

74VHC4051, 8-Channel Analog Multiplexer 74VHC4052, Dual 4-Channel Analog Multiplexer 74VHC4053, Triple 2-Channel Analog Multiplexer

74VHC4051, 8-Channel Analog Multiplexer 74VHC4052, Dual 4-Channel Analog Multiplexer
74VHC4053, Triple 2-Channel Analog Multiplexer

Features

- Wide analog input voltage range: $\pm 6\text{V}$
- Low "ON" resistance: 50 Typ. ($V_{CC} - V_{EE} = 4.5\text{V}$)
- 30 Typ. ($V_{CC} - V_{EE} = 9\text{V}$)
- Logic level translation to enable 5V logic with $\pm 5\text{V}$ analog signals
- Low quiescent current: 80 μA maximum
- Matched switch characteristic
- Pin and function compatible with the 74HC4051/ 4052/4053

General Description

These multiplexers are digitally controlled analog switches implemented in advanced silicon-gate CMOS technology. These switches have low "ON" resistance and low "OFF" leakages. They are bidirectional switches, thus any analog input may be used as an output and vice-versa. Also these switches contain linearization circuitry which lowers the "ON" resistance and increases switch linearity. These devices allow control of up to $\pm 6\text{V}$ (peak) analog signals with digital control signals of 0 to 6V. Three supply pins are provided for V_{CC} , ground, and V_{EE} . This enables the connection of 0–5V logic signals when $V_{CC} = 5\text{V}$ and an analog input range of $\pm 5\text{V}$ when $V_{EE} = 5\text{V}$. All three devices also have an inhibit control which when high will disable all switches to their off state. All analog inputs and outputs and digital inputs are protected from electrostatic damage by diodes to V_{CC} and ground.

VHC4051: This device connects together the outputs of 8 switches, thus achieving an 8 channel Multiplexer. The binary code placed on the A, B, and C select lines determines which one of the eight switches is "ON", and connects one of the eight inputs to the common output.

VHC4052: This device connects together the outputs of 4 switches in two sets, thus achieving a pair of 4-channel multiplexers. The binary code placed on the A, and B select lines determine which switch in each 4 channel section is "ON", connecting one of the four inputs in each section to its common output. This enables the implementation of a 4-channel differential multiplexer.

VHC4053: This device contains 6 switches whose outputs are connected together in pairs, thus implementing a triple 2 channel multiplexer, or the equivalent of 3 single-pole-double throw configurations. Each of the A, B, or C select lines independently controls one pair of switches, selecting one of the two switches to be "ON".

Absolute Maximum Ratings⁽¹⁾

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter	Rating
V_{CC}	Supply Voltage	-0.5 to +7.5V
V_{EE}	Supply Voltage	+0.5 to -7.5V
V_{IN}	Control Input Voltage	-1.5 to $V_{CC}+1.5V$
V_{IO}	Switch I/O Voltage	$V_{EE}-0.5$ to $V_{CC}+0.5V$
I_{IK}, I_{OK}	Clamp Diode Current	$\pm 20mA$
I_{OUT}	Output Current, per pin	$\pm 25mA$
I_{CC}	V_{CC} or GND Current, per pin	$\pm 50mA$
T_{STG}	Storage Temperature Range	-65°C to +150°C
P_D	Power Dissipation ⁽²⁾	600mW
	S.O. Package only	500mW
T_L	Lead Temperature (Soldering 10 seconds)	260°C

Note:

1. Unless otherwise specified all voltages are referenced to ground.
2. Power Dissipation temperature derating; plastic "N" package: -12mW/°C from 65°C to 85°C.

Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to absolute maximum ratings.

Symbol	Parameter	Min.	Max.	Units
V_{CC}	Supply Voltage	2	6	V

			-6.0V	6.0V		±0.05	±0.5	

Notes:

- For a power supply of 5V ±10% the worst case on resistances (R_{ON}) occurs for VHC at 4.5V. Thus the 4.5V values should be used when designing with this supply. Worst case V_{IH} and V_{IL} occur at V_{CC} = 5.5V and 4.5V respectively. (The V_{IH} value at 5.5V is 3.85V.) The worst case leakage current occur for CMOS at the higher voltage and so the 5.5V values should be used.
- At supply voltages (V_{CC}–V_{EE}) approaching 2V the analog switch on resistance becomes extremely non-linear. Therefore it is recommended that these devices be used to transmit digital only when using these supply voltages.
- Adjust 0dB for f = 1kHz (Null R₁/R_{ON} Attenuation).

Typical Performance Characteristics

Typical “On” Resistance vs Input Voltage

$$V_{CC} = -V_{EE}$$

Special Considerations

In certain applications the external load-resistor current may include both V_{CC} and signal line components. To avoid drawing V_{CC} current when switch current flows into the analog switch pins, the voltage drop across the switch must not exceed 1.2V (calculated from the ON resistance).
