

EV3302-J-01A 1.3A Fixed Frequency White LED Driver **Evaluation Board**

DESCRIPTION

The EV3302-J-01A is an evaluation board for the MP3302, a step-up converter designed for driving up to 27 white LEDs from a single cell lithium Ion battery. The EV board parameters are optimized for the load of 3 white LEDs in series, 9 strings paralleled.

MP3302 uses current mode, The fixed frequency architecture to regulate the LED current, which is measured through an external current sense resistor. Its low 195mV feedback voltage reduces power loss and improves efficiency. The MP3302 monitors the output voltage and turns off the converter if an overvoltage condition occurs due to an open circuit condition.

The MP3302 includes under-voltage lockout, current limiting and thermal overload protection preventing damage in the event of an output overload.

The MP3302 is available in small 5-pin TSOT23 package.

ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	Vin	3.3 – 6	V
Number of LEDs		27	

EV3302-J-01A EVALUATION BOARD

FEATURES

- 3.3V to 6V Input Voltage Range
- Drives up to 27 White LEDs
- Up to 87% Efficiency •
- **Open Load Shutdown**
- Fully Assembled and Tested

APPLICATIONS

- **Cell Phones**
- Handheld Computers and PDAs
- **Digital Still Cameras**
- Small LCD Displays

All MPS parts are lead-free, halogen free, and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance.

QUICK START GUIDE

- 1. Connect the positive and negative terminals of the load panel (3 white LEDs in series, 9 stings paralleled) to the LED+ and LED- pins on the EV board, respectively.
- 2. Connect the positive and negative terminals of the power supply (3.3V ~ 6V) to the VIN and GND pins on the EV board, respectively.
- 3. Drive EN pin high (1.5V < Ven < Vin) to enable the MP3302.
- 4. Apply a DC voltage of 0.7V to 1.4V on EN pin for analog dimming. Maximum brightness (180mA typical) occurs with 1.4V voltage or above applied.
- 5. For PWM dimming mode, apply a PWM rectangular waveform with a minimum voltage less than 0.5V and a maximum greater than 1.5V on EN pin. The frequency of the PWM signal is recommended between 100Hz to 1kHz.
