# TO OUR VALUED CUSTOMERS

I want to express my thanks to you for being interested in our products and for having confidence in MikroElektronika.

The primary aim of our company is to design and produce high quality electronic products and to constantly improve the performance thereof in order to better suit your needs.

Nebojsa Matic General Manager

# Table of Contents

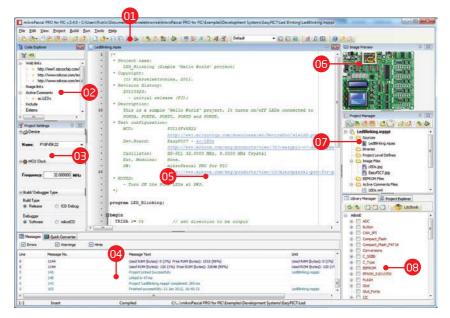

# **1. Introduction to mikroPascal PRO for PIC®**

**mikroPascal PRO for PIC**<sup>®</sup> organizes applications into projects consisting of a single project file (file with the **.mpppi** extension) and one or more source files (files with the .mpas extension). The mikroPascal PRO for PIC<sup>®</sup> compiler allows you to manage several projects at a time. Source files can be compiled only if they are part of the project.

A project file contains:

- Project name and optional description;
- Target device in use;
- Device clock;
- List of the project source files;
- Binary files (\*.mcl); and
- Other files.

In this reference guide, we will create a new project, write code, compile it and test the results. The purpose of this project is to make microcontroller PORTB LEDs blink, which will be easy to test.

Page 4

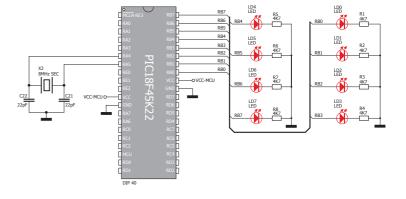

# 2. Hardware Connection

#### Figure 2-1: Hardware connection schematics

Let's make a simple "Hello world" example for the selected microcontroller. First thing embedded programmers usually write is a simple **LED blinking** program. So, let's do that in a few simple lines of Pascal code.

LED blinking is just turning ON and OFF LEDs that are connected to desired PORT pins. In order to see the example in action, it is necessary to connect the target microcontroller according to schematics shown on **Figure 2-1**. In the project we are about to write, we will use only **PORTB**, so you should connect the LEDs to PORTB only.

Prior to creating a new project, it is necessary to do the following:

# Step 1: Install the compiler

Install the mikroPascal PRO for PIC<sup>®</sup> compiler from the **Product DVD** or download it from the MikroElektronika website:

http://www.mikroe.com/eng/products/view/10/mikropascal-pro-for-pic/

# Step 2: Start up the compiler

Double click on the compiler icon in the Start menu, or on your desktop to Start up the mikroPascal PRO for PIC<sup>®</sup> compiler. The mikroPascal PRO for PIC<sup>®</sup> IDE (Integrated Development Environment) will appear on the screen. Now you are ready to start creating a new project.

# **3. Creating a New Project**

The process of creating a new project is very simple. Select the **New Project** option from the **Project menu** as shown below. The **New Project Wizard** window appears. It can also be opened by clicking the **New Project icon** from the **Project toolbar**.

Proj	ect	<u>B</u> uild	<u>R</u> un	<u>T</u> ools	<u>H</u> elp
B	New Project		Shift+Ctrl+N		
3	<u>O</u> p	en Proje	ect	Shif	t+Ctrl+O
1	Ogen Project Group				
	Recent Pro		jects		•

The **New Project Wizard** (Figure 3-1) will guide you through the process of creating a new project. The introductory window of this application contains a list of actions to be performed when creating a new project.

Figure 3-1: Introductory window of the New Project Wizard

### Step 1 - Project Settings

First thing we have to do is to specify the general project information. This is done by selecting the target microcontroller, it's operating clock frequency, and of course - naming our project. This is an important step, because compiler will adjust the internal settings based on this information. Default configuration is already suggested to us at the begining. We will not change the microcontroller, and we will leave the default **PIC18F45K22** as the choice for this project.

1: Project Sett	ngs:	
Project Name:	MyProject	
Project folder:	C:\Users\Public\Documents\Mikroelektronika\mikrot	Browse
Device Name:	P18F45K22 👻	
Device Cloc <u>k</u> :	8.000000 MHz	
xample: 80.000).	oject folder, select device name and enter a device clock and project folder must not be left empty.	

Figure 3-2: You can specify project name, path, device and clock in the first step

# Step 1 - Project Settings

If you do not want to use the suggested path for storing your new project, you can **change the destination folder**. In order to do that, follow a simple procedure:

- OI Click the Browse button of the Project Settings window to open the Browse for Folder dialog.
- Select the desired folder to be the destination path for storing your new project files.
- OB Click the OK button to confirm your selection and apply the new path.

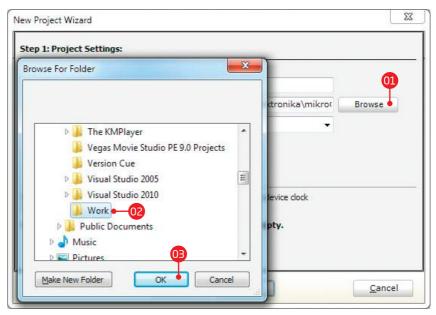

Figure 3-3: Change the destination folder using Browse For Folder dialog

### Step 1 - Project Settings

Once we have selected the destination project folder, let's do the rest of the project settings:

- Enter the name of your project. Since we are going to blink some LEDs, it's appropriate to call the project "LedBlinking"
- For this demonstration, we will use the default external crystal **8MHz clock**. Clock speed depends on your target hardware, and whether you are using PLL or not. But however you configure your hardware, make sure to specify the exact clock (**Fosc**) that the microcontroller is operating at.

1: Project Setti	ngs:	
Project Name:	LedBlinking •01	
Project folder:	C:\Users\anikolic.MIK\Documents\Work\	Browse
Device Name:	P18F45K22	(S <b>T</b> )
Device Clock:	8.000000 MHz	
xample: 80.000).	oject folder, select device name and enter a device clock and project folder must not be left empty.	3

Figure 3-4: Enter project name and change device clock speed if necessary

### Step 2 - Add files

This step allows you to include additional files that you need in your project: some headers or source files that you already wrote, and that you might need in further development. Since we are building a simple application, we won't be adding any files at this moment.

<u>A</u> dd <u>R</u> emove Re <u>m</u> ove A	Re
	Re
Re <u>m</u> ove A	
	File Name Re <u>m</u>

Figure 3-5: Add existing headers, sources or other files if necessary

### Step 3 - Include Libraries

Following step allows you to quickly set whether you want to include all libraries in your project, or not. Even if all libraries are included, they will not consume any memory unless they are explicitely used from within your code. The main advantage of including all libraries is that you will have over **500 functions** available for use in your code right away, and visible from **Code Assistant [CTRL+Space]**. We will leave this in default configuration:

Make sure to leave **"Include All"** selected.

Click Next.

Include Libraries Include All (Default) Include None (Advanced) Selecting all libraries is recommended for beginners. Selecting libraries manually using Library Manager (recommended for advanced users) results in faster compilation.	Library Manager Help
---	----------------------

Figure 3-6: Include all libraries in the project, which is a default configuration.

### **Step 4 - Finishing**

After all configuration is done, final step allows you to do just a bit more.

There is a check-box called "Open Edit (01 Project window to set Configuration bits" at the final step. Edit Project is a specialized window which allows you to do all the necessary oscillator and PLL settings, as well as to set other configuration bits. We made sure that everything is described in plain English, so you will be able to do the settings without having to open the datasheet. Anyway, since we are only building a simple application, we will leave it at default configuration (HS oscillator with PLL disabled). Therefore, leave the checkbox unchecked.

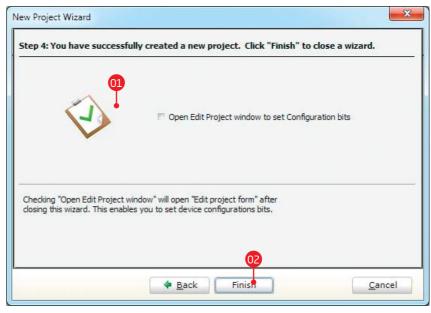

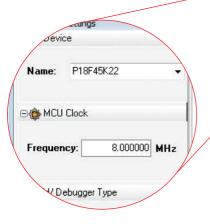

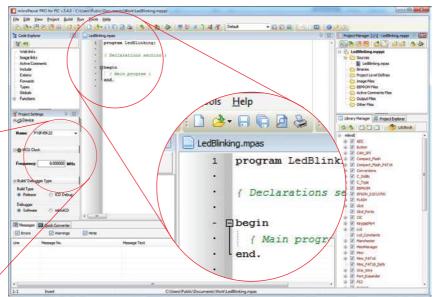

Figure 3-7: Choose whether to open Edit Project window after dialog closes.

# Blank new project created

New project is finally created. A new source file called **"LedBlinking.mpas"** is created and it contains the **begin...end.** block, which will hold the program. You may notice that project is configured according to the settings done in the **New Project Wizard**.

#### Figure 3-8: New blank project is created with your configuration

# 4. Code Example

Time has come to do some coding. First thing we need to do is to initialize the PORTB to act as digital output. TRISB register, associated with PORTB, is used to set whether each pin acts as input or output.

// set PORTB to be digital output
TRISB := 0;

LATB register is used instead of PORTB for digital output. We can now initialize it with logic zeros on every pin:

```
// Turn OFF LEDs on PORTB
LATB := 0x00;
```

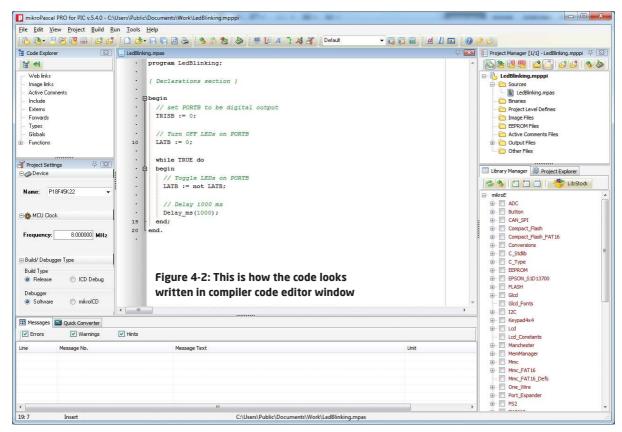

Finally, in a **while** loop we will toggle the PORTB value, and put a 1000 ms delay, so the blinking is not too fast.

```
while TRUE do
begin
    // Toggle LEDs on PORTB
    LATB := not LATB;
    // Delay 1000 ms
    Delay_ms(1000);
end;
```

### LedBlinking.mpas - source code

```
program LedBlinking;
 1
 2
 3
    begin
      // set PORTB to be digital output
 4
 5
      TRISB := 0;
 6
 7
      // Turn OFF LEDs on PORTB
 8
      LATE := 0;
 9
      while TRUE do
10
11
      begin
12
        // Toggle LEDs on PORTB
13
        LATB := not LATB;
14
15
        // Delay 1000 ms
16
        Delay ms(1000);
17
      end:
    end.
18
```

#### Figure 4-1: Complete source code of the PORTB LED blinking

# 5. Building the Source

When we are done writing our first LedBlinking code, we can now build the project and create a **.HEX** file which can be loaded into our target microcontroller, so we can test the program on real hardware. "Building" includes compilation, linking and

<u>B</u> uil	d <u>Run T</u> ools <u>H</u> e	elp
*	<u>B</u> uild	Ctrl+F9
	<u>R</u> ebuild All Sources	Alt+F9
з.	Build All Projects	Shift+F9
	Stop Build All	Ctrl+F12
-	Build + Program	Ctrl+F11

optimization which are done automatically. Build your code by clicking on the sicon in the main toolbar, or simply go to **Build menu** and click **Build [CTRL+F9]**. Message window will report the details of the building process (**Figure 5-2**). Compiler automatically creates necessary output files. **LedBlinking.hex** (**Figure 5-1**) is among them.

# 6. Changing Project Settings

If you need to change the target microcontroller or clock speed, you don't have to go through the new project wizard all over again. This can be done quickly in the Edit Project window. You can open it using Project->Edit Project [CTRL+SHIFT+E] menu option.

To change your MCU, just select the desired microcontroller from the

- To change your settings enter the oscillator value and adjust configuration register bits using drop-down
- Several most commonly used settings can be loaded using the provided oscillator "schemes". Load the desired scheme by clicking the Load Scheme
- Select whether to build a **Debug** HEX, which is necessary for hardware debugging, or a final **Release HEX**.

#### Figure 6-1: Edit Project Window

# 7. What's next?

### More examples

mikroPascal PRO for PIC® comes with over **150 examples** which demonstrate a variety of features. They represent the best starting point when developing a new project. You will find projects written for mikroElektronika development boards, additional boards, internal MCU modules and other examples. This way **you always have a starting point**, and don't have to start from scratch. In most cases, you can combine different simple projects to create a more complex one. For example, if you want to build a temperature datalogger, you can combine temperature sensor example with MMC/SD example and do the job in much less time. All projects are delivered with a working .HEX files, so you don't have to buy a compiler license in order to test them. You can load them into your development board right away without the need for building them.

# Community

If you want to find answers to your questions on many interesting topics we invite you to visit our forum at **http://www.mikroe.com/forum** and browse through more than 150 thousand posts. You are likely to find just the right information for you.

On the other hand, if you want to download more free projects and libraries, or share your own code, please visit the **Libstock** website **http://www.libstock.com**. With user profiles, you can get to know other programmers, and subscribe to receive notifications on their code.

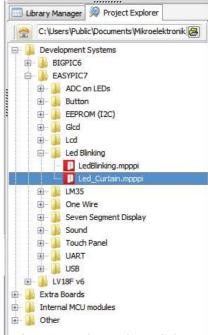

Figure 7-1: Project explorer window enables you to easily access provided examples and load them quickly
