt to occur).

Note 4: This applies when an external clock is fed to XIN.

Appendix 4.2 Precautions on Address Space

Appendix 4.2.1 Virtual flash emulation function

The 32171 can map one 8-Kbyte block of internal RAM beginning with the start address into one of 8-Kbyte areas (L banks) of the internal flash memory and can map up to two 4-Kbyte blocks of internal RAM beginning with address H'0080 6000 into one of 4-Kbyte areas (S banks) of the internal flash memory. This capability is referred to as the "virtual-flash emulation" function. For details about this function, refer to Section 6.7, "Virtual-Flash Emulation Function."

Appendix 4.3 Precautions on EIT

Address Exception requires caution because when an address exception occurs pursuant to execution of an instruction (one of the following three) that uses the “register indirect + register update” addressing mode, the value of the automatically updated register (Rsrc or Rsrc2) becomes indeterminate.

Except that the values of Rsrc and Rsrc2 are indeterminate, the behavior is the same as when using other addressing modes.

• **Applicable instructions**

LD	Rdest, @Rsrc+
ST	Rsrc1, @-Rsrc2
ST	Rsrc1, @+Rsrc2

If the above applies, because the register value becomes indeterminate as explained, consideration must be taken before continuing with system processing. (If an address exception occurs, it means that some fatal fault already occurred in the system at that point in time. Therefore, use EIT on condition that after processing by the address exception handler, the CPU will not return to the program it was executing when the exception occurred.)

Appendix 4.4 Precautions to Be Taken When Reprogramming Flash Memory

The following describes precautions to be taken when you reprogram the flash memory using a general-purpose serial programmer in Boot Flash E/W Enable mode.

- When reprogramming the flash memory, a high voltage is generated inside the chip. Because this high voltage could cause the chip to break down, be careful about mode pin and power supply management not to move from one mode to another while reprogramming.
- If the system uses any pin that is to be used by a general-purpose reprogramming tool, take appropriate measures to prevent adverse effects when connecting the tool.
- If flash memory protection is needed when using a general-purpose reprogramming tool, set any ID in the flash memory protect ID check area (H'0000 0084–H'0000 0093).
- If flash memory protection is not needed when using a general-purpose reprogramming tool, set H'FF in the entire flash memory protect ID check area (H'0000 0084–H'0000 0093).
- Before using a reset by Flash Control Register 4 (FCNT4)'s FRESET bit to clear each error status in Flash Status Register 2 (FSTAT2) (initialized to H'80), check to see that Flash Status Register 1 (FSTAT1)'s FSTAT bit = 1 (Ready).

- Before changing Flash Control Register 1 (FCNT1)'s FENTRY bit from 1 to 0, check to see that Flash Status Register 1 (FSTAT1)'s FSTAT bit = 1 (Ready) or Flash Status Register 2 (FSTAT2)'s FBUSY bit = 1 (Ready).
- If Flash Control Register 1 (FCNT1)'s FENTRY bit = 1 and Flash Status Register 1 (FSTAT1)'s FSTAT bit = 0 (Busy) or Flash Status Register 2 (FSTAT2)'s FBUSY bit = 0 (Busy), do not clear the FENTRY bit.

Appendix 4.5 Things To Be Considered after Exiting Reset

Appendix 4.5.1 Input/output ports

After exiting reset, the 32171's input/output ports are disabled against input in order to prevent current from flowing through the port. To use any ports in input mode, enable them for input using the Port Input Function Enable Register (PIEN) PIEN0 bit. For details, refer to Section 8.3, "Input/Output Port Related Registers."

Appendix 4.6 Precautions on Input/output Ports

Appendix 4.6.1 When using the ports in output mode

Because the Port Data Register values immediately after reset are indeterminate, it is necessary that the initial value be written to the Port Data Register before setting the Port Direction Register for output. Conversely, if the Port Direction Register is set for output before writing to the Port Data Register, indeterminate values will be output for a while until the initial value is set in the Port Data Register.

Appendix 4.7 Precautions about the DMAC

Appendix 4.7.1 About writing to DMAC related registers

Because DMA transfer involves exchanging data via the internal bus, basically you only can write to the DMAC related registers immediately after reset or when transfer is disabled (transfer enable bit = 0). When transfer is enabled, do not write to the DMAC related registers because write operation to those registers, except the DMA transfer enable bit, transfer request flag, and the DMA Transfer Count Register which is protected in hardware, is instable.

The table below shows the registers that can or cannot be accessed for write.

Table A4.7.1 DMAC Related Registers That Can or Cannot Be Accessed for Write

Status	Transfer enable bit	Transfer request flag	Other DMAC related registers
When transfer is enabled	○	○	×
When transfer is disabled	○	○	○

○ : Can be accessed ; × : Cannot be accessed

For even registers that can exceptionally be written to while transfer is enabled, the following requirements must be met.

(1) DMA Channel Control Register's transfer enable bit and transfer request flag

For all other bits of the channel control register, be sure to write the same data that those bits had before you wrote to the transfer enable bit or transfer request flag. Note that you only can write a 0 to the transfer request flag as valid data.

(2) DMA Transfer Count Register

When transfer is enabled, this register is protected in hardware, so that any data you write to this register is ignored.

(3) Rewriting the DMA source and DMA destination addresses on different channels by DMA transfer

In this case, you are writing to the DMAC related registers while DMA is enabled, but this practically does not present any problem. However, you cannot DMA-transfer to the DMAC related registers on the local channel itself in which you are currently operating.

Appendix 4.7.2 Manipulating DMAC related registers by DMA transfer

When manipulating DMAC related registers by means of DMA transfer (e.g., reloading the DMAC related registers' initial values by DMA transfer), do not write to the DMAC related registers on the local channel itself through that channel. (If this precaution is neglected, device operation cannot be guaranteed.)

Only if residing on other channels, you can write to the DMAC related registers by means of DMA transfer. (For example, you can rewrite the DMA_n Source Address and DMA_n Destination Address Registers on channel 1 by DMA transfer through channel 0.)

Appendix 4.7.3 About the DMA Interrupt Request Status Register

When clearing the DMA Interrupt Request Status Register, be sure to write 1s to all bits but the one you want to clear. The bits to which you wrote 1s retain the previous data they had before the write.

Appendix 4.7.4 About the stable operation of DMA transfer

To ensure the stable operation of DMA transfer, never rewrite the DMAC related registers, except the DMA Channel Control Register's transfer enable bit, unless transfer is disabled. One exception is that even when transfer is enabled, you can rewrite the DMA Source Address and DMA Destination Address Registers by DMA transfer from one channel to another.

Appendix 4.8 Precautions on Multijunction Timers

Appendix 4.8.1 Precautions to be observed when using TOP single-shot output mode

The following describes precautions to be observed when using TOP single-shot output mode.

- If the counter stops due to underflow in the same clock period as the timer is enabled by external input, the former has priority (so that the counter stops).
- If the counter stops due to underflow in the same clock period as count is enabled by writing to the enable bit, the latter has priority (so that count is enabled).
- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority (so that count is disabled).
- Because the internal circuit operation is synchronized to the count clock (prescaler output), a finite time equal to a prescaler delay is included before F/F starts operating after the timer is enabled.

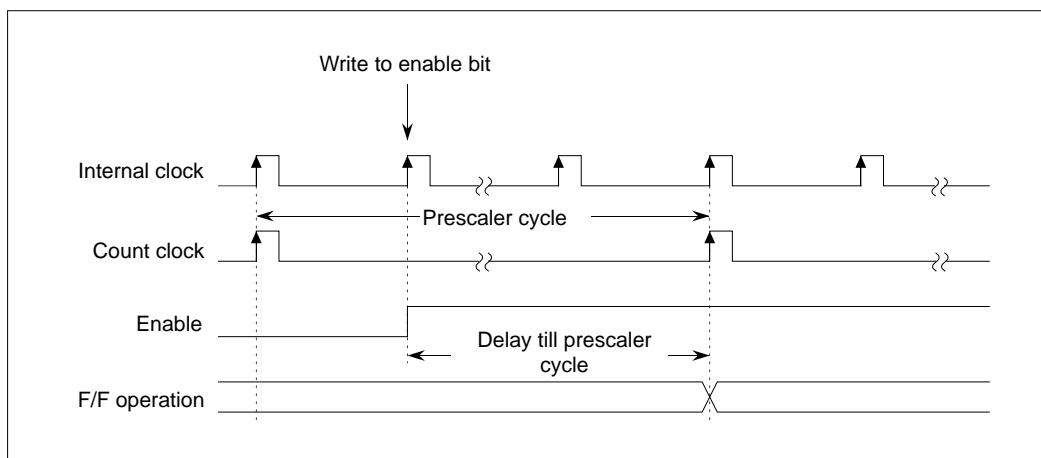

Figure A4.8.1 Prescaler Delay

- When writing to the correction register, be careful not to cause the counter to overflow. Even when the counter overflows due to correction of counts, no interrupt is generated for the occurrence of overflow. When the counter underflows in the subsequent down-count after overflow, a false underflow interrupt is generated due to overcounting.

In the example below, the reload register has the initial value H'FFF8 set in it. When the timer starts, the reload register value is loaded into the counter causing it to start counting down. In the example diagram here, H'0014 is written to the correction register when the counter has counted down to H'FFF0. As a result of this correction, the count overflows to H'0004 and fails to count correctly. Also, an interrupt is generated for an erroneous overcount.

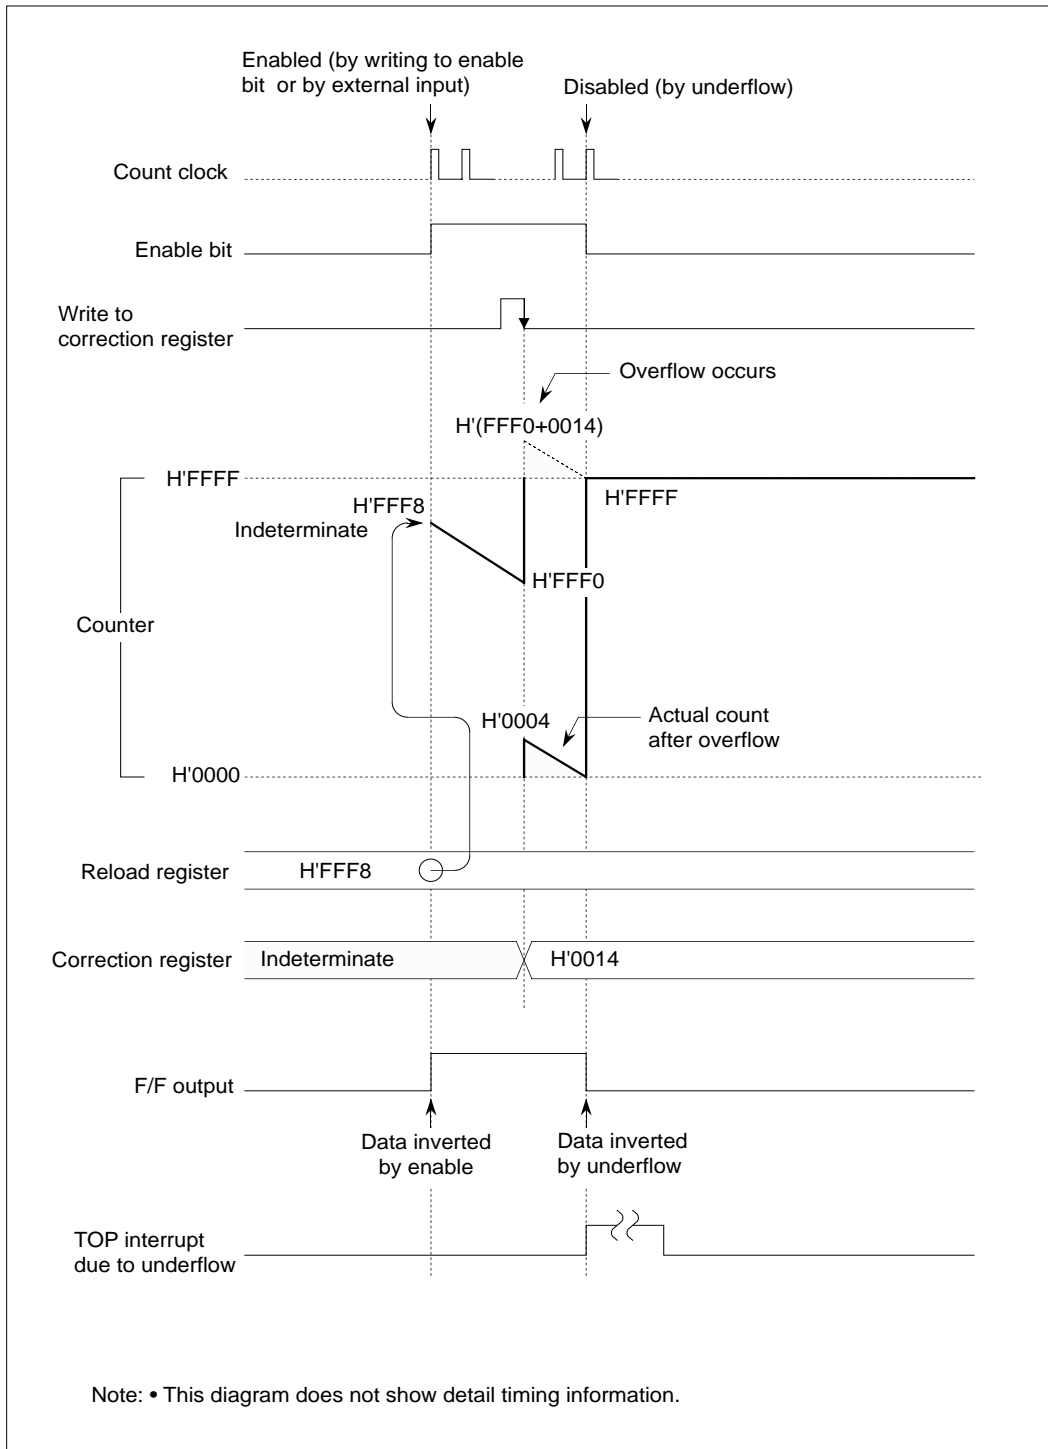

Figure A4.8.2 Example of Operation in TOP Single-shot Output Mode Where Count Overflows due to Correction

Appendix 4.8.2 Precautions to be observed when using TOP delayed single-shot output mode

The following describes precautions to be observed when using TOP delayed single-shot output mode.

- If the counter stops due to underflow in the same clock period as the timer is enabled by external input, the former has priority (so that the counter stops).
- If the counter stops due to underflow in the same clock period as count is enabled by writing to the enable bit, the latter has priority (so that count is enabled).
- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority (so that count is disabled).
- Even when the counter overflows due to correction of counts, no interrupt is generated for the occurrence of overflow. When the counter underflows in the subsequent down-count after overflow, a false underflow interrupt is generated due to overcounting.
- When you read the counter immediately after reloading it pursuant to underflow, the value you get is temporarily H'FFFF. But this counter value immediately changes to (reload value - 1) at the next clock edge.

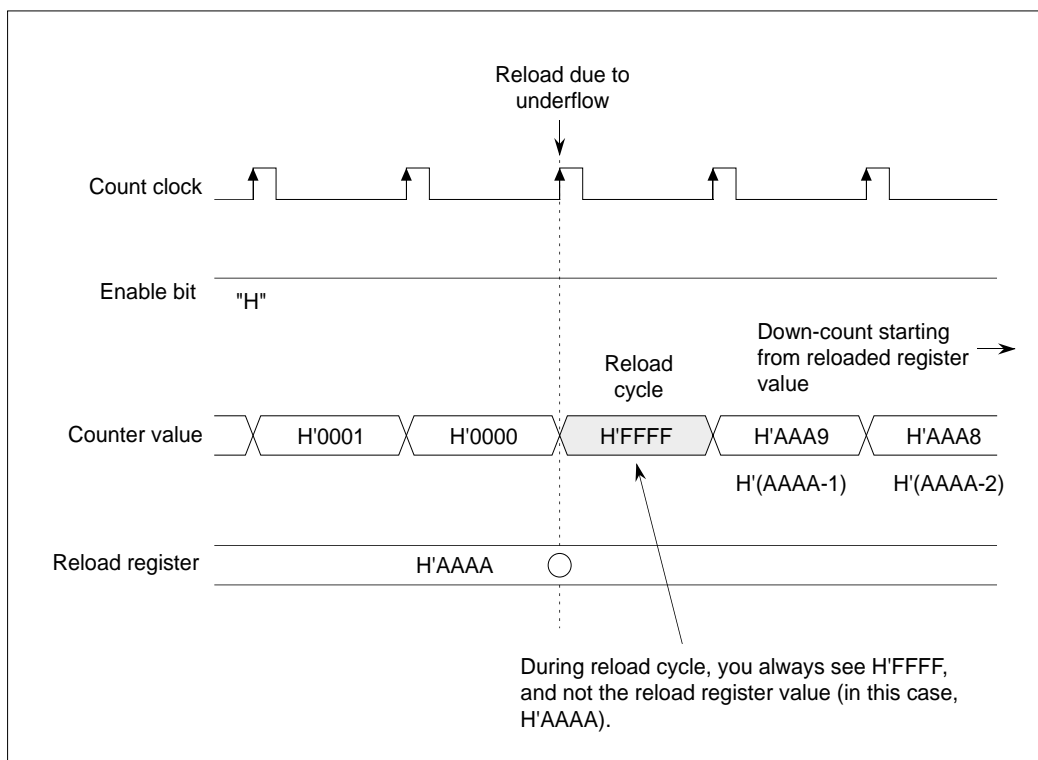

Figure A4.8.3 Counter Value Immediately after Underflow

Appendix 4.8.3 Precautions to be observed when using TOP continuous output mode

The following describes precautions to be observed when using TOP continuous output mode.

- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority (so that count is disabled).
- When you read the counter immediately after reloading it pursuant to underflow, the value you get is temporarily H'FFFF. But this counter value immediately changes to (reload value - 1) at the next clock edge.
- Because the internal circuit operation is synchronized to the count clock (prescaler output), a finite time equal to a prescaler delay is included before F/F starts operating after the timer is enabled.

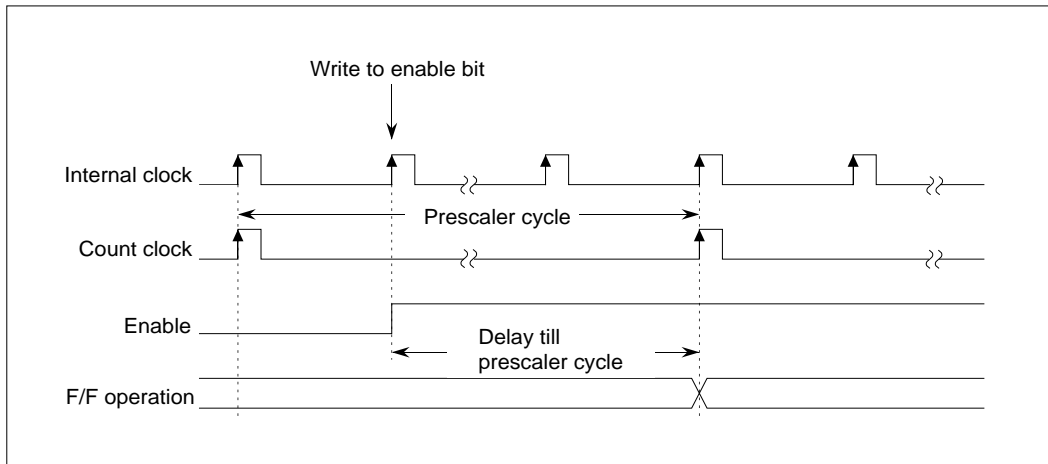

Figure A4.8.4 Prescaler Delay

Appendix 4.8.4 Precautions to be observed when using TIO measure free-run/clear input modes

The following describes precautions to be observed when using TIO measure free-run/clear input modes.

- If measure event input and write to the counter occur simultaneously in the same clock period, the write value is set in the counter while at the same time latched into the measure register.

Appendix 4.8.5 Precautions to be observed when using TIO single-shot output mode

The following describes precautions to be observed when using TIO single-shot output mode.

- If the counter stops due to underflow in the same clock period as the timer is enabled by external input, the former has priority (so that the counter stops).
- If the counter stops due to underflow in the same clock period as count is enabled by writing to the enable bit, the latter has priority (so that count is enabled).
- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority (so that count is disabled).
- Because the internal circuit operation is synchronized to the count clock (prescaler output), a finite time equal to a prescaler delay is included before F/F starts operating after the timer is enabled.

Appendix 4.8.6 Precautions to be observed when using TIO delayed single-shot output mode

The following describes precautions to be observed when using TIO delayed single-shot output mode.

- If the counter stops due to underflow in the same clock period as the timer is enabled by external input, the former has priority (so that the counter stops).
- If the counter stops due to underflow in the same clock period as count is enabled by writing to the enable bit, the latter has priority (so that count is enabled).
- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority (so that count is disabled).
- When you read the counter immediately after reloading it pursuant to underflow, the value you get is temporarily H'FFFF. But this counter value immediately changes to (reload value - 1) at the next clock edge.
- Because the internal circuit operation is synchronized to the count clock (prescaler output), a finite equal to a prescaler delay is included before F/F starts operating after the timer is enabled.

Appendix 4.8.7 Precautions to be observed when using TIO continuous output mode

The following describes precautions to be observed when using TIO continuous output mode.

- If the timer is enabled by external input in the same clock period as count is disabled by writing to the enable bit, the latter has priority (so that count is disabled).
- When you read the counter immediately after reloading it pursuant to underflow, the value you get is temporarily H'FFFF. But this counter value immediately changes to (reload value - 1) at the next clock edge.
- Because the internal circuit operation is synchronized to the count clock (prescaler output), a finite time equal to a prescaler delay is included before F/F starts operating after the timer is enabled.

Appendix 4.8.8 Precautions to be observed when using TMS measure input

The following describes precautions to be observed when using TMS measure input.

- If measure event input and write to the counter occur simultaneously in the same clock period, the write value is set in the counter while at the same time latched to the measure register.

Appendix 4.8.9 Precautions to be observed when using TML measure input

The following describes precautions to be observed when using TML measure input.

- If measure event input and write to the counter occur simultaneously in the same clock period, the write value is set in the counter, whereas the up-count value (before being rewritten) is latched to the measure register.
- If the timer operates with any clock other than the 1/2 internal peripheral clock while clock bus 1 is selected for the count clock, the counter cannot be written normally. Therefore, when operating with any clock other than the 1/2 internal peripheral clock, do not write to the counter.
- If the timer operates with any clock other than the 1/2 internal peripheral clock while clock bus 1 is selected for the count clock, the captured value is one that leads the actual counter value by one clock period. However, during the 1/2 internal peripheral clock interval from the count clock, this problem does not occur and the counter value is captured at exact timing.

The diagram below shows the relationship between counter operation and the valid data that can be captured.

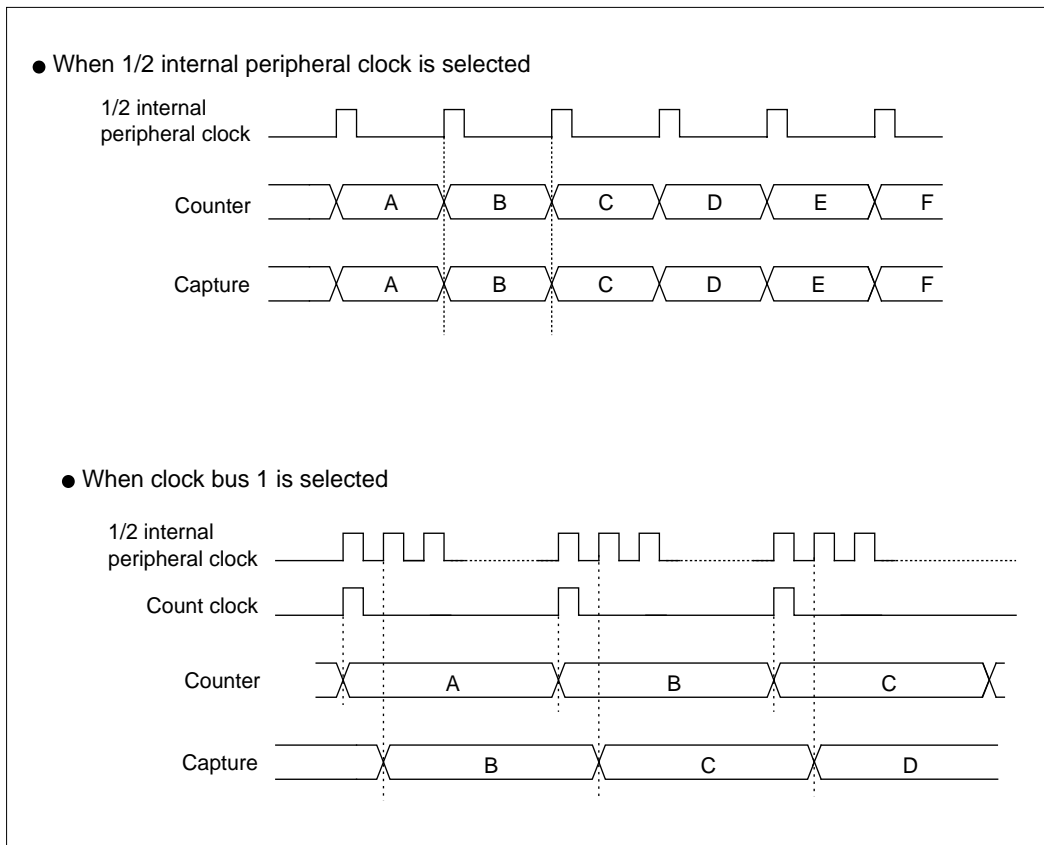

Figure A4.8.5 Mistimed Counter Value and Captured Value

Appendix 4.9 Precautions on Using A-D Converters

- Forcible termination during scan operation

If A-D conversion is forcibly terminated by setting the A-D conversion stop bit (AD0CSTP) to 1 during scan mode operation and you read the content of the A-D data register for the channel in which conversion was in progress, it shows the last conversion result that had been transferred to the A-D data register before the conversion was forcibly terminated.

- Modification of A-D converter related registers

If you want to change the contents of the A-D Conversion Interrupt Control Register, each Single and Scan Mode Register, or A-D Successive Approximation Register, except for the A-D conversion stop bit, do your change while A-D conversion is inactive, or be sure to restart A-D conversion after you changed the register contents. If the contents of these registers are changed in the middle of A-D conversion, the conversion results cannot be guaranteed.

- Handling of analog input signals

The A-D converters included in the 32171 do not have a sample-and-hold circuit. Therefore, make sure the analog input levels are fixed during A-D conversion.

- A-D conversion completion bit readout timing

If you want to read the A-D conversion completion bit (Single Mode Register 0's D5 bit or Scan Mode Register 0's D5 bit) immediately after A-D conversion has started, be sure to adjust the timing one clock cycle by, for example, inserting a NOP instruction before you read.

- Rated value of absolute accuracy

The rated value of absolute accuracy is that of the microcomputer alone, premised on an assumption that power supply wiring on the board where the microcomputer is mounted is stable and unaffected by noise. When designing the board, pay careful attention to its layout by, for example, separating AVCC0, AVSS0, and VREF0 from other digital power supplies or protecting the analog input pins against noise from other digital signals.

- Regarding the analog input pins

Figure A4.9.1 shows an internal equivalent circuit of the analog input unit. To obtain exact A-D conversion results, it is necessary that the A-D conversion circuit finishes charging its internal capacitor C2 within a designated time (sampling time). To meet this sampling time requirement, we recommend connecting a stabilizing capacitor, C1, external to the chip.

The following shows the analog output device's output impedance and how to determine the value of the external stabilizing capacitor to meet this timing requirement. Also shown below is the case where the analog output device's output impedance is low and the external stabilizing capacitor C1 is unnecessary.

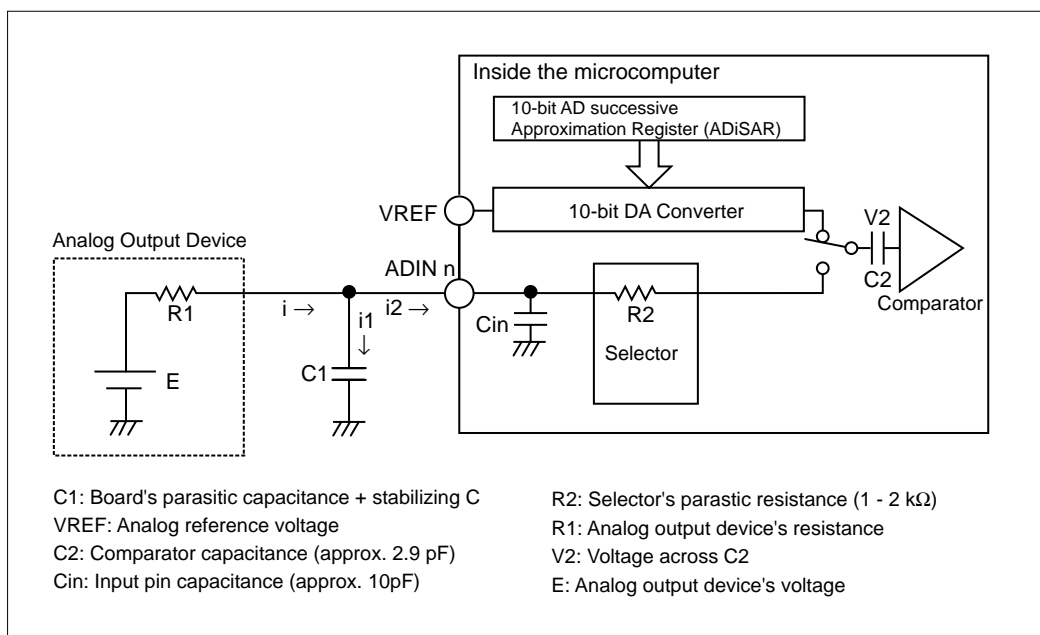

Figure A4.9.1 Internal Equivalent Circuit of the Analog Input Unit

- (a) Example for calculating the value of an external stabilizing capacitor C1 (recommended)

In Figure A4.9.1, as we calculate the capacitance of C1, we assume R1 is infinitely large, that the current needed to charge the internal capacitor C2 is sourced from C1, and that the voltage fluctuation due to C1 and C2 capacitance divisions, V_p , is 0.1 LSB or less. For the 10-bit A-D converter where VREF is 5.12 V, the 1 LSB determination voltage = $5.12 \text{ V} / 1024 = 5 \text{ mV}$. With up to 0.1 LSB voltage fluctuations considered, this equals 0.5 mV fluctuation.

The relationship between C1 and C2 capacitance divisions and Vp is obtained by the equation:

$$V_p = \frac{C_2}{C_1 + C_2} \times (E - V_2) \dots\dots\dots \text{Eq. (A-1)}$$

Also, Vp is obtained by the equation:

$$V_p = V_{p1} \times \sum_{i=0}^{x-1} \frac{1}{2^i} < \frac{V_{REF}}{10 \times 2^x} \dots\dots\dots \text{Eq. (A-2)}$$

Notes: • Where Vp1 = voltage fluctuation in first A-D conversion.

• The exponent x is 10 because of a 10-bit resolution A-D converter.

When Eqs. (A-1) and (A-2) are solved,

$$C_1 = C_2 \left\{ \frac{E - V_2}{V_{p1}} - 1 \right\} \dots\dots\dots \text{Eq. (A-3)}$$

$$\therefore C_1 > C_2 \left\{ 10 \times 2^x \times \sum_{i=0}^{x-1} \frac{1}{2^i} - 1 \right\} \dots\dots\dots \text{Eq. (A-4)}$$

Thus, for 10-bit resolution A-D converters where C2 = 2.9 pF, C1 is 0.06 μF or greater.

Use this for reference when determining the value of C1.

(b) Maximum value of the output impedance R1 when not adding C1

In Figure A4.9.1, if the external capacitor C1 is not used, examination must be made of whether C2 can be fully charged. First, the following shows the equation to find i2 when C1 is nonexistent in Figure A4.9.1.

$$i_2 = \frac{C_2 (E - V_2)}{C_{in} \times R_1 + C_2 (R_1 + R_2)} \times \exp \left\{ \frac{-t}{C_{in} \times R_1 \times C_2 (R_1 + R_2)} \right\} \dots\dots\dots \text{Eq. (B-1)}$$

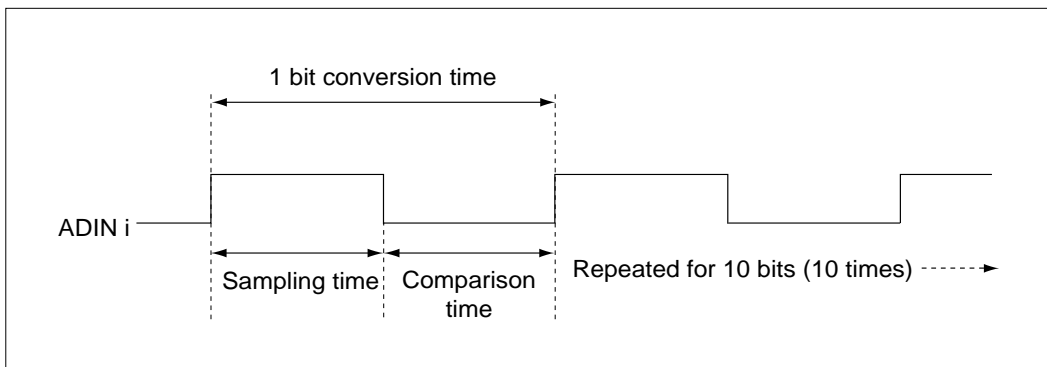

Figure A4.9.2 A-D Conversion Timing Diagram

The time needed for charging C2 must be within the sampling time (in Figure A4.9.2, A-D Conversion Timing Diagram) divided by 2.

Assuming $t = T$ (time needed for charging C2)

$$T = \frac{\text{Sampling time}}{2} = \frac{\text{A-D conversion time}}{10 \times 4}$$

Therefore, from Eq. (B-1), the time needed for charging C2 is

$$T = (\text{time needed for charging C2}) > C_{in} \times R1 + C2 (R1 + R2) \dots \dots \dots \text{Eq. (B-2)}$$

Thus, the maximum value of R1 as an approximate guide can be obtained by the equation:

$$R1 < \frac{\frac{\text{A-D conversion time}}{10 \times 4} - C2 \times R2}{C_{in} + C2} \dots \dots \dots \text{Eq. (B-3)}$$

The table below shows an example of how to calculate the maximum value of R1 during A-D conversion mode when $X_{in} = 10$ and 8 MHz.

Xin	BCLK period	Conversion mode	Speed mode	Conversion cycles	T (C2 charging time) in ns	Maximum value of R1 (Ω)
10MHz	50ns	A-D conversion mode/Single	Normal	294	367	28,225
			Double speed	168	210	16,054
8MHz	62.5ns	A-D conversion mode/Single	Normal	294	459	35,357
			Double speed	168	262	20,085

Note: • The above conversion cycles do not include dummy cycles at the start and end of conversion.

In compare mode, because sampling and comparison each are performed only once, the maximum value of R1 can be derived from the equation

$$R1 > \frac{\frac{\text{A-D conversion time}}{4} - C2 \times R2}{C_{in} + C2} \dots \dots \dots \text{Eq. (B-4)}$$

The table below shows an example of how to calculate the maximum value of R1 during compare mode when $X_{in} = 10$ and 8 MHz.

Xin	BCLK period	Conversion mode	Speed mode	Conversion cycles	T (C2 charging time) in ns	Maximum value of R1 (Ω)
10MHz	50ns	compare mode /Single	Normal	42	525	40,473
			Double speed	24	300	23,031
8MHz	62.5ns	compare mode /Single	Normal	42	656	50,628
			Double speed	24	375	28,845

Note: • The above conversion cycles do not include dummy cycles at the start and end of conversion.

Appendix 4.10 Precautions on Serial I/O

Appendix 4.10.1 Precautions on Using CSIO Mode

- **Settings of SIO Transmit/Receive Mode Register and SIO Baud Rate Register**

The SIO Transmit/Receive Mode Register and SIO Baud Rate Register and the Transmit Control Register's BRG count source select bit must always be set when not operating. When transmitting or receiving data, be sure to check that transmission and/or reception under way has been completed and clear the transmit and receive enable bits before you set the registers.

- **Settings of Baud Rate (BRG) Register**

If you selected f(BCLK) with the BRG clock source select bit, make sure the BRG register value you set does not exceed 2 Mbps.

- **About successive transmission**

To transmit multiple data successively, set the next transmit data in the SIO Transmit Buffer Register before transmission of the preceding data is completed.

- **About reception**

Because during CSIO mode the receive shift clock is derived from operation of the transmit circuit, you need to execute transmit operation (by sending dummy data) even when you only want to receive data. In this case, note that if the port function is set for TXD pin (by setting the operation mode register to 1), dummy data is actually output from the pin.

- **About successive reception**

To receive multiple data successively, set data (dummy data) in the SIO Transmit Buffer Register before the transmitter starts sending data.

- **Transmit/receive operations using DMA**

To transmit/receive data in DMA request mode, enable the DMAC to accept transfer requests (by setting the DMA Mode Register) before you start serial communication.

- **About the receive-finished bit**

If a receive error (overrun error) occurs, the receive-finished bit cannot be cleared by reading out the receive buffer register. In this case, it can only be cleared by clearing the receive enable bit.

- **About overrun error**

If all bits of the next receive data are received in the SIO Receive Shift Register before you read out the SIO Receive Buffer Register (an overrun error occurs), the receive data is not stored in the Receive Buffer Register and the Receive Buffer Register retains the previously received data. Thereafter, although receive operation is continued, no receive data is stored in the Receive Buffer Register (the receive status bit = 1). To restart reception normally, you need to temporarily clear the receive enable bit before you restart. This is the only way you can clear the overrun error flag.

- **About DMA transfer request generation during SIO transmission**

If the Transmit Buffer Register becomes empty (the transmit buffer empty flag = 1) while the transmit enable bit is set to 1 (transmit enabled), an SIO transmit buffer empty DMA transfer request is generated.

- **About DMA transfer request generation during SIO reception**

When the receive-finished bit is set to 1 (the receive buffer register full), a receive-finished DMA transfer request is generated. However, if an overrun error has occurred, this DMA transfer request is not generated.

Appendix 4.10.2 Precautions on Using UART Mode

- **Settings of SIO Transmit/Receive Mode Register and SIO Baud Rate Register**

The SIO Transmit/Receive Mode Register and SIO Baud Rate Register and the Transmit Control Register's BRG count source select bit must always be set when not operating. When transmitting or receiving data, be sure to check that transmission and/or reception under way has been completed and clear the transmit and receive enable bits before you set the registers.

- **Settings of Baud Rate (BRG) Register**

If you selected f(BCLK) with the BRG clock source select bit, make sure the BRG register value you set is equal to or greater than 7.

The value written to the SIO Baud Rate Register becomes effective beginning with the next period after the BRG counter finished counting. However, when transmit and receive operations are disabled, the register value can be changed at the same time you write to the register.

- **Transmit/receive operations using DMA**

To transmit/receive data in DMA request mode, enable the DMAC to accept transfer requests (by setting the DMA Mode Register) before you start serial communication.

- **About overrun error**

If all bits of the next receive data are received in the SIO Receive Shift Register before you read out the SIO Receive Buffer Register (an overrun error occurs), the receive data is not stored in the Receive Buffer Register and the Receive Buffer Register retains the previously received data. Once an overrun error occurs, no receive data is stored in the Receive Buffer Register although receive operation is continued. To restart reception normally, you need to temporarily clear the receive enable bit before you restart. This is the only way you can clear the overrun error flag.

- **Flags indicating the status of UART receive operation**

Following flags are available that indicate the status of receive operation during UART mode.

- SIO Receive Control Register receive status bit
- SIO Receive Control Register receive-finished bit
- SIO Receive Control Register receive error sum bit
- SIO Receive Control Register overrun error bit
- SIO Receive Control Register parity error bit
- SIO Receive Control Register framing error bit

The manner in which the receive-finished bit and various error bit flags are cleared varies depending on whether an overrun error has occurred or not, as described below.

[When no overrun error has occurred]

Said bits can be cleared by reading the lower byte from the receive buffer register or clearing the receive enable bit to 0.

[When an overrun error has occurred]

Said bits can only be cleared by clearing the receive enable bit to 0.

Appendix 4.11 Precautions on RAM Backup Mode

Appendix 4.11.1 Precautions to Be Observed at Power-on

When changing port X from input mode to output mode after power-on, pay attention to the following.

If port X is set for output mode while no data is set in the Port X Data Register, the port's initial output level is indeterminate. Therefore, be sure to set the output high level in the Port X Data Register before you set port X for output mode. Unless this method is followed, port output may go low at the same time port output is set after the clock oscillation has stabilized, causing the device to enter RAM backup mode.

Appendix 4.12 Precautions on Processing JTAG Pins

Appendix 4.12.1 Precautions on Board Design when Using JTAG

The JTAG pins require that wiring lengths be matched during board design in order to accomplish fast, highly reliable communication with JTAG tools.

An example of how to process pins when using JTAG tools is shown below.

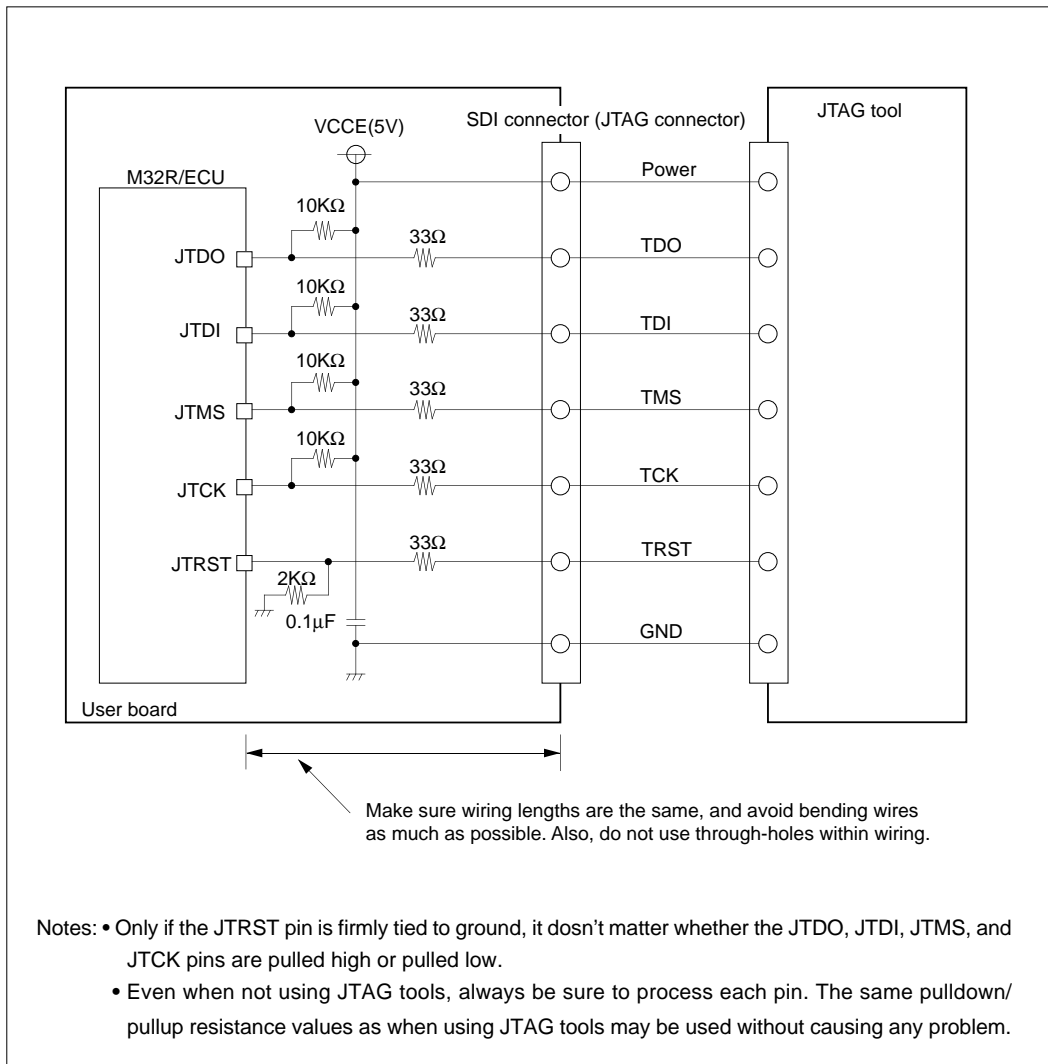

Figure A4.12.1 Example for Processing Pins when Using JTAG Tools

Appendix 4.12.2 Processing Pins when Not Using JTAG

The diagram below shows how to process JTAG pins when not using these pins (i.e. for boards that do not have pins/connectors connecting to JTAG tools).

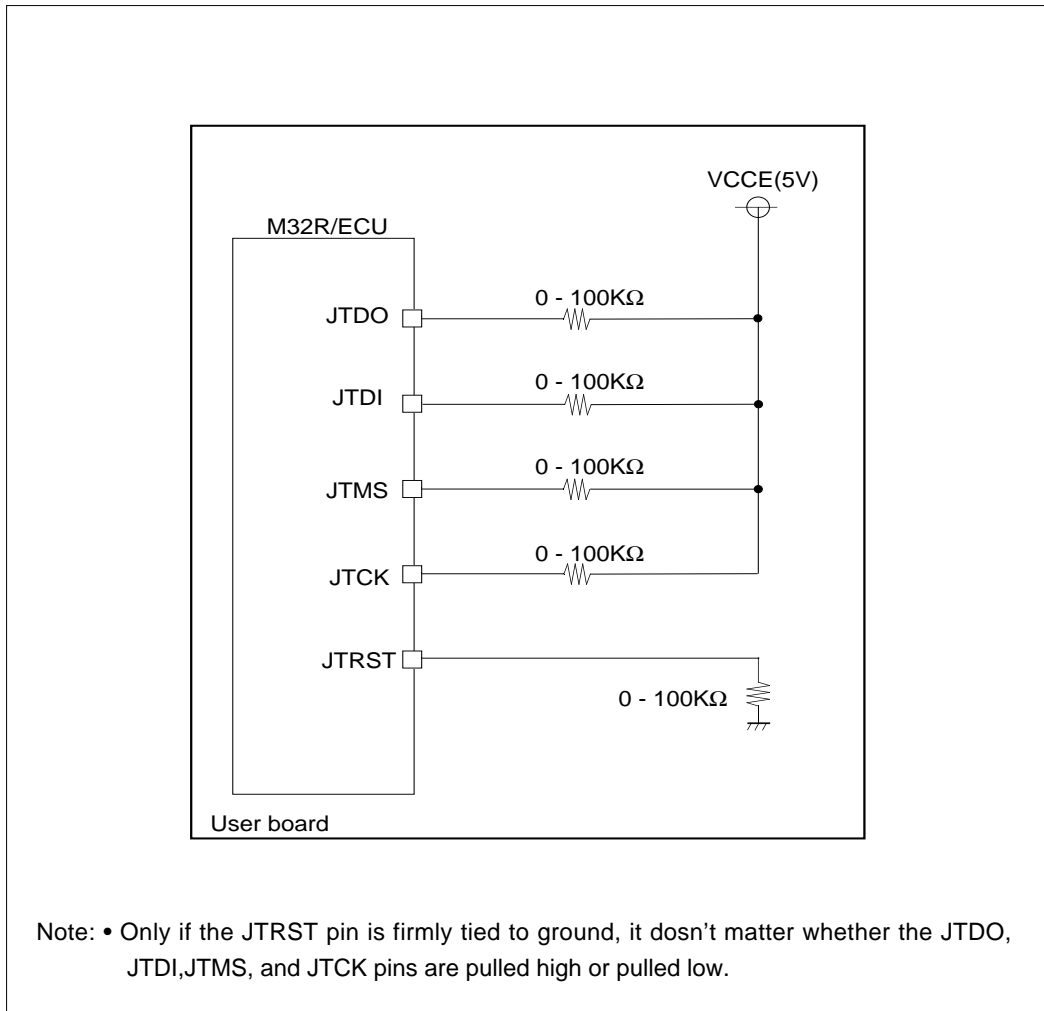

Figure A4.12.2 Example for Processing Pins when Not Using JTAG

Appendix 4.13 Precautions about Noise

The following describes precautions to be taken about noise and corrective measures against noise. The corrective measures described here are theoretically effective for noise, but require that the application system incorporating these measures be fully evaluated before it can actually be put to use.

Appendix 4.13.1 Reduction of Wiring Length

Wiring on the board may serve as an antenna to draw noise into the microcomputer. Shorter the total wiring length, the smaller the possibility of drawing noise into the microcomputer.

(1) Wiring of the RESET pin

Reduce the length of wiring connecting to the $\overline{\text{RESET}}$ pin. Especially when connecting a capacitor between the $\overline{\text{RESET}}$ and VSS pins, make sure it is connected to each pin in the shortest distance possible (within 20 mm).

<Reasons>

Reset is a function to initialize the internal logic of the microcomputer. The width of a pulse applied to the $\overline{\text{RESET}}$ pin is important and is therefore stipulated as part of timing requirements. If a pulse in width shorter than the stipulated duration (i.e., noise) is applied to the RESET pin, the microcomputer will not be reset for a sufficient duration of time and exit the reset state before its internal logic is fully initialized, causing the program to go malfunction.

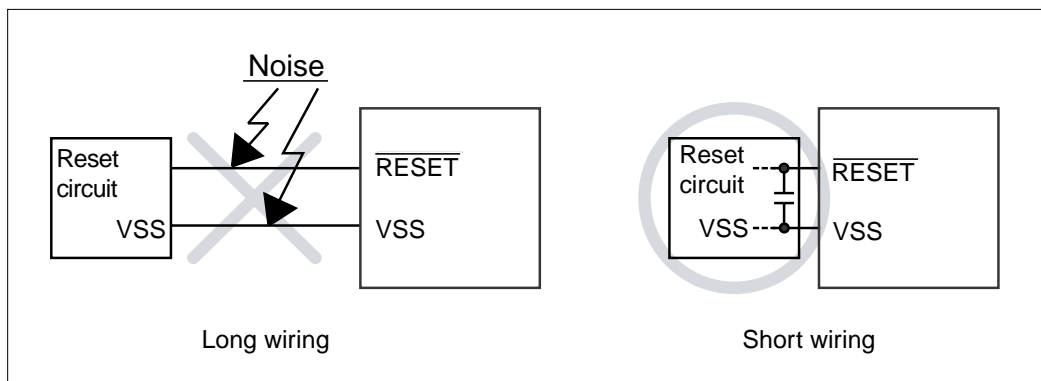

Figure A4.13.1 Example Wiring of the RESET Pin

(2) Wiring of clock input/output pins

Use as much thick and short wiring as possible for connections to the clock input/output pins. When connecting a capacitor to the oscillator, make sure its grounding lead wire and the OSC-VSS pin on the microcomputer are connected in the shortest distance possible (within 20 mm). Also, make sure the VSS pattern used for clock oscillation is a large ground plane and is connected to GND.

<Reasons>

The microcomputer operates synchronously with the clock generated by the oscillator circuit. Inclusion of noise on the clock input/output pins causes the clock waveform to become distorted, which may result in the microcomputer operating erratically or getting out of control. Also, if a noise-induced potential difference exists between the microcomputer's VSS level and that of the oscillator, the clock fed into the microcomputer may not be an exact clock.

Figure A4.13.2 Example Wiring of Clock Input/Output Pins

(3) Wiring of the VCNT pin

Use as much thick and short wiring as possible for connections to the VCNT pin.

When connecting a capacitor to VCNT, make sure its grounding lead wire and the OSC-VSS pin on the microcomputer are connected in the shortest distance possible.

Also, make sure the VSS pattern used for VCNT is a large ground plane and is connected to GND.

<Reasons>

The external circuit inserted for the VCNT pin plays the role of a low-pass filter that stabilizes the PLL's internal voltage and eliminates noise. If noise exceeding the limit of the low-pass filter penetrates into the wiring, the internal circuit may be disturbed by that noise and become unable to produce a precise clock, causing the microcomputer to operate erratically or get out of control.

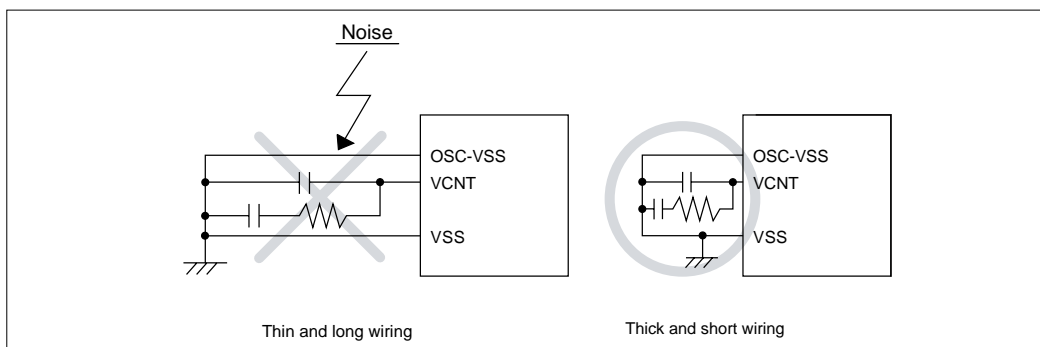

Figure A4.13.3 Example Wiring of the VCNT Pin

(4) Wiring of operation mode setup pins

When connecting operation mode setup pins and the VCC or VSS pin, make sure they are connected in the shortest distance possible.

<Reasons>

The levels of operation mode setup pins affect the microcomputer's operation mode. When connecting the operation mode setup pins and the VCC or VSS pin, be careful that no noise-induced potential difference will exist between the operation mode setup pins and the VCC or VSS pin. This is because the presence of such a potential difference makes operation mode instable, which may result in the microcomputer operating erratically or getting out of control.

Figure A4.13.4 Example Wiring of the MOD0 and MOD1 Pins

Appendix 4.13.2 Inserting a Bypass Capacitor between VSS and VCC Lines

Insert a bypass capacitor of about 0.1 μF between VSS and VCC lines in such a way as to meet the requirements described below.

- The wiring length between the VSS pin and bypass capacitor and that between the VCC pin and bypass capacitor are equal.
- The wiring length between the VSS pin and bypass capacitor and that between the VCC pin and bypass capacitor are the shortest distance possible.
- The VSS and VCC lines have a greater wiring width than that of other signal lines.

Figure A4.13.5 Example of a Bypass Capacitor Inserted between VSS and VCC Lines

Appendix 4.13.3 Processing Analog Input Pin Wiring

Insert a resistor of about 100 to 500 Ω in series to the analog signal line connecting to the analog input pin at a position as close to the microcomputer as possible. Also, insert a capacitor of about 100 pF between the analog input pin and AVSS pin at a position as close to the AVSS pin as possible.

<Reasons>

The signal fed into the analog input pin (e.g., A-D converter input pin) normally is an output signal from a sensor. In many cases, a sensor to detect changes of event is located apart from the board on which the microcomputer is mounted, so that wiring to the analog input pin is inevitably long. Because a long wiring serves as an antenna which draws noise into the microcomputer, the signal fed into the analog input pin tends to be noise-ridden. Furthermore, if the capacitor connected between the analog input pin and AVSS pin is grounded at a position apart from the AVSS pin, noise ridding on the ground line may penetrate into the microcomputer via the capacitor.

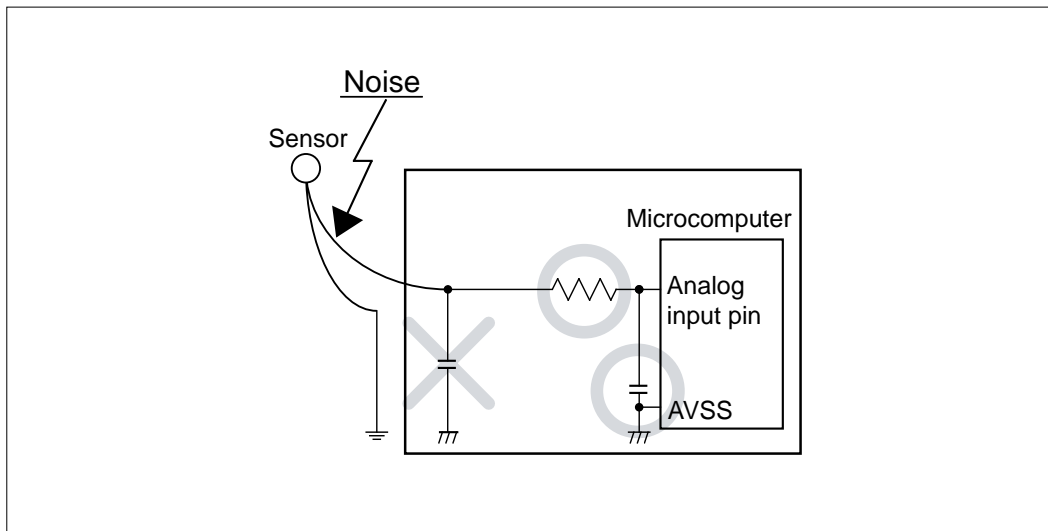

Figure A4.13.6 Example of a Resistor and Capacitor Inserted for the Analog Signal Line

Appendix 4.13.4 Consideration about the Oscillator and VCNT Pin

The oscillator that generates the fundamental clock for microcomputer operation requires consideration to make it less susceptible to influences from other signals.

(1) Avoidance from large-current signal lines

Signal lines in which a large current flows exceeding the range of current values that the microcomputer can handle must be routed as far away from the microcomputer (especially the oscillator and VCNT pin) as possible. Also, make sure the circuit is protected with a GND pattern.

<Reasons>

Systems using the microcomputer contain signal lines to control, for example, a motor, LED, and thermal head. When a large current flows in these signal lines, it generates noise due to mutual inductance (M).

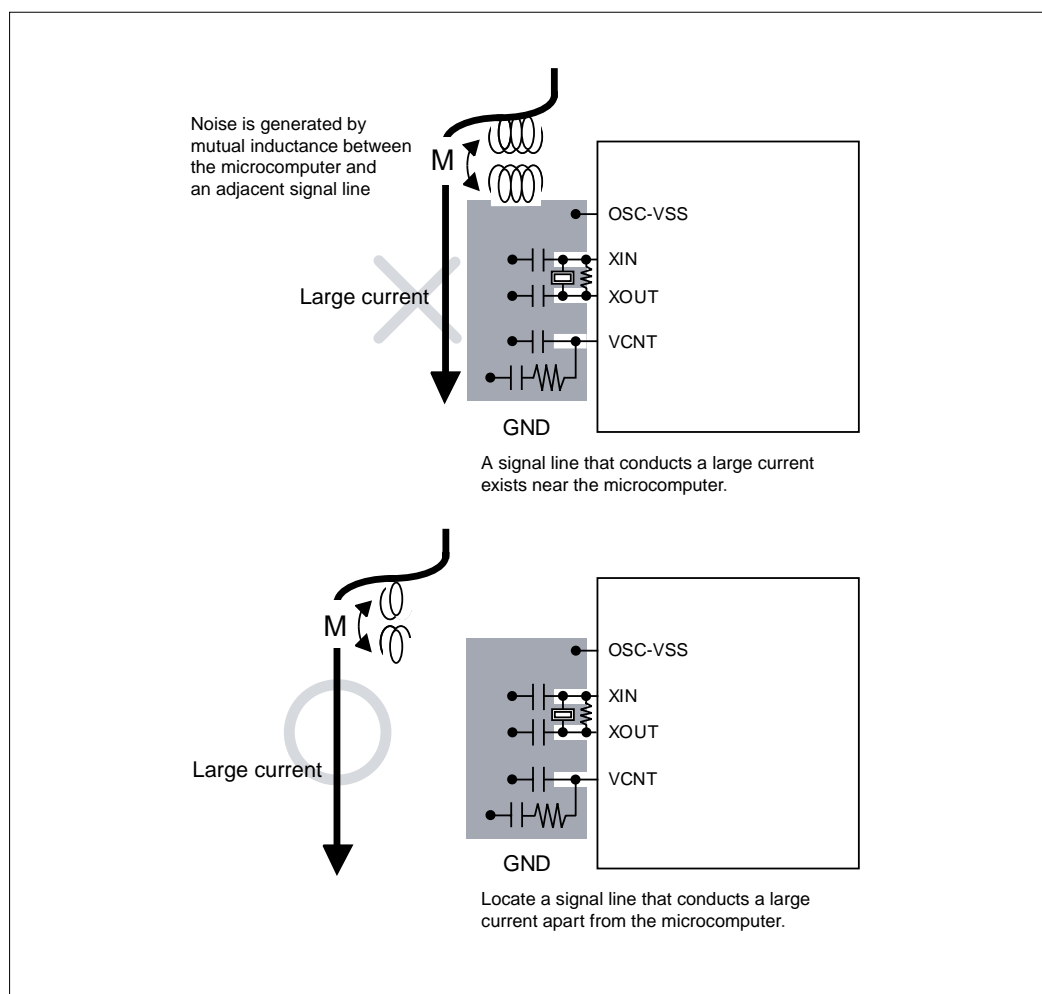

Figure A4.13.7 Example Wiring of Large-current Signal Lines

(2) Avoiding effects of rapidly level-changing signal lines

Locate signal lines whose levels change rapidly as far away from the oscillator as possible. Also, make sure the rapidly level-changing signal lines will not intersect the clock-related signal lines and other noise-sensitive signal lines.

<Reasons>

Rapidly level-changing signal lines tend to affect other signal lines as their voltage level frequently rises and falls. Especially if these signal lines intersect the clock-related signal lines, they will cause the clock waveform to become distorted, which may result in the microcomputer operating erratically or getting out of control.

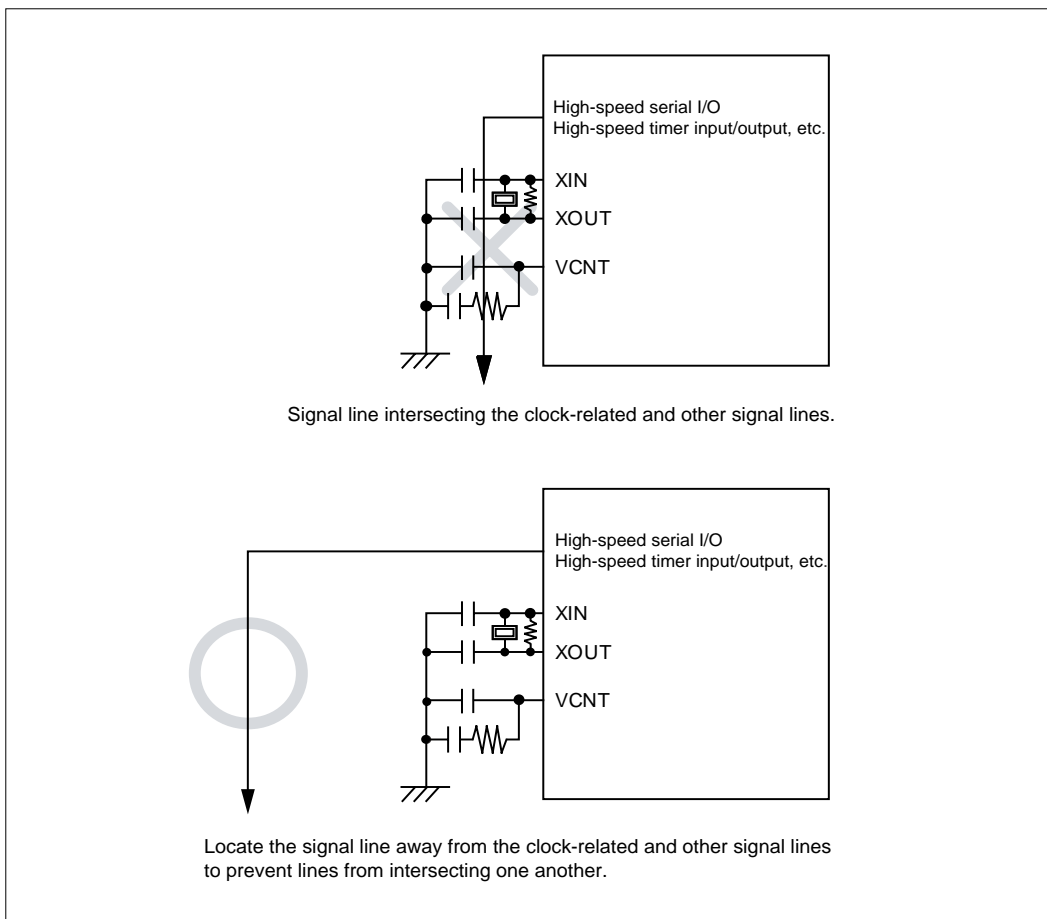

Figure A4.13.8 Example Wiring of Rapidly Level-changing Signal Lines

(3) Protection against signal lines that are the source of strong noise

Do not use any pin that will probably be subject to strong noise for an adjacent port near the oscillator and VCNT pins. If the pin can be left unused, set it for input and connect to GND via a resistor, or fix it to output and leave open. If the pin needs to be used, it is recommended that it be used for input-only.

For protection against a still stronger noise source, set the adjacent port for input and connect to GND via a resistor, and use those that belong to the same port group as much for input-only as possible. If greater stability is required, do not use those that belong to the same port group and set them for input and connect to GND via a resistor. If they need to be used, insert a limiting resistor for protection against noise.

<Reasons>

If the ports or pins adjacent to the oscillator and VCNT pins operate at high speed or are exposed to strong noise from an external source, noise may affect the oscillator circuit, causing its oscillation to become instable.

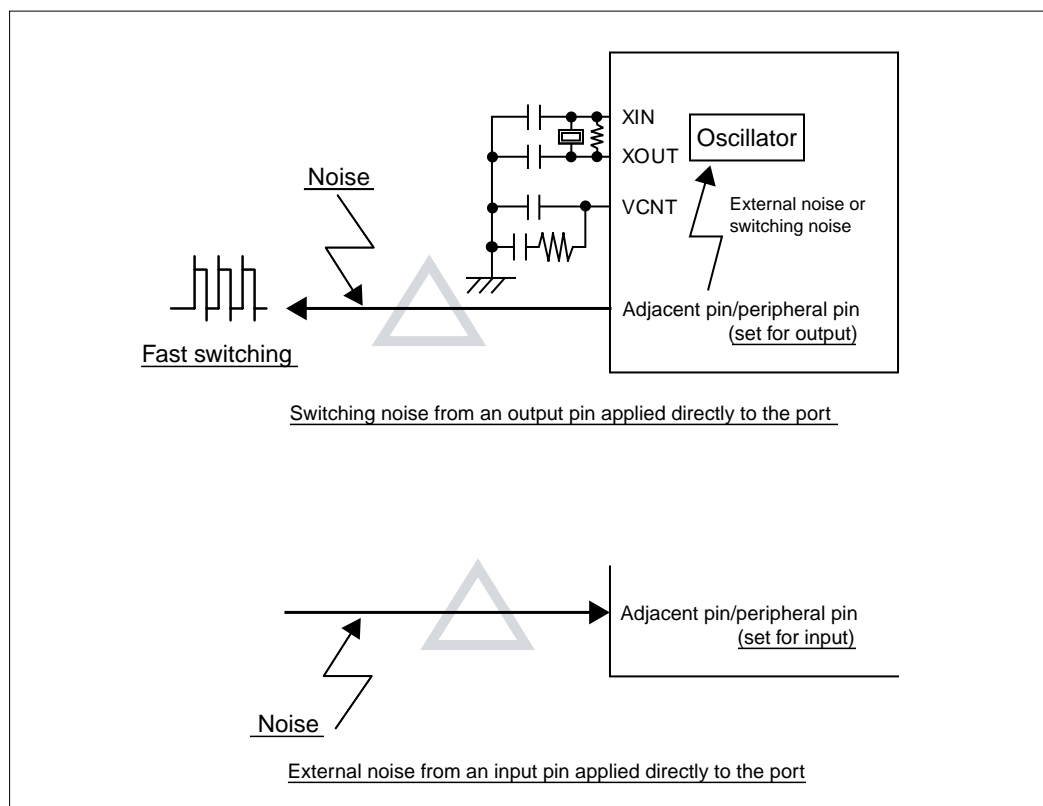

Figure A4.13.9 Example Processing of a Noise-laden Pin

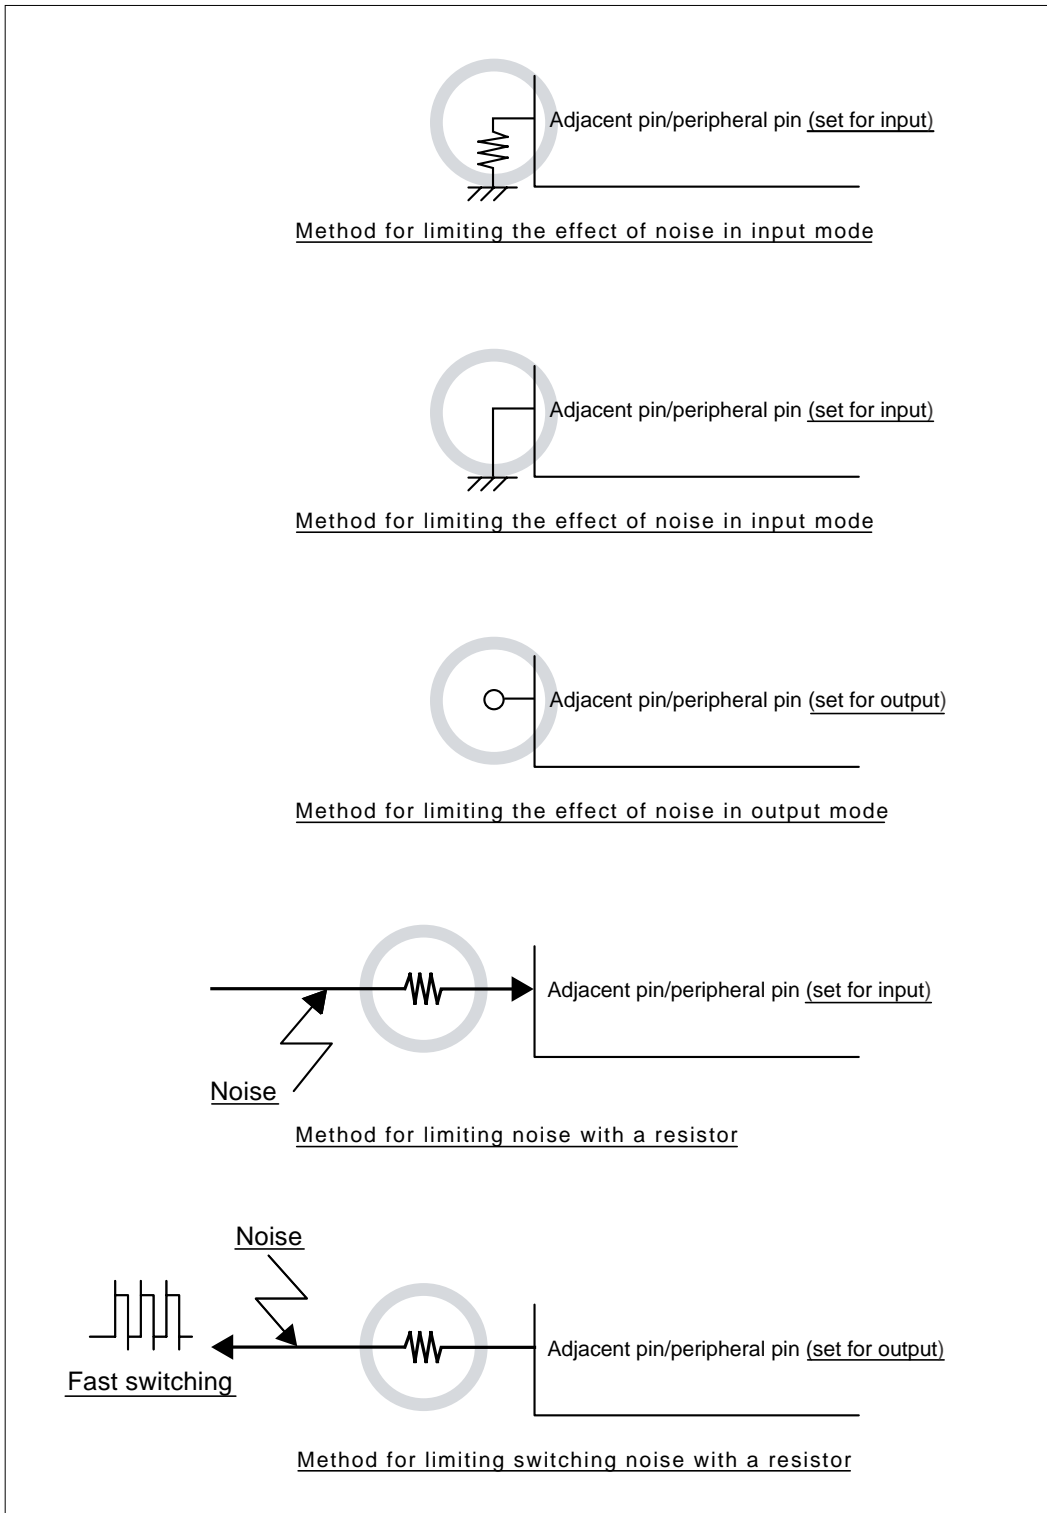

Figure A4.13.10 Example Processing of Pins Adjacent to the Oscillator and VCNT Pins

Appendix 4.13.5 Processing Input/Output Ports

For input/output ports, take the appropriate measures in both hardware and software following the procedure described below.

Hardware measures

- Insert resistors of 100 Ω (or more) in series to input/output ports.

Software measures

- For input ports, read out data in a program two or more times to verify that levels match.
- For output ports, rewrite the data register at certain intervals, because there is a possibility of the output data being inverted by noise.
- Rewrite the direction register at certain intervals.
